comments on the Draft Policy Statment on West Valley Clean up.

1 Drouting tanks + cement rubble is a poor substitute for total clean up. should erosion start in the near future the tanks + grout would shift break apart, there is no way this could be retrived. Fly ash cement is a very weak material it would pulverize in a very short period of time.

2 The N.D.A. with damaged fuel assembleys entrenched in cement with other wastes over them also in cement would be very costly to remove. these wastes are in a highley erodable site they must be removed off site

3 the S.D.A. trenches have already migrated downward + sideways, how do you propose to prevent future + further migration?

4 the tru wastes stored in the Drum Cell Bldg. are in containers that have exceeded the 10 yr. life span How can we not allow you to remove this Hazard.

5 with erosion on three sides of the site it is only a matter of time before the wastes shift and move on to Lake Erie, the Niagara River and the St. Lawarence Seaway these wastes must be removed to a more isolated area

Please consider my concerns for future generations a job half done is no job at all when you are dealing with very Dangerous Radioactive wastes.
