Re: Fedl. Register -- Jan. 23, 2009. pp. 4257-8.

RECEIVED

attention of NRC staff,

The newly designed French Areva reactor has no operating history.

As with Callaway-1, the second reactor would routinely discharge radioactively contaminated water back into the Missouri river.

People and other living things, downwind and downstream, would be exposed to the huge 1600-megawatt Callaway-2's radioactive gaseous and liquid emissions.

No safe disposal location may ever be found for Callaway's radioactive waste.

The shortage of experienced nuclear engineers and other personnel could jeopardize the quality control of the plant's operation and maintenance.

Sincerely, John Thompson
