9.4.4 Turbine Building Ventilation System

The turbine building ventilation system (TBVS) provides heating and ventilation in the Turbine Building (TB) for normal operating modes as well as during refueling outages. The TBVS supplies conditioned air to maintain TB temperatures within the operating requirements for equipment operation and provides an acceptable environment for personnel who operate and maintain the equipment within the building. The TBVS is classified as a non-safety-related system; it does not provide accident response nor does it provide radioactive effluent control functions for the U.S. EPR.
