JAN 12 1981

Docket No. 50-339

APPLICANT: Virginia Electric and Power Company

FACILITY: North Anna Power Station Unit 2

SUBJECT: SUMMARY OF MEETING HELD JANUARY 7, 1981 TO DISCUSS MATTERS RELATED TO THE LEAK TESTING OF REACTOR COLLANT SYSTEM ISOLATION VALVES.

We met with representatives of the Virginia Electric and Power Company on January 7, 1981 in Bethesda, Maryland to discuss matters related to the leak testing of the reactor coolant system isolation valves. A list of attendees is presented in Enclosure 1.

gnificant points descussed at the meeting were as follows:

1. VEPCO advised us that the reactor coolant system pressure isolation valves listed in Table 3.4.1 of the North Anna Unit 2 Technical Specifications lumps together flow paths which vary greatly in their contribution to overall risk associated with intersystem loss-of-coolant accidents. Therefore, they believe that the testing frequency specified in T. S. 4.4.6.2.2 should not apply to flow paths of lesser risk. On this basis they indicated that they will propose to delete Items b and d from T. S. 4.4.6.2.2 for all flow paths except for the low head safety injection lines. For these lines they propose to only delete Item b of the T. S. (T. S. 4.4.6.2.2 is described in Enclosure 2).

2. VEPCO further advise that:

   a. They should be allowed to take credit for valves which are continually tested during the operation of the plant. This includes Motor Operated Valves 2720 A & B which are located in the accumulator lines.

   b. The 1 g pm leak rate requirement may result in unnecessary repairs and retests due to inaccuracy of tests caused by

      (i) conservative extrapolation to 2235 pounds per square inch for check valve testing.

      (ii) accuracy of test methods.

U.S. NUCLEAR REGULATORY COMMISSION

P 8101290478

3. We advised VEPCO that they should formaly submit a proposed technical specification change and provide an adequate basis and justification for each change requested.
