

Official Transcript of Proceedings

NUCLEAR REGULATORY COMMISSION

Title: Advisory Committee on Reactor Safeguards
 Digital Instrumentation and Control Systems
 Subcommittee

Docket Number: (n/a)

Location: Rockville, Maryland

Date: Thursday, August 20, 2009

Work Order No.: NRC-3021

Pages 1-344

NEAL R. GROSS AND CO., INC.

(8:29 a.m.)

CHAIR APOSTOLAKIS: We are back in session. I understand Mr. Torok wants to finish a few things.

So what are you going to do, Ray?

MR. TOROK: I was asked just to touch on the final wrap up from our presentation, the part that you missed. That doesn't include any of the details of the DAS evaluation or that discussion. It is just the final comments from it. Right, Christine?

MS. ANTONESCU: Right, correct.

MR. TOROK: We want to do this so we can get to the next presentation.

CHAIR APOSTOLAKIS: So you are on number 57?

MR. TOROK: That's right.

CHAIR APOSTOLAKIS: Okay, go ahead.

MR. TOROK: This of course wraps up Dave's discussion of his DAS results. There was a lot of detail discussion. Your colleagues can fill you in on that. It was really good, actually. And it showed that this group had read the reports and read them very carefully, which was very good.

Anyway, the bottom lines are first, we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 believe it is possible to generate useful risk
2 insights right now, using existing PRA techniques and
3 I think we showed you an example of how that could be
4 done yesterday, right down to the low level details.

5 Now in regard to the actual analysis we
6 did and the results of that analysis, it was for this
7 automated DAS. And the results of the analysis
8 basically were that the DAS, as analyzed for the
9 events it applied to was shown to have little or no
10 benefit and for a number of reasons. One of them is,
11 it turns out the DAS would just be applied to low
12 frequency events, so-called rare events, large pipe
13 breaks and so on for which there are already
14 significant provision measures in the form of pipings
15 built to code and inspected and all those kinds of
16 things. And there is also significant mitigation in
17 the form of high quality ESFAS and that is really what
18 was driving the results of the analysis.

19 Oh, and one more thing, those two pipe
20 break and the common cause failure in the ESFAS are
21 independent and they have to stay independent. And if
22 you have all that, then it turns out that the results
23 of the risk analysis is going to be that the DAS is
24 not going to have much benefit. It may have some
25 small increase in due to the potential spurious

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 actuations.

2 In general, the conclusions were
3 insensitive to the assumptions that went into the
4 analysis, especially the controversial assumptions
5 about the level of modeling detail and the assumed
6 failure probabilities.

7 And another sort of overall conclusion
8 when you step back from that analysis and look at the
9 results, you conclude that if you are looking for
10 where a DAS is going to be beneficial or adding
11 defense in depth, it is going to have more benefit for
12 high frequency events than low frequency events.

13 So, those were the technical conclusions.

14 Now, in terms of recommendations based on these
15 conclusions, we are hoping that you will encourage the
16 staff and industry to continue to develop PRA methods
17 and to apply them now where it is possible to do that.

18 And there is some indication here of what that means.

19 Where the results are insensitive to the assumptions,
20 that is a good indication. And we think they are
21 applicable both for licensing actions and for specific
22 analyses such as the one that was done for automated
23 DAS.

24 It may also be helpful to consider
25 revising the BTP-19 guidance such that it considers

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 both frequency and consequences when it is looking at
2 adequacy, defense in depth and adequacy of protection
3 against common cause failure. What that means is, it
4 would allow a graded approach in which both the
5 solution and the protective measures are proportional,
6 in some sense, to risk.

7 Let's see. Oh, and we also think it is
8 important, but one of the things that the PRA analysis
9 is telling us is that prevention measures are really
10 important. So we shouldn't be talking about just
11 mitigation when we talk about protection against
12 common cause failure. Really, we should be talking
13 about both. So we really encourage that.

14 Now the last bullet on there refers to,
15 and I think I brought this up at the beginning of the
16 talk yesterday, refers to a number of ACRS statements
17 that are out there in various places, basically
18 expressing skepticism in terms of how far you can go
19 with risk methods for digital systems at this time.

20 And what has been somewhat problematic is
21 some of those statements have been interpreted to mean
22 that the kind of analysis we did is either
23 inappropriate or impossible. And in light of what we
24 showed and discussed yesterday, we think it is
25 possible and you can get reasonable results. And we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 would hope that ACRS would take a look at those
2 statements and decide whether some additional
3 clarification may be appropriate. So that was a
4 recommendation based on the DAS results.

5 And all we have now is a recap of the high
6 level conclusions for each area we talked about. In
7 operating experience we said from what we looked at,
8 software has been no more problematic than other
9 common cause failure contributors, which means the
10 measures being taken to prevent those kinds of
11 problems in software are working pretty well. What we
12 ought to do is capture them and make sure we
13 understand what they are and make sure we keep doing
14 them.

15 In regard to digital failure modes, we
16 think, basically that this notion of mechanisms versus
17 modes versus effects needs to be taken into
18 consideration in all of these analyses so that we use
19 those terms and those concepts at the level of
20 abstraction that is appropriate for the analysis being
21 done.

22 Let's see. And specifically in regard to
23 PRA, it appears that failure mechanisms are typically
24 not of great importance in terms of PRA modeling.
25 They may be helpful when you are trying to assess

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 failure probability but you shouldn't expect to see
2 individual failure mechanisms probably modeled in a
3 PRA model.

4 In regard to, oh I just said this about
5 prevention and mitigation. Both are important. And
6 as I said, PRA insights are possible now. Let's keep
7 doing that.

8 So this is the final recap here. We are
9 basically requesting ACRS concur with our findings
10 where it is appropriate to do that. One of them is
11 motherhood. It says, continue to gather and apply OE
12 lessons learned on failures. But we are a little more
13 specific. The causes, the corrective actions and the
14 preventive measures are really important to focus on
15 those things.

16 And also we think it is important to
17 develop a consistent taxonomy or language, terms and
18 definitions for doing this, because those things are
19 very important in terms of affecting the results. And
20 we are never going to see much agreement in terms of
21 overall results until we get together on what some of
22 these terms mean and what makes sense in terms of
23 binning.

24 For defensive measures, we think it is
25 really important to credit defensive measures. Not in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 regard to showing that common cause failure is not
2 credible or anything like that. It is to credit
3 defensive measures in terms of protecting against
4 common cause failure as a very effective mechanism for
5 doing that and to use it in concert with diversity
6 attributes, where that makes sense. What you would
7 ideally like to do is use some combination of those
8 things and for specific instances, you would use
9 whichever one is more appropriate.

10 I already said this. Let's use risk
11 methods more where it makes sense. And then the last
12 thing there is just encouragement to, I am hoping you
13 will encourage staff to participate more in these
14 technical exchanges to resolve issues with technical
15 discussions. Like it would have been nice to do that
16 on the OE and DAS work. We were unable to do that.
17 The good news is now Dan Santos has been doing a lot
18 of work to get this MOU in place between EPRI and
19 Research so we think that is going to work better in
20 the future.

21 I think that is all I had. Did I get
22 through it fast enough?

23 CHAIR APOSTOLAKIS: Any comments from the
24 members?

25 (No response.)

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: Thank you, Ray.

2 MR. TOROK: Thank you.

3 CHAIR APOSTOLAKIS: I understand the staff
4 has a few comments to make. Would you please come
5 here? You have 40 slides to make a few comments?

6 I hope there will be enough time to
7 discuss the plan.

8 MEMBER BROWN: There will.

9 CHAIR APOSTOLAKIS: Okay, would you tell
10 us who you are for the record?

11 MS. HERRMANN: Debra Herrmann, NRO,
12 Division of Engineering.

13 MR. WATERMAN: I'm Mike Waterman and I am
14 in the Office of Nuclear Regulatory Research in the
15 Division of Engineering.

16 MR. SANTOS: Dan Santos, Office of Nuclear
17 Regulatory Research, Division of Engineering.

18 MS. HERRMANN: We are here to present the
19 NRC comments on the EPRI reports. EPRI requested that
20 we review both the CCF and the DAS reports. All four
21 offices participated in this review, NRR, NRO,
22 Research, and NMSS. Multiple divisions participated
23 in the review. In NRO, we had DSRA, DCIP, and NDE.
24 So, it was a concerted effort and we appreciate the
25 opportunity provide comments to EPRI.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 We look at this as input to the
2 collaborative research, which will be discussed later
3 during the research plan.

4 CHAIR APOSTOLAKIS: So EPRI has seen these
5 comments?

6 MS. HERRMANN: Pardon me?

7 CHAIR APOSTOLAKIS: They have seen these
8 comments that you are about to make?

9 MS. HERRMANN: We discussed the comments
10 at the all-day meeting with EPRI about two weeks ago.

11 CHAIR APOSTOLAKIS: But they have not seen
12 the report or anything?

13 MS. HERRMANN: The handouts, no.

14 CHAIR APOSTOLAKIS: Okay.

15 MS. HERRMANN: NRC policy in this area and
16 how it was developed was documented in the letter from
17 Jack Grobe to NEI last November. Our policy has not
18 changed. Today we are providing technical comments on
19 the EPRI reports.

20 CHAIR APOSTOLAKIS: NRC policy. Which
21 policy is this?

22 MS. HERRMANN: This is the various SECY
23 papers. The SRMs, the BTPs that were all listed
24 yesterday regarding D-3.

25 CHAIR APOSTOLAKIS: Okay. Then we are not

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to assume that we remember too much.

2 MS. HERRMANN: Okay. It was a long day.

3 The EPRI report makes the statement that
4 software is not a significant source of CCFs. We
5 don't believe that is the correct way to frame the
6 question, particularly because it doesn't address a
7 key problem and that is the lack of understanding of
8 digital system failure modes, particularly as they
9 relate to the nuclear industry.

10 The primary concern when migrating from
11 digital technology is that a new source of failure may
12 be introduced. And that is, software CCFs. The other
13 sources of CCFs, as we discussed yesterday, hardware,
14 human error, etcetera, remain essentially the same.
15 So we think you need to reframe the question to what
16 is the prevalence of software CCFs in digital systems,
17 so that you can understand the appropriate prevention,
18 mitigation and verification activities that need to be
19 undertaken.

20 We believe that determining the percentage
21 of software CCFs as to the total CCFs experienced in
22 the plant is not as useful to a digital system
23 engineer.

24 CHAIR APOSTOLAKIS: And why is that?

25 MS. HERRMANN: Because it dilutes the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 data. In other words, if you are a digital system
2 engineer designer, you want to know the failure modes
3 of a digital system. You are not as interested in the
4 external events.

5 I think a good analogy is the EPRI study
6 is an epidemiologic study, whereas, if you are trying
7 to determine the prevalence disease in a specific
8 ethnic group, you only sample data from that ethnic
9 group.

10 MEMBER STETKAR: Didn't they only look at
11 failures in digital systems? They didn't look at
12 software failures out of all common cause failures in
13 the plan. It was software failures out of digital
14 system common cause failures, as I understood their
15 analysis.

16 MS. HERRMANN: Yes, but if you go through
17 the --

18 MEMBER STETKAR: It isn't an
19 epidemiological study to me.

20 MS. HERRMANN: It is but what we are
21 saying is that you need a pathological study. Because
22 if you look at the 322 events, only 24 of them were
23 classified as software failures.

24 MEMBER STETKAR: Okay, that is
25 classification. That is your classification versus

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 mine.

2 MS. HERRMANN: Right.

3 MEMBER STETKAR: That is a different
4 issue.

5 MS. HERRMANN: Right.

6 MEMBER STETKAR: You are talking about the
7 scope of the underlying data and what it is trying to
8 tell us.

9 MS. HERRMANN: Yes.

10 MEMBER STETKAR: Okay.

11 MS. HERRMANN: It is the classification,
12 the data-binning error.

13 MEMBER BROWN: Well, I am hesitant. I
14 guess I don't understand the difference between
15 bullets four and five. In one you say the question
16 that NRC needs to answer is the prevalence of CCFs in
17 digital systems. Then you say determining the
18 percentage of software CCFs is of no interest.

19 MS. HERRMANN: Plant-wide. Outside of the
20 digital systems.

21 MEMBER STETKAR: They didn't try to do
22 that.

23 MEMBER BROWN: All right.

24 MEMBER STETKAR: Did EPRI try to do that?

25 MS. HERRMANN: Well, if you look at a lot

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 of the events, human error, other things that aren't
2 software failure proper. And this gets back to the
3 definitions, which we will get into later.

4 CHAIR APOSTOLAKIS: But that fraction of
5 three point something percent they denied yesterday.
6 I thought it was common cause failures, the fraction
7 of common cause failures in software, digital
8 software. And I asked them, you know, is the PRA
9 guide going to use that and they said no.

10 But it was limited to software, as I
11 remember.

12 MEMBER STETKAR: And in digital systems.
13 The fraction of digital software failures versus
14 motor-operated valve hardware common cause failures.

15 CHAIR APOSTOLAKIS: Now are you saying,
16 Debra, we can't take digital software systems of
17 different missions and do different things, and do
18 what EPRI did? Maybe that is what you are saying.

19 MS. HERRMANN: No, what I am saying is
20 that the focus should be on the software events, the
21 24 software events and not the whole pocket of the
22 322.

23 CHAIR APOSTOLAKIS: Oh, that I agree.

24 MS. HERRMANN: Yes.

25 CHAIR APOSTOLAKIS: That was broader.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Anyway, let's go on.

2 MS. HERRMANN: We talked about this one
3 briefly yesterday, the separation of the 1E and the
4 non-1E events and Mike is going to address this.

5 MR. WATERMAN: As you recall from our
6 March 2008 meeting, Dr. Stetkar pointed it out first
7 and I amplified his comment was that I don't think you
8 can really segregate the non-1E and 1E systems because
9 a lot of those process systems that are included in
10 here were important for plant availability, which
11 would have classified them up in a software integrity
12 level scheme of around three or four if you used the
13 scheme that was introduced in IEEE Standard 1012, 1996
14 and all future ones, where they use a software
15 integrity level scheme to determine how much effort
16 you put into the quality of the software product you
17 are developing.

18 In the case of plant availability systems,
19 the impact of the failure for plant availability is
20 that the business is going to lose a lot of money. So
21 that makes it a major, major event, if you will, if a
22 plant shuts down. Because for example, feedwater, a
23 digital feedwater system fails and you can't run a
24 plant until they get it fixed. So as a consequence,
25 you want a high level of quality to be put into that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 system.

2 But what we found in the EPRI report was
3 they said well now, the 1E systems have a higher
4 quality than non-1E and so you can't compare those.
5 But actually, if you look at the data that was
6 presented yesterday, for example in slide 19, which is
7 non-1E software mechanisms and you compare that with
8 slide 17, which is the 1E non-failure mechanisms,
9 instead of just saying how many software common cause
10 defects out of the total number of common defects, if
11 you compare software common cause failures out of the
12 total number of non-1E events, you find that you get
13 about one failure per seven events in non-1E systems.
14 And if you go over and you do the same comparison of
15 software common cause failures out of total 1E events,
16 you get about one software common cause failure in
17 every eight events.

18 So, one-eighth, one-seventh, seems to me
19 that they are fairly equivalent. So I don't know that
20 you can actually segregate your 1E stuff from your
21 non-1E stuff, which was one of the things that was
22 done in the report is there is a reason for only
23 considering the 1E software common cause.

24 CHAIR APOSTOLAKIS: So are you saying that
25 the quality assurance requirements during the design

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 phase for 1E and non-1E system is about the same?

2 MR. WATERMAN: Well, the quality assurance
3 requirements are probably more stringent for 1E.

4 CHAIR APOSTOLAKIS: Yes.

5 MR. WATERMAN: But performance of that may
6 not be equivalent to the requirement.

7 CHAIR APOSTOLAKIS: So the quality --

8 MR. WATERMAN: The performance proves
9 process. And so it is one thing to lay down a set of
10 requirements and say this is how we are going to build
11 this system, it is quite another to actually build it.

12 For example, you know, in an extreme
13 example, you can say here is all the requirements to
14 build a Boeing 747. And then you take ten people and
15 tell them to build it.

16 CHAIR APOSTOLAKIS: But I remember, I am
17 playing the devil's advocate here, years ago when the
18 stuff came with the first guidance on the digital I &
19 C, the whole focus was on the design cycle or process.

20 And there was an implicit assumption or presumption
21 that if you control the process, the product will be
22 highly reliable. But now you are saying even if you
23 control your process as much as you want, I don't know
24 about the performance.

25 Sounds like a little bit contradictory to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 me.

2 MR. WATERMAN: Well, process and
3 performance are two different things. Process is what
4 is promised to be done. Performance is how well that
5 promise is met.

6 CHAIR APOSTOLAKIS: So was the Agency
7 misguided then? Yes, sir?

8 MEMBER BROWN: Years ago, we had a concern
9 relative to the ability on quality assurance processes
10 for software development and this was 20 years ago.

11 So we did some analysis and found when you
12 are trying to make sure software is right, it is very,
13 very difficult. And you kind of achieve a level of
14 defects that are still there based on time you put
15 into it. And the commercial systems have these. They
16 just go troubleshoot, you know, they remove, remove,
17 remove until the defect level. This was 20 years ago.

18 I can't say what is going on today.

19 When you get down, you are only finding a
20 few things every now and then, and define every now
21 and then as whatever you want, they quit. It is just
22 well, that is good enough. We will just let the other
23 stuff pop up. You get to that same point where you
24 are doing the higher level. More fail, more detailed
25 type stuff.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 It is just a question of whether software
2 can be done and troubleshot and defects removed that
3 well.

4 CHAIR APOSTOLAKIS: That is just the
5 process. I mean there is extensive testing
6 afterwards.

7 MEMBER BROWN: But you can't test all the
8 points. That is the problem. You cannot test all the
9 input and output conditions.

10 MR. HECHT: Isn't one of the issues the
11 difference between the 1E and the non-1E systems, the
12 architecture and the degree of complexity, and whether
13 or not to use asynchronous versus a deterministic time
14 slot?

15 MR. WATERMAN: That is true but if you
16 look at the data, they appear to be failing at about
17 the same rate.

18 CHAIR APOSTOLAKIS: Which is what some
19 people have been saying about safety-related and non-
20 safety related components for a long time.

21 MEMBER BLEY: But there is a related
22 thing. I have said this to them yesterday and I will
23 say it to you today. It doesn't seem to me it does
24 much good to talk at that gross aggregate level. When
25 we get down to parsing out what we were called

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 yesterday failure mechanisms, at that level, you can
2 tell whether the failure mechanisms apply to the one
3 you are interested in or not. And so you can use the
4 data from both if you have a good categorization
5 scheme to go after one of those mechanisms. And I
6 think it is about time we started doing that.

7 And if you look at those old Idaho
8 National Laboratory, they called them risk studies but
9 they went back at operating data and something
10 seemingly simple like a diesel generator. They broke
11 into its pieces and showed that some tests tested one
12 part, some tests test the other part. And you can't
13 just use general data from everywhere. You have to
14 kind of break your data into modules, too and fit into
15 those modules of your subsystem.

16 So it seems to me we are at the point that
17 it is time to start looking a level deeper and trying
18 to match up those failure mechanisms and draw the data
19 from whatever source is appropriate for each one of
20 them.

21 CHAIR APOSTOLAKIS: Which by the way is
22 the central theme also, that old common cause failure
23 study. We did EPRI and NRC where they said, you know,
24 here is what happened in the past. We are not going
25 to give you any statistical information. When you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 analyze a particular system, go back, look at each one
2 of these and declare this one is applicable, this one
3 is not, which is essentially what Dennis is saying.
4 You go back to the mechanism earlier.

5 So, that sounds very reasonable to me.

6 MR. WATERMAN: And not all non-1E systems
7 are a single-point vulnerability. For example,
8 variable frequency drives in BWRs recirc pump A train,
9 recirc pump B train. Right? Those are two different
10 systems.

11 And if you take a look at the Browns Ferry
12 event that occurred on March 26, 2003, that was a
13 common cause failure. Two different computers. The
14 recirc pump A tripped because a microprocessor
15 software fold led the system to believe there was a
16 ground fault. It tripped pump A. Pump A went
17 offline, the reactor down-powered to run on pump B.
18 Pump B microprocessor software, and this was an event
19 that was reported by INPO, microprocessor software
20 error tripped pump B before the operators could fix
21 pump A.

22 That is a case where that is essentially
23 the same thing as a Class 1E system. Right? You have
24 independent trains running the same software.

25 Well, Mike, so you can't just say well we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 will take all the class, the non-class 1E as segregate
2 for the class 1E. You have to look at the
3 architecture and determine where we have redundant
4 architecture, you have to lump it all together.

5 CHAIR APOSTOLAKIS: What is the -- I mean,
6 okay, you made this comment. What is the practical
7 implication of this?

8 MS. HERRMANN: That is on the next page.

9 CHAIR APOSTOLAKIS: It is? I guess you
10 figured out the question was coming. Right?

11 MS. HERRMANN: Right.

12 MR. WATERMAN: Forty-nine events were
13 related to the 1E systems, such as reactor protection,
14 this is what EPRI stated, engineered safety features,
15 diesel load sequencer, post accident monitoring,
16 etcetera. However, this is sort of misleading because
17 you don't have really a lot of digital reactor
18 protection systems out there. As a matter of fact, I
19 think Oconee is going to be the first one that is
20 actually putting in a full digital RPS, ESFAS.

21 And so you could say well what about
22 Eagle-21? But Eagle-21 is not totally digital. Just
23 only parts of it are digital.

24 So there really isn't --

25 MEMBER BROWN: That is not all there.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BLEY: Yes. It's not all there.

2 MR. WATERMAN: So there was really a low
3 level of safety-related digital systems in current
4 operating reactors. You could probably a back of the
5 envelope calculation, actually, estimate how many
6 digital safety systems are in our plant fleet. And it
7 would probably work out to maybe, I don't know, a
8 thousand, total, just for a ballpark number.

9 CHAIR APOSTOLAKIS: These are still
10 comments. My question was in terms of practical
11 applications, what do you want me to do? Okay, you
12 disagree with EPRI. What are we to do?

13 MR. WATERMAN: I think what we need to do
14 is recategorize.

15 CHAIR APOSTOLAKIS: I'm sorry?

16 MR. WATERMAN: I think what we need to do
17 is recategorize those failures.

18 CHAIR APOSTOLAKIS: And go to the
19 mechanisms?

20 MR. WATERMAN: And go and look at the
21 architecture also. What kind of things can have
22 common cause failures because, in an architecture that
23 has redundant transfers.

24 MR. SANTOS: This is Dan Santos from the
25 Office of Research. The answer is we are going to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 undertake a research project that will deeper look at
2 that classification categorization of failure modes
3 and detailed assessments of the systems. So we will
4 discuss that in more detail later today. I am going
5 to bring it up. That is where this is leading to.

6 CHAIR APOSTOLAKIS: Is anything, any
7 results that EPRI presented yesterday, should I say
8 no, this is not right because the staff disagrees, as
9 a result of your comments?

10 MS. HERRMANN: It is not that we disagree
11 with the results. I mean, they went through their
12 methodology and the rationale for it. It's just that
13 we believe that the question should be asked
14 differently and we believe in a different
15 categorization scheme. So, we are asking a slightly
16 different question than they are asking, basically.

17 MR. WATERMAN: And hopefully, the MOU will
18 be able to work out that.

19 MR. SANTOS: And we do plan to use EPRI's
20 work to leverage and insights that we can extract from
21 that to compliment our research moving forward.

22 MEMBER BLEY: That means you are going to
23 start with the data they have already collected?

24 MR. SANTOS: Absolutely.

25 MEMBER STETKAR: Let me ask a broader, so

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 we can keep moving here because we are obviously not
2 going to get through 40 slides and look at different
3 categories of different events.

4 EPRI said that they made an effort to find
5 backup documentation for the LERs that were originally
6 identified by RES. And they couldn't find backup
7 documentation for a 182 of them. Now, 182 events,
8 additional events in the database would increase the
9 whole size of the database by about 60 percent. That
10 is a measurable fraction. Why is that? Why couldn't
11 they find that? Are they not real events? Did you
12 guys look into that all?

13 MR. WATERMAN: I went back and took a look
14 at the list of events I had. And when I made the
15 original list, I didn't put in the OER report number.
16 So I thought okay, I'll put in report numbers now.

17 When I got to 1993, all of those events
18 were gone out of the database. I don't know what
19 happened to them. It was very discouraging.

20 MEMBER STETKAR: And most of the 182
21 events have --

22 MR. WATERMAN: I don't know about most of
23 them. I am still working my way back up through the
24 list, starting from the earliest data first to get the
25 report numbers. But it seems that the database is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 being scrubbed or something. I mean, some of the
2 events are recorded. I couldn't have possibly made
3 them up.

4 CHAIR APOSTOLAKIS: But as part of the
5 MOU, you would agree with EPRI finally on a database?

6 MR. WATERMAN: Oh, yes.

7 MR. SANTOS: And reconcile some of that.

8 MS. HERRMANN: I get to that when we go
9 through the independent standing.

10 CHAIR APOSTOLAKIS: So my level of
11 understanding, really continues to understanding.
12 Doesn't it?

13 MS. HERRMANN: Yes. Like I said, this is
14 input to --

15 MR. KEMPER: If I could interject
16 something, please.

17 CHAIR APOSTOLAKIS: Yes.

18 MR. KEMPER: Hi. I'm Bill Kemper. I work
19 in NRR.

20 When I was in the Office of Research a few
21 years ago, we undertook a project called COMPSIS. I'm
22 sure you all probably heard about that, which was
23 designed to collect this very information that you are
24 asking for. It is an international joint, six or
25 seven different countries participated in it. And

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 what we found in trying to gather that information was
2 from the LER database, the LER as you all know, are
3 usually produced within a certain time frame. You
4 know, within 30 days of the event. So the recalls
5 investigations that are actually going on at the
6 utility sites themselves, is generally not completed.

7 It is very common for them not to be completed. And
8 there is also no requirement for them to send that to
9 us as a result of that.

10 So what we see often is LERs is the first
11 blush, if you will, a further detailed look but not
12 all of the details. In other words, actually going in
13 and dissecting semiconductors and things like that,
14 which is often done to try to determine what the
15 failure mechanism actually was for a system.

16 So, we had the same problem in the COMPSIS
17 arena, as we were trying to populate that database.
18 Really, we have to depend on resident inspectors to
19 gather that information from us and it turned out to
20 be a very arduous, difficult task to do. So that is
21 why that most of the information is not available,
22 associated with LERs.

23 MEMBER STETKAR: It is an arduous
24 difficult task but it is an absolutely necessary task.

25 Because what we found in our common cause experience

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 was that if you didn't have the actual detailed
2 information that was available only at the plant, you
3 really couldn't understand anything. You drew, in
4 many cases, very, very misleading conclusions from
5 that very brief summary information, especially if you
6 had predefined categories that you were trying to
7 throw those individual summary events into.

8 So, I think we are saying the same thing
9 is that you need that backup information. And trying
10 to draw any inferences from simple LER summaries is --

11 MR. KEMPER: It is very difficult.

12 MEMBER STETKAR: Yes, at best. It is very
13 limited.

14 MR. KEMPER: You could come to the wrong
15 conclusion.

16 CHAIR APOSTOLAKIS: So, what you want to
17 say something?

18 MR. SANTOS: No, move on.

19 CHAIR APOSTOLAKIS: Mike, go ahead. I'm
20 sorry, Debra.

21 MS. HERRMANN: Yes, we talked about this
22 yesterday, the difference between failure mechanism
23 and failure mode. I don't think we have anything new
24 to say there.

25 The same thing on the -- we talked about

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 yesterday the difference between potential versus
2 actual CCF. It is important to capture the potential
3 CCF in the a priori analysis because it is a latent
4 defect.

5 MEMBER BLEY: Do you agree with the way
6 they organized that and categorized those events,
7 those non-common cause, potential common cause, and
8 actual common cause?

9 MS. HERRMANN: Yes and no. The first two
10 columns we agree with. The last two columns we kind
11 of start from the point that a CCF is a CCF, depending
12 if you are doing the a priori or the post-event
13 analysis that the potential CCF becomes important and
14 needs to be counted. So there is that distinction
15 there.

16 MEMBER BLEY: I think that is what they
17 did, their last two columns they treated equally.

18 MS. HERRMANN: Yes, as a CCF. But it is
19 at different points in time the distinction becomes
20 important.

21 MEMBER BLEY: How about the middle column,
22 the one that had the condition that had no triggers?

23 MS. HERRMANN: That one we are still
24 debating, I will say.

25 CHAIR APOSTOLAKIS: But coming back to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 potential CCF, I still think that what was done for
2 hardware associates with the little guide is something
3 that would be very useful to both teams.

4 MS. HERRMANN: Yes.

5 CHAIR APOSTOLAKIS: It is not going to
6 revolutionize what you are doing but I think you can
7 build on what these people have done.

8 MS. HERRMANN: Yes, there is a lot of
9 insights there.

10 CHAIR APOSTOLAKIS: Okay, good. But I am
11 not sure I agree that the distinction between failure
12 modes and failure mechanisms is an artificial
13 boundary. I don't know.

14 MS. HERRMANN: If you remember the chart
15 that came out of the NUREG, it kind of stair-steps
16 through where it will be a failure mode of one level
17 of abstraction and then it becomes the failure
18 mechanism at the next level of abstraction. So, it
19 flip-flops as you go through the different levels of
20 abstraction. So it is a terminology thing. But I
21 think we --

22 CHAIR APOSTOLAKIS: What ultimately
23 matters is the failure mode.

24 MS. HERRMANN: Yes, and that is what we
25 need to zero in on.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BLEY: It is what matters to put
2 something in to a PRA. But what matters to understand
3 how you get there and eventually if you want to try to
4 quantify the likelihood of getting there is certainly
5 not at that level.

6 MS. HERRMANN: It is lower, yes.

7 CHAIR APOSTOLAKIS: Yes, but ultimately
8 means, actual operation. Ultimately, what I want to
9 know is how it fails. Now, to understand that, I may
10 have to do other things.

11 MEMBER BLEY: I guess I am uncomfortable
12 with that because you aren't going to fix it knowing
13 its impact on a system. You are going to fix it by
14 understanding what has gone wrong inside. Ultimately,
15 if you want it better, you can't stay here.

16 MEMBER STETKAR: Common cause failure
17 stuff, you know, just quantifying a beta factor wasn't
18 the purpose of that. It was to understand what was
19 happening and do you alter your testing program, for
20 example, to eliminate some of those causes? And
21 without understanding those mechanisms --

22 CHAIR APOSTOLAKIS: Nobody is arguing we
23 shouldn't understand anything. I don't know where
24 that motion came from.

25 Okay, guys, the ACRS recommendation is do

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 not understand. Just so.

2 MS. HERRMANN: Okay. Getting back to the
3 question of wording we found, I guess these are
4 probably some of the missing events. We did a query
5 of the LER database. And yes, it is being scrubbed
6 and updated. So I imagine your EPRI report cut off at
7 December '08 and this query was run in June. So I
8 imagine we picked up some events here.

9 MR. TOROK: Excuse me?

10 CHAIR APOSTOLAKIS: Sure.

11 MR. TOROK: Ray Torok. We cut off in
12 2007.

13 MS. HERRMANN: Right. I mean your report
14 was published in 2008 but the data cuts off in 2007.

15 MR. TOROK: That's right.

16 MS. HERRMANN: Right. So our query was
17 run later this summer. So we picked up some events
18 and these are probably some of the missing events.

19 We also question the value of the data
20 prior to 1996, like the '87 to '96 because that
21 technology is really, really old and we are talking
22 like 8086s and I don't think you want to draw too many
23 inferences from that type of data when you are looking
24 at the new reactors coming down the pike.

25 MEMBER BROWN: They had to be programmed.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 They had software. They had their standards to which
2 the program had been compiled. So I wouldn't --

3 MEMBER BLEY: The requirements were the
4 same and if you look at failure mechanisms, they are
5 probably going to be the same.

6 MEMBER BROWN: I mean, we had a lot of
7 386s. All right? And the early systems that I was
8 familiar with before we spring boarded to the latest
9 technology is 386s, which was already superseded by
10 the next 15 generations, by the time we got around to
11 using the 386s.

12 So, I don't think you can throw that out.

13 MS. HERRMANN: I wouldn't throw it out but
14 I don't think it is as --

15 MEMBER BLEY: Software quality assurance
16 is a problem regardless --

17 MS. HERRMANN: Oh, definitely.

18 MEMBER BLEY: -- of a particular
19 microprocessor.

20 CHAIR APOSTOLAKIS: I guess it depends on
21 what you mean by questionable value. Does this mean
22 you discard it or you are more skeptical when you read
23 it?

24 MS. HERRMANN: More skeptical. It is more
25 of a weighting factor. The older the data, I would

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 weight it less value. Number one, you are getting to
2 software quality. I think people have learned a lot
3 about software quality in the last 20 years that they
4 didn't know in the '80s. There is all sorts of
5 different design techniques.

6 CHAIR APOSTOLAKIS: What is up there?

7 MEMBER BROWN: What the hell is up there?

8 CHAIR APOSTOLAKIS: We have all this
9 software.

10 MS. HERRMANN: We all did the best we did
11 then.

12 MEMBER BROWN: I meant that in a nice
13 manner.

14 MS. HERRMANN: Okay, good. Well, I did
15 some 8086, too.

16 CHAIR APOSTOLAKIS: So, these are general
17 comments.

18 MS. HERRMANN: Yes, right.

19 CHAIR APOSTOLAKIS: Obviously you are --

20 MS. HERRMANN: I am leading up to
21 something.

22 CHAIR APOSTOLAKIS: -- telling me what
23 EPRI has done and you are making these comments.

24 MS. HERRMANN: Right.

25 CHAIR APOSTOLAKIS: You have not

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 implemented anything of these. Right? So let's not
2 take it literally.

3 MS. HERRMANN: Right. This is input to
4 the collaborative research.

5 CHAIR APOSTOLAKIS: Okay.

6 MS. HERRMANN: Things to think about.

7 CHAIR APOSTOLAKIS: So starting with the
8 right foot. And then you want them to use the LER
9 abstracts verbatim?

10 MS. HERRMANN: Remember on the database
11 screens, there is that text field. And it was
12 explained yesterday that that was just kind of a notes
13 field. We interpreted that that was summarizing the
14 abstract. So that was a disconnect. We understand
15 what happened there so we can ignore that one.

16 CHAIR APOSTOLAKIS: But you agree that you
17 can't always go with the verbatim.

18 MS. HERRMANN: Right. Well, the point
19 here is that you don't want to read the LER abstract.

20 You want to read the entire LER and the backup data
21 because the abstract often is not an abstract. Often
22 it is just the first paragraph. So we just ignored
23 the LER abstracts and we looked at the entire report
24 and the backup data that went with it.

25 I think we need some LER writing training

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 for the industry.

2 MEMBER BROWN: That will never work.

3 MS. HERRMANN: Well, we can recommend it.

4 Okay, on the root causes, in the report
5 there is bar graph where they show the distribution of
6 the different types of root causes. We had some
7 concerns or questions there because the categories of
8 root causes that are given are not mutually
9 exclusive.

10 For example, one of the items listed is
11 ineffective change management. Ineffective change
12 management includes inadequate requirements,
13 inadequate testing, inadequate CM, inadequate V and V.

14 If you look at it the other way, V and V is supposed
15 to present or prevent all of your errors. So V and V
16 would include inadequate requirements, inadequate
17 testing, inadequate CM. You could say everything is
18 the result of inadequate V and V.

19 So what we are recommending, this gets
20 back to the categories. The categories, if you are
21 really going to analyze root causes, you need to get
22 down to the lowest level. You need to have categories
23 that are mutually exclusive and need to be at the same
24 level so that that way you can start deriving some
25 meaningful intelligence.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: And you are convinced
2 that EPRI did not do this or it is something you want
3 to make sure they did?

4 MS. HERRMANN: This is something, again
5 this is a recommendation going in to when we start
6 working together.

7 CHAIR APOSTOLAKIS: Okay.

8 MS. HERRMANN: What EPRI did is they
9 reported the root causes as they were on the reports.
10 They didn't makeup the categories. So again, this
11 gets back to we need some LER writing training. Let's
12 get these categories --

13 CHAIR APOSTOLAKIS: Is a root cause the
14 same as a mechanism?

15 MS. HERRMANN: Not always.

16 CHAIR APOSTOLAKIS: So a root cause leads
17 to a mechanism that leads to a failure mode?

18 MEMBER BROWN: It leads to an effect.

19 MS. HERRMANN: Which could have a trigger.

20 MR. HECHT: The root cause is generally
21 what I call the seven deadly sins. You know,
22 gluttony, vice, laziness, things like that. But
23 ultimately, the root cause could be a failure to
24 understand, implement, manufacture, install.
25 Basically, human.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: And what would be an
2 example of a mechanism that results from this cause?

3 MR. HECHT: A mechanism might be that the
4 limits on a input variable aren't properly set because
5 the root cause was that the people who wrote the
6 requirements didn't understand the proper range of the
7 variable.

8 CHAIR APOSTOLAKIS: And then the failure
9 mode?

10 MR. HECHT: It might be a crash because
11 the software couldn't process the input variable.

12 CHAIR APOSTOLAKIS: Very good.

13 (Laughter.)

14 MEMBER BROWN: You better write that down.

15 CHAIR APOSTOLAKIS: It makes sense.

16 MEMBER BROWN: That is on the transcript?
17 You had better print that out.

18 CHAIR APOSTOLAKIS: Okay.

19 MS. HERRMANN: Same thing, there was a bar
20 graph on the corrective action. And again, EPRI was
21 just reporting what was on the reports. They didn't
22 make the categories up. But the categories are not
23 mutually exclusive. One of them was given as analysis
24 and analysis is not a corrective action. You do
25 analysis in order to determine what corrective action

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to take.

2 So again, we are getting back to we need
3 to have the classification levels that are at the
4 appropriate level and there is no overlaps in order to
5 really determine what is going on here.

6 I think I mentioned yesterday some of the
7 events that were not counted as CCF in the statistics.

8 Actually, we are CCFs, we found three where the text
9 described it as a CCF but the box wasn't checked and
10 counted. So we went over some of those yesterday.

11 Same thing, there were three events that
12 were not counted as potential CCFs where it is
13 described as a potential CCF. So that is part of the
14 data scrubbing we can do when we start working
15 together on the database.

16 There is one analog system. I think that
17 was just a fluke. And then there was one event where
18 it had a bogus LER number. EPRI yesterday indicated
19 that that is a typo. We have got that one squared
20 away.

21 So we decided to do an independent study
22 of the LER data and kind of see if we could reproduce
23 the similar results. And we used the LERs because
24 there is a threshold for reporting LERs and the
25 reporting is mandatory.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 On the approach, we did a query based on,
2 we were trying to answer the --

3 MEMBER BLEY: I understand what you said
4 but the reasons you use the LERs, is that something
5 you intend to take forward and just stick with LERs?
6 I mean, you are missing an awful lot of data if we do
7 that.

8 MS. HERRMANN: Oh, LER plus the backup
9 data.

10 MEMBER BLEY: But the only things to get
11 rebuilt is LERs.

12 MS. HERRMANN: For this independent study.
13 Not the future research.

14 MEMBER BLEY: Not the future.

15 MS. HERRMANN: Right.

16 MEMBER BLEY: Okay.

17 MS. HERRMANN: Yes, this is --

18 MEMBER BLEY: I thought you were making
19 arguments that you will want to hold to.

20 MS. HERRMANN: No.

21 MEMBER BLEY: Okay.

22 MS. HERRMANN: And I should point out here
23 is the other thing we did is we only used -- like Bill
24 brought up the point that there are interim LERs. We
25 only used the final LER. Because the interim, like

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 you know, you are in the spur of the moment, panic.
2 You know, it may not be the accurate assessment. So
3 we paid no attention to the interim. We only did the
4 final LERs. And a lot of times there was a big gap
5 between the interim and the final. So we only used
6 the final ones to help get a little closer to reality.

7 And we only went back to November '97. We
8 figured a 10 to 12 year period was kind of more
9 accurate of what is going to happen in the future.
10 Sorry about the 8086s.

11 CHAIR APOSTOLAKIS: Well you can always go
12 back later and --

13 MS. HERRMANN: Yes, I mean, the LER
14 database goes back a long ways. You know, we just did
15 a snapshot.

16 MEMBER BROWN: You need to go back to Z-
17 80s.

18 MS. HERRMANN: No. I did like Ralph
19 Underman. He was a very creative person.

20 MEMBER BROWN: Z-80s were up and
21 operational in reactor clients in 1984.

22 CHAIR APOSTOLAKIS: I think it really
23 comes down -- I mean these are artificial
24 distinctions. It all comes down to what we said
25 earlier. Something happened, you know in Athens in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 500 B.C. If that is relevant to today, you use it.

2 MS. HERRMANN: Yes.

3 CHAIR APOSTOLAKIS: Whether it is ancient
4 or not I think is irrelevant, unless you can make a
5 good case that this now because of A, B, C, is
6 impossible to happen.

7 I think that that really, I mean, the
8 basis should be the actual mechanism and the causes.
9 The root causes.

10 MS. HERRMANN: Root causes, yes.

11 CHAIR APOSTOLAKIS: Thank you. Don't you
12 think that is a reasonable thing to do? Then you take
13 away all this criticism. You know, you stop at '97.

14 MS. HERRMANN: If the data is relevant.

15 CHAIR APOSTOLAKIS: Absolutely. Yes, that
16 is what we are saying. The conditions are more or
17 less the same and you judge that this thing could
18 happen today, then you use it.

19 MS. HERRMANN: Yes.

20 MEMBER BROWN: One of the arguments you
21 could make is that the architecture of the
22 microprocessors themselves are far more high quality
23 relative to their structure, than they were 30 years
24 ago. And that is a relevant fact in terms of the way
25 you construct your software when you build it. I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 mean, that would have been a better argument than just
2 it is old.

3 I mean some of us think that being old is
4 not necessarily all bad. Right?

5 CHAIR APOSTOLAKIS: I have to agree with
6 that.

7 MEMBER BROWN: Yes, I think that is right.

8 CHAIR APOSTOLAKIS: Okay.

9 MS. HERRMANN: Okay. So this is where
10 there is a distinction between the EPRI report. We
11 included within software failures the final items.
12 This is requirements errors, design errors, algorithm
13 errors, implementation errors, interface errors and
14 parameter errors. And here we mean software
15 parameters, i.e., constants. Parameter has a
16 different meaning in the overall plant. And then
17 timing errors.

18 MR. HECHT: Debra, can I ask a question?
19 You have used the term failure and you have used the
20 term error. Are those the same thing?

21 MS. HERRMANN: What this is capturing is
22 the error in the software product, yes. And these are
23 from the IEEE standard, since we use --

24 MR. HECHT: The IEEE standard?

25 MS. HERRMANN: Pardon me?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. HECHT: Which IEEE standard?

2 MS. HERRMANN: 1044 or excuse me 1045, I
3 think it is. It is where it classifies software
4 anomalies.

5 MR. HECHT: I see, okay.

6 CHAIR APOSTOLAKIS: Would the --

7 MS. HERRMANN: It is either 1044 or 1045.
8 I can't remember. I will check that out. But it is a
9 classification scheme for software anomalies.

10 CHAIR APOSTOLAKIS: In the context of root
11 cause mechanism and so on, where does the term error
12 fall in?

13 MS. HERRMANN: An error could be a root
14 cause.

15 MR. HECHT: Well this appears to be --

16 CHAIR APOSTOLAKIS: It could be a
17 mechanism, too?

18 MS. HERRMANN: Again, where it is in the
19 architecture, yes. But what we looked at is these
20 errors, if you will, in the software product as a root
21 cause and that is how it shows up in these statistics.

22 MR. HECHT: It looks like they are causes,
23 ultimately. In other words, the software didn't do
24 something you expected it to do because it wasn't
25 designed properly or the interface was wrong.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MS. HERRMANN: Yes.

2 MR. HECHT: So it is kind of a cause.

3 CHAIR APOSTOLAKIS: A cause.

4 MR. HECHT: So there is a defect which led
5 to the error. Is that -- to the failure.

6 MS. HERRMANN: Yes, these are your classic
7 error of omission/error of commission type.

8 MR. HECHT: Wow. Well, as usual, those
9 terms also need to be defined.

10 MS. HERRMANN: Yes, and we excluded human
11 error and operator error from the software failures.

12 MR. HECHT: By the way, how would you --
13 there is this thing called a timing error there at the
14 back. I guess there would be a timing error where it
15 came, you designed it to come later than it did and
16 there might be a timing failure where you didn't
17 necessarily design it to come later than it did but it
18 did anyway for another reason.

19 So which one is that? Which one is that
20 timing error? The former? In other words, you were
21 wrong about when you said something, you told it to
22 wait 15 seconds and it should have been to wait seven
23 seconds or something?

24 MS. HERRMANN: No. This would be a timing
25 error at an integration point between --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. HECHT: Well then that isn't quite
2 consistent. Because a timing error at the integration
3 might be because of something different than the
4 software, which might be considered an algorithm
5 error.

6 It sounds like it is more like a failure.

7 It is a result of some other kind of error. Are you
8 with me? Let me try again.

9 If you are talking about integrating two
10 things, let's just say you are talking about
11 integrating one processor talking over some kind of
12 digital connection to another processor. And the
13 information doesn't come over in time because there is
14 some contention on that network or something is
15 happening and it stays in the buffer until it gets
16 over to the other side. That is a different kind of
17 phenomenon than one where you said hold it in the
18 buffer because the software is telling it to and then
19 send it over and it comes late.

20 MS. HERRMANN: Right. Okay, in this case
21 the latter category is what is considered a timing
22 error.

23 MR. HECHT: Okay. So the fact that it
24 came late because of some external --

25 MS. HERRMANN: External.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. HECHT: -- circumstance, that would be
2 a failure.

3 MS. HERRMANN: Right.

4 MR. HECHT: By the way, how would you
5 distinguish a design error from an algorithm error?

6 MS. HERRMANN: An algorithm error is a
7 specific case where the calculation is wrong. The
8 design would say multiply X by Y, or whatever,
9 determine that, and then it actually got implemented
10 some way wrong. I have examples of each of these
11 coming up.

12 And we defined software, I think, a little
13 bit broader than EPRI did. It is all of the above.
14 Operating systems, utilities, applications, firmware,
15 and data. And again, this is consistent with IEEE
16 nomenclature.

17 And we looked at four categories of CCFs.
18 Failure of primary and a back-up, multiple systems
19 operating in parallel, multiple units at a single
20 location, and then another category, which is a common
21 vendor's product that failed at multiple locations.

22 MEMBER BLEY: Just to be clear. Because
23 you are not doing maintenance errors, a plant
24 maintenance person reinstalling the wrong, out-of-date
25 software isn't --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MS. HERRMANN: Isn't captured here, no.

2 MEMBER BLEY: Got you.

3 MS. HERRMANN: That got put under human
4 error.

5 MEMBER BLEY: Okay.

6 MS. HERRMANN: Because we wanted to really
7 zero in on what is wrong with the software.

8 Okay, the query we ran, we got 45 records.
9 And you can see the distribution here.

10 MEMBER BROWN: You say that only one of
11 these was included in the EPRI report. Is that one
12 subsequent to 2007 or is that one in the entire 1997?
13 Are you saying all other data is, they missed 40 -- I
14 mean, they said they had 49, out of this 1E stuff.

15 MS. HERRMANN: This is everything that
16 meets the threshold for reporting LER data. The one
17 overlap record was from 2005 and that was identified
18 as a software failure.

19 So this, I think, is part of the missing
20 160 that you couldn't face for whatever reason.

21 MEMBER BROWN: And yet you still came up
22 with 27 software errors --

23 MS. HERRMANN: Yes.

24 MEMBER BROWN: -- as opposed to common
25 defects, the way they classify them.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MS. HERRMANN: Right. So this is the
2 distribution. If you take out the seven that aren't
3 hardware/software, you get a different distribution.
4 Software still leading the pack. And then if you take
5 the software failures and split them into common cause
6 versus non-common cause, about 78 percent.

7 CHAIR APOSTOLAKIS: So let me understand
8 this business. The 45 LER records involved software.

9 MS. HERRMANN: They --

10 CHAIR APOSTOLAKIS: They were in response
11 to your search --

12 MS. HERRMANN: Yes.

13 CHAIR APOSTOLAKIS: -- for software. Then
14 you looked more carefully to see whether it was really
15 a software problem or something else.

16 MS. HERRMANN: Right.

17 CHAIR APOSTOLAKIS: And you concluded that
18 60 percent of those were in fact legitimate software
19 failures, according to your definition.

20 MS. HERRMANN: Right.

21 CHAIR APOSTOLAKIS: And of these 60
22 percent --

23 MS. HERRMANN: Then you throw.

24 CHAIR APOSTOLAKIS: I understand this.
25 How about the next slide?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MS. HERRMANN: Okay.

2 CHAIR APOSTOLAKIS: Seventeen, what does
3 it say now?

4 MS. HERRMANN: This is throwing out the
5 seven that are not hardware or software. That is when
6 we went from the 45 to 38. There were seven of them
7 where software was not part of the problem but it was
8 mentioned in the LER.

9 CHAIR APOSTOLAKIS: Okay. But the number
10 of legitimate software failures remains the same.

11 MS. HERRMANN: Yes.

12 MEMBER BLEY: So that other one is just
13 because your search for the LERs gave you something
14 that wasn't --

15 CHAIR APOSTOLAKIS: It was really broad.

16 MEMBER BLEY: So that is not a very
17 interesting --

18 MS. HERRMANN: Yes, we threw those out.

19 MEMBER STETKAR: Did you look for LERs
20 that didn't have key words that were perhaps related
21 to digital failures?

22 MS. HERRMANN: We ran a variety of
23 different queries to get, you know, kind of zero in on
24 the data set.

25 CHAIR APOSTOLAKIS: So the real data are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 on 17. Is that correct?

2 MS. HERRMANN: Oh, page 17, yes.

3 MEMBER BLEY: I'm sorry to hang on this
4 one little thing. If the maintenance guy installs the
5 wrong software, that is not a software error. But if
6 a clerk at the vendor sends out the wrong software,
7 that is a software error in your classification
8 scheme.

9 MS. HERRMANN: If there was an error in
10 the software that the vendors sent out, yes.

11 MEMBER BROWN: No, that is different.

12 MEMBER BLEY: That is the way they
13 classify it.

14 MEMBER BROWN: She said if there was an
15 error in the software. You said if they sent out the
16 wrong software version? That is not an error in the
17 software. It is just a wrong version.

18 MS. HERRMANN: Yes.

19 MEMBER BROWN: There is a difference in
20 terminology. That is all. I just want to make sure
21 she is answering the question you phrased. So, you
22 want to answer that again?

23 MS. HERRMANN: Okay. If there was an
24 error in the software and the vendor shipped it out,
25 that is considered a failure.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 If the vendor sent out the UNIX and they
2 were supposed to send out Windows, that was not
3 counted.

4 MEMBER BLEY: Yes, but if they had a
5 version out. They made a new version. Instead of
6 sending the new version, they sent out one three
7 versions ago.

8 MS. HERRMANN: Yes, that is not counted.

9 MEMBER BLEY: Okay, thank you.

10 MS. HERRMANN: Can't blame that one on the
11 software.

12 CHAIR APOSTOLAKIS: Okay.

13 MS. HERRMANN: Now if we take the 27
14 software failures and split them between common cause
15 and not common cause, you get this distribution.

16 MEMBER BLEY: Now, did you define what you
17 told me earlier, I think is what you would call common
18 cause here would have been the two right-hand columns
19 of what EPRI called the common cause.

20 MS. HERRMANN: Yes.

21 MEMBER BLEY: Okay.

22 CHAIR APOSTOLAKIS: And these are actual
23 common cause.

24 MEMBER BLEY: No. These are potential or
25 actual.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: No they said actual.

2 MEMBER BLEY: Well to them, actual is what
3 EPRI called potential or actual. You had a common
4 defect and you had a common trigger, such that if you
5 had called upon it to work, it wouldn't.

6 CHAIR APOSTOLAKIS: Is that true with your
7 case?

8 MR. HECHT: Now, look at the next slide
9 and it looks like the affects actually happened.

10 CHAIR APOSTOLAKIS: I think they are
11 actual.

12 MS. HERRMANN: Here is the distribution.

13 CHAIR APOSTOLAKIS: By the way, do you
14 make such a distinction between trigger and defect?

15 MS. HERRMANN: No.

16 CHAIR APOSTOLAKIS: Or you are looking at
17 the whole thing. Okay.

18 So again, to be clear, these are actual
19 common cause failures.

20 MEMBER BLEY: The equipment didn't start
21 or whatever.

22 MS. HERRMANN: These 21, yes.

23 MEMBER BLEY: So it is only EPRI's right-
24 hand column.

25 MS. HERRMANN: Right. I think your

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 question, the way I answered your question earlier is
2 we defined CCF. We include both. But this data --

3 MEMBER BLEY: But these were all real
4 equipment that didn't start or didn't do what it was
5 supposed to do.

6 MEMBER STETKAR: This is not a Licensee
7 Event Report where a licensee reported an error in the
8 software that had a demand for the diesels occurred,
9 none of the diesels would have started.

10 MS. HERRMANN: No.

11 MEMBER STETKAR: Okay, this is none of the
12 diesels actually started. Okay.

13 CHAIR APOSTOLAKIS: Wait a minutes. Then
14 why is that so? I mean, if the diesels could not have
15 started, why don't we care about that? I mean, --

16 MEMBER STETKAR: We are just trying to
17 understand --

18 CHAIR APOSTOLAKIS: I know.

19 MEMBER STETKAR: -- what those numbers
20 mean.

21 MEMBER BLEY: She said they would have
22 counted. I'm sorry.

23 CHAIR APOSTOLAKIS: Well, see that is a
24 computer error.

25 MEMBER BLEY: But it wouldn't have been

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 reported.

2 CHAIR APOSTOLAKIS: Would it have included
3 those there? If they find that you know, again, we
4 are giving you a hardware example, that the diesels
5 could not have started but there was never a demand,
6 would that be a common cause failure or not?

7 MS. HERRMANN: Well number one, it
8 wouldn't have been reported in the LER data but it
9 would be counted as an on-call figure, unless they had
10 met or set the criteria for reporting an LER.

11 CHAIR APOSTOLAKIS: So there must have
12 been an actual demand.

13 MEMBER SIEBER: The only way we come up
14 this through Part 21 if somebody said this is a
15 generic defect. We didn't have an event.

16 MEMBER BLEY: Or like the one EPRI talked
17 about when they actually shut the plant down to
18 investigate it.

19 CHAIR APOSTOLAKIS: Well, if it was found
20 during testing, though, it would have been reported.
21 Right, Jack, if it is found during the test?

22 MS. HERRMANN: During the audit.

23 MEMBER SIEBER: I don't think so.

24 CHAIR APOSTOLAKIS: I think it is
25 reported.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER SIEBER: Well in some other way
2 because it was causing a plant event.

3 CHAIR APOSTOLAKIS: I mean, you tried it
4 and they don't start and you don't report it to the
5 NRC?

6 MEMBER SIEBER: If it doesn't start, you
7 report.

8 MR. WATERMAN: Yes, because if it is
9 declared inoperable, you would have to report it.

10 CHAIR APOSTOLAKIS: Yes, that is what I am
11 saying. It doesn't have to be an actual demand.

12 Okay, so these are actually the things do
13 whatever they were supposed to do.

14 MS. HERRMANN: Right. Okay and then if we
15 take the 21 common cause failures, this is how they
16 split out. And then a couple of them hit multiple
17 categories there.

18 MR. HECHT: Debra, I am looking at the
19 EPRI data on page 13 of their presentation and they
20 basically say there were no actual common cause
21 failures due to software. And you are counting
22 actuals and you seem to have 24. Do you have --

23 MS. HERRMANN: That gets back to the slide
24 where we said we had 27 reports that aren't included
25 in the EPRI data.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. HECHT: I see. Are those all between
2 2007 and 2009?

3 MS. HERRMANN: No, '97 forward.

4 CHAIR APOSTOLAKIS: Ray?

5 MR. TOROK: Just as a clarification, I am
6 Ray Torok from EPRI, if I can make these comments.
7 Our statement had to do with 1E systems only, where
8 there were actual common cause failures. There were
9 plenty on the non-1E side.

10 MR. HECHT: Right. Okay. Thank you.

11 CHAIR APOSTOLAKIS: So you are not -- all
12 these failures are both 1E and non-1E.

13 MR. TOROK: Right.

14 MEMBER BROWN: So if I take the non-1E
15 software where you came up with 20 and I add in your
16 four 1E, that is 24.

17 Does that mean they really captured all of
18 the ones you say they didn't capture?

19 MS. HERRMANN: No because our numbers
20 didn't match.

21 MEMBER BROWN: So they found another 20
22 somewhere that you didn't count.

23 MS. HERRMANN: Not that we didn't catch
24 them.

25 MEMBER BROWN: I'm not criticizing.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MS. HERRMANN: Remember they captured the
2 INPO data and we did not query off the INPO data. We
3 queried off the LER database.

4 MEMBER BROWN: Was your non 1E off the
5 LERs or off the INPO data?

6 MR. TOROK: Ours were both. We used both
7 databases and so I imagine we had both 1E and non-1E
8 from both places.

9 MEMBER BROWN: So you still came up with
10 the same number. That is kind of interesting.

11 CHAIR APOSTOLAKIS: They will reconcile
12 those things. So, let's understand what this is.

13 MS. HERRMANN: We are looking for trends.
14 The exact number is not important.

15 CHAIR APOSTOLAKIS: Yes, they will
16 reconcile it. So, what was your conclusion on 19?

17 MS. HERRMANN: On 19? We just wanted to
18 know what types of common cause failures were
19 occurring. And it looks like the multiple systems in
20 parallel and multiple units.

21 One thing we were trying to keep an eye on
22 was the common vendors product failing at multiple
23 locations. That could be problematic.

24 MR. HECHT: When you look at the
25 classification, it is not really the mechanism. It is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 not really the mode. It is the effect in terms of
2 whether it affected --

3 MS. HERRMANN: Yes.

4 CHAIR APOSTOLAKIS: So common failure of a
5 common vendors product at multiple locations.

6 MEMBER BLEY: How did you find this?

7 CHAIR APOSTOLAKIS: Can you elaborate a
8 little bit on that? What does it mean?

9 MS. HERRMANN: I don't want to name names
10 here. This is a hypothetical example. If say a
11 Common Q platform failed at multiple locations and it
12 failed because of the same reason, --

13 CHAIR APOSTOLAKIS: But did you find other
14 locations where did it not fail or it was just
15 defective and whoever used it it would fail?

16 MS. HERRMANN: The latter.

17 CHAIR APOSTOLAKIS: The latter?

18 MS. HERRMANN: And it was interesting
19 because if you sorted the LERs by date, you would see
20 it failed here on Monday, Wednesday, Friday. So it
21 was like generally the failures happened within the
22 same time frame.

23 MEMBER BLEY: Were they common cause
24 failures at multiple places or one failure at one
25 place and one at another?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MS. HERRMANN: Okay, so it was a common
2 cause at a location, as well as these particular --
3 you see the asterisk?

4 CHAIR APOSTOLAKIS: Yes.

5 MS. HERRMANN: That means it fell into
6 both categories. So multiple units at and multiple
7 locations.

8 CHAIR APOSTOLAKIS: So the product was
9 defective, period.

10 MS. HERRMANN: Yes.

11 MEMBER BLEY: And it was common cause at
12 each location where it failed. And that is how you
13 found it --

14 MS. HERRMANN: Right.

15 MEMBER BLEY: -- because each of those
16 reported it separately. So it may be sitting there
17 failed at others.

18 MS. HERRMANN: Yes and not reported.

19 And then we --

20 MEMBER BROWN: Were the common cause
21 failures different in each circumstance?

22 MS. HERRMANN: No, I wouldn't say so.

23 MEMBER BROWN: But they are all the same.
24 So the product had an inherent failure mechanism
25 which reproduced itself at each location and in some

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 single locations, multiple times on multiple
2 applications of that platform.

3 MS. HERRMANN: Right.

4 MEMBER BLEY: Can you tell us more about
5 that one?

6 MS. HERRMANN: No.

7 MEMBER BLEY: We are kind of interested in
8 that. Do you have more slides on that one?

9 MS. HERRMANN: No, I don't.

10 MEMBER BLEY: Sometime, we would like to
11 see some information on that, I think.

12 MS. HERRMANN: Okay.

13 MEMBER BROWN: So I am just thinking. So
14 if somebody had three applications of use your
15 hypothetical Common Q platform, they all would have
16 been expected to exhibit this particular failure. And
17 I am not disagreeing with you because I have seen that
18 in other compliments before.

19 MS. HERRMANN: And I think that situation
20 highlights the need for industry to communicate among
21 itself. So if something happens, industry talks to
22 the other people who have the same platforms
23 installed.

24 MR. WATERMAN: I think one example would
25 be ultrasonic flow measurements on feedwater for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 calorimetrics. We have had some issues with how
2 accurate that instrumentation is. It is installed in
3 various plants. Wherever it was installed, it had the
4 same accuracy issues. So, you could say well, your
5 calorimetrics are failing, whether it be at multiple
6 units, a Part 21 notice type.

7 CHAIR APOSTOLAKIS: So yet another
8 question. I see all of these numbers and percentages
9 and so on in several slides. Are these going to be
10 useful to a PRA analyst or are you also refraining
11 from giving that advice like EPRI did?

12 MS. HERRMANN: No. These are just, we are
13 looking for trends. These are not numbers I would
14 plug into any calculation.

15 CHAIR APOSTOLAKIS: But if somebody tells
16 me that the probability of failure of a package is ten
17 to the minus four and I have seen your numbers, I
18 having great difficulty believing ten to the minus
19 four. I really am.

20 MEMBER STETKAR: Well that's not true.
21 That ten to the minus four is a number that got thrown
22 in as an unavailability on demand. And you are just
23 counting numbers of events here. You are not counting
24 the number of unit installed digital system operating
25 hours, nor the number of demands. You know, this has

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 no information about the denominator. That is what we
2 have always faced --

3 CHAIR APOSTOLAKIS: I still would be very
4 uncomfortable. I appreciate that but --

5 MEMBER STETKAR: I wouldn't necessarily.
6 I mean, look at what we did with D.C. Generators where
7 suddenly if you counted the number of demands, keep
8 the same number of failures and the real number of
9 demands, you suddenly found that your diesel generator
10 failure rate became one-third of what it was because
11 you hadn't counted all of the real demands.

12 CHAIR APOSTOLAKIS: I appreciate that this
13 is focused only on failures. But I see too much
14 information here that really shakes my confidence in a
15 ten to the minus four number, unless you do give me
16 the denominator. If you don't give it to me, I don't
17 believe it. That is too much going on here.

18 MEMBER STETKAR: I am not trying to defend
19 the ten to the minus four number either. It is just
20 that --

21 CHAIR APOSTOLAKIS: I appreciate that this
22 is focused really on failures, things that could fail.

23 MEMBER STETKAR: That is the danger of
24 just --

25 MEMBER BROWN: Well that is what you want

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to use. That is what you would like to get out of
2 this, eventually. If you had enough information to
3 get the denominator, --

4 CHAIR APOSTOLAKIS: Okay.

5 MEMBER BROWN: -- then that would give you
6 a number.

7 CHAIR APOSTOLAKIS: But if I go back to
8 the common cause failure evaluations for hardware,
9 again, there they had the same problem. So they said
10 okay, we will separate the actual successes and
11 demands and focus on beta, gamma, delta.

12 MEMBER STETKAR: This is useful
13 information in that sense.

14 CHAIR APOSTOLAKIS: So it does give you
15 something regarding beta, for example. But yesterday
16 EPRI said no.

17 MEMBER BLEY: It said that number wasn't -
18 -

19 MEMBER STETKAR: The numbers may not be
20 relative but they didn't say you couldn't derive one
21 that is certainly relevant.

22 CHAIR APOSTOLAKIS: Right. That is all I
23 am saying. This is shaking up the confidence.

24 MS. HERRMANN: Sorry about that.

25 MR. HECHT: Did you forget that these are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 both 1E and non-1E systems that are continuously
2 operating and some of them are not on a discrete
3 event.

4 CHAIR APOSTOLAKIS: Put yourself in a
5 situation where you have to make a real decision and
6 if something goes wrong at San Onofre, you are
7 responsible. If you see those numbers, are you going
8 to say, yes, it is ten to the minus a hundred? No.
9 This really makes me worry about it. That is what I
10 am saying.

11 MR. HECHT: Let's just say that those are
12 all Westinghouse numbers and San Onofre is a CE plant.
13 All right?

14 CHAIR APOSTOLAKIS: Well, they didn't tell
15 me that.

16 MR. HECHT: No, I am just saying that
17 there are lots of reasons why you wonder without
18 worry.

19 CHAIR APOSTOLAKIS: Anyway, I guess this
20 is a different interpretation but I have a question
21 for you, Myron. Do you see anything here that is
22 really very different from your experience with the
23 space business? Are we crazy? Are we consistent?
24 Are we what?

25 MR. HECHT: What I see is that I am very

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 surprised at the low number of requirements/errors.

2 MS. HERRMANN: We were, too.

3 MR. HECHT: I am not surprised by the low
4 number of implementation errors. And design looks
5 high to me as well.

6 MS. HERRMANN: Yes, generally, the trend
7 that you see is that requirements account for the
8 majority. I agree that we were a little bit surprised
9 with this.

10 MEMBER BROWN: You said requirements count
11 for the majority?

12 MS. HERRMANN: If you read all of the
13 classic papers and textbooks, they always say that
14 requirements account for the majority.

15 CHAIR APOSTOLAKIS: That's true.

16 MS. HERRMANN: But this doesn't show this.
17 And we compared this to the INPO Technical Report 8-3
18 or 8-63. And this distribution is very similar to
19 what is in the INPO report and they highlighted design
20 as a problem. They explained it as a lack of germane
21 knowledge in moving from the requirements to the
22 designers. I think that is a plausible explanation.

23 The other thing that happens and I think
24 this more gets into business practices, a lot of times
25 the importance of taking the time to do the design

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 right and actually analyze all of the different ways
2 you could design it, different options. That is not
3 well understood and the design phase gets rushed.
4 Let's get to coding. And so I think the rushing
5 introduces a lot of errors.

6 CHAIR APOSTOLAKIS: The requirements --

7 MEMBER BROWN: They have to deliver a
8 product in July.

9 MS. HERRMANN: Yes, schedule pressure.

10 CHAIR APOSTOLAKIS: The requirements are
11 probably set by nuclear people.

12 MS. HERRMANN: Yes.

13 CHAIR APOSTOLAKIS: Then the guys who make
14 mistakes they call in.

15 MEMBER BROWN: Well, they try to overcome
16 this in contracts with what is called requirements
17 traceability matrices. And I mean, I had very simple
18 systems that I was working on and they were 57 pages.

19 I mean, the guy actually, the vendor went through and
20 pulled out every LAN out of the specification and laid
21 it in. There must have been 500 requirements.

22 And they went and showed, this piece of
23 software did this. This piece of hardware did that.
24 This blank did blank. It really helps when you do
25 that. It is expensive and it is time consuming

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 because you have to have a defined hardware design to
2 answer that question and you have to have a defined
3 software architecture and you have to have a defined
4 set of coding that you put in place to implement that
5 architecture.

6 So, you don't just get that done in the
7 beginning. It is something you have to do at the end
8 and it is very time consuming, very engineering
9 intensive, and people don't like to pay for it.

10 MR. WATERMAN: But it has been our
11 experience in the NRC on the audits is that just about
12 every system the NRC has looked at has had
13 requirements traceability matrix backing it up.

14 MEMBER BROWN: Well, how thorough is that
15 done? And how thorough is the audit of it? Because
16 if nobody checks it, it is a form, if they did it,
17 they put it in the file cabinet. If you don't review
18 it and check it, --

19 MEMBER BLEY: George's comment might have
20 sounded a little flip but if you go back 35 years ago
21 or so when WASH-1400 was done, the guys who came over
22 who brought fault tree analysis over from aerospace,
23 were very surprised when they finished that analysis,
24 they didn't find lots more single element failures and
25 had to say we have never looked at an industry where

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 you didn't find those in complex design.

2 So something about the standard approach
3 you had been using, which was single failure analysis,
4 really did a good job. Maybe the same kind of thing
5 is going on here.

6 MEMBER BROWN: Yes.

7 MEMBER SIEBER: I think another piece of
8 the problem is that the bulk of the instrumentation,
9 the elements of it, come from other industries, the
10 don't come from ours.

11 Now, if you go out to an instrument
12 vendor, they used to sell them to the chemical
13 industry, refineries and stuff like that. So
14 everything is sort of a forced fit. It makes for an
15 occasional problem.

16 CHAIR APOSTOLAKIS: Anyway, I think
17 ultimately what will matter is how do we deal with
18 these numbers. You don't have to answer that today.
19 I don't know what we do with them but eventually we
20 will have to have some idea where we are going with
21 all of this. Right?

22 And I appreciate this is still the
23 exploratory phase. We are still trying to understand,
24 collect information. Yes, that is great. In fact,
25 that is what we recommended, what, a couple of years

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 ago.

2 So I really would like to understand, when
3 I see those numbers, what I can do about them.

4 Yes, sir?

5 MR. HECHT: Well, I was going to ask, in
6 light of the fact that the cause of the design
7 failures was in fact inadequate understanding of the
8 domain by the application engineers, that that implies
9 that there has to be a second set of requirements.
10 The first set of requirements might be called system
11 requirements and the second set of requirements might
12 be called software requirements.

13 MS. HERRMANN: Yes, that is sort of what
14 is recommended in the INPO technical report.

15 MEMBER BLEY: Myron, let me ask you a
16 question back to what George had asked you before and
17 you were surprised by the imbalance between
18 requirements and design. What about the shear numbers
19 of them? Are there a lot fewer or more than you
20 think?

21 MR. HECHT: Well we don't know the
22 denominator. The denominator I need now are these
23 lines of code.

24 MEMBER BLEY: Oh, I hope not. There has
25 got to be a better denominator. Go ahead.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: But I think our
2 systems here are simpler than the ones you are used
3 to.

4 MR. HECHT: Much simpler, yes.

5 CHAIR APOSTOLAKIS: Much simpler.

6 MEMBER BROWN: These are actually not. I
7 mean, if you look over that is just a twelve year
8 period.

9 MR. HECHT: That's true.

10 MEMBER BROWN: Actually I take that back
11 because if you are including non-1E in here, the plant
12 I&C systems might be as complicated.

13 CHAIR APOSTOLAKIS: Because of that
14 feedback in control.

15 MEMBER BROWN: Well the process control
16 system misinterprets control. For example, digital
17 interpreting controls are pretty sophisticated systems
18 on these.

19 MR. SANTOS: George, Dan Santos, Research,
20 if I may go back to your question, what are we going
21 to do with this. I think with the numbers, it will
22 probably be more of a long-term answer. But today, we
23 can use all this insight to help better focus the
24 reviewers efforts and then help industry improve their
25 own processes by getting who knows the insights we are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 deriving from --

2 CHAIR APOSTOLAKIS: From the end of
3 process.

4 MR. SANTOS: Yes.

5 CHAIR APOSTOLAKIS: Okay.

6 MEMBER BROWN: What also helps, folks is
7 the fact that your overall --

8 CHAIR APOSTOLAKIS: But at the same time
9 you are telling me, Mike is telling me that
10 performance and process are two different things.

11 MR. WATERMAN: Well, performance proves
12 process.

13 CHAIR APOSTOLAKIS: The other way.

14 MR. WATERMAN: No. Performance proves
15 process. When you go out --

16 CHAIR APOSTOLAKIS: Oh, proves.

17 MR. WATERMAN: Proves. Proves process.
18 When you go out to look at something, you look at the
19 performance and that tells you how good the process
20 is, the actual process.

21 CHAIR APOSTOLAKIS: Okay. I'm sorry.

22 MEMBER BROWN: I was just going to echo
23 that fundamentally what you find is that you are
24 always going to have problems and, therefore, your
25 overall system architecture is really is one of your

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 main defenses is making sure the plant works right.

2 CHAIR APOSTOLAKIS: By the way --

3 MEMBER BROWN: So there is independence
4 and redundancy and stuff like that that really plays
5 into your --

6 CHAIR APOSTOLAKIS: I don't want to give
7 the impression that I am at a loss here or I don't
8 like what I see here. I am really very pleased to see
9 what EPRI did yesterday and what you guys are doing
10 today. I think we are on the right track now.

11 Looking at the evidence, we are
12 questioning it, we have different interpretations,
13 debating it.

14 MEMBER BROWN: Yes, we really need to get
15 that MOU in place so that they can really, so they can
16 --

17 CHAIR APOSTOLAKIS: That was the idea
18 behind that ACRS letter whatever two years ago that
19 said you know, let's look at failure modes and all of
20 that. So, this is really a very nice effort, I mean
21 both days. I mean the rest is questions, as usual.

22 So this is now a new way of presenting
23 slides, looking at yellow stripe? EPRI did that
24 yesterday. You guys are doing it.

25 MS. HERRMANN: We are consistent. Okay,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 this is just some examples. I thought of this as just
2 kind of an interesting side light here of our
3 requirements error. And on this one it was the right
4 position deviation monitor alarm. It was define to
5 enunciate on a greater than, rather than a greater
6 than or equal to setting. So that caused problems.

7 The design one I found really amusing.
8 This was a control rod drive processor software and it
9 was looking at minutes, seconds, hours, and day of
10 year. And on the minutes, seconds and hours it did
11 everything correctly. It did range checks, the whole
12 nine yards. On the day of year, for some reason it
13 assumed that it would roll over to a one instead of a
14 zero.

15 Computers, since the 1940s have started
16 counting from zero, rather than one. So I was a
17 little surprised that this error occurred. Then it
18 range checked everything else but it didn't range
19 check the year. So when it rolled over to zero, all
20 sorts of faults, you know, it went crazy from there.
21 And this particular error actually occurred in 2008,
22 60 years after the first computer.

23 This one I would attribute to the designer
24 rushed. Because he did it on the other three, didn't
25 do the checking on this one.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 The next one is a calculation error and
2 this was a simple, they were dividing by 1.5 instead
3 of 1.15. And the LER goes through all the math and
4 this that and the other. But as a software engineer,
5 I have to sit back and think did the guy just type it
6 wrong? Maybe he got in a hurry and he typed a 1.5
7 instead of a 1.15. So if the calculation here may
8 have been a typo.

9 The last two illustrate a common
10 phenomenon in software engineering where you fix one
11 problem and you introduce another problem. On the
12 interface, there was an Arcnet coupler communication
13 board installed and they were having some problems
14 with it. So they said they would fix it by going to
15 the next version of the Arcnet coupler and that
16 introduced more problems and worse problems.

17 MEMBER STETKAR: That is interesting. So
18 you found some of that. I was going to ask EPRI
19 yesterday, one of the conclusions that I recalled
20 reading in their report that people were doing an
21 awful lot of software patches to compensate for both
22 software and hardware failures.

23 MS. HERRMANN: Yes.

24 MEMBER STETKAR: And I was going to ask
25 them whether they saw any evidence of quick patches

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 resulting in --

2 MS. HERRMANN: Other problems.

3 MEMBER STETKAR: -- later problems.

4 MS. HERRMANN: Yes.

5 MEMBER STETKAR: So you found some of
6 those.

7 MEMBER BLEY: This is more than a quick
8 patch.

9 MEMBER STETKAR: Well, this is more than a
10 quick patch. But that is right.

11 MS. HERRMANN: And the same thing on the
12 parameter is they were trying to fix one problem, the
13 control valve oscillation. So they changed the time
14 constant. They fixed that problem and created another
15 problem in transmitter delay.

16 So a lot of this gets back to I think
17 rushing and not thinking things through.

18 MEMBER BROWN: Sometimes software
19 architecture and where a piece of information comes
20 from to be selected to make a decision has a play in
21 that.

22 MS. HERRMANN: Yes.

23 MEMBER BROWN: So it is not just I am
24 rushing to do that but there is a how you select a
25 particular end result and from what input data can

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 make a difference also. It can cause the same
2 problem.

3 MS. HERRMANN: I mean, it is like when you
4 do your boundaries of your change effect analysis,
5 usually people do it too narrow and they need to let
6 it go out.

7 MEMBER BROWN: Then that is the key point.

8 MS. HERRMANN: Yes.

9 MEMBER BROWN: You really have to walk
10 your way forward and way backward to make sure you
11 have caught all of the inputs and outputs.

12 MS. HERRMANN: Yes.

13 CHAIR APOSTOLAKIS: Well, let me interrupt
14 here. Mr. Santos, all this time is taking away from
15 your presentation on the plan, on which there will be
16 an ACRS letter in September. Are you comfortable with
17 this? You are not going to have tomorrow.

18 MR. SANTOS: Yes.

19 CHAIR APOSTOLAKIS: And I have to stop you
20 at 4:00 because BNL is presenting something.

21 MR. SANTOS: Which is part of it. I am
22 okay.

23 CHAIR APOSTOLAKIS: You are okay?

24 MR. SANTOS: Well after the break --

25 CHAIR APOSTOLAKIS: I see we have another

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 20 slides.

2 MEMBER BLEY: We have like two or three
3 more. We are not going through the backup data.

4 CHAIR APOSTOLAKIS: Okay. We are going to
5 take a break at 10:00. So, Debra.

6 MS. HERRMANN: Okay. The next step we did
7 is we took the statistics from the LER independent
8 study and we put them together with the EPRI data just
9 to see what would happen. You see the 62.5 percent,
10 if you take the EPRI, you combine the two, the EPRI
11 and the NRC, you come out with a 70 percent rate. So
12 we are still, I mean, it is consistent, even though we
13 sliced it a little different.

14 DAS report, I think this was covered
15 yesterday. A lot of the comments are OBE because it
16 was based on earlier versions of the ISG.

17 And then we got into the discussion on
18 spurious actuation. I am not sure we need to go into
19 that. So, I will jump to the recommendations.

20 And basically what we are saying here is
21 that we think we need to go through the research that
22 is identified in the plan, particularly the MOU. This
23 is all just input into that collaborative research.

24 We would caution from drawing real
25 decisions from this data. This is a very small data

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 set. We are very glad there has been few software
2 failures but it is not a statistically significant
3 sample. So orders of magnitude are probably okay, not
4 much else. And then the recommendation we have talked
5 about a lot as we need to come up with a very precise,
6 accurate way of classifying the data so that there is
7 not overlaps, gaps, or inconsistencies.

8 MEMBER BROWN: How do you get back to
9 getting information reported via the LERs? I mean
10 that seems to me that would be a big hole. If they
11 are big or they are not inclusive enough. Is that
12 your point with EPRI?

13 MEMBER STETKAR: The only way they can get
14 it is through the collaborative work.

15 MEMBER BROWN: That is just a classic
16 problem with getting reported events and failures.

17 MR. SANTOS: Yes, that is why we believe
18 when we get to a more standard way of industry and --

19 MEMBER BROWN: Well, it is more work of
20 industry to provide more detail, I would think. I
21 mean that is what the classifying is.

22 MS. HERRMANN: You need a standard
23 classification scheme that everybody is using in the
24 same way.

25 MEMBER BROWN: Very common. I agree.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Okay.

2 MR. HECHT: Wasn't COMPSIS supposed to do
3 that?

4 MEMBER BROWN: Who?

5 MR. HECHT: COMPSIS.

6 MS. HERRMANN: Bill, you want to address
7 that?

8 MR. KEMPER: I'm sorry, I missed the
9 question.

10 CHAIR APOSTOLAKIS: Ask again.

11 MR. HECHT: Wasn't COMPSIS supposed to
12 address the problem of data standardization and
13 classification schemes?

14 MR. KEMPER: It could have gotten to that,
15 yes, but really COMPSIS was intended just to identify
16 the failure on loads and have a good explanation to
17 the person who is searching for the data what the root
18 cause was, really. So some of those things could have
19 been sifted and gathered from the data.

20 But the problem we have had, as I said
21 earlier, the data is just not available or it is
22 available and we can't get our hands on it. They
23 won't release it.

24 CHAIR APOSTOLAKIS: Okay. Ray, you want
25 to make a comment no more than three sentences?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. TOROK: Oh, wow.

2 CHAIR APOSTOLAKIS: Four sentences with
3 semi-colons, if you like.

4 MR. TOROK: Three sentences? Would you
5 give me five?

6 CHAIR APOSTOLAKIS: Start with three now
7 and we will see.

8 MR. TOROK: Okay. Okay.

9 CHAIR APOSTOLAKIS: Well, I don't want to
10 make this back and forth but I feel it is fair to give
11 you a chance to comment on what the staff has said.

12 MR. TOROK: Sure. Yes, I guess this is
13 working?

14 CHAIR APOSTOLAKIS: Yes, it is.

15 MR. TOROK: Well, I have to say for us,
16 this is a lot of new stuff and we really haven't had
17 time to digest it or discuss it with staff.

18 So and as far as I know, none of this is
19 published yet. Is that right? I haven't seen
20 anything.

21 CHAIR APOSTOLAKIS: This is not uncommon
22 at ACRS meetings.

23 MR. TOROK: Oh, okay. So my point is we
24 haven't really had a chance to digest it or to discuss
25 it with staff. Still, I have a few reactions that I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 wouldn't mind sharing.

2 CHAIR APOSTOLAKIS: Okay, go ahead.

3 MR. TOROK: My first reaction was that you
4 know a couple of years ago, staff told us that it
5 wasn't possible to do this kind of evaluation because
6 the data was insufficient to do it. And now I am
7 really gratified to see that they are actually doing
8 it. I think that is terrific.

9 There are many observations that they are
10 making that I would say, yes we would agree
11 absolutely. The big one is that we need to get a
12 handle on the importance of software-related common
13 cause failure contributors compared to other common
14 cause failure contributors. That is absolutely true.

15 They said something about the low number
16 of 1E digital systems in place. And it is true, there
17 aren't that many. But on the other hand, there have
18 been core prediction calculators out there for
19 decades. So there is a fair amount of experience in
20 some areas.

21 Now in regard to the pre-'96 data, I think
22 the comment was already made, I wouldn't be so quick
23 to throw it away because I think we have seen good
24 lessons learned and so on, even though the data may
25 not be as detailed, as more up-to-date on stuff. I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 think there are good lessons in there.

2 In regard to finding some errors in our
3 report, I believe there are errors in our report. We
4 thought we were doing pretty well but I appreciate
5 them calling attention to those and we will look into
6 that. Obviously, we haven't had time to do that yet.

7 One of the things that I know happened is
8 when we went through our exercise of bringing people
9 together to argue about how to disposition key events,
10 in some cases, the initial assessment was changed, for
11 various reasons as we discussed yesterday. And you
12 saw how we struggled with those things. I don't think
13 we did a good job in some cases of going back and
14 doing configuration management on our records there
15 and that is why there is some inconsistencies.

16 Also, there were cases where there was
17 confusion about whether or not a spurious actuation is
18 a common cause failure and it appears both ways in
19 some of our records. And we should fix that. Okay?
20 So there is some of that going on there.

21 In regard to the statistical results,
22 well, their definitions in binning approach is very
23 different from ours. And so obviously, the statistics
24 coming out of that are going to be very different.
25 So, I can't comment in detail.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 There are a couple of things that I am not
2 comfortable with here. I still don't buy this notion
3 of combining 1E and non-1E events. In our experience,
4 design errors in 1E systems are very unusual and for
5 good reason. They are functionally very simple. And
6 for the 1E systems, you really do go through all of
7 this rigorous process, elements like requirements
8 traceability matrices. Those are being used and have
9 been for a long time.

10 So I think there are still important
11 differences in 1E and non-1E such that you shouldn't
12 just be throwing them all together.

13 Now, I really like the suggestion I think
14 that came from Dr. Bley yesterday about identifying
15 bins that are sort of a lower-tier bin compared to
16 what was in the actual reports. Because we just took
17 the words out of the report and we combined everything
18 in terms of root causes and corrective actions. We
19 didn't make judgments about which was the real root
20 cause. We put all the causes in that had been
21 identified. The same thing with all the corrective
22 actions.

23 I think it is an interesting exercise to
24 go to that next level and try to find bins that can be
25 mutually exclusive and help you see more about what is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 going on. And that also may be a mechanism for
2 combining aspects of 1E and non-1E and I think we
3 should continue to look at that.

4 Now it made me uncomfortable to tell you
5 the truth when they said out of 27 events, we only
6 found one. I'm not sure how that can happen. So, I
7 would like to find out more about that. And I don't
8 see, I was looking for a list of those events in the
9 handouts and I didn't find that but hopefully that
10 will be coming out soon in publication somewhere along
11 the line.

12 One thing I noticed in listening to the
13 discussion is that I think that Mike and Debra are
14 experiencing some of the same difficulties we had when
15 we went to disposition these events, in terms of
16 arguing about, you know, was it really common cause.
17 Could there have been extenuating circumstances? And
18 we argued among ourselves. It flip-flopped and
19 everything else. And I think they are still in the
20 middle of that. So, it would be nice to continue that
21 discussion with them.

22 I think that would be very helpful because
23 sometimes there is this tendency to try to do root
24 cause analysis on the fly. You know, as an example,
25 was that a typo? Did the programmer just missing

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 something? What is going on. And lots of times it is
2 difficult to figure that out. Sometimes there are
3 hints in the write-ups that let you but it is not a
4 trivial exercise. So, I think more discussion of
5 those things is needed.

6 CHAIR APOSTOLAKIS: You are on sentence
7 17.

8 (Laughter.)

9 MR. TOROK: And in conclusion I would like
10 to thank you very much for giving me the opportunity
11 to comment.

12 (Laughter.)

13 CHAIR APOSTOLAKIS: Okay. Thank you all.

14 As I said earlier, I am really pleased to see this
15 effort both yesterday and today and on the issues that
16 you raised, staff and EPRI. I think this is the way
17 to go, unless my fellow members object to this. I
18 thought that was very, very helpful, very useful. And
19 with the MOU in place, I think we are going to get
20 somewhere.

21 Thank you very much. We will recess until
22 about 10:20. About. About. Don't comment.

23 (Whereupon, the foregoing meeting went off the record
24 at 10:04 a.m. and resumed at 10:24 a.m.)

25 CHAIR APOSTOLAKIS: Okay, we are back in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 session. Mr. Santos. Go ahead.

2 MR. SYDNOR: Good morning. My name is
3 Russell Sydnor. I am the Branch Chief for the Digital
4 I&C Branch in the Office of Research and I am here
5 with Dan Santos, who is the Senior Technical Advisor
6 for Digital I&C in the Office of Research. And Sushil
7 Birla is also Senior Technical Advisor in the Office
8 of Research right now on rotation NRR. He is going to
9 present some of the research topics. And Paul
10 Rebstock is the Senior Digital I&C Engineer and who
11 also works in the Branch of Research and he will be
12 presenting some of the topics.

13 In our bullpen over here, we have Mike
14 Waterman, as you know from previous discussions. And
15 I will introduce Jeanne Dion, who is a relatively new
16 NRC employee but actually was real experienced in our
17 work at Sandia on some of our cyber security research
18 and some of the other research which you may have
19 questions about. And Debra Herrmann, Senior Technical
20 Advisor from NRO, who has been giving us lots of input
21 on the research plan.

22 The agenda. In order to save some time,
23 what I propose to do is the area that we are most
24 interested in getting your feedback is the proposed
25 research programs, obviously, the new plan. And so

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 that is where we are looking for your insights and
2 judgments and any notification of gaps that we may
3 have missed.

4 So, I am going to shorten my discussion.
5 We have 17 slides on background, history, and some of
6 the process that we went through to develop the new
7 research plan. And we will go through that after. I
8 will try to curtail that to just what you really need
9 to hear about.

10 So the purpose here to talk to the
11 subcommittee, we are looking for a ACRS endorsement of
12 the new updated research plan, digital research plan.

13 And like I just said, we are obviously interested in
14 our insights and about the research currently ongoing
15 and it is going to continue into the new plan. Plus
16 there are several key new research projects which we
17 have formulated, some of which are influenced by
18 advice from the subcommittee and the ACRS and other
19 presentations on whether it was from the steering
20 committee, discussions of the last two days, things
21 like that.

22 Background information, I am going to go
23 through this real quick just to save time. The
24 subcommittee is very familiar with why Digital I&C
25 system reviews are challenging.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 CHAIR APOSTOLAKIS: We noticed that, yes.

2 MR. SYDNOR: You noticed that. You know,
3 some new committee members, Research's role is, what
4 we do is confirmatory and anticipatory research,
5 testing and analysis. We develop tools, data and the
6 local methods that licensing offices use. And also we
7 lead national and international collaboration efforts
8 in our area.

9 Research plans, there are different ways
10 of coming to the Office of Research and getting us to
11 develop or commit resources with research. One of the
12 ways that we like to use is research plans because
13 they are an excellent planning tool and provide for a
14 resource, loading and budget and things like that.
15 But it also allows us to communicate with the industry
16 our broader intentions and get feedback from internal
17 licensing offices and from ACRS on research
18 directions.

19 The new plan that we are presenting today
20 is essentially the third in a series of formal plans
21 in the Digital I&C area that really had their basis in
22 a 1997 National Academy of Sciences Report on digital
23 instrumentation that you see there on the first slide.

24 And that provided a lot of guidance to the industry
25 and to NRC on the topics that we need to understand

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 better to implement digital systems at nuclear power
2 plants.

3 There was a research plan developed for
4 the '01 through '04 time period. And the ones the
5 committee may be more familiar with is the current
6 plan, which we are currently implementing and was the
7 '05 through '09 plan and it built upon the 1997
8 report, it built upon the '01 through '04 plan and
9 then added some new topic areas that came from just
10 changes in the industry, changes in technology,
11 emphasis, new emphasis on new reactors, things like
12 that. And so those are some of those topics.

13 Another thing I just wanted to mention
14 briefly is that one thing that had a big influence on
15 what research was doing in this time interval from '06
16 to even continuing to this point is the Agency formed
17 the Steering Committee for Digital I&C. And that
18 created, as you know, because the subcommittee has
19 heard of all the work and is still hearing about some
20 of the work on TWGs and ISGs that came out of that.

21 In that time frame, from 2006 to the
22 current time, the Office of Research restructured our
23 approach on what we were doing in a number of areas
24 and the resources were committing to support that
25 effort because it was essentially a fast, as it were,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 on creating some interim staff guidance that the
2 industry was really asking for, for improved guidance.

3 And so many of the issues in those, in the interim
4 staff guidance and the issues in the TWGs we are
5 dealing with were in Research topics in our plan. And
6 in a much shortened timeline, we ended up refocusing
7 the labs we had under contract to help work with the
8 TWG efforts and help formulate the ISGs.

9 So the current plan, these are the seven
10 areas in the current plan.

11 I really wanted to spend a little time and
12 take some questions if there are some, on current
13 status. The seven major program areas, as most of you
14 are aware, those are somewhat arbitrarily divided up
15 into 29 research projects and tasks. And actually, we
16 ended up to implement those, we ended up dividing that
17 into even more specific research projects that were,
18 you know, commercial contracts, research with the
19 universities, research with DOE, many DOE labs.

20 As of August, the items that were in the
21 '05 through '09 plan, we have delivered 23 research
22 projects. And those are things like reg guides,
23 NUREGs, lab technical reports, letter reports, tools
24 that we have developed, things like that. But I also
25 wanted to highlight the fact that all of that work is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 not done. There are 17 of those projects are still in
2 progress. Some are just starting but many are getting
3 near to completion. Some the committee has heard
4 about in other presentations.

5 An example would be Mike Waterman
6 presented his research results on adequate diversity.

7 We are hoping to wrap that one up. We are in the
8 final stages of comment incorporation on that NUREG.
9 So that is an example of one that has been ongoing for
10 several years and we hope to drive to completion
11 shortly.

12 Another thing I wanted to mention is that
13 all these ongoing projects are being carried over to
14 the new plan. So a lot of the discussions that we are
15 going to have later when we get into the specific
16 research topics, we are going to be giving you the
17 opportunity to talk about that on-going research, hear
18 a little bit about it at a high level, anyway, or ask
19 questions if you have specific areas of interest. But
20 also, primarily understand where we are going with it
21 and what we hope to achieve.

22 Another thing I wanted to mention about
23 current status is that there are eight project areas
24 out of those 29 that were not started for various
25 reasons, either priorities, research, resources, just

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 going back quickly. Three of those we are carrying
2 over to the new plan, Our first version that we put
3 out for comments, we received some comments from the
4 licensing offices, know we still have interest in
5 those three items and so leave those in there and you
6 will hear a little bit about those later.

7 Five that we thought did not need to be
8 carried over into the new plan for a lot of different
9 reasons, priorities, interest from the industry,
10 interest from the licensing offices, need for new
11 regulatory guidance, those type of things, these are
12 the topic areas that were in the '05 through '09 plan.

13 No significant work was ever started from the
14 Research basis. And in fact, the most recent review
15 as we updated the plan validated our determination
16 that these did not need to go forward. And so if
17 there are any questions on those.

18 Some of the challenges we experienced in
19 the last several years in implementing the plan. And
20 these are, obviously a lot of these, impact the whole
21 agency. There has been a lot of staff turnover.
22 Close to 80 to 90 percent staff turnover in my branch.

23 Most of the branch, the Research Branch for Digital
24 I&C are less than two years for the NRC right at this
25 point. We have a couple of experienced engineers in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Paul and Mike but outside of that, most everyone else
2 is relatively new, including myself.

3 There were other things impact, the
4 ability to do the contracting, continuing resolutions,
5 some conflict of interest issues with specific DOE
6 labs that started and caused us to stop and restart
7 research with different labs, things like that.

8 Some reprioritization, like I already
9 mentioned, the Digital I&C Steering Committee and the
10 work on those specific issues caused us to
11 reprioritize our emphasis on where we were putting our
12 resources. And we have had some new user need
13 requests from other offices. A good example is the
14 committee already reviewed and will be reviewing again
15 a NUREG guide on cyber security and that has been an
16 effort that we have been dedicated to for over a year
17 now.

18 CHAIR APOSTOLAKIS: Now, before we move on
19 to the new plan, what would be the two or three major
20 accomplishments of the previous plan?

21 MR. SYDNOR: Well, I would list as one of
22 the higher accomplishments our support of the steering
23 committee. Because for instance, we have the
24 diversity research that was ongoing at the time. It
25 was very timely and influence at ISG. And the highly

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 integrated control room research that was ongoing
2 influenced the ISG-4 for communications issues. But
3 there was significant research that was done.

4 The committee hasn't been presented the
5 research but the research that was done to look at
6 nontraditional PRA methods for digital systems. The
7 Ohio State work looking at dynamic methodology --

8 CHAIR APOSTOLAKIS: Which you are not
9 using anymore. And so you decided it is not worth
10 pursuing it?

11 MR. SYDNOR: We have stopped the
12 benchmark, the second benchmark, similar to how the
13 other division stopped a second benchmark by
14 Brookhaven looking at traditional methods, in part
15 because of the redirection from the subcommittee that
16 we really needed to take a step back and understand
17 the inputs we would need to do valid modeling and
18 digital PRA. But that research was completed, the
19 first benchmark was completed. And so we gained a
20 really good understanding of constraints and
21 limitations of that and where we need to refocus it
22 going forward.

23 And one of the directions we had from the
24 subcommittee when Alan Kuritzky presented his findings
25 for the Brookhaven work on traditional methods was

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 that we needed to take a step back, look at failure
2 modes like the discussion from the last couple of
3 days. And also that maybe that the parallel paths of
4 dynamic and traditional methods maybe in fact was
5 superficial. And we ought to look, as we get back
6 into methodology after we go back, and take a look at
7 the basics and make sure we have our alignment on the
8 basic inputs that you would need for this, that we
9 look at a different way of managing.

10 And we have, I would say, closer
11 collaboration with the other divisions' research at
12 this point. Well actually, the discussion topics
13 later in the day will cover that in significant
14 detail.

15 There has also been significant research
16 done by the University of Virginia on the fault
17 tolerance testing methods for digital systems.
18 Several years ago, we actually purchased an AREVA
19 TELEPERM system and we just recently finished the
20 fault tolerance testing on that. We just presented
21 preliminary results of that both to AREVA and to
22 internal licensing offices and received some excellent
23 feedback on the direction of that research.

24 We are moving on to looking at other
25 platforms, the Invensys Triconex platform, for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 instance.

2 CHAIR APOSTOLAKIS: So the agency is using
3 this fault tolerance, what is faulty is objectionable.

4 MR. SYDNOR: Well, it is still in the
5 formative research right now but like I said, we
6 presented the preliminary results of our findings from
7 the testing we did on the AREVA TELEPERM system. And
8 really got some excellent feedback both from AREVA
9 from the engineers that work with that system and also
10 from the licensing offices, with the direction of that
11 research.

12 And ultimately, it looks like that could
13 be a viable method. In fact, the University of
14 Virginia is considering commercializing the research
15 because they have fine-tuned their methods for doing
16 this work to the point that it could be a commercial
17 application.

18 Now, we haven't presented that to the
19 subcommittee because it is still on-going. It is sort
20 of in the middle of a multi-year, multi-platform
21 testing research program. But we could, at some
22 point.

23 CHAIR APOSTOLAKIS: Well it was presented
24 what, three years ago?

25 MR. SYDNOR: As preliminary.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: Yes, and the major
2 objection was to the reliability numbers.

3 MR. SYDNOR: Right. And certainly that is
4 an area that is wide open for discussion.

5 MR. HECHT: Can I ask a few --

6 CHAIR APOSTOLAKIS: Yes, you can.

7 MR. HECHT: -- question on that? How can
8 you do fault tolerance testing without the knowledge
9 of failures?

10 MR. SYDNOR: Well actually, we are going
11 to --

12 CHAIR APOSTOLAKIS: That is a detail
13 question, perhaps.

14 MR. SYDNOR: That is a detail question.

15 CHAIR APOSTOLAKIS: Yes.

16 MR. SYDNOR: But we are going to cover
17 that topic later in the presentation.

18 CHAIR APOSTOLAKIS: Okay.

19 MR. SYDNOR: So, we will cover the fault
20 tolerance testing, bringing that up again. I am sure
21 Mike could address the University of Virginia's
22 approach on that.

23 MR. HECHT: Is the approach just random
24 fault injection?

25 CHAIR APOSTOLAKIS: There is whole

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 methodology.

2 MR. SYDNOR: Not purely random.

3 MR. SANTOS: Not purely random. There is
4 an element.

5 CHAIR APOSTOLAKIS: And we can always
6 present the presentation from the University of
7 Virginia, if you are interested.

8 MR. HECHT: Right.

9 MR. SYDNOR: Well then now we have actual
10 results.

11 CHAIR APOSTOLAKIS: We will substitute the
12 members because you were not here when we had that
13 last time.

14 MR. SYDNOR: Now we have some actual
15 preliminary results.

16 CHAIR APOSTOLAKIS: I hope not on the
17 reliability.

18 MR. SYDNOR: No. On the --

19 CHAIR APOSTOLAKIS: On the methodology, I
20 assume.

21 MR. SYDNOR: On the methodology.

22 CHAIR APOSTOLAKIS: What we learned about
23 the system.

24 MR. SYDNOR: Right.

25 CHAIR APOSTOLAKIS: Okay, so where are we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 now?

2 MR. SYDNOR: Well, just real quickly. Dan
3 didn't and I didn't create this plan last month. It
4 is something that we have been working for a
5 considerable amount of time. We have gone through a
6 pretty extensive effort at the working level to get
7 and receive feedback, and up to the Branch Chief
8 level, to receive feedback from all of the user
9 offices. We have gotten lots of comments and feedback
10 from all of the offices you see listed there.

11 And so we have formally addressed all of
12 those comments and transmitted that back to the
13 offices. And so we are right in the process. We do
14 not have formal office concurrence yet. We are really
15 looking for ACRS input in advance of that, so that
16 there is opportunity for the committee to influence
17 direction of individual research programs.

18 CHAIR APOSTOLAKIS: Is that what we
19 normally do?

20 MR. SYDNOR: That is generally what you
21 are like.

22 CHAIR APOSTOLAKIS: Before office
23 concurrence, we express a view?

24 MS. ANTONESCU: Yes.

25 CHAIR APOSTOLAKIS: Really? Okay. So but

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 you say that NRR and NRO have had answer?

2 MR. SYDNOR: Yes. There is a significant
3 security.

4 CHAIR APOSTOLAKIS: Sure. So is getting
5 concurrence a formality now, since you already have
6 received a lot of input from them?

7 MR. SYDNOR: We always hoped that.

8 MR. SANTOS: That is the plan.

9 MEMBER BLEY: Did you get much guidance
10 from NSIR?

11 MR. SYDNOR: In their area. Actually, as
12 you are well aware, there has been a lot of give and
13 take. We have been working very closely with them for
14 the last year and a half on our cyber security
15 research which we will talk a little bit about, as we
16 get into the topic area.

17 These are just some of the comments we
18 received, you know, that obviously the offices are
19 interested in training, not just delivering a NUREG
20 that may be difficult to understand. Some of these
21 are your typical comments. But we did have, I will
22 just point out, we had specific comments, very high
23 level comments of the direction of research programs.

24 No, we don't need this topic. No, we disagree with
25 you dropping this one, so bring that one back. So we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 had significant comments. They were not casual
2 comments.

3 CHAIR APOSTOLAKIS: Now when you say
4 encourage industry, is the MOU with EPRI out of this?

5 MR. SYDNOR: Yes, it is interwoven into a
6 number of their research topics, especially what we
7 have been discussing.

8 CHAIR APOSTOLAKIS: So that MOU is kind of
9 broad? I mean, you can pick any project from here
10 that you feel is appropriate and collaborate with
11 them?

12 MR. SANTOS: There are several topics that
13 we have met for the past year with EPRI. Developing
14 that MOU for some targeted areas and I will show them
15 to you a little later. But one of them is an
16 operating experience. So it is not everything.

17 One other point I want to make here is as
18 we came through this, there was a lot of good research
19 initiatives but none of them fit our regulatory
20 scope. So, an example will be sustainability and
21 obsolescence management. So areas like that we find
22 are important for the discipline, then you have to ask
23 the question is this regulatory research or some
24 research of the industry.

25 So we try to collaborate with the industry

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to try to have them take the lead and leverage --

2 CHAIR APOSTOLAKIS: When you say industry,
3 who do you mean?

4 MR. SANTOS: I mean most of it, I mean
5 EPRI for the most part.

6 And also a challenge we have sometimes how much
7 state-of-the-art research should be undertaken versus
8 the industry. And that is a challenge sometimes.

9 CHAIR APOSTOLAKIS: Sushil, yes?

10 MR. BIRLA: I would like to add to that
11 answer. Sushil Birla from the NRC.

12 Just to give you a little bit more on the
13 MOU, it was initiated by the Division of Research
14 Analysis. It was written up broadly but basically
15 that was their interest, the PRA when they did
16 research. And with Dan's initiative and counterparts
17 on the EPRI side, interest was expressed in some
18 topics of research and Dan mentioned EPRI is a very
19 important one.

20 We have not yet had the detailed
21 discussion meetings but as we enter into those
22 discussion meetings, some of this is going to get
23 sorted out. What is really purely non-NRC mostly EPRI
24 side, what is joint, what is really more NRC side,
25 will the exchange of information only give in certain

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 cases we share information but EPRI publishes its own
2 reports and NRC publishes. All that has yet to be
3 discussed out.

4 MR. SANTOS: A new marriage.

5 MR. HECHT: I know that NRC and EPRI have
6 cooperated for many years on many projects but how is
7 any potential conflict of interest issues resolved in
8 the MOU? I don't need to know the details but is that
9 covered adequately?

10 MR. SANTOS: Yes, adequately. What is
11 reviewed by the OGC, General Counsel, and there are
12 several protocol you will follow, include
13 transparency. And basically, bottom line is you can
14 share data but you draw your own conclusions. That is
15 kind of the bottom line. But we are following agency
16 protocols and OGC advice to make sure because we are
17 very aware of that issue and one that we respect very
18 carefully.

19 MR. BIRLA: And EPRI, mind you, is a
20 research institute. So earlier when the question came
21 up what do you mean by industry, we need to make that
22 distinction.

23 And would someone from EPRI like to
24 clarify the distance they keep between research and
25 industry interests?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. TOROK: Yes, this is Ray Torok from
2 EPRI. When you say -- I am not sure if I understand
3 the question correctly. But the point is that EPRI
4 does research that is intended to support the
5 industry. Could you be a little more specific?

6 MR. BIRLA: The boundaries of our MOU are
7 purely research, without any direct connection with
8 licensing issues.

9 MR. TOROK: Right.

10 MR. BIRLA: So we on the NRC side maintain
11 that boundary, similarly you do. So our discussions
12 of where this project goes, why under the MOU when we
13 meet, we are meeting as researchers. You are not
14 bringing in a physical discussion. Similarly, you are
15 not bringing licensing officers.

16 MR. TOROK: That is right. And EPRI does
17 both research of the type you described. And we also
18 get involved in efforts to generate technical basis
19 for a licensing position, that sort of thing. But in
20 this case, we are talking about, you know, the
21 research part of it.

22 And Dan's point was a good one is that the
23 notion is that we can share data and discuss ways to
24 deal with the data and so on. But in the end, we need
25 to separately generate our assessments of what it

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 means to the conclusions.

2 MR. BIRLA: We do plan to have the
3 appropriate level of transparency also. So point well
4 taken.

5 CHAIR APOSTOLAKIS: Okay.

6 MR. SYDNOR: Okay, just real quickly on
7 this, the second comment slide, the first three
8 bullets are examples of fairly major research
9 initiatives where we have received comments to ensure
10 that we included these. The first one we just
11 discussed briefly.

12 The next one was really a new one that
13 came from I think we received lots of comments from
14 both NRO and NRR because of the new uses by vendors of
15 automated software tools and how do we judge the
16 validity of those and their use in a licensing
17 submittal.

18 And obviously, the third bullet you are
19 very familiar with. That was part of the reason that
20 is in the plan is a feedback from previous ACRS
21 discussions. And then you know, obviously specific
22 deliverables. There is always an appropriate
23 criticism of research that you know, you get a
24 deliverable that is usable, not just research results
25 that people are not sure what to do with.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. SANTOS: One thing we are trying to
2 improve is not necessarily wait until the end. You
3 know, to your destination but involve as knowledge get
4 generated, try to through the journey of the research
5 get the user officers more involved as we get let's
6 say a significant finding. You know, get together and
7 start discussing, instead of waiting for a final
8 product that sometimes might have missed the
9 timeliness for a nugget of information that we could
10 not have provided to them earlier.

11 MR. HECHT: Is any licensee proposing the
12 use of, you know, MATLAB or RHAPSODY for 1E systems?

13 MR. SYDNOR: Not that I am aware of.

14 MR. SANTOS: I will refer that question to
15 some of the reviewers in the licensing office. Debra,
16 if you can help with that or Mike.

17 MR. WATERMAN: Mike Waterman, Office of
18 Research, perhaps not MATLAB or the other tool that
19 you mentioned but for example, the TELEPERM X S system
20 uses a product called CVAT, a simulation and
21 validation tool, to help them verify a system they put
22 together. I believe the representative is here and he
23 can go into greater detail about CVAT.

24 Apparently, the issue arose as well, what
25 is the qualification of that CVAT tool that you are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 using to verify that the software is really at a high
2 enough quality to be acceptable to be used as a safety
3 system.

4 So CVAT is one example of a tool that is
5 being used to help develop a system.

6 MR. HECHT: And this is a verification
7 tool, not a code generation.

8 MR. WATERMAN: Yes, it is a verification
9 tool.

10 MR. SANTOS: I will cover that briefly but
11 we are seeing automation at pretty much every stage of
12 the lifecycle, all the way from requirements,
13 management, doors, to code generation, to code
14 transformers, to V&V activity, to flat automation.
15 The trend is to move into more automation.

16 MR. WATERMAN: And part of what drives
17 that is that IEEE Standard 7432, which was endorsed by
18 Reg Guide 1.152 says that any tools used to develop
19 safety related software should be qualified at the
20 equivalent level of quality.

21 So you know, how do you go about doing
22 that?

23 MEMBER STETKAR: I was going to ask this
24 when you get into the individual topics but perhaps it
25 is better at the higher level.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Kind of a pet topic of mine is I see very
2 little in the plan for international cooperation. I
3 have a two-part question. One is I know you have had
4 some in the past. And I guess, what is your
5 experience? Is there a benefit there? And I know the
6 glib answer is well yes, of course, there is. I mean,
7 is there a practical benefit? Is there information?

8 The sense that I have is that indeed the
9 technologies are being developed in other countries so
10 the actual experience, the applications have many
11 years' operating experience in other countries. And I
12 have talked to people in other countries and they
13 claim that they have what they feel are fairly
14 effective methods on assessing the reliability in
15 other countries.

16 So, I am curious why we are perhaps now
17 inventing our own methodologies simply because we live
18 in the United States and have 322 events that we can
19 point at.

20 MR. SANTOS: You want talk that one?

21 MEMBER STETKAR: Now, if your conclusion
22 is there isn't much to be actually learned, that a lot
23 of those assertions are simply thin air, that is fine.

24 MR. BIRLA: We could choose to discuss
25 that now or wait for the topic.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER STETKAR: If you feel it is better
2 in the topics then do that.

3 MR. BIRLA: Yes.

4 MEMBER STETKAR: As I said, I was kind of
5 bouncing back and forth.

6 MR. BIRLA: There is a lot to be said
7 there. Let's save the discussion until then.

8 MEMBER STETKAR: Thank you, Sushil.

9 CHAIR APOSTOLAKIS: Somebody said
10 yesterday there is a CSNI committee that you guys are
11 participating in.

12 MS. HERRMANN: COMPSIS.

13 MR. SANTOS: The OECD NEA COMPSIS. That
14 is one of them. We will talk about that. We will
15 cover that but that is an element.

16 CHAIR APOSTOLAKIS: The thing that -- well
17 maybe we can ask questions as you go now to more
18 specifics. But I mean, you said that you had
19 significant input from the various offices, which is
20 good. But did you also try to anticipate future
21 needs, perhaps, that specific offices don't care about
22 right now and do some anticipatory work that is there?

23 MR. SYDNOR: Yes, there is a topic that
24 has been in all the previous plans and it really
25 worked fairly well for us and we call it emerging

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 technologies. But every two to three years, we
2 initiate some research to look at that.

3 CHAIR APOSTOLAKIS: Okay, so we can look
4 at these things as we go along.

5 MEMBER BLEY: And I just have one question
6 on the overall. Are you going to talk anywhere about
7 the things that have been dropped or is that, you are
8 not going to get into that.

9 MR. SANTOS: Yes, we can go back to that,
10 if you want.

11 MEMBER BLEY: Well you don't have to go
12 back to it. If you are not going to talk about it
13 again, I just wanted to ask because I saw some things
14 in some work that I was doing with the Army where they
15 have learned some things in the last ten years about
16 lightning that were kind of surprising and lightning
17 protection. And I see you have deleted the lightning
18 program.

19 MR. SYDNOR: Actually, in the '04 and in
20 the beginnings of the '05 through '09 research time
21 frame, there was. Oak Ridge did some research in that
22 area and there was actually a reg guide issued.

23 MEMBER BLEY: Okay, so you think it is
24 pretty well caught up-to-date.

25 MR. SYDNOR: That is the lightning

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 protection.

2 MEMBER BLEY: Yes.

3 MR. SYDNOR: We have not, since that reg
4 guide was issued, it has not been a topic that there
5 has been any.

6 MEMBER BLEY: Okay.

7 MR. SYDNOR: But that was the thrust of
8 that research and that reg guide.

9 MEMBER BLEY: Okay.

10 CHAIR APOSTOLAKIS: Okay, so let's pick up
11 slide 18.

12 MR. SYDNOR: The new plan has essentially
13 five program areas. And we are going to go through
14 those essentially program by program. And the last
15 one there is pretty much carry over that we will talk
16 about. But in 3.1, 3.2., 3.3., 3.4, there is also
17 some things that are ongoing from the current plan.

18 Did you want to say something?

19 MR. SANTOS: Yes, again I just want to
20 clarify like you mentioned, even from the old plan,
21 this classification, binning is more for convenience.
22 But in reality a lot of these projects have
23 dependency between them.

24 CHAIR APOSTOLAKIS: Sure.

25 MR. SANTOS: And we are trying to improve

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the way, how the values products input others and try
2 to make this a more integrated generation of knowledge
3 as we go through. So, even if it is convenient to
4 look at bins, we recognize there is a lot of
5 integration.

6 MR. HECHT: Christina sent out a handout,
7 I think on August 13th or something like that. And
8 the numbering of the topics there is not the same as
9 the numbering here. Did I not understand something?

10 I have, for example, 3.1 through 3.7 as
11 opposed to --

12 MS. HERRMANN: Status one.

13 MR. SYDNOR: Status one is the seven
14 program areas in the '05 to the existing, '05 through
15 '09 plan.

16 MR. HECHT: I see.

17 MR. SYDNOR: So that is a status one. We
18 do have a separate tool, a mapping tool which mapped
19 the whole plan to it.

20 MEMBER BLEY: It's an Excel.

21 MR. HECHT: Okay. All right, I see.

22 CHAIR APOSTOLAKIS: So we start with the
23 safety aspects?

24 MR. SYDNOR: Right. We are going to start
25 with safety aspects of digital systems and Paul

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Rebstock is going to discuss the first project, which
2 is a new project that we are proposing, a new research
3 topic area.

4 MR. REBSTOCK: The issue that we are
5 concerned about with this effort is that digital
6 systems will permeate a new plant. There are already
7 a lot of digital systems in existing plants and we
8 expect more and more direct control and safety
9 implications in future plants. And interconnections
10 between that plant data systems and management systems
11 and all kinds of interconnections.

12 We have done a fairly complete job so far
13 of looking at individual systems and saying what the
14 individual systems need to do and what do you need at
15 the boundary between one system and another.

16 This plan is to step back and look at the
17 plant from 10,000 feet and say what are all of the
18 systems in the plant. How do they interact with each
19 other? What functions should be performed where? How
20 should these systems talk to one another?

21 Some of the issue has to do with
22 communications, communications protocol, the very
23 specific kind of communication process that is
24 described in ISG-4. There are also kinds of
25 communications that may be appropriate or maybe should

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 be avoided. And that is what this plan is to look at.

2 The end product will be, or one of the end
3 products will be what I and probably nobody else
4 refers to is the abstract integrated model, which is
5 intended to be a way of looking at the plant and
6 defining areas of kinds of systems and the
7 interrelationships among them.

8 CHAIR APOSTOLAKIS: So I guess that is not
9 very clear to me. The final product and do what?
10 Give advice to some reviewer as to what to look for?

11 MR. REBSTOCK: It would do that. It would
12 also provide advice to us, to the industry, to create
13 a framework for discussing this kind of system, these
14 kinds of systems to recognize where interfaces are,
15 how pathways, for example, from outside the plant --

16 CHAIR APOSTOLAKIS: Somebody is putting
17 papers on the microphones. Can you move the
18 microphone a little bit away? Thank you.

19 MR. REBSTOCK: So the intent is to look at
20 the plant from, like I said, from 10,000 feet, to look
21 at all of the systems in the plant and how they are
22 all connected together. There is incentive to want to
23 be able to get certain information out of the plant
24 control system on the CEO's desk. You don't
25 necessarily want it to run the other way. There is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 information that needs to be shared between the
2 control system and the protection system. That should
3 be a very highly restricted communications process.
4 And we will address that particular communications
5 process in ISG-4. There may be other communications
6 that are necessary or appropriate. What this is to do
7 is to try to get a handle on the entire picture of all
8 of the digital systems in the plant and how they would
9 relate to one another.

10 CHAIR APOSTOLAKIS: How they are related
11 to one another or how they should?

12 MR. REBSTOCK: Yes.

13 CHAIR APOSTOLAKIS: It is both.

14 MR. REBSTOCK: Both, yes. Like I said,
15 you need generation information on the CEO's desk but
16 you don't want some kid on the internet to modify your
17 protection settings.

18 CHAIR APOSTOLAKIS: Right.

19 MR. REBSTOCK: So, how does all of that
20 fit together? Where are the boundaries, what should
21 be done where?

22 MR. HECHT: That particular example that
23 you gave seems to be an issue for security, cyber
24 security, but it is not listed there as one of the
25 issues. It is reliability, redundancy and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 independence.

2 MR. SYDNOR: Well the ultimate concern
3 under this one, if I may speak for Paul is you know,
4 the effect on safety and its effect on safety systems.
5 And it is not purely a safety issue.

6 CHAIR APOSTOLAKIS: It's both.

7 MR. SYDNOR: It is a security issue as
8 well.

9 MR. HECHT: But isn't the way you
10 described the issue really one primarily of
11 information flow and is that really worthy of a
12 research topic?

13 MR. REBSTOCK: I'm not sure I understand
14 the question.

15 MR. HECHT: Well okay. Basically what you
16 have said is put a firewall to prevent or put in what
17 is called a guard to prevent certain information from
18 going out or going in to whatever it is. Your
19 containment region or what is called in the security
20 world, enclave. And the methods and technologies for
21 doing that are pretty well defined. What is the
22 innovation of the research questions that have to be
23 asked here?

24 MR. REBSTOCK: What you have described is
25 a solution for one particular kind of an interface.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 What this project wants to do is to look and see what
2 interfaces exist. What interfaces should there be.
3 What information is needed in which system? Step back
4 and look at the whole thing.

5 Your are right. A firewall might be an
6 appropriate barrier between one kind of system and
7 another kind of system. What we are talking about
8 here is what are those systems? What kinds of systems
9 are there? The question of how do you protect and
10 whether you use a firewall or whether you use an ISG-4
11 style blackboard kind of shared memory kind of
12 communication or whether you use some other kind of
13 process is one of the things that would be a
14 derivative of this.

15 MEMBER STETKAR: To as the question
16 differently, the third bullet there is development of
17 a generic model, plant-wide digital systems. What is
18 the vision for that generic model? I mean, is it just
19 a few little bubbles with arrows going back and forth
20 among them or is this a fairly detailed model?

21 MR. REBSTOCK: The intent is to make that
22 model sufficient abstract that it would accommodate
23 the system designs in most plants. I don't know right
24 now what it would look like, whether it would be a
25 block diagram or whether it would be sort of a box

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 with lines that separate it. But the point is that it
2 is an abstract thing so that we can look at levels of
3 security requirements and levels of interface.

4 MEMBER BROWN: Why wouldn't -- are you
5 finished John?

6 MEMBER STETKAR: I am but I don't know
7 enough about it. I guess I come back to what Myron
8 asked is I am not sure why research wants to be able
9 to do that.

10 MEMBER BROWN: Yes, my question is more
11 fundamental. When I looked at the section 3.1 and
12 then section 3.2, which was the security aspect of it.
13 We are seeming to assume that all of these diverse
14 methods of communication are welcome, wholesome,
15 useful, and desirable.

16 MR. REBSTOCK: Absolutely not.

17 MEMBER BROWN: But yet I didn't see the
18 evaluation or the analysis or an approach to an
19 analysis. For instance, why would we have wireless,
20 for instance? Do I really want my data being
21 broadcast such that it can be picked up as opposed to
22 going with wired systems?

23 And that seems to me that is a higher
24 level topic than let's assume that people do it. Now
25 here is all the methodologies or the methods to make

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 sure we are protected on the cyber security or from
2 interception or what have you.

3 And so that was, I am not necessarily
4 disagreeing but that just seems to me that as soon as
5 I saw wireless, I am starting to wonder why in the
6 world do I want this stuff out in the airways,
7 particularly if you are worried about somebody hacking
8 in, which we now know that people can hack almost
9 anything. And the only true barrier then, you don't
10 have any barrier other than a bunch of algorithms and
11 other types of things you have sitting down there in
12 the systems that protect yourself from it as opposed
13 to a mechanical barrier. I want the wire going
14 someplace.

15 MR. REBSTOCK: Right. I'm not sure I get
16 the connection.

17 MR. HECHT: Well my --

18 MR. REBSTOCK: The question of whether
19 wireless communications are acceptable or not is a
20 legitimate question and something that we should look
21 at.

22 Personally, I am not so sure that it is a
23 good idea. But to communicate what?

24 MR. HECHT: Well before I start doing
25 that, before I start assessing techniques and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 methodologies for cyber security, why would I even
2 work on this if I haven't made a decision whether I am
3 going to do wireless or not do wireless for whatever
4 basis I have?

5 That was my thought relative to -- I see
6 the program. The fundamental in my own mind, it was
7 do I have to go that way in order to make that
8 research relevant. And if you decide that we don't
9 want to do wireless, then why would I have a research
10 program for assessing those applications?

11 I mean, if I am missing something --

12 MR. SYDNOR: Well specific to wireless, it
13 exists.

14 MEMBER BROWN: Well we could use it.

15 MR. SYDNOR: Nuclear plants are using it.
16 They have wireless communication networks in the
17 plant. They are using it for several different
18 applications. I worked at a plant that had wireless
19 applications.

20 So it exists. Not for safety systems but
21 we are concerned about the implications on safety
22 systems.

23 MR. HECHT: But if you have guidance for
24 -- there is not thought, I haven't seen anything
25 listed that says hey, you wouldn't do it that way or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the staff.

2 MR. SYDNOR: Well some of our research in
3 that topic area is looking at that. There was a
4 previous research done that looked at applications of
5 wireless, and we do power plants and some, for lack of
6 a better term, best practices that if you are going to
7 do that. And now we are investigation the cyber
8 security aspects because they already exist out there.

9 And so we need to be cognizant of the
10 affect of those systems on safety systems because
11 ultimately, the wireless systems do connect into plant
12 intranet. That exists in plants currently operating.

13 MR. REBSTOCK: Right. But the point of
14 the abstract integrated model isn't really to talk
15 about this particular technology. It is to look at
16 what systems there are in the plant and how they would
17 interface. The wireless communication process or some
18 other kind of a communication process would be a
19 detail of all the different areas of the plant or the
20 different areas of digital implementation would
21 interact with one another. That is a separate issue.

22 This is to step back and say what is
23 there?

24 MR. HECHT: So this is really data flow.
25 It is not really -- you know, I guess one of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 reasons why Charlie and maybe I have gotten hung up is
2 that this is really a question of the flows of
3 information, what is allowed and what is not allowed.

4 MR. REBSTOCK: I would rather say
5 information than data, yes. At this level, see this
6 is an abstract level.

7 MR. HECHT: So what you really need to do
8 here is in your abstract plant representation, what
9 you need to do is identify all of the sources of
10 information and all the users of information and say
11 which, whether it is bi-directional or uni-
12 directional. Is that right?

13 MR. REBSTOCK: That general concept would
14 be something that we would be looking at. The amount
15 of detail that we go into I think will depend
16 partially on what we find. I am not sure what the end
17 product is going to be.

18 CHAIR APOSTOLAKIS: Is this a big project?

19 MR. REBSTOCK: I don't think so.

20 MR. SANTOS: No and totally internal.

21 CHAIR APOSTOLAKIS: So we are not talking
22 about something major here.

23 MR. SANTOS: No.

24 MEMBER BROWN: I only read one where it
25 would be beneficial to develop further regulatory

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 guidance on communication processes that are
2 appropriate for the exchange of information between
3 plant sensors/actuators and the protection and control
4 systems among safety channels. That was under the
5 technical basis for --

6 CHAIR APOSTOLAKIS: Where are you reading
7 from?

8 MEMBER BROWN: Well, I am looking in the
9 research program, section 3.1.1.

10 CHAIR APOSTOLAKIS: Oh.

11 MEMBER BROWN: I am just reading the words
12 of what you are doing. And we already have -- so from
13 reading that, I am saying oh, okay, I have got these
14 detectors down there that are going to be broadcasting
15 the plant parameter data out to my reactor protection
16 system or control system.

17 MR. REBSTOCK: I wouldn't presume that we
18 are going to do that, at this point.

19 MEMBER BROWN: Well, I am just reading the
20 words, okay, in terms of the research approach.

21 MR. SANTOS: If the words are bothering
22 you Charlie, --

23 MEMBER BROWN: No, no, no, no. And I try
24 to relate it back to the --

25 CHAIR APOSTOLAKIS: It is an issue of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 communication.

2 (Laughter.)

3 MEMBER BROWN: I was trying to relate it
4 back to ISG-4, which was issued to provide guidance on
5 data communications between channels. Now is this
6 related to data communications between channels? Or
7 is this the -- I just couldn't get a picture of what
8 the thrust was. That was my point.

9 MR. SANTOS: We will take the comment.

10 MEMBER BROWN: I don't know. So I don't
11 want to get down in the weeds. It was just a matter
12 of what are we talking about. I'm sorry.

13 CHAIR APOSTOLAKIS: Okay. Is everyone
14 satisfied?

15 MR. WATERMAN: This is Mike Waterman,
16 Office of Research. I just want to emphasize that the
17 research plan really provides a framework within which
18 we develop projects. So this particular project is,
19 it sort of lays out a broad scope of things that we
20 need to look at.

21 But one of products I would see out of
22 that is sooner or later, somebody in the NRC is going
23 to have to go out and look at a plant design and you
24 are going want to know what to look at and what to
25 expect when they look at that. Somebody has to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 approve these systems, as they come in.

2 And so what we are trying to do with all
3 of these projects is to provide guidance to the people
4 on the ground so that when they get a whole map layout
5 of the plant, they understand what they have to look
6 at, what they can ignore, and what kind of things they
7 ought to be aware of as potential safety issues.

8 So that is the basis for all of the
9 research. But what I am trying to do is just provide
10 a framework within which we can start projects down
11 specific roads.

12 CHAIR APOSTOLAKIS: And I think it is
13 important to bear in mind even a comment that Myron
14 made earlier, that the Office of Research here is
15 charged with doing things that are not necessarily
16 research in the academic sense.

17 MEMBER BROWN: No, I understand. I got
18 that point.

19 CHAIR APOSTOLAKIS: You are giving advice
20 to like Mike just said, where you are what to do and
21 so on. I mean, in another environment, you might say
22 well, this is not research. But the Office of
23 Research does that for the Agency. So, I think it is
24 useful to bear that in mind. Let's not look for
25 innovative research results into everything here. I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 mean, developing guidance is part of their job.

2 MR. REBSTOCK: Yes, and it doesn't presume
3 what the guidance is going to be.

4 Deliverable 2 here says that we are going
5 to look into communications processes between sensors
6 and actuators in the system. That doesn't mean --

7 MEMBER BROWN: Such as voting.

8 MR. REBSTOCK: I'm sorry?

9 MEMBER BROWN: Such as voting, --

10 MR. REBSTOCK: Okay.

11 MEMBER BROWN: -- which is also covered in
12 TWG-4 very explicitly.

13 MR. REBSTOCK: Right. But it doesn't say
14 how we are going to do that. And it doesn't say what
15 we are going to accept.

16 MEMBER BROWN: Well the TWG-4 just says
17 you can do anything you want to, as long as you prove
18 to us it is okay.

19 MR. REBSTOCK: No, TWG-4 says --

20 MEMBER BROWN: I have got the words right
21 here, if you would like me to read them to you.

22 MR. REBSTOCK: We can talk about that
23 separately.

24 MEMBER BROWN: Okay.

25 MR. SANTOS: Okay, next up is, were barely

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 touch on it but again the trend is the various life-
2 cycle activities are becoming more --

3 CHAIR APOSTOLAKIS: Can you explain the
4 title? Maybe it is obvious to everyone. "Tool
5 Automated Processes."

6 MR. SANTOS: Right.

7 CHAIR APOSTOLAKIS: Safety Assessment of a
8 Tool.

9 MR. SANTOS: Engineering activities are
10 become more and more automated. The process for which
11 people carry out their engineering activities are
12 becoming automated. So we are trying to assess what
13 was the impact of mistakes on the use of that
14 automation that will lead to eventual failures.

15 MEMBER BROWN: There are V&V tools out
16 there that people want to use to prove that their
17 software is satisfactory and defect free.

18 CHAIR APOSTOLAKIS: Like fault injection.

19 MEMBER BROWN: Whatever. The point being
20 is if somebody has to validate the tools, you have to
21 have some idea of whether those tools are correct,
22 whether they are going to give you a correct result.

23 And this is very difficult to do and
24 everybody has their own tool. And it is like models
25 in the thermal hydraulic world or whatever. You know,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 how do you validate the model? Well you never have an
2 end result that you can validate that you really got
3 the true result because the only answers you get are
4 out of the model, I mean out of the tool.

5 CHAIR APOSTOLAKIS: So the problem is that
6 --

7 MEMBER BROWN: I am not against looking.
8 I think you obviously have to do it. I am just saying
9 this is --

10 CHAIR APOSTOLAKIS: This is usually what
11 happens when developers of the tool exaggerate it
12 significantly.

13 MEMBER BROWN: Absolutely.

14 CHAIR APOSTOLAKIS: So you guys will come
15 back and put them in their place.

16 MR. BIRLA: This is Sushil Birla from
17 research. In the first bullet you see two examples
18 listed and those are real examples. New applications
19 are coming in with code generation tools. You have a
20 function block diagram design. Typically, this is
21 done in a homegrown tool. The code generator is also
22 a homegrown tool. And then they have verification
23 tools, which automatically generate the test cases,
24 automatically test that generator program and want to
25 make a claim that you don't need physical testing. So

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 that is an example of a verification tool. Again,
2 these are homegrown tools.

3 So this touches on your earlier question.

4 When there are industry-wide well used, well-known
5 tools like MATLAB, like the RHAPSODY, your question
6 was, is the industry leveraging any of that? This
7 industry is not. It has typically got its own style
8 of function block diagrams and then therefore, it ends
9 up with its own homegrown tools. And that becomes
10 then an issue of concern.

11 MR. SANTOS: And you know, another issue
12 is, like we said in the technical basis, before it was
13 one guy made a mistake. Okay. Now, as you move
14 upstream in the same process you are introducing more
15 of a systemic problem. If your tool is at fault, the
16 propagation is going to affect all of your downstream
17 activities.

18 CHAIR APOSTOLAKIS: So is this research
19 going to look at individual tools and provide
20 guidance? I mean, your next slide says that there
21 will be regulatory guidance. So can you do this in a
22 generic way or do you have to look at each tool or
23 what?

24 MEMBER BLEY: Somebody drew a parallel to
25 verifying form hydraulic calculations. And what their

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 staff is trying to do is build their own models to
2 test the calculations, maybe not in as much thorough
3 detail as the designers did, but to have a really
4 independent look. Have you given thought to anything
5 like that?

6 MEMBER BROWN: There is an experiment you
7 could run in this area that gives you a set of data
8 that you can benchmark. And they talked about
9 benchmarking as one of their other sections in here.

10 So but you can run these other
11 experiments, get a benchmark, run the model and tool
12 against it and see if you get a result.

13 CHAIR APOSTOLAKIS: If you follow this
14 part under the terms of hydraulics, I think this makes
15 a good point. Should the staff have its own tool?

16 MEMBER BROWN: I am not objecting to this.
17 I am just pointing out that that is what they are
18 trying to do, from what I can see when I read this
19 one.

20 CHAIR APOSTOLAKIS: It is for sure. What
21 is the answer?

22 MR. BIRLA: Your specific question was is
23 this specific tool a particular classification of
24 tools or a bit more general. This cannot be specific
25 to a particular set of tools. The research is going

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to be more general. However, the starting point in
2 each piece of research is going to be close to what is
3 the set of conditions that you are confronted with.
4 So as examples, you will certainly take what we are
5 seeing emerging in licensing applications but the
6 result will be more general.

7 And we aren't the only ones facing this
8 issue. Someone asked earlier about international,
9 what are you gaining. So I am going to weave in part
10 of the answer to that here.

11 European regulators are experiencing the
12 same issue. And they are a little ahead of us in the
13 curve. And they are in the middle of drafting some
14 guidance for qualification of tools.

15 CHAIR APOSTOLAKIS: So then somebody will
16 take that guidance and actually apply it to a specific
17 tool. Is that what you are saying? I mean,
18 ultimately it will have to have some advice as to how
19 this specific tool can achieve certain things. Who is
20 going to do that? NRR?

21 MR. BIRLA: The user of the guidance will
22 be the licensing office, NRO or NRR.

23 CHAIR APOSTOLAKIS: And you will provide
24 kind of a higher level guidance. And I am really, I
25 guess I don't understand this very well. I mean, high

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 level guidance, if it is too broad is not too useful.

2 Is it?

3 MR. FREGONESE: Can I make an industry
4 comment on this?

5 CHAIR APOSTOLAKIS: Identify --

6 MR. FREGONESE: My name is Vick Fregonese
7 from AREVA. Mike mentioned I was here today.

8 This is a real life example for us in the
9 U.S. We have a topical report that has been submitted
10 to the NRC on our CVAT tool, which is our validation
11 tool. It is used extensively in Europe on all of our
12 applications and builds over there. And so that is
13 something that is really germane to us in the near
14 term. So one thing would be that the guidance that
15 does get promulgated would be something that will be
16 timely.

17 To answer the question about MATLAB, there
18 are uses of MATLAB that generate test vectors for some
19 of our automated testing that we do, depending on what
20 kind of modules they are. So our European experience
21 where we are building four or five EPRs then bringing
22 that over to the U.S. makes extensive use of these
23 type of tools. In some cases, the staff has already
24 evaluated, for instances, our space tool, which is our
25 code generation tool for TXS.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 So this is something I think that is
2 pertinent to us and I can see why the staff would need
3 some guidance to help them through to review it.
4 There are some IEC standards and IEEE standards that
5 talk about tools and how they should be clarified.
6 You know, any clarification of that to make it easier
7 both on your side and the staff side will probably be
8 something that will be valuable.

9 MR. SANTOS: And what are the right
10 questions a reviewer should be asking are of the
11 applicant to validate the claims I think will be a
12 great outcome of this.

13 CHAIR APOSTOLAKIS: How about Dennis'
14 suggestion? I mean, in other areas, this stuff has
15 its own codes.

16 MR. SANTOS: I am getting to that in a
17 future project. I will cover that.

18 CHAIR APOSTOLAKIS: Okay, fine. You
19 answered it. Anything else on this topic?

20 MR. HECHT: Yes, I just wanted to point
21 out in the aerospace -- not the aerospace industry,
22 the commercial aviation industry, RTCA DO-178 does
23 have some comments on that. And at the top level, it
24 defines development tools in two areas. Those that
25 generate code and those that are used for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 verification.

2 And the overall philosophy is that if the
3 output of a tool cannot be manually verified, then the
4 tool, the code generation tool has to be qualified to
5 the same level as the code which is supposed to be
6 produced.

7 For verification tools, the standards are
8 relaxed. But particularly if manual verification can
9 be done, then that is relied upon as the primary
10 justification. And I imagine that with you folks -- I
11 have looked at that.

12 MR. SANTOS: The answer is yes. And we
13 are lucky enough to have Debra with us. She is an
14 expert. She came from the FAA and she is an expert on
15 that.

16 MR. BIRLA: This is Sushil Birla. That is
17 an excellent example of looking outside the nuclear
18 industry for available capabilities, state-of-the-art,
19 state of practice. How others are addressing these
20 issues. The qualification of tools is an issue
21 everywhere.

22 MR. HECHT: Oh, so you didn't mention that
23 before that you were looking at other industries.

24 MR. BIRLA: There is another section in
25 the project plan and as opportunities and questions

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 arise, we will try to weave in our answer there. This
2 is one of areas.

3 So the committee in DO-178 is right now
4 wrestling with the same issue, with inadequacies of
5 their standard, what should be the additional
6 requirements, and part of the project to be tracking
7 such efforts.

8 MR. HECHT: Thank you.

9 MR. SANTOS: Our next topic is an ongoing
10 project. I have Mike Waterman here. He is --

11 MEMBER BROWN: Let me back track. Sorry.

12 Why wouldn't a possible fallout of these
13 tool assessments or research that you do, I'll spin a
14 little bit off of Myron's comment, say that gee, we
15 really don't like these tools. And probably the
16 methodology we should be using would be manual code
17 evaluation and/or a hookup of the software platform
18 and its system configuration to a generic plant
19 simulator where you can then run the plant through a
20 set of transients, other types of, you know
21 pressure/temperature increases, trying to see that
22 everything performs in a manner as expected.

23 So those are a couple of ways that have
24 been used, to validate this stuff. There was that
25 track.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. BIRLA: This is Sushil Birla. Let me
2 tackle that, Charlie.

3 First of all, the boundaries of the
4 regulator. We cannot prescribe solutions.

5 MEMBER BROWN: I agree you cannot
6 understand that. Let me finish.

7 MR. BIRLA: Okay.

8 MEMBER BROWN: I understand you can't.
9 But you can say no to approaches to doing things if
10 they don't provide a substance satisfactory for you to
11 agree that it is okay.

12 MR. BIRLA: That is exactly what I was
13 getting at.

14 MEMBER BROWN: That is my point. That is
15 the only point of my comment.

16 MR. BIRLA: Yes, so part of the outcome
17 might be that the state-of-the-art is not adequate to
18 give you the degree of assurance you need and
19 therefore, this is not acceptable, the technique at
20 the moment.

21 MEMBER BROWN: Or much of that is driving
22 you. You come to the conclusion that these tools are
23 not adequate.

24 MR. BIRLA: But then we would have to at
25 least establish the criteria.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BROWN: You mean a criteria -- you
2 have to prove that it is not okay?

3 MR. BIRLA: Say why it is not okay.

4 MEMBER BROWN: No. Why don't they have to
5 prove that it is okay?

6 MR. BIRLA: Yes, so what are the criteria?
7 Yes, I guess they would be evaluated.

8 MEMBER BROWN: I know how to do that.

9 MR. BIRLA: Yes, so we would have to
10 document that and get an agreement, a broad consensus
11 on that. That is part of the issue here.

12 MEMBER BROWN: Well you walk into a trap
13 is all I am saying, when you do it that way. It is
14 like we will allow you to use any methodology you come
15 up and we have to prove it won't work as opposed to
16 you proving it will work.

17 MR. SANTOS: Let's offer some
18 clarification on that. Oh, sorry.

19 MR. RICHARDS: I am Stu Richards from the
20 Office of Research.

21 You know, that is an interesting idea that
22 we tell them what to do but we can't do that, as
23 Sushil said.

24 MEMBER BROWN: No, I understand that.

25 MR. RICHARDS: All right. But what we do,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the way we do business just with I&C, generically
2 across the board, should satisfy your concern.
3 Licensees can come forward with a proposal and say
4 this is how we want to do I&C or pumps or valves or
5 whatever. And then they have to satisfy us that what
6 they are doing meets our standards for safety before
7 we will approve it. So the burden is on the licensee
8 to demonstrate what they are doing is acceptable.

9 On the other hand, part of the Agency's
10 mission is to be clear and transparent on how we
11 regulate. So I think what they are talking about here
12 today is in trying to accomplish that part of our job
13 is to work with the industry and other regulators
14 throughout the world to come up with appropriate
15 criteria on how to use tools.

16 You are suggesting maybe the criteria is
17 tools are unacceptable.

18 MEMBER BROWN: I didn't say that.

19 MR. RICHARDS: You know, we have to do the
20 work. We have to look at, you know, can we come up
21 with criteria that will satisfy? You know, if you do
22 all these things, we will be satisfied that the tool
23 is acceptable. We owe the industry that criteria if
24 we can produce it, rather than saying, kind of bring
25 me a rock and we will look at it and tell you a yes or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 no. We need to be able to come up with some way to do
2 business. And I think that is what we are trying to
3 do. You know, the result might be ultimately down the
4 road that we have got so many questions about these
5 tools, maybe we really don't want to do it. But I
6 don't think we are there yet. Right?

7 So the burden isn't on us. I just want to
8 make that clear.

9 MEMBER BROWN: In a way, that is what you
10 sounded like when you first started.

11 The problem here is that the licensees or
12 the designers have to show that their methodologies
13 for their approaches are satisfactory and meet your
14 fundamental overarching criteria.

15 MR. RICHARDS: Yes, but we don't want to
16 do business where everything is custom one-time only
17 review. You know, we like to move to where we have
18 standards and things so it is a much more efficient
19 process.

20 MEMBER BROWN: I don't disagree with that.

21 MR. RICHARDS: Well that is where we are
22 trying to go.

23 MEMBER BROWN: It is always a nice thing.

24 MR. RICHARDS: But believe me, our job is
25 to say no. Our job is not to prove it is unsafe. Our

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 job is to say you haven't proved to us it is safe and
2 we are not going to approve it until you do.

3 MEMBER BROWN: Okay, well I will use one
4 example, okay, just to show you. And this has been
5 heard before. If you look at independence of I&C, go
6 back in the old days in the analogue systems, there
7 was one additional criteria. You had to have
8 electrical isolation.

9 MR. RICHARDS: Channel-to-channel.

10 MEMBER BROWN: By default, you ended up
11 with literally a channel of this and a channel of
12 that. And they were independent. You almost could
13 not get there. You had to work at not being
14 independent.

15 With the advent of software-based systems,
16 computer-based systems, now that electrical
17 independence does not do it for you. You have to deal
18 with data communication independence and how that is
19 executed. And if you look at the methodologies that
20 are used and you start pumping data from one computer
21 to the other, now how do you prove that you are still
22 independent? That is a very thorny issue which I am
23 trying to deal with right now in the context of my
24 time on this committee. I don't know how long I will
25 live.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. RICHARDS: Well I think everybody here
2 will agree with you that is a really good issue.

3 MEMBER BROWN: All I am trying to say, my
4 point I am trying to get to is this is another area of
5 the software validation process that brought some of
6 that -- I mean you used to be able to look at the old
7 systems and it was kind of obvious. You had an
8 amplifier that did this and that. It is not that
9 obvious anymore.

10 MR. RICHARDS: No.

11 MEMBER BROWN: And it is a far more
12 difficult task to do. And the tools that people have
13 been using and then advertised. The comment was very,
14 they were homegrown. People are doing their own stuff
15 and they want to tell you this is okay. I don't have
16 to test anything. And it is difficult to step back
17 and say how hard do they have to demonstrate that or
18 if they yell loud enough, they will just well, okay.
19 They say it is okay so it is okay.

20 That is kind of a struggle. It is an
21 abstract thought process but that is the thought
22 process.

23 MR. RICHARDS: You know, there is a lot of
24 people I am sure with the staff that are probably more
25 in agreement with you than you realize.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 What we are doing is we are presenting the
2 issues here. These are the things that we need to go
3 off and learn more about. We don't know the answers
4 yet. You know, we are just trying to tell you, her is
5 the areas that we have to explore, we have to learn
6 more about. We have to get that international
7 experience. We have to work with industry so that we
8 can grow in this.

9 We don't have the answers. And what we
10 are looking for from you guys is, are we exploring the
11 right questions. Are we going and looking at the
12 right areas and is there things we have missed? We
13 don't have all the answers.

14 MEMBER BROWN: I did not disagree with
15 this particular. I wasn't disagreeing with this with
16 my comments.

17 It is just that I am trying to make the
18 point. You asked for committee comments or a member
19 comment. I am not saying that the others agree with
20 me, necessarily. Observations relative to what you
21 are doing. I am just trying to put it in a context of
22 the overall problem.

23 MR. RICHARDS: Yes, it is just difficult
24 for us. I mean sometimes some of the comments I am
25 hearing today are basically answers. They are saying

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 you are looking at this issue. It is isn't the answer
2 to this. You know, we haven't done the work yet. You
3 know, we are working for the program offices. They
4 have input into this, too. So it is hard for us to
5 agree or disagree with you when you start talking
6 about what the answer is.

7 MR. BIRLA: Thank you for the support,
8 Stu.

9 (Laughter.)

10 MR. BIRLA: And Charlie, I understand the
11 general theme that you are getting at.

12 MEMBER BROWN: Yes.

13 MR. BIRLA: If you take over the boundary,
14 you can say for sure that this problem won't hit you.
15 That theme ran in your wireless example. Why don't
16 you just ban it? Same thing in the independence. If
17 we have physical disconnection, then the problem won't
18 be there. And you could take the same thing with
19 tools.

20 And we used to. Now that boundary is
21 being pushed. And this is where the regulator is
22 between a hard rock and a -- what is that?

23 MEMBER BROWN: Yes, but I agree. I would
24 say you are not between a rock and a hard place
25 because you still have the job of assuring

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 independence. And architecture is in the software
2 world just as best setups for validating software in
3 the testing world have certain boundaries or
4 conditions that you know you have to meet.

5 And if it is fuzzy whether it is being
6 met, you have to be careful about being too acceptable
7 -- no that is the wrong word. The locator bit is
8 gone. So that is the only point.

9 CHAIR APOSTOLAKIS: And we totally agree.

10 MEMBER BROWN: We can go on.

11 CHAIR APOSTOLAKIS: Have we reached that
12 point? Okay, okay. Next.

13 MR. SANTOS: I will speed up and stuff for
14 you.

15 MEMBER BROWN: It is not over, George. It
16 is not over.

17 MR. SANTOS: You had a question, sir? Oh,
18 this is the UVA work where you had a previous
19 question.

20 CHAIR APOSTOLAKIS: What is going on?
21 Have I lost control here?

22 (Laughter.)

23 MEMBER BROWN: You just regained it,
24 George.

25 CHAIR APOSTOLAKIS: Okay, what is next?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. SANTOS: It is an ongoing project.
2 University of Virginia fault injection is developing a
3 methodology so we say to fault injection. So there
4 are basic methods basically to try to shake the
5 system, once it is finished. Okay? To try to uncover
6 faults that weren't found through the normal lifecycle
7 --

8 CHAIR APOSTOLAKIS: I thought we objected
9 to that second sub-bullet, that you cannot use those
10 methods to say anything about probabilities. It was
11 very clear, black and white.

12 MR. SANTOS: They still want to try.

13 CHAIR APOSTOLAKIS: Sometimes I get the
14 feeling that the EPRI listens to us more than you
15 guys.

16 MEMBER BROWN: You noticed that.

17 CHAIR APOSTOLAKIS: We said explicitly
18 that this is not appropriate.

19 MR. WATERMAN: This is Mike Waterman,
20 Research. The other outcome of this research is to
21 develop a method whereby we could do the equivalent of
22 exhaustive testing of a system to reach some measure,
23 if you will, and objective measure of whether or not
24 that system is of sufficient dependability, if you
25 will, or reliability.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 The project started out with the title
2 Software Dependability, I believe and Dr. Johnson then
3 in here discussing how you go about doing a coverage
4 analysis of the system. And then using that coverage
5 analysis in the Markov model, you can determine how
6 many tests you need to do and where you need to do
7 those fault injection tests to come up with some idea
8 of just dependable is that software.

9 The idea being that if you could come up
10 with some kind of idea of where your failure modes
11 were in a particular system, you could then feed that
12 into a PRA, along with some numbers that are developed
13 out of that. And I think Jeanne Dion can provide even
14 more detail.

15 CHAIR APOSTOLAKIS: I suppose if you find
16 faults in the system, you fix them.

17 MR. WATERMAN: But the idea is that when a
18 safety system is developed, well all the faults have
19 been eliminated. Right?

20 CHAIR APOSTOLAKIS: They are two separate
21 things.

22 MS. DION: This is Jeanne Dion.

23 CHAIR APOSTOLAKIS: Is it useful to have
24 fault injection and increase your confidence if this
25 thing is going to do its job?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. WATERMAN: Yes.

2 CHAIR APOSTOLAKIS: Yes. Is it reasonable
3 to say that based on that I can say something about
4 the probability of the thing not doing its job? No.

5 MS. DION: That was the point I was going
6 to make. We did decide that the use of fault
7 injection methodology to produce failure rates for PRA
8 is not appropriate. However, the fault injection
9 process could be used to verify failure modes or
10 perhaps --

11 CHAIR APOSTOLAKIS: At some point -- does
12 it say it? Unless PRA models, you mean also failure
13 modes, which I am going to say you are going to say
14 yes. Right? I agree with you.

15 MS. DION: For the development of PRA
16 models.

17 MR. SANTOS: All I am trying to say here
18 is that we are looking at PRA. We will discuss it
19 later today in a more integrated manner. And this one
20 of the projects that could help provide to their
21 efforts.

22 CHAIR APOSTOLAKIS: But isn't it also true
23 that if you identify your failure mode, you are not
24 going to say, oh, there was a failure mode, I will
25 give to BNL. No. You are going to say, I am going to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 go and fix it. Isn't that true? And that has been
2 the problem from day one in the academy report and so
3 on. These are not random failures that you say well,
4 gee, I have to tolerate some of them.

5 In the software, you find the problem. I
6 don't know, are you going to say it is okay? No, you
7 are going to fix it. Right? And that makes a big
8 difference in the calculation of probabilities. And
9 then we get to publish to these idiotic papers that
10 will assume there are so many faults remaining.

11 MEMBER BLEY: Well, no.

12 CHAIR APOSTOLAKIS: You know, that is good
13 for giving you tenure but not doing real stuff.

14 MEMBER BLEY: I think one thing is, and I
15 wasn't around when you guys talked about this before,
16 of course you will fix the exact problems you find.
17 But you might find classes of problems that are
18 indicative of what else might be there, if you could
19 test everything. And if I -- I don't want to dwell on
20 the words on the slide, but if I learn something there
21 about the failure modes or mechanisms that might help
22 in structuring the problem, that will be useful. It
23 wouldn't give me answers, probabilities, just like you
24 said.

25 CHAIR APOSTOLAKIS: But they do have in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the presentation, we were actually presented with
2 formulas that give you failure rate.

3 MEMBER BLEY: I suspect I wouldn't like
4 that very much.

5 CHAIR APOSTOLAKIS: Okay.

6 MR. SANTOS: We agree with that. And I
7 told you we are de-emphasizing that aspect of the work
8 and putting more on the fault, you know, the invasive
9 part. But we don't want to throw away everything that
10 we have learned.

11 CHAIR APOSTOLAKIS: So let me understand
12 how you are going to use this tool. AREVA comes with
13 a new program to do something. Code. Are you going
14 to start injecting faults and doing things? Are you
15 going to have one of your contractors do that for you
16 or are you going to ask AREVA to do it? I don't
17 understand how this is going to be used.

18 MR. SANTOS: Right now, this is research.
19 So we will develop a methodology. It is up to the
20 licensing offices to determine how will they
21 implement, whether they do independent contract or how
22 they will roll it into the regulatory framework. That
23 is up to the --

24 CHAIR APOSTOLAKIS: Let's do it for the
25 why to see whether they can --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. SANTOS: If I give you answer, it
2 would be my own opinion. But it is still --

3 MR. SYDNOR: Well, the answer is we
4 haven't answered that question.

5 MR. SANTOS: Right.

6 MR. SYDNOR: I mean, that is part of this
7 work is to determine viability and whether it can be
8 used in that manner.

9 We have already, and that was what I was
10 talking about earlier. We had the UVA come and
11 present their preliminary results, which they obtained
12 from testing the AREVA TELEPERM platform which we
13 purchased a couple of years ago. And that is not a
14 full RPS mockup. It is a channel, channel and a half
15 of equipment. But there were some interesting results
16 out of that and we also presented those to AREVA for
17 their benefit.

18 CHAIR APOSTOLAKIS: So when is this going
19 to close?

20 MR. SYDNOR: We are testing another
21 platform. The Invensys Triconex platform. It has
22 just been sent to the University of Virginia and we
23 are going to test that to see what other plans we
24 have.

25 That vendor is very interested in the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 outcome because they believe they have a fault
2 tolerance testing program that they have used
3 successfully. So they are interested in the results.

4 CHAIR APOSTOLAKIS: So when I look at this
5 --

6 MR. SYDNOR: But we are looking at the
7 method. And I believe from what I have seen, just
8 personal opinion, that UVA could commercialize this
9 methodology and vendors could use it. Now, are we
10 going to require that use as a part of a licensing
11 submittal? That decision hasn't been made yet.

12 MR. HECHT: There are two, you mentioned
13 two programs. You mentioned Triconex and you
14 mentioned the AREVA TELEPERM platform. Triconex is
15 basically a triple modular and redundant PLC. It is a
16 platform on the TELEPERM system, I assume as a reactor
17 protection system, which had the application
18 integrated.

19 Testing of the Triconex system using fault
20 injection would get significantly different
21 information than testing of the TELEPERM.

22 MR. WATERMAN: This Mike Waterman,
23 Research. The purpose of the research right now is
24 not to test platforms and say this platform is good,
25 that platform is bad.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 The purpose of using platforms is so you
2 can develop a systematic methodology, if you will, for
3 testing systems in general, by applying a coverage
4 process such that you can identify particular tests
5 that would represent many fault injection tests that
6 would come out with the same result.

7 The reason we use different platforms is
8 simply to develop that methodology. And in the
9 process of doing it, it is actually quite interesting
10 to see some of the things that University of Virginia
11 has developed to make that process more systematized,
12 if you will. For example, the automatic generation of
13 the test scripts and things like that and identifying
14 which test.

15 So the idea is not well we are going to
16 single out AREVA or we are going to single out
17 Invensys in these tests. That is not the purpose of
18 the test. It is to develop a methodology that we
19 could perhaps apply in the future to help us reach
20 reasonable assurance that a system is good enough to
21 be used as a safety system.

22 MR. HECHT: It still comes back to the
23 question of if you are testing the reactor trip
24 system, there are a finite number of inputs. If you
25 are testing the ability of the Triconex system to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 respond and recover and reconfigure, it is a
2 completely different --

3 MR. WATERMAN: And is there a generic
4 process you can use so that no matter what the system
5 is, you can apply that process to the system to
6 identify which faults to inject to give you reasonable
7 assurance?

8 We also tested a feedwater system that was
9 donated by Calvert Cliffs. Okay? So but the idea is
10 to develop a method and not to say oh, you know, we
11 are going to test Invensys. Yes, it is a different
12 system but fundamentally it is a system. And where do
13 you inject the faults? How do you determine how you
14 inject those faults? Do you understand what I am
15 saying? You have to develop a method to
16 systematically prove it.

17 MS. DION: Can I just add something that
18 would probably help clarify your question? You are
19 right with the TELEPERM system being tested as a mock
20 RPS system. There will be a similar application that
21 we will set the Triconex up with and test it under a
22 similar application. So, it is not just --

23 MEMBER BROWN: Protection system
24 application.

25 MS. DION: Yes. Something representative

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 of a reactor protection system.

2 MR. HECHT: But is the Triconex system
3 representing one channel or is it representing three
4 channels?

5 MS. DION: Well, since we only have --
6 that is still yet to be determined. I think we only
7 have two channels.

8 MEMBER BROWN: You have two separate
9 platforms.

10 MS. DION: Yes, we have two. Two chassis.

11 MR. REBSTOCK: Well, there may be some
12 confusion on the Invensys system. They call that
13 three channels. That is three processors in one
14 channel. It is a redundant system. Each individual
15 channel has three processors in it that are all part
16 of the same channel.

17 MR. HECHT: But presumably, the reason why
18 you would use Triconex is to increase the reliability
19 of even your single channel.

20 So, I guess we should speak about
21 divisions.

22 MR. REBSTOCK: Well that is kind of a
23 commercial issue. One division in one system and one
24 division in the other system are the same definitions.
25 One of them implemented with a single processor, one

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 implements with triple processors. They have
2 different ways of going about it.

3 MR. HECHT: But if you just --

4 MR. REBSTOCK: It is still just one
5 division.

6 MR. SANTOS: I guess if you do have four
7 channel Triconex, you end up with 12 processors.
8 Right?

9 MEMBER BROWN: Yes. You have four
10 divisions.

11 MR. SANTOS: Right.

12 MEMBER BROWN: Four divisions, right.

13 MR. SANTOS: I believe four separate
14 chassis.

15 MR. HECHT: So what are you testing? Are
16 you testing the ability of the Triconex platform to
17 recover from failures internally or are you testing
18 the ability of an application of your mock
19 application?

20 MR. SANTOS: We are testing our
21 methodology.

22 MR. WATERMAN: We are developing a
23 methodology so that no matter what the application is,
24 it can be fault injected and you come up with some
25 idea is this system fairly bullet proof? What kind of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 assurance do I have that this system qualifies as a
2 safety system?

3 You know, we are getting all hung up on
4 the platforms and much to the chagrin of the vendors
5 who have been kind enough to support us in this
6 project, we are not testing the AREVA TELEPERM XS to
7 say the XS is no good or the XS is good enough. We
8 are trying to develop a methodology so that down the
9 road, whatever application runs on whatever platform,
10 we can apply this method to come up with some
11 reasonable assurance using a systematic process that
12 is predictable and is consistent from application to
13 application.

14 The vendor has gotten just as upset about
15 the idea of us testing their platform. What we needed
16 was we needed hardware and we needed software running
17 on the hardware. Where should we get it? Well, lets
18 go out to the nuclear industry which maybe someday we
19 will apply this to and use some of their stuff, which
20 is what we did.

21 We bought an AREVA platform. Invensys
22 donated theirs. I believe Calvert Cliffs donated some
23 hardware and software of theirs so that we could start
24 developing this methodology that we can use to
25 consistently evaluate one system after the next,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 regardless of whether it was Invensys, TELEPERM,
2 Westinghouse or whatever.

3 CHAIR APOSTOLAKIS: I think there is
4 enough interest here so we should schedule maybe a
5 series of Subcommittee meetings in the next year or so
6 where we can go into more detail in these projects as
7 the members of our consultant feel appropriate.

8 I don't think we can go into too much
9 detail today. So, this is definitely a project where
10 obviously there is interest. So maybe we can invite
11 the University of Virginia to actually give a
12 presentation. And you know, we can ask all these
13 questions then and make comments and even write
14 letters if we would feel that way.

15 MR. WATERMAN: It is a very good
16 presentation. They spent about, I don't know, four to
17 six hours down at AREVA presenting it. They came up
18 here and gave us an abbreviated two-hour presentation.
19 So it is pretty interesting stuff.

20 CHAIR APOSTOLAKIS: So you know, and I am
21 sure there will be -- I mean, we have done it in the
22 past. There is nothing new here.

23 MEMBER BROWN: I don't know. I haven't
24 done it in the past, George. I am just listening,
25 absorbing interesting information.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: Good. As you should.

2 I think we have to get moving here and it
3 is unfortunately --

4 MR. SANTOS: I will try to speed up.

5 CHAIR APOSTOLAKIS: Well, it is not only
6 up to you.

7 (Laughter.)

8 MR. SANTOS: Okay. I will try anyway.

9 CHAIR APOSTOLAKIS: So let's see, you are
10 going to move now onto a new project?

11 MR. SANTOS: Yes.

12 CHAIR APOSTOLAKIS: I think we should
13 break here and maybe beat the crowds downstairs. So,
14 we will be back at 1:00.

15 (Whereupon, at 11:51 a.m., a lunch recess was taken.)

WASHINGTON, D.C. 20005-3701

A-F-T-E-R-N-O-O-N S-E-S-S-I-O-N

(12:59 p.m.)

CHAIR APOSTOLAKIS: Okay.

MR. SANTOS: Okay, the next topic is one that sometimes people talk about Digital I&C is different from other disciplines. And you know, you walk the halls and you see people working at their models, whether it is thermal hydraulics or finite element models and what have you. And I am just like, where is our model?

So basically, we are trying to develop and the level of detail exact question that we will develop the answer as we go through developing the actual projects.

But in a high level, we want an integrated model of the digital system that will be integrated to some of the thermal hydraulics and physics models. So we have an integrated model of the overall plant so we can help, you know, validate responses to digital system failures, validate application algorithms, and basically assist their reviewers when they get a proposal for enhancing their functions.

CHAIR APOSTOLAKIS: So how do you envision that model? I mean, what would it be? Again, would it be a diagram?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. SANTOS: No this is not of the high
2 level. This is of the details actually whether this
3 will be --

4 MEMBER SIEBER: Software?

5 MR. SANTOS: -- software models. Okay?

6 MEMBER SIEBER: It's like a simulator
7 model.

8 MR. SANTOS: A simulator model that is
9 integrated with the simulator with TRACE, for example,
10 RELAP. Okay? And the fidelity of that model will be
11 a subject of the research itself. Okay? Because this
12 could get very expensive in a heartbeat.

13 MEMBER SIEBER: Could you actually use a
14 simulator model?

15 MR. SANTOS: Yes.

16 MEMBER SIEBER: I would think that would be
17 a pretty good tool, provided you could benchmark it to
18 something.

19 MR. SANTOS: That's right. And in other
20 applications, I have seen such a concept work very
21 well and be very helpful to reviewers accomplish their
22 work.

23 So that is basically it.

24 MEMBER SIEBER: It gives you the
25 opportunity to insert faults.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. SANTOS: Yes.

2 MEMBER SIEBER: System upsets, all kinds
3 of things.

4 MR. SANTOS: Correct.

5 MR. HECHT: Is this with respect to safety
6 systems or is this with respect to control systems?

7 MR. SANTOS: We will start with safety
8 systems but that doesn't necessarily limit us there.
9 Again, the scope, the detail, how far we take this,
10 okay, it will be part of the research itself. But we
11 will probably start small and grow from there.

12 MR. HECHT: Well, safety systems has been
13 emphasized over the past couple of -- or yesterday.
14 And basically just monitor and if a condition is met,
15 then intervene. How much fidelity? What would you
16 learn from such analyses or from such a simulator?

17 MR. SANTOS: Basically more of the
18 functional dependencies that may exist between
19 parameters. You could help discover racing conditions
20 that you weren't aware of when you are trying to
21 develop your trip calculations, for example.

22 MR. HECHT: But isn't that already
23 addressed in great detail prior to, you know, in the
24 reactor physics calculations, reactor kinetics
25 calculations?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. SANTOS: Some of it is but basically
2 you also want to see that the assumptions, the actual
3 system, the sign doesn't violate your safety analysis
4 that you have bounded. Okay? If you made a change to
5 digital systems, you want to see how the time response
6 and everything is bounded within your analysis also.

7 MEMBER SIEBER: Yes.

8 CHAIR APOSTOLAKIS: Okay.

9 MR. SANTOS: We will skip this because we
10 have covered it in great detail. The next topic is
11 operating experience analysis. I will turn to Russ.

12 MR. SYDNOR: I am going to talk about this
13 topic. And obviously we have talked a lot about it in
14 the last day and a half. And some of the things that
15 we are going to be doing under this research topic
16 have already been discussed. So I am going to try not
17 to duplicate those discussions. I do want to touch
18 base on some of the stuff that has been ongoing and
19 the things we have done.

20 The COMPSIS has been mentioned a couple of
21 times. And a number of years ago Bill Kemper started
22 the U.S.'s participation in OECD NEA COMPSIS database
23 and I have been continuing that. And some of the
24 points about the usefulness of that database are well
25 taken.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 It is at a fairly high level. It doesn't
2 get into any type of taxonomy that we have found
3 useful down at the mechanism level. But what we have
4 been hoping is to learn more about failures in other
5 countries due to that because there are about ten
6 nations participating in it. And we are trying to,
7 via the steering committee we work on there, get them
8 to enter more data because the representatives tell us
9 they have more data but that they haven't entered more
10 failure data. So, we are still trying to work that
11 effort. Is it a useable tool at this time? No, it
12 has got some interesting things in it and some people
13 have even run analysis on the limited number of events
14 that are in there. Limited in sites, I would say that
15 you can get from that at this point.

16 MEMBER STETKAR: Russ, I don't really know
17 what they are doing but is this, if you were to, in
18 this forum, hazard a guess, do you expect any
19 substantial participation in terms of the utilities in
20 the other countries supplying that information in the
21 near future? I am talking about two or three years.
22 Or will this be a 20-year, German-type develop the
23 amount of data to support the failure rate for a valve-
24 type exercise?

25 MR. SYDNOR: I will just answer that. I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 am disappointed in the participation level at this
2 point in time. And you know, I haven't seen --

3 MEMBER STETKAR: I was just curious in
4 terms of recommended level of our Agency's
5 participation.

6 MR. SYDNOR: Well, I am trying to put more
7 events in and maybe lead by example by putting more
8 events in that we have from all of the LER events that
9 have been discussed here.

10 MEMBER STETKAR: The LERs, that is a good
11 seed, but the LERs in our country, I suspect are
12 perhaps more detailed than the regulatory reports that
13 are received in other countries, the underlying
14 information is there. But if you can't have timely
15 access to that through their organization, the
16 question is --

17 MR. SYDNOR: Is it worth it?

18 MEMBER STETKAR: -- is it worth it.

19 MR. SYDNOR: That is certainly in the back
20 of my mind. Like I say, we are trying to regenerate,
21 foster interest in it via our participation. My
22 personal opinion, I would say the prognosis is not
23 good --

24 MEMBER STETKAR: Okay.

25 MR. SYDNOR: -- because I am just not

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 seeing it. And there is a couple of key countries
2 that are not participating in that. The French don't
3 participate. The Japanese don't participate. So I
4 mean, you are missing a lot.

5 MEMBER STETKAR: You are missing the vast
6 majority of the international experience.

7 MR. SYDNOR: Yes.

8 MR. SANTOS: Because of that prognosis, we
9 don't want to solely rely on that. And the Agency has
10 other --

11 MEMBER STETKAR: I was just getting a
12 sense in terms of balance of resources and emphasis.

13 MR. SANTOS: Right.

14 MR. SYDNOR: So we are still supporting at
15 this time. It is a collaborative effort that we have
16 committed to.

17 MEMBER STETKAR: All right.

18 MR. SANTOS: The Agency has other vehicles
19 already placed where we could emphasize the digital
20 discipline aspects of it through some of the
21 bilaterals that we haven't been doing as much.

22 MEMBER STETKAR: Do you think that might
23 be more effective?

24 MR. SANTOS: My opinion, is probably.

25 MR. HECHT: In trying to deal with the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 COMPSIS data, it is a very elaborate record structure
2 and it probably takes a number of hours, maybe eight
3 hours to translate an LER into that COMPSIS framework,
4 assuming you know what the LER is.

5 So it sounds like I don't know, even the
6 322 reports that were spoken about earlier today would
7 take more than a staff year of effort. Right?

8 MR. SYDNOR: Well not all of those would
9 qualify for entry into it, the way they have the scope
10 of it set up.

11 MR. HECHT: So I notice that in the 2005
12 to 2009 research plan there were three projects that
13 dealt with the COMPSIS database. I guess the lesson
14 learned from that experience is that it is a dying or
15 a dead effort.

16 MR. SYDNOR: OECD is not, you know,
17 whether they continue to support funding in it, I
18 guess really depends on the member countries. I mean,
19 it is fairly low cost and the problem really is --

20 MR. HECHT: Low cost or low budgeted?

21 MR. SYDNOR: The database is up and
22 running. I mean, they have already committed. It is
23 really just individual countries dedicating their
24 resources to input data.

25 MR. HECHT: The server is up and running.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. SYDNOR: Yes.

2 MR. HECHT: That is not -- yes, okay. I
3 guess you understand that that is not a great
4 achievement. I mean, it is -- So, how many records
5 are in COMPSIS at this point?

6 MR. SYDNOR: Oh, it is really only about
7 probably about three dozen high level events. But
8 again, remember the scope does not include things like
9 turbine control or feedwater control. The computer
10 system is important to safety.

11 MR. HECHT: And how many of those 3,000
12 records relate to digital system --

13 MR. SYDNOR: Three dozen.

14 MR. HECHT: Three dozen.

15 MR. SYDNOR: Thirty-six.

16 MR. HECHT: Thirty-six. Oh. Oh. I
17 withdraw my question.

18 MR. SYDNOR: Thirty-six.

19 MR. HECHT: I withdraw my question.

20 MR. WATERMAN: This is Mike Waterman,
21 Office of Research. The only thing about the COMPSIS
22 database is when you tunnel down in there to find out
23 what the level of granularity is, as I recall, it
24 stopped at software failure. Which is not a lot of
25 granularity. I mean, we have already identified

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 several subcategories of that. And both us and EPRI
2 has identified many different categories under
3 software failure. And the COMPSIS database, the last
4 time I looked at it, didn't go into that level of
5 detail. So I don't know how useful it is going to be
6 anyway.

7 MR. SYDNOR: Under this topic area, we
8 have also, I think George mentioned yesterday, that
9 will we ever get meaningful data from non-nuclear
10 industries. We had explored that starting a couple of
11 years ago and using Oak Ridge, we had done some
12 efforts to go out and try to find digital fire data
13 databases, any information we could from a number of
14 nuclear industries.

15 I found some information usefulness was
16 questionable. We did some assessments on that that
17 were part of the ISG-2 effort to see if we could learn
18 anything that influenced the guidance that was put out
19 on diversity under ISG-2.

20 But part of that work also uncovered some
21 other databases that we could potentially purchase.
22 And so we went ahead and authorized Oak Ridge to
23 proceed to see if we could find meaningful there. Not
24 just from the data standpoint but, you know, from a
25 taxonomy standpoint, could we learn some things that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 would help us as we structure the classification or
2 taxonomy system going forward. And that is almost
3 complete. But your prognosis from yesterday is
4 probably right. We are probably not going to learn
5 anything that gets down into the level of detail that
6 we are going to be interested in.

7 But we have invested in that time. At
8 least when we are asked have you looked we can answer
9 yes, we have looked. And we have looked quite
10 extensively.

11 CHAIR APOSTOLAKIS: It is okay, Dan. It
12 is okay.

13 MR. SANTOS: I am not ready to make that
14 conclusion. That is all I wanted to say.

15 And now an example I wanted to give is
16 that the Agency also has a Memorandum of Understanding
17 with NASA. And as part of that effort, we are trying
18 to expand. It is already covered with the terms to
19 look at data. JPL is an example, some of their V&V-
20 centered efforts to try to derive some insights and
21 knowledge on that.

22 So I don't know. I don't know if I can
23 make that conclusion yet, given their vast
24 experiences.

25 MR. HECHT: I know that the PRA work is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 going to be covered separately by Alan. But there is,
2 I think, a strong relationship between the operating
3 experience work and the PRA work because the
4 parameters, of course, would come from this. The
5 question that was raised earlier yesterday was I
6 think, and today, was actually phrased and I think the
7 short hand is the denominator. And so is there going
8 to be any attempt to get that total operating time or
9 number of demands so that a rate or a probability of
10 recovery from a failure is going to be gathered?

11 MR. SYDNOR: Well, I think the answer is
12 we are going to explore is that achievable. You know,
13 I can't say that we will be able to do that.

14 I have had discussions with people at INPO
15 that have a similar interest in getting better failure
16 data information.

17 CHAIR APOSTOLAKIS: The digital system is
18 useful when you are talking about random failures, not
19 when you are talking about designs.

20 MR. HECHT: And that is one of the issues.
21 Let me ask you in follow-up to George's question, I
22 am going to ask you another one. And that is that we
23 have 322 nuggets that were discussed yesterday and I
24 think that is going to be a major focus of the
25 operation experience. But is there more information

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 available elsewhere, particularly on annoying failures
2 that may be recorded somewhere or could be recorded
3 somewhere that aren't reported that might very well be
4 random failures?

5 MR. SANTOS: I think the answer is yes.
6 And you know, that is where we get into how far is the
7 regulatory arm reaches. And that is why the MOU with
8 EPRI will help us reach into some of their other
9 members to get some of that additional information.

10 MR. HECHT: I didn't see that stated
11 anywhere as an objective in this plan. I mean, do you
12 think that it might help to understand the relative
13 proportion of random versus systematic failures?

14 MR. SANTOS: Good comment.

15 MR. HECHT: I think that operating
16 experience would be a key, I think figure of merit in
17 determining how far one could push the PRA work.

18 With respect to JPL, one of the points
19 that came up at the BNL conference which is relevant
20 here is that two of the people who participated in
21 that panel and they are one was from JPL and that was
22 Allen Nikora. And then the other person was Kishor
23 Trivedi of Duke University. They were working
24 together on analyzing NASA operational data or JPL
25 operational data. And they claim that more than half

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of the failures from operational experience were of
2 the random nature.

3 MR. BIRLA: I followed up with both of
4 them. Allen is very interested in going deeper into
5 the data. If you recall, they classified in two broad
6 categories, board bugs and window bugs. But that was
7 just two cores. So, Dr. Allen Nikora is formally
8 leading a project. And the purpose of the project is
9 more refined analysis, finite granularity analysis.
10 But what should be the framework of that analysis?
11 So, he is very interested in collaborating with us.
12 And if we can set up the structure, that would be
13 useful to both. That could be one good outcome, even
14 though that it by itself might not be just the
15 structure of how you analyze the detail.

16 The trouble is that it pulls even greater
17 on architectural and you have to use a lot of
18 knowledge and intelligence in extracting meaning out
19 of that. In the first case, Dr. Nikora himself read
20 through 1800 such reports. Now it is time to scale
21 himself up. But you can not scale up that level of
22 competence, so he is trying to write an artificial
23 intelligence program to do that. And that is where we
24 think that we would probably have to invest economic
25 manual labor and reading and interpreting and having a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 common understanding of how to interpret. We see some
2 value in that.

3 MR. HECHT: So is that part of that, is
4 that going to be part of this effort?

5 MR. BIRLA: We envision it is again
6 something being explored under the MOU, again DRA,
7 Division of Risk Analysis, the leader in the MOU with
8 NASA and through the DRA coordinator we have reached
9 out. There is interest on both sides to pursue
10 further.

11 Technically, I had enough conversations
12 with Dr. Nikora to know that technical people,
13 himself, myself, we both want to work together. But
14 the logistics of, you can't take a contractor and say
15 now go read there. You can't get the same level,
16 guarantee the same level of depth and knowledge.

17 And the second thing is the visibility of
18 the data. JPL typically does not allow outsiders to
19 look at the data. The contractor can. Their
20 headquarters cannot. So we would have to work out
21 some arrangement where even if we used a third party,
22 a contracted party, it would be a party acceptable to
23 JPL. And yet having the competence that we would like
24 to see to analyze the data manually. That is still
25 under exploration.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 So you will see that there is another
2 section in the research plan that talks about
3 collaboration outside of our industry. In that broad
4 category, this is one of the topics.

5 MR. HECHT: I see.

6 MR. SANTOS: And I go back to what I said
7 in the beginning, these projects, all of them are
8 integrated. So even though I am presenting this, it
9 is really, there are other projects that fit in.
10 There is tentacles everywhere.

11 Next, Sushil Birla.

12 MR. BIRLA: Okay, this project, as you see
13 from the background sheet, the drivers are a number of
14 elements here, some the ACRS itself is aware. There
15 was a recommendation on taking inventory of all the
16 DI&C systems currently in the plans and some kind of
17 a classification of them.

18 And then there are several ACRS letters
19 about focusing increasing effort on identifying
20 failure modes and then there is an SRM that enforces
21 that recommendation of the ACRS plus adds another one
22 about exploring the feasibility of risk quantification
23 in failure methods.

24 These came from the ACRS and the
25 Commission. We integrated in this project some other

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 requests, one that you all are familiar with in the
2 PRA research project they needed parameter of the
3 base, they needed offices' opinions. Enough of that.

4 Is there some other approach we can take
5 analytically? Yes. And similarly would be human
6 factors research group.

7 Over and above that, from the licensing
8 offices there was some interest, specifically from NRR
9 as they were going through the review of Ocone, they
10 began realizing that within the time available, they
11 have to exercise some judgment. I am not really sure
12 whether that is deep enough. And I have requested
13 research to take a deeper dive into the three pre-
14 approved platforms and the associated networks and the
15 effect of having very highly integrated systems.

16 So it is really the issue, the new issue,
17 the new kinds of failure modes that arise when you
18 integrate functions that were hitherto independent,
19 like RPS, ESFAS, non-safety, safety, service units,
20 human interface units. A number of these kinds of
21 elements are integrating into the system that are
22 first including the complexity and secondly
23 introducing unknown and uncertainties.

24 So this project was formulated to address
25 all those needs. So include the technical basis for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 understanding failure modes the feasibility, risk
2 quantification that the Commission asked us to
3 investigate.

4 To do these kinds of studies without a
5 context becomes too open-ended. So given that we got
6 the NRR request for the three pre-approved platforms
7 and their networks, we thought that we ought to use
8 that as a nucleus to characterize the domain over
9 which we would bound the scope of this activity.

10 There are right now seven or eight
11 platforms that are in the picture, the three pre-
12 approved ones plus a few more have surfaced in
13 applications. So we would like to limit the scope of
14 this work to the domain characterized by what we see
15 in these emerging platforms. And of course, the
16 application, the safety functions applications, RTS
17 ESFAS.

18 So with that bounding, we would have some
19 hope that we can come up with a cause-effect
20 understanding, particularly introduced through the
21 effect of interactions that come with this higher
22 level of integration.

23 MR. HECHT: If I were to rephrase this
24 project, is it to basically how to assess a DI&C
25 system? Is that --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. BIRLA: Well, failure mode
2 characterization, yesterday we had the discussion on
3 effects and modes and mechanisms, depending on the
4 level of indentation. So for this class of systems
5 that you see for safety functions, what would that
6 framework be that would be the major output?

7 Professor Apostolakis calls this a cause-
8 effect chain, you might say contributing factor chain
9 but limited to this domain of applications, RTS ESFAS
10 and the seven or eight platforms that you see.

11 MR. HECHT: Are you looking at what
12 regulatory agencies internationally have done with the
13 advanced systems? For example, the use of safety case
14 methods and what is being done in that area?

15 MR. BIRLA: Remember, this is the scope of
16 this is failure mode characterization.

17 MR. HECHT: I see.

18 MR. BIRLA: Yes. Now the safety case idea
19 relates to it but safety case method or such methods
20 are not the scope of this project.

21 CHAIR APOSTOLAKIS: One of the problems at
22 the beginning of this whole business of Digital I&C
23 nuclear, which in fact I witnessed myself during the
24 deliberations of the committee that wrote the Academy
25 report in '97 was that people just didn't know. So

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the most popular example was the Arion failure.

2 So the poor guy here is talking about a
3 simple digitalized system to start the pump and they
4 would hit him with the Arion failure. You know, but
5 you can't you do anything and all of that because look
6 at what happened in France. And that was part of the
7 motivation of this. You know, tell us what kind of
8 systems we have in nuclear power. Are they actuation
9 systems only, in which case talking about Arion is not
10 appropriate? Are you talking about feedback and
11 control systems, in which case now you are beginning
12 to get closer? That was missing and I remember a
13 member of the committee was from a major A&E and he
14 was hit by some academics with Arion and the guy was
15 frustrated. My systems are not that complicated. Why
16 are you bringing up that damn example all the time?

17 So that is part of the motivation is that
18 we have certain classes of systems. Some of them are
19 very simple. So their operating experience that
20 applies to them, you know, should be the appropriate
21 one. Everybody had Arion up here. Arion, Arion.

22 MR. HECHT: Because it happened in 1996.

23 CHAIR APOSTOLAKIS: Yes, it is what
24 Tversky and Kannerman said, you know, anchoring
25 effect, I think it is. You remember the most recent

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 occurrence and you always bring it up.

2 MR. HECHT: Yes.

3 CHAIR APOSTOLAKIS: Very good. Shall we
4 move on?

5 MR. HECHT: What kind of output do you
6 expect from this activity?

7 MR. BIRLA: A framework of cause-effect
8 relationships that you would see in this application
9 environment for this family of platforms.

10 MR. HECHT: So it is kind of like an FMEA.

11 CHAIR APOSTOLAKIS: Oh, absolutely. Yes.

12 MR. BIRLA: That would be going a little
13 too far but a framework within which you can develop
14 either an FMEA or a root cause analysis.

15 CHAIR APOSTOLAKIS: Don't pay much
16 attention to me. I take that back.

17 Okay, where are we now? Diagnostics and
18 prognostics. Nice Greek words you stole.

19 (Laughter.)

20 CHAIR APOSTOLAKIS: You stole them. They
21 are almost unrecognizable but that is okay.

22 MR. REBSTOCK: This is a new effort. The
23 work will be getting under way soon. It hasn't begun
24 yet.

25 The issue is that there are a lot of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 things out there that can examine plant equipment,
2 digital equipment and mechanical equipment and tell us
3 good stuff about what kind of condition it is in. But
4 we don't have much experience with it and it has the
5 potential for adding considerable amount of complexity
6 to the systems that are doing the monitoring, plant
7 computers that are doing the monitoring.

8 So what this project is supposed to do and
9 I expect it will be a fairly simple project is to take
10 a look and see what is out there, what kinds of things
11 are available, how they work, how they should be
12 implemented, where they should be implemented, for
13 mechanical equipment and for digital systems as well.

14 And it includes self-testing and digital systems and
15 automatic calibration.

16 Online monitoring is a particular aspect
17 that could be included under this but it has already
18 been addressed in NUREG/CR-6895. It was issued a
19 couple of years ago. So we will leave online
20 monitoring out of here if it has already been
21 addressed. This is looking more at things like
22 vibration signatures and control valve actuators and
23 mechanical equipment issues, using noise analysis to
24 evaluate conditions of bearings and that kind of
25 stuff, auto testing, calibration, and digital systems.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BROWN: You are talking about real
2 time calibration when you are talking about that?

3 MR. REBSTOCK: Potentially. I mean, the
4 point of the project is to see what is there and what
5 the implications of it are, not necessarily to approve
6 it.

7 MR. SYDNOR: Okay, I am going to move on
8 to essentially a new program area, the security of
9 digital platforms. This is ongoing work. We began
10 about a year and a half ago using Sandia National Labs
11 to help us do some cyber-vulnerability assessments of
12 digital platforms for several different projects. One
13 was a collaborative effort with the utility who
14 volunteered to let us use their Common Q equipment,
15 which they had in a lab mockup type environment. And
16 so we actually set up a collaborative research
17 equipment with the utility and Sandia. And Sandia
18 went to the utility site and performed some cyber
19 assessments of their equipment. Again, it was a
20 Westinghouse Common Q platform, which the utility was
21 using in a safety-related plant application. Now we
22 didn't actually do assessments on the plant equipment.
23 This was in a laboratory mock-up environment and was
24 a partial simulation of what was in the plant.

25 That work has been complete and we have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 two reports from Sandia that documents their findings
2 there. And they did find, again, this is not a fully
3 integrated system so it is in a mock-up environment
4 but they found that not surprisingly there are cyber
5 vulnerabilities in a digital system depending on what
6 type of access you give to that system.

7 And so these reports will help generate
8 knowledge internally and help. And we are also
9 working on some regulatory guidance. Not only the
10 NUREG guide 5.71, which really deals more with
11 programmatic and cyber security from a programmatic
12 standpoint, but the licensing offices have also
13 initiated an effort where they are looking at a
14 potential new ISG looking at the technical, the
15 safety-related system review aspects of cyber
16 security, more under the NUREG guide 1.152 and
17 criteria. And so this testing has some real life
18 examples of what probabilities can exist. It is a
19 good thing it did for the utility. They were
20 interested in mitigations. You know, how could they
21 protect against these vulnerabilities. And so Sandia
22 gave recommendations, too.

23 As part of that work, the utility also
24 asked that we actually do an assessment of their
25 plant-specific plant data network, which was an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 interesting exercise because that is not something
2 that the NRC would normally look at but we had Sandia
3 do a cyber assessment there and they were able to give
4 the utility advice on potential vulnerabilities on
5 their plant data network, the firewall configuration,
6 for example.

7 We are also at Sandia. We just completed
8 and the documentation I think was just finalized for
9 the report. Again, Invensys has been very supportive
10 of a number of our efforts and they loaned us
11 equipment, the Triconex equipment and we did some
12 cyber-vulnerability assessment at Sandia in a lab
13 environment and so we have some documentation of that.

14 And we are moving on, the next step there
15 is Sandia is the AREVA TELEPERM equipment that was at
16 University of Virginia has been moved to Sandia and
17 they are going to take a look at that from a cyber-
18 vulnerability standpoint. The reports that are coming
19 out of this are, you know, fairly detailed and
20 technical. They get down into things that these cyber
21 assault specialists are actually getting in and
22 playing with the code and changing things. And so
23 they are fairly detailed reports. They are non-public
24 documents but the generic outcomes of those we want to
25 make sure that we are covering those aspects and our

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 regulatory guidance that we are using not only on the
2 security side but also the new ISG on the technical
3 side.

4 So the lines that are coming out of this
5 are going to help us improve our regulatory guidance
6 and make sure it is adequate. And there is also some
7 potential feedback on these vulnerabilities that the
8 vendors may want to do something about.

9 Again, these aren't fully integrated
10 systems in plants. They are partial markups and
11 things like that. But we are learning some
12 interesting things about the vulnerabilities.

13 MR. SANTOS: Expanding on that, I think
14 the context is critical. I mean, this is an inside
15 out look. We are not looking all the programmatic
16 things, the licensees can implement to provide
17 adequate protection of their systems. It is just
18 looking at inside out from the platforms out.

19 An interesting follow-up question might be
20 okay, once you identify your security mitigations.
21 Well, what is the impact of that on your safety
22 functions. So that to me is also a research question
23 to ask because you might find out, oh, let's put all
24 this encryption and all of this good stuff. Well,
25 what are you doing to your safety function?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 So, it will be very interesting.

2 MR. SYDNOR: Not all of the mitigations
3 have to be designed into a system.

4 MR. SANTOS: Exactly.

5 MR. SYDNOR: The mitigations can be
6 external.

7 MR. HECHT: Have you -- I mean well, let
8 me put it this way. Does DHS have anything to offer
9 this with their cyber security center?

10 MS. DION: Can I say something? This is
11 Jeanne Dion in the Office of Research. Prior to
12 coming to NRC, I was a Sandia employee and there is a
13 number of different groups at Sandia that are involved
14 with this project. The people who are doing the
15 vulnerability assessments, they are a part of
16 Department of Homeland Security. So they are the same
17 people involved with the DOE projects.

18 MR. SYDNOR: But NRC does maintain liaison
19 at DHS. It is the US search site and others that are
20 security.

21 MR. SANTOS: NSIR is our lead.

22 MR. SYDNOR: Nuclear Security Incident
23 Response office.

24 MR. SANTOS: And we are plugged in with
25 them.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. HECHT: Okay. And are those links
2 being used to direct or influence the results of this
3 research or the results of the reg guide that are --

4 MR. SYDNOR: Yes, certainly for the reg
5 guide. This research is pretty down in the details of
6 these system-specific. And so --

7 MR. SANTOS: Actually, I got it the other
8 way around. The DHS folks wanting for us to come talk
9 to the critical assets groups.

10 MR. SYDNOR: The next network security
11 topic here is what we are doing under this one is
12 actually we have Sandia again looking at a generic
13 networking issues in protection and control systems in
14 nuclear power plants. What type of networks are
15 likely to be used and what type of regulatory issues
16 and cyber security issues do we need to be aware of
17 because of those uses of networking.

18 And so we have got Sandia working that
19 one. There was a little discussion previously on this
20 wireless network security. And as a follow-on to some
21 previous work, in previous years, Oak Ridge had done
22 some exploratory anticipatory research for us looking
23 at potential uses of wireless applications in nuclear
24 power plants. And like I say, there are applications
25 in use at nuclear power plants that are limited to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 maintenance and commercial applications at this point
2 in time. They are not being used for -- I won't say
3 no one is using them for a control system but they are
4 certainly not being used for safety-related systems.

5 But the previous work looked at best
6 practices for using wireless in a nuclear environment
7 and things that people really need to be aware of so
8 they don't misuse it or don't inadvertently affect
9 other things.

10 The work we are doing now is then, you
11 know, okay, given that you have some wireless networks
12 in the plants, what type of cyber security issues do
13 you need to be aware of for those type of things?

14 So these are not, you know, looking at
15 physical. They are more looking at best practices and
16 standards and making sure we understand what those
17 are.

18 MR. HECHT: Is there a plan to consider,
19 you know, wireless can sometimes buy you things,
20 particularly in terms of less vulnerability to fire.
21 I am out of my area of expertise, but is that a long-
22 term plan or is that any part of this what benefits
23 wireless could give you?

24 MR. SANTOS: There is an effort that NRC
25 is also plugged in. LWR sustainability projects, life

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 plus 60, life beyond 60 years. And as part of that,
2 there is a Digital I&C group that is looking also at
3 cable-replacing issues and things where wireless might
4 play a role. So that is how we are looking at the
5 long-term potential benefits.

6 MR. SYDNOR: That is not being --

7 MR. SANTOS: That is not the other. This
8 project, that is all.

9 MR. SYDNOR: But there is an effort with
10 DOE to look at long-term life extension.

11 MR. SANTOS: So we are monitoring that
12 effort.

13 MEMBER STETKAR: The preliminary stuff
14 from the fire people --

15 MEMBER BROWN: Do you really want me to
16 start talking? I have already said all I need. I'm
17 sorry, John. Go ahead.

18 MEMBER STETKAR: The preliminary stuff,
19 the fire research folks have a program looking at
20 fiber optic cable impacts from fires. And some of the
21 preliminary stuff they have done looks pretty good.
22 So in terms of putting off vulnerabilities, there may
23 not be much to be gained in terms of fire risk benefit
24 versus all the other detriments from the wireless
25 technology. Although, the fire research people don't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 have conclusive information either.

2 MEMBER SIEBER: I don't want to get us off
3 the track but is it true that fiber optics is better
4 in fire scenarios than wire?

5 MEMBER STETKAR: That is certainly what
6 they indicate, that it is, yes.

7 MEMBER SIEBER: It's made out of plastic.

8 MEMBER STETKAR: Well not only doesn't it
9 short, but apparently it is pretty hard to actually
10 burn the stuff to open it up.

11 MEMBER SIEBER: Well, yes, it is sheets.
12 In sheets.

13 MEMBER STETKAR: Anyway, we are off the
14 topic here.

15 MEMBER SIEBER: We converted all of our
16 data systems not control systems to fiber optics. And
17 that was part of the reason that we didn't have data -
18 -

19 MEMBER STETKAR: There is not a lot out
20 there yet. The research folks, they have something in
21 their budget for it. But DOE is working on it a
22 little bit.

23 MEMBER SIEBER: It's good stuff. It is
24 high speed.

25 MR. SYDNOR: I am going to move on to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 last topic area in the security program is it is
2 called security assessments of EM/RF vulnerabilities.

3 But what this really is, it is an ongoing project.
4 We are already substantially into it. In fact, we may
5 be wrapping up this with the final report, soon. So
6 it depends on maybe some policy-level decisions and
7 whether this applies in the NRC's scope or role of
8 regulatory oversight.

9 This is really revisiting a study that was
10 done in the early 1980s looking at EMP affects on
11 nuclear, potential EMP affects on high level nuclear
12 detonation on nuclear power plants. And I am sure
13 most of it where there has been a lot of new press out
14 there, with the Commission on EMP as reported to
15 Congress several times in the last couple of years on
16 the potential affects on national critical
17 infrastructure for such an event, potentially a new
18 terrorist-type adversary delivering such a threat.

19 So the effort here is revisiting that.
20 The early 1980s study concluded that nuclear plants at
21 that time would trip, would shutdown but would
22 survive, the equipment would survive the pulse because
23 of some inherent protective features you get in the
24 rugged construction of a nuclear power plant. And the
25 analogue instrumentation control systems would survive

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 and you would be able to achieve, say shutdown. What
2 they did at that time, they did a detailed assessment
3 of four different nuclear power plants.

4 MEMBER BROWN: Analog semiconductors.
5 When we looked at that from the Navy standpoint, the
6 analog stuff that was transistors and stuff were very
7 vulnerable to EMPT.

8 MR. SYDNOR: I'm not saying that they
9 weren't vulnerable.

10 MEMBER BROWN: You can go back to some
11 Digital I&C.

12 MR. SYDNOR: This conclusion didn't say
13 they weren't vulnerable. It is saying that they were
14 protected by the plant structures.

15 MEMBER BROWN: Oh, plant structures. Yes,
16 you put stuff inside a steel hull or a steel
17 containment.

18 MR. SYDNOR: Or concrete walls with rebar.

19 MEMBER BROWN: It depends. Yes, I got
20 you. I got your point.

21 MR. SYDNOR: The people that we are using
22 at Sandia do this for a living both defensively and
23 offensively. They know what we are talking about.

24 The current study was taking a fresh look
25 at that. You know, the wave transmission and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 everything from an EMP pulse is still the same. They
2 have some new techniques, analysis techniques they use
3 now obviously much better than they did in the early
4 '80s. And they are also considering the fact that we
5 have digital equipment installed in these plants. And
6 there is a potential new threat with portable high
7 radio frequency, high level radio frequency of
8 weapons.

9 And so they are drawing some conclusions
10 about potential vulnerabilities from those and what
11 are the -- Are there new impacts? Potentially yes,
12 but again it gets into these are acts of war or
13 whatever. Is it in NRC's regulatory role or scope and
14 we have had some preliminary discussions with our
15 office director and at the director-level in the
16 Nuclear Security and Incident Response Office to talk
17 about these.

18 Former chairman Klein had a specific
19 interest in this. And one of the reasons we were
20 doing this research was his interest in the subject
21 and making sure that we had analyzed for affects on
22 the plants themselves.

23 And so where we are at on this, we have
24 gone out and looked at several nuclear power plants.
25 We have preliminary reports from Sandia. We are going

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 to be wrapping that up, presenting that information to
2 the right management level at NRC and determining is
3 it a threat potential that the NRC wants to, needs to
4 take action.

5 There is the potential that preliminary
6 conclusions from the EMP are probably going to agree
7 with the conclusions of the earlier study. The plants
8 will still be able to achieve safe shutdown for an
9 EMP-type effect for high frequency. Perhaps not.

10 MR. REBSTOCK: They only give me the
11 little projects. Advanced instrumentation and
12 advanced controls I can talk about pretty much at the
13 same time.

14 They are two separate projects. Their
15 kickoff meeting on both of them is a week from
16 tomorrow with Oak Ridge. What they are looking at is
17 the milieu that we are working in for these is the
18 next generation reactors, high temperature gas
19 reactors. And the concern, as far as instrumentation
20 is concerned, is that the operating conditions in
21 these plants are very different from the operating
22 conditions in conventional plants and most everything
23 else.

24 There are some very high temperatures in
25 there. There are some very severe challenges to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 certain measurements. And so the purpose of the
2 instrumentation projection is to look at that, look at
3 what the current DOE designs have, what direction they
4 are going in, what sorts of solutions are they looking
5 at to try to get a leg up on what may be coming in in
6 a licensing request in the not too distant future for
7 one of these plants, so that we know what it is that
8 we need to look for and what it is that we need to be
9 concerned about.

10 The controls is the same issue. There
11 are, the plants operate differently from conventional
12 plants. The control systems will be very different.
13 There may be interest on the part of the designers for
14 using control strategies and control logs that we
15 haven't looked at in the past. So we are just trying
16 to get a look over the horizon to see what is coming.

17 MEMBER STETKAR: Paul, the advanced
18 reactor controls, is that -- you prefaced it by saying
19 it is strictly for the new, next generation reactors.
20 Is it the new reactors?

21 MR. REBSTOCK: The new reactors would be
22 addressed in there, too. The controls would be.

23 MR. SANTOS: It includes some of the
24 modular --

25 MEMBER STETKAR: Because I can see the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 words that are in there about plant start up,
2 shutdowns, mode changes and things, indeed our current
3 technology that is being used.

4 MR. REBSTOCK: It could be.

5 MEMBER STETKAR: It is.

6 MR. REBSTOCK: Well, yes. Right. It is
7 not used in our current domestic fleet.

8 MEMBER STETKAR: It is not used here but
9 it is current technology in other operating reactors.

10 MR. REBSTOCK: Overseas and in other
11 industries.

12 MEMBER STETKAR: In nuclear power plants,
13 in terms of an automated shutdown.

14 MR. REBSTOCK: No, I said and in other
15 industries.

16 MEMBER STETKAR: Oh, okay.

17 MR. REBSTOCK: Other industries. Yes,
18 there are all kinds of wonderful things that you can
19 do --

20 MEMBER STETKAR: I'm just curious.

21 MR. REBSTOCK: -- that are not done in
22 current plants. And what we wanted to do is to get
23 our arms around that whole story.

24 MR. SANTOS: It includes some of the
25 proposed module reactors also.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BROWN: Let me ask one question.
2 When you talk about advanced sensors and whatever.
3 Different mediums require different types of sensors.

4 MR. REBSTOCK: Right.

5 MEMBER BROWN: What would you be looking
6 for relative to from the regulatory standpoint that
7 you would need to look at. I mean, you have got
8 fundamental guidelines in 10 C.F.R. 50 relative to the
9 application. But in a short time, I haven't seen
10 anything specific to details of types of
11 instrumentation. If somebody wants to measure
12 temperature with this doohickey or that doohickey, you
13 get an output. It has got to meet certain other
14 environments and other type qualifications.

15 And if people build a gas reactor, they
16 are going to have to find something that is going to
17 measure the parameters under which they are operating.

18 You are fundamentally interested still in the overall
19 -- I am not trying to tell you what you are interested
20 in.

21 MR. REBSTOCK: No, I understand.

22 MEMBER BROWN: Please don't take that the
23 wrong way.

24 MR. REBSTOCK: I understand what you are
25 saying.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BROWN: I mean, the idea is you are
2 going to have sensors. You are going to have
3 temperature pressures. You are going to have flows.
4 All the standard stuff.

5 MR. REBSTOCK: But we want to have
6 confidence that whatever it is that is proposed is
7 going to work. Whatever it is that we approve.

8 MEMBER BROWN: Yes, but if you look at all
9 the IEEE standards, etcetera, etcetera, there is
10 tests, environmental qualification, those apply to the
11 regime which you will have to define for their testing
12 regimes before they come out.

13 I was just looking for an idea of what you
14 mean you are looking for that it is different from the
15 application and the qualification of the standards you
16 already have in place.

17 MR. REBSTOCK: We would want to have an
18 idea. If they say that they want to measure the
19 discharge gas from a pebble bed reactor at a thousand
20 degrees Celsius with a certain kind of temperature
21 sensor, we want to have already some understanding as
22 to how that sensor will behave under those
23 circumstances and what sorts of things it might
24 experience.

25 It may turn out to be a very simple issue

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 and that everybody knows that a type whatever,
2 thermocouple, will do the job and there is not an
3 issue. In that case, this would be a very short
4 project, as far as that particular cleansing is
5 concerned.

6 On the other hand, that regime,
7 considering the pressure, considering the corrosive
8 nature of the gas, may turn out to be very difficult
9 to find something to do that. So we want to know
10 about another issue.

11 MEMBER BROWN: Yes, but -- go ahead.

12 MR. REBSTOCK: You need to know the flow
13 through the core. You need to know the coolant flow.
14 You have go very tight geometry. So ways of
15 measuring, accurately measuring that coolant flow are
16 very limited.

17 So, we want to get an idea of what it is
18 that the researchers that are designing these things
19 have in mind so that we can look ahead and get a feel
20 for ourselves as to whether they are moving in the
21 right director of if they go that way, what it is that
22 we need to look at.

23 MR. SANTOS: And another example is the
24 proposed solutions have techniques that infer the
25 parameter for even directly measuring something. And

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 therefore, you need some sort of different techniques
2 for calculating accuracy or what have you. You want
3 to be able to get a sense of what that will be,
4 specifically for the dynamic pebble bed ones.

5 MR. REBSTOCK: Plus you need three
6 dimensional flux map in the core.

7 MR. SANTOS: Right.

8 MR. REBSTOCK: You have to know that.

9 MEMBER BROWN: Yes, but are not going to
10 use it if they don't demonstrate some way to do it. I
11 mean if you can't design -- if you design a reactor
12 with instrumentation, if you monitor it --

13 MEMBER SIEBER: You don't have a fixed
14 geometry.

15 MEMBER BROWN: I understand that.

16 MEMBER SIEBER: So that is going to be
17 tough.

18 MR. REBSTOCK: Those are the challenges.

19 MEMBER BROWN: But if you have got rocks?

20 MR. REBSTOCK: Our point is not to design
21 the instrumentation.

22 MR. SANTOS: That's right.

23 MR. REBSTOCK: But it is not to solve
24 their problem. It is to know what it is that they are
25 --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER SIEBER: But other than core flux,
2 core mapping, all of this other stuff is used in other
3 industries. Steel mills, coal fired power plants,
4 there is high temperatures, corrosive. So it not like
5 it is, you know, 20 years of research.

6 MR. REBSTOCK: Correct.

7 MEMBER BROWN: But we built reactors in
8 the early days without adding for protectors because
9 we didn't have any. We had X core. And then we would
10 --

11 (Laughter.)

12 MEMBER BROWN: It is nicer to use that
13 stuff in the core.

14 MEMBER SIEBER: Safety feature is
15 distance, then. You want to be miles away.

16 MR. SANTOS: Like I said, this might be --

17 MR. REBSTOCK: So the point, John?

18 MEMBER STETKAR: Well my question here
19 was, it was interesting when I read this one. It was
20 reactor instrumentation for advanced reactor
21 application type stuff. And when I looked, my
22 perception, rightly or wrongly is from the regulatory
23 viewpoint. I am looking down. People propose a
24 design. If they have a design that doesn't have
25 instrumentation that works with the design and allows

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 them to do this stuff, well, I am not out promoting
2 that, that is up to the industry to determine what
3 they are going to use, not the NRC.

4 So, if they are being aware, they are
5 going to have to come through and tell you those kind
6 of things.

7 CHAIR APOSTOLAKIS: So you don't think
8 this is necessary.

9 MEMBER BROWN: I don't know. It just
10 seemed, this one seemed marginal to me when I looked
11 at it.

12 CHAIR APOSTOLAKIS: Okay.

13 MEMBER BROWN: It is not that I am against
14 it. It just, if I looked at -- and he is right. You
15 may go out there and look at it and this may be a five
16 minute research project. Say well, okay, we are not
17 going to spend any money on this right now because
18 there is no place to go.

19 MR. REBSTOCK: The thing we don't want is
20 for them to come along and say here is how we are
21 going to do the instrumentation and it is something we
22 have never seen before. And then we have got to go
23 and run and figure out what it is.

24 MR. SANTOS: Right. And hold up that
25 review for them because we don't know.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. REBSTOCK: Hard to imagine how they
2 could do that.

3 MEMBER BROWN: Theoretically, if they want
4 their project to go through, they should be feeding
5 that information out before you ever get there.
6 Otherwise, they are not very smart and you don't want
7 to work with them in the first place.

8 MR. SANTOS: No comment.

9 MR. SYDNOR: It would be nice if it worked
10 that way.

11 CHAIR APOSTOLAKIS: I think you made your
12 point. Where are you now, survey?

13 MR. SANTOS: This is anticipatory
14 research. It is ongoing. We do our reports every few
15 years. We try to be ahead of the curve looking at
16 their things. An example might be instrumentation
17 technologies like Johnson Noise thermometry for high
18 temperature applications.

19 MEMBER BROWN: What was that again?

20 MR. SANTOS: Johnson Noise thermometry.

21 MEMBER BROWN: Oh, okay.

22 MR. SANTOS: NIST is developing that.
23 That is an example. You know, some people would say
24 nanotechnology.

25 MEMBER BROWN: Sure.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. SANTOS: I mean, I am not saying we
2 will see this but we are trying to be anticipatory,
3 develop knowledge at a minimum, at the staff level.

4 CHAIR APOSTOLAKIS: Are you going to be
5 also up-to-date with the state-of-the-art in software
6 methods, in general?

7 MR. SANTOS: Yes.

8 CHAIR APOSTOLAKIS: Are you guys going to
9 conferences? Are you reading the literature knowing
10 what is going on?

11 MR. SANTOS: Yes.

12 CHAIR APOSTOLAKIS: When was the last time
13 you went?

14 MR. SANTOS: Actually were you at the --

15 CHAIR APOSTOLAKIS: Don't tell me
16 Brookhaven.

17 MR. SANTOS: No, no, I am bringing to
18 mike.

19 CHAIR APOSTOLAKIS: Yes?

20 MS. HERRMANN: For NRC people in general.

21 CHAIR APOSTOLAKIS: What?

22 MS. HERRMANN: I said NRC people in
23 general. I was there two weeks ago.

24 CHAIR APOSTOLAKIS: You were, two weeks
25 ago? Where?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MS. HERRMANN: It was DHS and I forget
2 which university was sponsoring it on cyber security.

3 CHAIR APOSTOLAKIS: But how about
4 technical societies like the American Nuclear Society
5 has a meeting every whatever year and the IEEE Society
6 does.

7 MR. SANTOS: Yes, the staff is heavily
8 involved. I mean, we have a lot of members of actual
9 working groups of IEEE standards.

10 CHAIR APOSTOLAKIS: But these are groups.
11 I am talking about --

12 MR. SANTOS: But also conferences.

13 CHAIR APOSTOLAKIS: -- the open meeting,
14 here anybody can come and present something.

15 MR. SANTOS: That's right. I mean, the
16 Agency supports the ANS meetings. I mean, we had the
17 one in I&C in Knoxville back in April and we sent like
18 20 staff there, 20 plus staff to that meeting. And
19 staff presented several papers. A lot of members
20 share findings through their readings or their own
21 personal research is also fostered and encouraged by
22 management. So, I think we are in good shape in that
23 arena.

24 MR. BIRLA: And to add to the examples
25 that Dan gave, the National Security Agency holds a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 once a year not totally open, by invitation open forum
2 of researchers that I got an invitation to and spent a
3 whole week with the min the Baltimore area. And that
4 was very educational to me on what other researchers
5 are finding out about the difficulties of cyber
6 security risk assessment.

7 So your point is that part of the research
8 portfolio should be to learn about what others are
9 doing in the area and that point is well taken.

10 CHAIR APOSTOLAKIS: Well, be up-to-date.
11 I mean, that doesn't mean that you are going to apply
12 everything that you read but you have to be up-to-
13 date.

14 MR. BIRLA: And we agree.

15 CHAIR APOSTOLAKIS: Charlie, you are about
16 to say something?

17 MEMBER BROWN: Well, this is emerging
18 technologies.

19 CHAIR APOSTOLAKIS: Yes.

20 MEMBER BROWN: How can you argue against
21 seeing working with them?

22 CHAIR APOSTOLAKIS: Collaborative and
23 cooperative.

24 MR. SANTOS: We are undertaking several
25 collaborative activities. We heard a lot of the MOU

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 but that is not it. We also heard NASA. But we also
2 have good collaboration with other federal agencies in
3 relevant areas. Safety assessment and security are
4 two of them.

5 The White House, through the Office of
6 Science and Technology Policy, they have a NITRD
7 program which comprised, Sushil help me out, what 18
8 federal agencies?

9 MR. BIRLA: Something like that.

10 MR. SANTOS: Official members but all the
11 members are held where they actually meet and share
12 the products of their research.

13 CHAIR APOSTOLAKIS: What does it stand
14 for?

15 MR. BIRLA: Networking and Information
16 Technology Research and Development. It is an
17 interagency coordination effort. And they have
18 coordination groups in cyber security in high
19 confidence software and systems.

20 CHAIR APOSTOLAKIS: That is exchange of
21 ideas or somebody actually says, let's do this?

22 MR. BIRLA: Well, each agency has its own
23 program. So the first thing is just to be aware of
24 what each other is doing so that we can piggyback on
25 each other, exchange information, do not duplicate

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 effort and waste all the resources. So that is the
2 baseline.

3 MEMBER BLEY: How long has that been going
4 on?

5 MR. BIRLA: This is probably seven or
6 eight years ago about five agencies started. So the
7 Department of Defense and Department of Commerce
8 through NIST, National Security Agency, National
9 Science Foundation, NASA, have been the prominent
10 ones.

11 The FDA is there because they have medical
12 devices that they regulate and they have had some
13 difficulties in that area. The numbers have grown.
14 Department of Homeland Security is there now.

15 The Nuclear Regulatory Commission got
16 invited through a contact that Dan had at a workshop
17 that he went to. So, he passed that contact on to me
18 to be the representative and then Stu and I had a
19 discussion. Stu agreed that we should participate in
20 the interagency coordination effort. The NRC is not
21 an official member of the group but --

22 CHAIR APOSTOLAKIS: Too small?

23 MR. BIRLA: I beg your pardon?

24 CHAIR APOSTOLAKIS: We are too small or
25 what?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. BIRLA: Well, it is just a matter of
2 going through the formalities. For all practical
3 purposes, any information that is available anywhere
4 in any federal agency is accessible to us. The main
5 thing is that we are getting to know who the
6 researchers are. Who the program managers are, what
7 are their ideas, whether we have similar issues. And
8 we do.

9 How do other regulators approach the same
10 issues? A little bit learning about that is going on.

11 MEMBER BLEY: Did you find you had been
12 going to the same people for the researchers
13 supporting or is it a different community?

14 MR. BIRLA: It is a different community.

15 MR. SANTOS: Yes and different networks of
16 natural expertise.

17 MR. BIRLA: So we get a little bit of an
18 inside track on the agenda of the National Science
19 Foundation because before the program announcement
20 they give an opportunity the coordination group
21 members. Here is the program announcement. Does it
22 address the needs of the federal agencies represented
23 in the NITRD program? If not, what would you like to
24 see added in that.

25 MR. SANTOS: Two points I want to make.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: Even NSF is becoming a
2 user need agency?

3 MR. SANTOS: Two points I want to make.
4 Although you heard Sushil mention that each program
5 executes their project, this program coordinates
6 cross-cutting issues and proposed budget to the OPM,
7 you know, to the budget cycle, funding for programs
8 that will satisfy all the members.

9 So if one agency doesn't have enough
10 budget, it could leverage the team to get cross-
11 cutting issues resolved. And we are finding in the
12 areas of safety assessment, there is a lot of similar
13 issues that we are tackling with.

14 So one of the proposed ideas are still
15 being discussed is to create a subgroup out of the
16 regulators, the FDAs --

17 MR. BIRLA: So informally we have an
18 agreement that from the regulatory perspective, what
19 should be the research? Nobody is looking at that.
20 All the economics and the developers all out there
21 look at it from the developer's perspective.

22 So, yes, the FDA representatives said they
23 have an interest. The FAA representative isn't there
24 but NASA is doing some work that would be applicable
25 for future aircraft. We said yes, we would like to be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 a part of that discussion group. So on an informal
2 basis, we have begun to share ideas on what our issues
3 on which we need to get some more spotlight, or more
4 funding or whatever, or make sure that we formulate
5 our individual projects a little better with your
6 input or reviewers on.

7 MR. SANTOS: COMPSIS we talked about.
8 Halden Reactor Project, I had the opportunity to visit
9 and work with some of their engineers. Although they
10 are a small shop, they do have some very good ideas
11 they are trying to work and be ahead of the curve. So
12 we get a leverage where a member participates and
13 provide them feedback on the direction of their
14 program. So, I think we can do more with them and we
15 should. So that is something, I hope, moving forward
16 we can do with them.

17 The MOU again is kind of new but talking
18 to EPRI, I expect the more meaningful meetings
19 starting next month, as schedules allow. These are
20 some of the topics that we are going to collaborate
21 on. Clearly a starting point could be the
22 reconciliation of our finding on the -- go ahead, sir.

23 MEMBER STETKAR: I was going to ask
24 Sushil. It is really interesting the interagency
25 stuff. Have you found that any other agencies are as

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 quantitatively oriented as we are?

2 MR. BIRLA: There is a group in NASA and
3 Alan has already had them here for a day and there is
4 ongoing collaboration going on there. But there are
5 other groups in NASA who think differently.

6 MEMBER STETKAR: Okay. But NASA.

7 MR. BIRLA: Yes. Other than that, I am
8 not aware of any.

9 MEMBER STETKAR: Thanks. I was just
10 curious.

11 MR. BIRLA: Yes. Alan, are you aware of
12 any other federal agency where there is that kind of
13 an enthusiasm on quantification?

14 MR. KURITZKY: Alan Kuritzky, Office of
15 Research. No. NASA, as Sushil mentioned, we have
16 been trying to work with them. We have a memorandum
17 of understanding with them and we are working in that
18 area. But that is the only one so far that we have
19 identified.

20 MEMBER STETKAR: FAA, FDA have.

21 MR. KURITZKY: I mean, they may have
22 something. I am not aware of it.

23 MR. SANTOS: Another are of the MOU I am
24 excited about if it comes to bear is that we know
25 Halden is helping us in human reliability analysis,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 trying to put real operators through simulators. But
2 then the question of cultural differences and all
3 that, well, can we do it here with our own operators
4 in our own simulators. And you know, maybe leveraging
5 EPRI's access under members to help us generate the
6 data that we need is something that I found.

7 CHAIR APOSTOLAKIS: What data? Human
8 operations?

9 MR. SANTOS: Human, yes.

10 CHAIR APOSTOLAKIS: Why is that your
11 business?

12 MR. SANTOS: I'm sorry?

13 CHAIR APOSTOLAKIS: It is not your
14 business, is it? Human reliability?

15 MR. SANTOS: Of course it is. I mean,
16 PRA, Digital I&C, human reliability on these systems
17 are becoming more and more integrated.

18 MEMBER SIEBER: Who is at the handle at
19 the endpoint of a system? It is the human.

20 MR. SANTOS: It is the guy, yes.

21 CHAIR APOSTOLAKIS: Something that
22 breathes.

23 MEMBER SIEBER: Yes. You read it and turn
24 it.

25

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. SANTOS: But the MOU, what I am trying
2 to say is not only Digital I&C but also it covers some
3 human factors elements.

4 CHAIR APOSTOLAKIS: Oh, sure, yes, we know
5 that. We have known that for a long time.

6 MR. SANTOS: But that is an aspect I hope
7 we can leverage.

8 CHAIR APOSTOLAKIS: Swedish operators on
9 Norwegian reactors. It tells you a lot about Texas.

10 MR. BIRLA: This continues in the same
11 theme of working outside the organization and exchange
12 of ideas.

13 In the international arena as you already
14 will know, there are a set of I&C standards that set
15 up a different regulatory framework, an assessment
16 framework for users and suppliers outside the U.S.
17 And then there is the NRC framework. So there has
18 been an interest within the NRC in a long-range goal
19 of harmonization across international standards
20 because suppliers are international. The same
21 companies are putting in plants and digital systems
22 and different environments.

23 There are some fundamental differences,
24 due to which this is not going to be an easy task but
25 this is part of the scope of this project. So it is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 taking off through many different directions. One is
2 a traditional participation in the standardizing
3 organizations. The NRC has mostly been the IEEE,
4 working groups, and there is a nuclear industry-
5 specific body which plays an active role. But it has
6 been many years since the NRC has been in any IEC
7 working group. It has pretty much abandoned presence
8 there.

9 The bright spot in the whole dark spectrum
10 is that there is a memorandum of understanding between
11 the IEEE and IEC now that in this are, Digital
12 Instrumentation and Controls, if there is any new
13 standard in the future, they will joint logo it. That
14 means they will work together.

15 There is also an understanding in
16 principal that if there is a revision to an existing
17 standard that overlaps each other's territory, they
18 will work together to see if they can harmonize but
19 they have not made a commitment to.

20 So, I have talked across the program
21 offices and everyone recognizes that it is something
22 that needs to be undertaken but it is also going to
23 take a lot of effort. It is a long-range, 10 to 15
24 year horizon activity.

25 Through NRO's leadership, there is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 participation in the MDEP program which has a couple
2 of working groups that address this area. And some
3 work has been done to compare different standards to
4 see what are the deltas. But where it goes, it is
5 part of this project is to add some resources and
6 investigate, at least on a thorough comparison basis,
7 where we are aligned, where we are different, what
8 needs to be done to overcome the differences. And
9 then item by item pursue which difference we
10 eliminate.

11 And through each of the societies are
12 working organizations, IEC and IEEE, make sure that
13 when standard comes up for revision or something new
14 is proposed in the area, have a presence there.

15 So in principle, we have an agreement. We
16 have not yet estimated the resource requirements and
17 not represented to management what resources it will
18 take but in concept and principle, there is good
19 support from both program offices, NRR and NRO.

20 MR. HECHT: I would just point out that
21 getting to know a standard, a serious standard is
22 something which takes years.

23 MR. SANTOS: You will probably see this in
24 the next three plants.

25 MR. BIRLA: Yes, it is something we are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 undertaking, that is true.

2 MR. HECHT: That is one standard.

3 MR. BIRLA: Yes. There is a small effort
4 in the direction, the NRC, as I mentioned earlier
5 through NRO, is participating in several MDEP working
6 groups. And in NRR, there is an initiative to start
7 meeting with a task force of safety-critical software
8 that includes seven West European regulators. And
9 they put together a position, common position, with
10 their knowledge of the prevalent standards in Europe
11 of what is not covered well enough in those standards
12 that should be to make regulation more effective. So
13 the NRC has been invited by the task force to join it
14 and to work with it.

15 So to gain an understanding of the
16 standards, the issues, this is another avenue.

17 MR. FREGONESE: Can I make a comment about
18 the MDEP really, really quickly?

19 This is Vick Fregonese from AREVA. The
20 one thing I have noticed about the MDEP is that there
21 seems to be a lack of transparency with those
22 proceedings. With the NRC's interacting with the
23 other regulators, those are not open meetings. And
24 the one thing I would like you to consider as you go
25 forward because we are very interested in this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 international regulation because we are building
2 plants all over the world, there is misalignment
3 between the safety classes. As you know, there is Fla
4 and Flb in Europe, here we have Class 1E, and STUK has
5 the Safety Class II. And so as we try to draw lines
6 to line these safety classes up, we are very
7 interested in what you all are talking about.

8 And it seems as if when you are discussing
9 some of these issues which involve all of these
10 designs with the international community, it would be
11 great if we could somehow participate in that. So, I
12 don't know if you can influence that. But when the
13 NRC is involved with the other regulators, I know it
14 is kind of their meeting but you know, my kind of
15 outsider view is that we are really interested and we
16 actually have some information we could probably share
17 to help those conversations.

18 So that is just something that I put out.
19 If it is really a research project, I just wanted to
20 make that clear.

21 MR. SANTOS: I would like to --

22 CHAIR APOSTOLAKIS: Go ahead, Debra.

23 MS. HERRMANN: Yes. Since the MDEP's is
24 an NRO initiative, I will be glad to take your
25 suggestion forward.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. FREGONESE: I appreciate that. Thank
2 you.

3 MR. WATERMAN: Perhaps the industry will
4 reciprocate with its meetings.

5 (Laughter.)

6 MR. FREGONESE: Yes, I think -- sure, if
7 we have a meeting. One of these forums you have
8 talked about are meetings.

9 CHAIR APOSTOLAKIS: I have participated in
10 meetings of foreign committees, semi-regulators, and
11 it is really a very different environment. We just
12 close the door and start talking. Nobody can come in
13 to the room unless invited. So you should appreciate
14 what is happening here.

15 MR. FREGONESE: I do and that is why I
16 made the comment. Thank you.

17 CHAIR APOSTOLAKIS: Okay, that is a simple
18 diagram there.

19 MR. SANTOS: It is self-explanatory.

20 CHAIR APOSTOLAKIS: And I have no problem
21 with that. Charlie, do you?

22 MR. SANTOS: It is self-explanatory so
23 let's move on.

24 CHAIR APOSTOLAKIS: It is self-
25 explanatory.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BROWN: Are we going to the next
2 page? Do you agree with that?

3 MEMBER SIEBER: I have no idea.

4 CHAIR APOSTOLAKIS: Well, it is regulatory
5 guides and the standards they approve, or they endorse
6 with exceptions.

7 MEMBER SIEBER: That's right.

8 CHAIR APOSTOLAKIS: Okay.

9 MR. SYDNOR: The last program area has
10 three research projects and quite frankly we will
11 admit this is kind of a catch-all area. These were
12 carry-over projects from the '05 through '09 programs,
13 some of which we tried to work and didn't finish and
14 then a couple that were never started.

15 This first one we really are maintaining
16 it primarily because of a request from EPRI and the
17 industry to. There is still an issue with our
18 regulatory guidance where we have some potentially
19 overly conservative criteria for conducted
20 susceptibility testing in one certain area. And that
21 criteria was based on some in-plant testing that was
22 done a number of years ago that may have been
23 interpreted wrong. And so we have been asked to visit
24 that. So we are maintaining this project in the
25 research plant and take a look at that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 As part of exploring that, we thought that
2 was primarily the only issue. But really, you know,
3 meeting with the EPRI and industry working group for
4 EMI, they have a new what is it called, Ray, a
5 technical report or a topical report, your TR?

6 MR. TOROK: Yes, that was a topical
7 report.

8 MR. SYDNOR: There is an EPRI report, a
9 new report out and industry has a lot of valid claim
10 to update to the latest standards here, both U.S.
11 standards and IEC standards. And so we are going to
12 maintain this in the research and try to devote some
13 effort to it maybe perhaps as part of the MOU again
14 because there is a potential if we have to do some
15 testing, which is debatable whether we need testing.
16 But if we do, it is perhaps some collaboration between
17 NRC and EPRI would be the best way to achieve it.

18 This was a carry over project. It was in
19 the '05 through '09 plan but no work was started in
20 this area and it was really just a prioritization or
21 need that was not an identified issue or need that
22 drove this. But in our process for updating the plan,
23 we were requested by NRR to retain this project and to
24 try to devote some resources to it.

25 It is certainly a valid technical issue

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 and is worth exploring to see if there are
2 implications that perhaps we are not using our
3 regulatory guidance adequately to make sure that we
4 are protecting these systems from power supply issues.

5 Are we doing that adequately? We certainly have good
6 guidance on 1E power supply systems.

7 MEMBER BROWN: Now is this a consideration
8 that you don't understand what the level, in other
9 words, you have inadequately or not properly
10 characterized the fluctuation of a power input power
11 to a bunch of the power supplies? I mean, you do have
12 over-voltage spike-type tests in place right now. So
13 presumably, those were developed with some knowledge
14 of the switching transients and other type things that
15 can be on -- I can see Jack shaking his head.

16 That is what we did on naval plants is we
17 ran tests and found out that there was some ranges
18 that we had to cover and there were some ranges that
19 we would never be able to cover, so we ignored those
20 and just started with fry stuff.

21 MEMBER SIEBER: The issue is the grid is
22 changing from time to time. Load distribution is
23 changing. And so a major blackout introduces a lot of
24 transients to the electrical grid.

25 If you look over the last ten years, the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 most significant national risk event was that
2 blackout. Fortunately, everything worked at nuclear
3 power plants but when we get to my operating
4 experience report, you will see from the risk
5 standpoint, that is the dominant event from the last
6 ten years and we ought to pay attention to it.

7 MEMBER BROWN: Yes. I guess my question
8 is if you are looking at what -- is this the grid? I
9 mean, this is looking at what is coming off the grid
10 that you have to protect against and assessing it
11 against your present standards?

12 MR. SYDNOR: No matter what is driving the
13 power supply --

14 MEMBER BROWN: Whatever.

15 MR. SYDNOR: -- fluctuation, certainly the
16 grid and the grade of grid are issues that industry
17 has spent a lot of time and a lot of redesign on those
18 issues and in many cases, installed new backup diesels
19 and station blackout diesels. There has been a lot of
20 work done in the industry to protect against the grade
21 of grid and loss.

22 But with the implementation of new digital
23 systems, plant-specific configurations of power
24 supplies that power the networks and the digital
25 systems, I think NRR's concern here is, you know, do

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 we fully understand all of the implications of that?

2 We haven't started this. We haven't
3 scoped it. It was requested to be retained and so we
4 will be working with NRR as move forward on it. It is
5 a legitimate issue. We all recognize that.

6 MEMBER SIEBER: There were not a lot of
7 I&C failures induced to my knowledge out of the last
8 one. On the other hand, the potential was there. And
9 every blackout with a lot of switching transients, is
10 not going to produce the same thing. So the more
11 know, the better off you are. All of it is important.

12 MR. SYDNOR: One of my first learnings
13 involving digital systems back in the '90s, I think it
14 was, installing a digital feed system at the plant, we
15 didn't get the power supply configuration correct as
16 far as redundancy. And we continued to have events,
17 not because the digital system wasn't working but
18 because we would have power supply issues.

19 And so we learned some painful lessons
20 about going back in the design.

21 MEMBER SIEBER: And simple things like
22 CPUs can reset, if there is a momentary interruption.
23 It is really beyond the capability of the EMI
24 resistance.

25 MR. SYDNOR: And this last topic here is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 again another one where there has been some very early
2 exploratory research done on this. I think it is part
3 of the '01 to '04 plan. But there hasn't been an
4 active licensing on this so we have not devoted
5 resources to it. But again, we were asked to retain
6 this one.

7 I think there is still some discomfort
8 level. Do we understand the basic operating systems
9 that are being used in the platforms that are being
10 proposed and you know, what are some implications of
11 that from a regulatory review standpoint that we might
12 need to know. It could be more educational type of
13 research than anything else.

14 MR. HECHT: Can I ask some questions about
15 that? Because this also relates to the other topics
16 of operational experience and PRAs. If the operating
17 system fails, then obviously you lose that processor.

18 What operating systems are currently being
19 used in safety systems?

20 MR. SANTOS: How many?

21 MEMBER BROWN: I thought they were custom.

22 MR. SANTOS: Home-grown.

23 MR. HECHT: So basically it was the kernel
24 that came along with the architectures that we were
25 considering. Is that changing in the advance plant?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Can you address that?

2 MR. FREGONESE: The operating systems in
3 the existing fleet versus the advanced plants?

4 MR. HECHT: In up-coming I&C systems. And
5 maybe you ought to identify yourself again.

6 MR. FREGONESE: This is Vick Fregonese
7 from AREVA.

8 Globally, the systems that we are going to
9 be installing in the U.S. are an evolution of systems
10 that we have had in operation in Europe and Asia for
11 many years.

12 MR. HECHT: Do they have operating
13 systems?

14 MR. FREGONESE: Excuse me?

15 MR. HECHT: Do they have operating
16 systems?

17 MR. FREGONESE: Yes, they do. So, and I
18 know the NRC has extensively reviewed the platform.
19 You know, Mike was involved extensively in that
20 review. The existing fleet, I spent 15 years in the
21 existing fleet. There is a lot of discreet digital
22 devices, EPROMs, PROMs, small custom systems and there
23 are some systems that are used on the commercial side
24 for digital feedwater turbine controls.

25 There have been some events that we saw on

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the EPRI research that the digital systems do have
2 some power supply of vulnerabilities in terms of their
3 monitoring because one of the digital monitoring
4 techniques is to put the system at a known safe state
5 when you reach a certain instability in the power
6 supply. So they have a different failure mode. And I
7 think if you look at the operating experience, it
8 needs to be considered.

9 So normally, we have an uninterruptible
10 power supply or a reliable source of power that
11 supplies these digital systems. In a new plant
12 design, that is our approach to avoid perturbations,
13 especially from the grid. You shouldn't see grid-
14 induced perturbations work their way down to affect
15 the digital systems, at least in our design.

16 MR. SANTOS: I don't think I --

17 MR. FREGONESE: Oh, operating systems,
18 okay.

19 MR. SANTOS: Yes, I have got --

20 MR. FREGONESE: You have got slides of it.
21 Okay.

22 MR. HECHT: Not operating systems,
23 operating systems.

24 MR. FREGONESE: Operating systems.

25 MR. HECHT: Like VX.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. SANTOS: Yes, the architectures.

2 MR. FREGONESE: So we do use an operating
3 system on our computer system?

4 MR. SANTOS: Yes, like Windows.

5 MR. FREGONESE: It is not like Window.
6 Asynchronous, deterministic, --

7 MR. SANTOS: An example.

8 MR. FREGONESE: -- operating system. It
9 is a stupid computer running dumb software for safety
10 applications. That is kind of the approach we take.

11 MEMBER BROWN: Is it a custom --

12 MR. SANTOS: Yes, it is custom.

13 MR. FREGONESE: Yes, yes, it is.

14 MEMBER BROWN: -- design main operating
15 system.

16 MR. FREGONESE: Yes, that is right. And
17 the other DCS's you will see around the world will
18 use, do use windows in some cases for the HMI. There
19 is various vendors that use versions of Windows. I
20 forget what that version is called.

21 MR. SANTOS: What I have seen is, you
22 know, bought super package, operating system in the
23 application and they tend to be home-grown.

24 MR. HECHT: So nothing like VX Works or
25 VERTEX or --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. SANTOS: No, I haven't seen stuff like
2 that.

3 MR. FREGONESE: UNIX for some of the
4 DCS's.

5 MR. HECHT: Well for the DCS's. You have
6 a controller for the DCS's --

7 MR. FREGONESE: Yes.

8 MR. HECHT: -- doing the HMI.

9 MEMBER BROWN: What is a DCS?

10 MR. FREGONESE: Distributor Control
11 System.

12 MEMBER BROWN: You mean managing the LAN?

13 MR. FREGONESE: The human machine
14 interface which would be a flat screen that you would
15 use to interface with the automation system.

16 MR. HECHT: But Vince was saying that they
17 are actually also using them for control.

18 MR. FREGONESE: The distributor control
19 system for sure. They are using those for control.

20 MR. HECHT: UNIX.

21 MR. FREGONESE: In the one instance I know
22 of, they are using it for the HMI only.

23 MEMBER BROWN: Well, make sure you define
24 your terms. Are you thinking control in terms of it
25 is used to control a turbine generator speed or are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 you talking about -- I think he is talking about
2 control in terms of it is the way the information is
3 presented to the operator.

4 MR. FREGONESE: Right. The automation
5 system has a different operating system then the human
6 machine interface.

7 MEMBER BROWN: Okay, I wasn't clear.

8 MR. FREGONESE: I'm sorry.

9 MEMBER BROWN: All right.

10 CHAIR APOSTOLAKIS: Whatever.

11 MR. HECHT: So what operating systems are
12 we talking about which would, I guess my initial
13 interpretation of this topic was are there some
14 generic operating systems that might be used across
15 platforms, as opposed to AREVA or Common Q or, you
16 know, there is another one that might be used.

17 MR. SANTOS: It is vendor-specific. And I
18 go back to link their relationship of projects.
19 Sushil talked about the three pre-approved up to seven
20 platforms for which we have the information. We will
21 start focusing on those.

22 I have a proposal to make. I would like
23 for you to consider starting the PRA topic at 3:00, so
24 finishing up the research plan by 2:45 at most or
25 earlier and then going into the PRA topic at 3:00 p.m.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 or 3:15 instead of 4:00.

2 CHAIR APOSTOLAKIS: Good proposal.

3 (Laughter.)

4 CHAIR APOSTOLAKIS: Well, I was wondering
5 about that. You need --

6 MR. SANTOS: I really would like --

7 CHAIR APOSTOLAKIS: -- to go through the
8 slides --

9 MR. SANTOS: There is no need really. The
10 rest is for completeness, schedule, priorities.
11 Unless you have any questions on the slides, this is
12 more of the process, I would rather stay focused on
13 the topics themselves.

14 CHAIR APOSTOLAKIS: You want to go to the
15 summary, then?

16 MR. SANTOS: Sure.

17 CHAIR APOSTOLAKIS: I think, you know, I
18 don't know what we can say about setting priorities.
19 I mean, that is your business.

20 MR. SANTOS: Yes, we just put it for
21 completeness, unless you have any questions.

22 CHAIR APOSTOLAKIS: Well, that is it.

23 MEMBER BROWN: There is no summary.

24 CHAIR APOSTOLAKIS: We don't get involved
25 in that. So, you have a nice picture here from the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 web someplace?

2 MR. SANTOS: This is an internal web page.

3 CHAIR APOSTOLAKIS: So summary. Unless
4 somebody objects, we go to the summary.

5 NRC Digital System Research Plan is a
6 flexible -- keep going. Keep going.

7 MEMBER BROWN: I think we are done.

8 MR. SANTOS: Basically, I would like to
9 repeat this morning's --

10 CHAIR APOSTOLAKIS: This is, yes, this is
11 something that is expected.

12 MR. SANTOS: This morning's objective, I
13 go back to that. That is the summary within our
14 objectives.

15 CHAIR APOSTOLAKIS: Your objective is to
16 help the Agency.

17 MEMBER BROWN: Page three?

18 MR. SANTOS: Page three. Let's go over
19 there.

20 CHAIR APOSTOLAKIS: Purpose and
21 objectives. Oh, that is your objective, to get a
22 letter from the ACRS?

23 MR. SANTOS: That is my summary right
24 there. Are we missing something?

25 CHAIR APOSTOLAKIS: I don't know.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BROWN: Questions?

2 CHAIR APOSTOLAKIS: Well, you guys are
3 going to give me input after we hear the PRA folks.
4 Right? But you have a comment right now.

5 MEMBER BROWN: No, I just had made some
6 notes, a couple of notes. And this is based, and my
7 thought process here on what you are all doing is just
8 relative to what I perceive is the hardest problems we
9 face today and that is how do you ensure you have got
10 satisfactory software for these programs.

11 CHAIR APOSTOLAKIS: That's right.

12 MEMBER BROWN: And I guess I didn't really
13 see the focus of a particular effort. It may well be
14 there. I mean, you talked about V & V but not in the
15 manner in which I would have thought about it. And
16 you talked about their tools for whatever. And as I
17 have listened to how we try to streamline the
18 regulatory process so that these guys aren't jumping
19 every -- you don't have to learn something new with
20 every new design iteration. I noticed in a bunch of
21 the standard guidance that you issued, you say hey if
22 you do it this way, we are kind of happy with that.
23 And if you do this, this, and this. And it is amazing
24 how they like to do it that way because they know you
25 will agree with it and it won't take as much time.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 So when I looked at software methods or
2 quality assurance methods, they are normally program-
3 type methods. You know, you will have a program to do
4 this. You will have a program to do this. You will
5 validate data. But there is no details. There is not
6 a methodology that yields, that you all have
7 determined. You are letting people feed that to you.

8 And I would have thought that we would try to develop
9 what methods appear to provide the best software. I
10 don't know on what basis you make that conclusion but
11 that is what I would be looking for.

12 I know what we tried to do in our program
13 30 years ago, but that is not really relevant from a
14 resource standpoint to the regulatory regime in which
15 you all operate. So that was the first item. In
16 other words, not programs but a specific QA software
17 method. You know, whether you adapt somebody's or
18 whatever, that is what I would have thought would have
19 been a good thrust.

20 The second item was, if you look at the
21 way the systems are being implemented with shared data
22 going from -- you can argue whether I like that or
23 not, okay, as the boss over here so capably tried to
24 tell me that I wasn't allowed to say no. Although I
25 disagree with that, we will work on that later.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 The point being is you are faced with this
2 and that is another vulnerability that you have to
3 deal with. And Paul and I had probably a half an hour
4 discussion which delayed my lunch, but that was beside
5 the point. I wouldn't waste away.

6 In terms of shared data and error
7 detection correction codes and stuff like that. And
8 so it would really behoove you, I would think, to have
9 some idea of the types of algorithms, of data
10 evaluation algorithms or what have you if this stuff
11 is being traded from channel to channel. But you
12 would say okay, look, we have gone and we scoped this.

13 We have researched it. We have run thousands of
14 tests in this particular algorithm for assessing data
15 coming from other. That says we are going to get non-
16 corrupt data when we go from division to division.

17 And the same thing with error detection
18 codes. Some would argue, and Paul stated, he says, oh
19 no, once you do this error, it always comes out right.

20 There ought to be something. You are now putting the
21 protection for bad data at the processor, at the
22 division level at the processors, once you start
23 allowing data to go back and forth. Therefore, you
24 have to have more robust means for evaluating that
25 information if it is going to be there.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Those are the three areas I would have
2 expected maybe a little bit more emphasis or
3 elaboration. I don't know which section you put this
4 under but it is probably the one up in the beginning
5 under 3.1 or something like that.

6 So anyway, that was my input. I don't
7 know whether that is --

8 MR. SANTOS: I think they are good
9 comments. We will take them into consideration.

10 MEMBER BROWN: You never tell us we have
11 bad comments, until later.

12 MR. SANTOS: Until later.

13 MEMBER BROWN: I'm just kidding. All
14 right, I am done.

15 MR. SANTOS: We will probably have to take
16 it and formulate it in appropriate activities and then
17 get it through the process.

18 MEMBER BROWN: It is just an observation
19 of what I consider you all's biggest vulnerability, at
20 least from what I have seen to date. And that is why
21 I tossed it on the table.

22 CHAIR APOSTOLAKIS: Jack?

23 MEMBER SIEBER: Well I think the staff has
24 to respond to what hinders what applicants come in
25 with. And I think this plan is pretty versatile from

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the standpoint of touching the bases, so to speak.

2 On the other hand, I don't see anything
3 specific enough in there that would allow full
4 knowledge sufficient for the review of any type of
5 system that I know about now. And so this is going to
6 be an ongoing project for some time. But overall, I
7 find it pretty good.

8 CHAIR APOSTOLAKIS: Well, since we are
9 going around, Dennis? Are you prepared to say
10 something?

11 MEMBER BLEY: I agree with John. I think
12 it is broad. It has got good coverage. The devil is
13 in where it heads and what we begin to see. From my
14 own little corner of the world what I really want to
15 see is the collaboration exercise and where that is
16 headed on the things we were talking about this
17 morning.

18 I think the rest of it is pretty well
19 formed and that is the place I am at.

20 CHAIR APOSTOLAKIS: John, do you agree
21 with what you heard or you are just no comment?

22 MEMBER STETKAR: I have no comment.

23 CHAIR APOSTOLAKIS: No comment. Not from
24 them. I mean from what you heard from Dennis and
25 Jack.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER STETKAR: I understand that. I
2 have no comment.

3 CHAIR APOSTOLAKIS: Okay.

4 MR. HECHT: There were, I think, several
5 areas that required further, I guess, looking at. You
6 have already spoken about the fact that you are going
7 to be providing us with more detail on the work that
8 UVA has been doing under that test he called benchmark
9 reliability data.

10 Then with respect to operating experience
11 analysis, you have, if you have the budget, you are
12 certainly in a position to get data that could be much
13 more useful than, I would say, the small data set that
14 you have with the 322 failure reports that EPRI has.
15 And that comes from a variety of sources. Like, I
16 will be feeding comments to a chairman who may or may
17 not pass them on to you in that regard.

18 With respect to the analytical
19 assessments, I found that vague and I didn't quite
20 understand what was coming forward. And maybe what
21 some additional definition that will become clear, or
22 it might be that it is unnecessary or may not address
23 what is needed. I don't know.

24 And finally, the communications task, it
25 was unclear. On the one hand, Charlie, I think,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 raised his concerns, which I would call fault
2 containment or fault containment regions. It is
3 called partitioning in the aviation world.

4 And then on the other we were talking
5 about data flows which sounded to me like it was a
6 known problem. But once again, I guess you will be
7 getting comments, the validation of those concerns
8 through the subcommittee chairman.

9 Thank you.

10 CHAIR APOSTOLAKIS: Okay. So we will
11 recess until 3:00. Yes?

12 MR. BIRLA: Would you entertain comments
13 from the staff?

14 CHAIR APOSTOLAKIS: On?

15 MR. BIRLA: On the day.

16 CHAIR APOSTOLAKIS: On what?

17 MR. BIRLA: I would like to convey a few
18 words of appreciation.

19 CHAIR APOSTOLAKIS: Yes.

20 MR. BIRLA: Well first of all, yesterday
21 you pointed out, cautioned us against looking at data
22 on the outside, outside the nuclear industry. And you
23 gave us an example of connections with software
24 reliability papers were publish and the value is minus
25 2.5 percent. We appreciate that feedback. And we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 assure you we will not go there.

2 CHAIR APOSTOLAKIS: Don't take it
3 literally.

4 MEMBER BROWN: You have got to be careful,
5 George.

6 CHAIR APOSTOLAKIS: Why?

7 MEMBER BROWN: They are liable to remember
8 what you said.

9 MR. BIRLA: And we heard from several
10 other members that there was value in looking at data
11 outside and we appreciate that, too. We would like to
12 get some specific tips on where to go so that the
13 effort is well spent.

14 When Charlie was vocal, life was
15 interesting. Later on in the afternoon, he got
16 silent. And when again he was talking, it got a
17 little dull. So we would appreciate more, and more,
18 and more engagement. We thank you all very much for
19 the active involvement and criticism.

20 MEMBER BROWN: Are they saying I didn't
21 talk enough?

22 CHAIR APOSTOLAKIS: Yes.

23 (Laughter.)

24 MEMBER BROWN: I have never, ever heard
25 that comment before.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. BIRLA: And we look forward to more
2 fueling of that sort from all of you.

3 So any detail that you didn't see today
4 because the plan was flexible at the beginning and you
5 would like to see more substance or more detail or
6 have more specific discussions, I think it was a very
7 healthy process to call us back on the specific areas
8 of interest and give us more time.

9 CHAIR APOSTOLAKIS: We will probably have
10 subcommittee meetings on specific matters.

11 MR. BIRLA: Okay.

12 CHAIR APOSTOLAKIS: Or areas. So, we will
13 get much more detailed information so that Mr. Brown
14 will speak up more.

15 Well, thank you very much. This is not
16 done yet. We have to look at the PRA part.

17 (Whereupon, the foregoing meeting went off the record
18 at 2:43 p.m. and resumed at 3:05 p.m.)

19 CHAIR APOSTOLAKIS: Back in session with
20 PRA and I&C. Mr. Kuritzky.

21 MR. KURITZKY: Thank you. I am Alan
22 Kuritzky with the Office of Research and we are here
23 to talk to you today about Digital I&C PRA. With me
24 is Louis Chu from Brookhaven National Laboratory. He
25 is the principle investigator for the work that BNL is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 doing for the Division of Risk of Analysis in the
2 Digital I&C PRA area. It is a very complicated area.

3 It covers a lot of disciplines. There are a number
4 of other individuals at Brookhaven that are supporting
5 us in this work. Gerardo Martinez-Guirdi who has
6 previously briefed this subcommittee has been heavily
7 involved as Dr. Meng Yue, also an electrical engineer
8 with a lot of experience in Digital I&C systems, has
9 been involved as well as some other support staff at
10 BNL.

11 We last briefed this subcommittee in April
12 of 2008 and followed along with a full committee
13 briefing in May of last year. And what I really
14 wanted to do was come here today to just give you an
15 overview of some of the activities that have gone on
16 in the last 14 months or so. As you are well aware,
17 we do not supply any documents for your review this
18 time. So therefore, it is not going to be as in-depth
19 as in the past.

20 CHAIR APOSTOLAKIS: What happened when you
21 draft NUREG that we reviewed at that time, did you
22 ever --

23 MR. KURITZKY: Yes.

24 CHAIR APOSTOLAKIS: -- finish it?
25

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. KURITZKY: Yes, that document was
2 published in October of last year. We also have a
3 draft NUREG, a second in the series, which was sent
4 out for public comment in November of last year and we
5 are just getting ready to finalize that document. It
6 is going through the final phase of getting ready to
7 get published.

8 Again, because we haven't supplied any
9 documents at this time, my intention here was just to
10 give a brief overview of what we have done over the
11 last 14 months if it has been quite a while since we
12 have talked to the subcommittee, my intention and hope
13 is to be able to come back to the subcommittee early
14 next year for a much more detailed briefing, at which
15 point we will have several documents to give you to
16 look at and we can get into a much more detailed
17 technical discussion.

18 CHAIR APOSTOLAKIS: January, February, is
19 that what you mean?

20 MR. KURITZKY: I'm thinking February.
21 Again, it depends on what the availability of the
22 subcommittee is, the schedule which I haven't checked
23 into as well as of course just the fluctuations in our
24 project schedule. But right now, February looks like
25 a pretty good time, if it works.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BLEY: Are you going to tell us
2 what has happened to that old Appendix C? Is that
3 still living and moving somewhere?

4 MR. KURITZKY: You know, that isn't part
5 of the presentation but I can tell you kind of what
6 has happened to that. That appendix doesn't exist as
7 a formal document anywhere. Some parts of it were,
8 I'm kind of jumping the gun but some parts were,
9 involved in a software PRA workshop that we held up at
10 Brookhaven, recently. Some of it also is going to be
11 involved in some of the work that we are doing right
12 now that Brookhaven is doing for us in software. And
13 the document as a whole has been given to the Division
14 of Engineering and it is going to be considered as
15 part of some of the projects that we are doing that
16 you heard about earlier today in failure mode
17 application etcetera.

18 So, it is kind of living on in various
19 different arenas. But as a whole document, it is not
20 actually in the process of being published.

21 Okay, so let me just go ahead and get into
22 the brief overview that we have. I am just going to
23 spend a few seconds --

24 CHAIR APOSTOLAKIS: Is Louis having a
25 second set of slides?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. KURITZKY: No.

2 CHAIR APOSTOLAKIS: Oh!

3 MR. KURITZKY: No. No, Louis is here -- I
4 will tell you why Louis is here.

5 CHAIR APOSTOLAKIS: For support.

6 MR. KURITZKY: I wanted one hour just to
7 give you a heads up on what we have been doing in the
8 last 14 months and to let you know we are going to
9 come back in a more detailed presentation. But since
10 you requested two hours, I immediately got on the
11 phone and told Louis that he had to come down here. I
12 don't want to handle that next hour by myself.

13 (Laughter.)

14 MR. KURITZKY: So that is why Louis is
15 here.

16 CHAIR APOSTOLAKIS: You need less than two
17 hours? Did we do that?

18 MS. ANTONESCU: Yes, we did.

19 MR. KURITZKY: So in any case, so Louis
20 does not have a presentation.

21 CHAIR APOSTOLAKIS: Let's finish in an
22 hour.

23 MR. KURITZKY: Yes, that works. That
24 works for me. Sorry Louis.

25 (Laughter.)

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. KURITZKY: Even in the one hour or
2 half an hour, if you have any tough questions, he will
3 still earn his pay.

4 Okay, so quickly, I am just going to go
5 quickly over the background just to remind people the
6 objective. The previous research I am going to go
7 over. Mostly we will focus on what was in the most
8 recent NUREG CR that we are currently finishing up.

9 I am going to just give you a brief
10 overview of an international meeting we held, a
11 technical meeting on Digital I&C of PRA last year, as
12 well as go over our plans and recap the software PRA
13 workshop we had in Brookhaven a few months ago, and
14 then talk about the future interactions.

15 Okay, we all know that the current
16 licensing process for digital systems is based on
17 deterministic criteria. However, the commission in it
18 1995 period policy statement has encouraged the staff
19 to use PRA in the regulatory arena, wherever,
20 supported by the state-of-the-art. However,
21 unfortunately right now we know that for digital
22 systems, the capabilities in the PRA area are not up
23 to snuff or a robust risk-informed applications.

24 I don't want to pass judgment on the work
25 you heard about yesterday from yesterday. I don't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 view that as really Digital I&C PRA application
2 because that was a black box which released a general
3 PRA application. And that can be decided by others,
4 as they see fit.

5 But inside that black box, with the
6 digital system itself, there are a number of gaps that
7 exist, which we have identified, we have to work and
8 we are not really in the position to do much with it
9 at the present time.

10 Okay, the objective of this work, the
11 ultimate objective is actually to come up with tools
12 and methods, and regulatory guidance for making risk-
13 informed decisions related to digital systems and for
14 getting digital system models into plant PRAs. That
15 is the goal.

16 Some of the previous research that we have
17 done over the last few years, the subcommittee has
18 been briefed on this. We have identified a set of
19 desirable characteristics for doing digital system PRA
20 models. We have applied various methods to a
21 benchmark system. An example, a system, digital
22 feedwater control system, using both traditional and
23 dynamic methods.

24 Just to remind the subcommittee, I know
25 you don't particularly like the terminology

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 traditional and dynamic but it is an artifact of our
2 programmatic breakdown, so we keep it in dynamic for
3 the purpose of this research is really those methods
4 which explicitly account for the interactions between
5 the digital system being modeled and the plant
6 physical processes and the timing of those
7 interactions.

8 So in other words, you are linked to
9 essentially a plant dynamics model so that you can get
10 real-time integration there. With the traditional
11 methods, we don't. We have some boundary conditions
12 that are input at the beginning of, you know, for the
13 model and we just work on those set conditions.

14 This research has been documented in a
15 number of reports over the last few years. The work
16 Brookhaven has done for the division of risk analysis
17 on the traditional methods was documented in NUREG/CR-
18 6962 was the first report, which was the one that the
19 subcommittee reviewed last spring. That one was
20 published final in October of last year. We also are
21 now working on the final publication of NUREG/CR-6997.

22 That one discusses the application of the traditional
23 methods to the digital feedwater control system. That
24 report, like I said, should be published in a couple
25 of months. And both of those reports, we feel reflect

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the comments that we received from the subcommittee
2 back in April. Because if you recall, back in April,
3 besides providing you with the draft of NUREG/CR-6962,
4 we also had already completed a lot of the technical
5 work for the second NUREG and we gave you preliminary
6 insights on that. And so you gave us comments back
7 there when we tried to account for those in the second
8 NUREG.

9 CHAIR APOSTOLAKIS: Is the work that
10 Brookhaven is doing incorporate, does that work
11 incorporate any of the findings of Ohio State and ASCA
12 and Virginia, or is it just something we did and we
13 will forget about it?

14 MR. KURITZKY: Well, the work that I am
15 talking about right here that was done over the past
16 few years that is documented with NUREG/CRs, that is
17 when we had the two separate groups.

18 CHAIR APOSTOLAKIS: I understand that.

19 MR. KURITZKY: So there was some
20 interaction but not a lot. So that NUREG 6997 does
21 not incorporate the general work that was done by OSU
22 or its subcontractors.

23 CHAIR APOSTOLAKIS: Okay. But the work, I
24 understand Brookhaven is continuing the work.

25 MR. KURITZKY: In the software reliability

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 area?

2 CHAIR APOSTOLAKIS: Yes.

3 MR. KURITZKY: Okay in that work, yes. In
4 that work, actually NUREG/CR, and again, I am kind of
5 jumping the gun but we are going to discuss the work
6 that BNL is currently doing on quantitative software
7 reliability methods. And that builds on work that BNL
8 did previously in that area some years ago. It is
9 expanding it to look at other methods, more recent
10 methods, and it also is looking at some of the methods
11 that are identified in NUREG/CR-6901, it was the
12 original NUREG/CR produced by Ohio State University
13 and company and they identified a number of dynamic
14 modeling methods, some of which those are broader
15 methods for modeling a digital system, doing a
16 reliability model. But again, we are focusing on
17 quantifying the software reliability failure right now
18 but some of those methods are in fact, or parts of
19 those methods are ones you want to consider for
20 quantifying software. So there is some of that being
21 looked at.

22 MR. HECHT: Alan, isn't it true and
23 perhaps, Dr. Chu, you could comment on this as well
24 but in the model that you did on the digital feedwater
25 control system, in that report, that you considered

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 both the hardware and the software? I mean, I don't
2 understand how one can consider software in isolation.

3 Software, I mean, the most reliable software there is
4 is a software which doesn't run and doesn't execute
5 and has a success probability of one.

6 MR. KURITZKY: Right.

7 MR. HECHT: Once it starts executing, that
8 is when you have failures and didn't the DFWCS also
9 include channel failures in general and
10 reconfigurations in general?

11 MR. KURITZKY: I can answer. The report
12 that we did or the study that we did with the digital
13 feedwater control system, we did consider software.
14 We considered software in the sense of the successive
15 software, how it normally operates. And that was
16 heavily involved in the identification of the various
17 hardware failure modes and understanding the operation
18 of the system.

19 In fact, the simulation tool which we had
20 to develop to identify the failure sequences, the
21 component level failure pads, was based on a source
22 code of the software for the system. As far as
23 failure, software failures, we had only placeholder
24 events, recognizing that of course, software can fail
25 and it can lead to system failure. But because that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 was one of the areas identified as needing additional
2 work.

3 Again, the study that we did was to
4 establish where the state-of-the-art stood at the
5 point we were looking at it, not necessarily to
6 advance the state-of-the-art. So, we went there to
7 fill the holes. We just wanted to see how far we
8 could model the system with the current state of
9 knowledge.

10 So one of the big holes that we identified
11 was the fact that we could not quantify or even model
12 software failure at that point. So, we had
13 placeholder events in there.

14 Now, the additional work that is being
15 done, including the software workshop PRA, the
16 workshop that you attended, is to start having this
17 head down the road of seeing how we can incorporate
18 software failure into the models.

19 MR. HECHT: Well, those placeholder
20 events, as you called them, based on my maybe
21 inadequate understanding of the model, consisted of
22 states, did they not? And so the real question
23 whether to transition rates into and out of those
24 states.

25 MR. KURITZKY: That directly goes to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 quantitative -- that is putting a probability value or
2 failure rate on those events. But even so, those are
3 two events that we stuck in there.

4 I jumped back for a minute to the
5 discussion we had yesterday with EPRI and of course
6 with the staff this morning about failure modes,
7 failure mechanisms. Okay, in the PRA, we were worried
8 about the failure modes. And again as we saw, you
9 know, if you take a component level, the failure modes
10 at the component level or the failure causes of the
11 system level, the failure, you know, it works its way
12 up.

13 So the failure modes that we have in there
14 are again just some high level. I think we have one
15 that it hangs or something or it doesn't provide the
16 right output. But others might say that there could
17 be other failure modes you need to consider. We think
18 it is a fairly limited set at that level but
19 nonetheless, we were not attempting to try and be
20 exact or complete in modeling software in that DFWCS
21 proof of constant study. We just had some placeholder
22 events, recognizing that we are going to need to do
23 more work in that area. And that if you were going to
24 theoretically use that model for something, you would
25 have to come back and do a better job at monitoring

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the software.

2 MR. HECHT: All right. I have to be very
3 careful because I am sitting next to the person who
4 taught me Markov modeling 35 years ago. But is it not
5 true that if you were to consider other failure modes,
6 it would just be a matter of adding additional states
7 and that just, you know, if you had the proportion of
8 failure modes and the overall failure rate, or you had
9 a failure rate or a transition rate, let me call it
10 that, into each one of those failure modes, you could
11 do that?

12 MR. KURITZKY: I think that our belief,
13 Brookhaven's and my belief right now, well I don't
14 know if it is our belief, but we think that it is
15 possibly or probably a way we can go about it. That
16 is a discussion that is still open. I mean, there are
17 a lot of people out there who some people feel that we
18 can do it. It is essentially looking at it discreet
19 from the hardware almost, you have these software
20 events. Others may say no, you can't. You need some
21 type of integrated approach with the hardware,
22 software, or somehow combined together.

23 Some people just use a beta factor to
24 account for software. You know, a beta factor on top
25 of their hardware to account for software failure. So

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 I mean, there are different approaches and I don't
2 think we were at the point where we can say
3 definitively what the proper approach should be. That
4 is why we are doing the research into the software
5 reliability area.

6 But the way we are kind of by default
7 going along, is just like you have said. Well, we
8 would have failure modes in there. Maybe we have to
9 add a couple of more. The biggest issue is quantify.

10 You know, coming up with a value to stick on those
11 events. But I just have to caution, even the concepts
12 of just sticking those different events in there isn't
13 universally accepted.

14 Does that answer the question?

15 MR. HECHT: It is certainly not
16 universally accepted. And -- but -- It kind of does.

17 Yes, thank you.

18 MR. KURITZKY: Okay. All right. So, --

19 CHAIR APOSTOLAKIS: Slide number six.

20 MR. KURITZKY: Okay. This just I wanted
21 to quickly just go over a couple of the findings that
22 are documented in NUREG/CR-6997.

23 CHAIR APOSTOLAKIS: Which is the
24 Brookhaven report.

25 MR. KURITZKY: It is the Brookhaven report

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 that is going to be published shortly. It is the
2 second one. It is the one that we actually applied
3 the traditional methods to the digital feedwater
4 control system.

5 These findings are essentially the same as
6 the ones that we presented back in April of 2008. So,
7 I don't want to, I don't intend to spend a lot of time
8 on them.

9 Again, if you recall, we modeled the
10 system at a relatively low level of detail. Probably
11 lower than most other models that are out there right
12 now. We call it a major component of the module
13 level. And that is down to like microprocessors,
14 analogue digital converters, multiplexers, ram, bios.
15 It is a fairly low-level component model for the
16 digital feedwater control system.

17 We used that level of detail because that
18 is where we had some publicly available data to stick
19 in. Granted, not very good data and we had a big
20 discussion about that last year, but also allowed us
21 to model certain design features of the system, which
22 we felt were important to understanding and correctly
23 modeling how the system operated. And that is where
24 again, there may be some different discussions. I
25 think some of the other models out there, maybe some

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

1 of the vendor models that are out there for the new
2 reactors don't go to that level of detail. And that
3 is two things.

4 I mean, the level of detail obviously in a
5 PRA model is driven by a couple of things. Where you
6 have data available -- I mean, you don't want to go
7 down to lower levels if you don't have to because it
8 just makes it a lot more complicated. So you go down
9 to as far as you need to get data and to find out
10 where you have system interactions. And so, you know,
11 those are the two main ideas.

12 A third one, kind of a bonus, almost, is
13 that as you will see from the fourth bullet, is that
14 by going to that lower level of detail, you can
15 sometimes identify things about the design or
16 operation of the system that maybe other people in the
17 design and implementation process haven't caught.

18 And particularly in our case, Louis and
19 company identified a couple of scenarios, failure
20 scenarios that were not picked up in the plant hazards
21 analysis, the plant who the system is based on. One
22 of them involved single delay times, where there is
23 fault corrective, fault tolerant features in the
24 system. They are supposed to pick up a certain
25 failure, failure over to the backup CPU if there is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 some problem with the main CPU. And there is also a
2 manual control station which you can fail over to,
3 too, in certain situations.

4 In this one particular scenario that was
5 picked up that the plant did not identify was you
6 actually want to fail over to the back up CPU so you
7 keep automatic control going but the signal times were
8 such that the failure over to the manual control
9 station occurred before the signal for failure over to
10 the back up. So, you end up losing --

11 MEMBER BLEY: And then you are there.

12 MR. KURITZKY: I'm sorry?

13 MEMBER BLEY: I said and then you are
14 there.

15 MR. KURITZKY: Right. And so that was one
16 issue.

17 CHAIR APOSTOLAKIS: And this was picked up
18 by the simulation.

19 MR. KURITZKY: Well, this was picked up,
20 in reality, what BNL did, was they went through and
21 manually did a very detailed FMEA of the system.
22 Okay, and then when we went to try and model it and
23 come up with their failure paths, and by we, of
24 course, I mean BNL, but when they went to look at the
25 failure paths and realized that certainly when it came

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to combinations of failures, you couldn't just do it
2 mentally. You had to have some type of systematic
3 method for finding out what impact on the system was
4 of these various combinations of component failure
5 modes.

6 And in fact, even some individual
7 component failure modes it wasn't very easy to tell
8 what the impact on the system was going to be. So
9 that is when they developed the deterministic
10 simulation model that was based on the source code.

11 Now, I think these two events, correct me
12 if I am wrong, were picked up when you were doing the
13 manual FMEA.

14 MR. CHU: I think the first one, the one
15 associated with time delay was picked up during the
16 manual FMEA. The other one was during the running of
17 the simulation to basically, by doing the manual FMEA,
18 we have certain expectation, you know, how failure
19 mode would affect the system. But then when we run
20 the simulation too, we get the outcome of the failure
21 mode and we compare with the manual FMEA.

22 Sometimes there are disagreement and then
23 we try to resolve the difference. So in doing that,
24 we recognize the other situation that, you know, it
25 appears that you know, the design, it becomes a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 question of the design. Maybe the design could be
2 changed so that that kind of failure mode could be
3 avoided or will not cause loss of control.

4 CHAIR APOSTOLAKIS: What do you do if
5 manual FMEA in a computer code? What do you do? You
6 start assuming faults?

7 MR. KURITZKY: Excuse me. We didn't do
8 the manual FMEA on the computer code. The manual FMEA
9 was done on the hardware system.

10 CHAIR APOSTOLAKIS: Oh.

11 MR. KURITZKY: The software --

12 MEMBER STETKAR: You assumed the software
13 would respond --

14 MR. KURITZKY: Right.

15 MEMBER STETKAR: -- the way the software
16 was designed to designed to respond --

17 MEMBER BLEY: When you did that part.

18 MR. KURITZKY: When we did the model, the
19 simulation model.

20 MEMBER STETKAR: -- in response to that
21 fault.

22 MR. KURITZKY: Right, exactly. It was the
23 source code of the system that was used to come up
24 with that simulation model, so we could process
25 through actual hardware failures.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: Did you bring the
2 possibility of software faults anywhere in this
3 evaluation?

4 MR. KURITZKY: Again, just going back to
5 what Myron had mentioned before, when I was responding
6 to Myron's question, we have a couple of placeholder
7 events for software failure.

8 CHAIR APOSTOLAKIS: Okay but these two
9 failure modes --

10 MR. KURITZKY: Hardware.

11 CHAIR APOSTOLAKIS: The search for these
12 did not include software faults, did they?

13 MR. HECHT: No. This is purely on
14 hardware.

15 CHAIR APOSTOLAKIS: This is only first.

16 MR. KURITZKY: Exactly.

17 MR. HECHT: But what happened was that
18 that simulation was actually a form of V&V or was a
19 verification of the code. It wasn't a stochastic.

20 CHAIR APOSTOLAKIS: It was partial
21 unification.

22 MR. HECHT: Yes.

23 CHAIR APOSTOLAKIS: I'm sorry again.
24 Okay.

25 MR. KURITZKY: Yes and Louis would love to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 have anybody who wants to have their codes V&V'd using
2 a similar process, he would be happy to do it for
3 them.

4 CHAIR APOSTOLAKIS: So you -- I'm sorry.
5 Jack, you were looking at the control system over
6 feedwater system.

7 MR. KURITZKY: Yes.

8 CHAIR APOSTOLAKIS: You found those two
9 failure modes. Did you fix them?

10 MR. KURITZKY: Did we fix them? No.

11 CHAIR APOSTOLAKIS: So when you say later
12 that you did something with the reliability, what, you
13 assumed that these existed?

14 MR. KURITZKY: When we did something --
15 oh, yes in the calculation. Yes, when we calculate
16 and again, only for proof of concept purposes, when we
17 calculate the failure rate, potentially we are doing
18 it, initiating to that frequency, but failure rate for
19 the systems, those are essentially cut sets, yes.
20 Those are point-level failure pads that are included
21 in the quantification.

22 CHAIR APOSTOLAKIS: Well that is what I am
23 a little fuzzy how that can be done. But --

24 MR. KURITZKY: Well there are different
25 states in the Markov model. We stuck in values for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 each of them.

2 CHAIR APOSTOLAKIS: Let's put in the
3 numbers.

4 MR. KURITZKY: Again, remember the values
5 are being stuck in for proof of concept purposes only.

6 CHAIR APOSTOLAKIS: But the states in a
7 Markov model assume that you have transitions
8 occurring at constant rates and so on. And this is of
9 a different nature, it seems to me.

10 MR. KURITZKY: Well it was still based on,
11 these each involved like some hardware failure causes
12 this condition to occur.

13 CHAIR APOSTOLAKIS: So the randomness
14 counts for the random failure of that hardware
15 component.

16 MR. KURITZKY: Exactly. Exactly. It is
17 just the way the system responds to that hardware. I
18 mean, better design --

19 CHAIR APOSTOLAKIS: Yes from a hardware
20 point of view, I don't think we ever had any major
21 objection to what you have done. It is when you bring
22 in software faults in, the disagreements begin to
23 grow.

24 MR. KURITZKY: Right.

25 CHAIR APOSTOLAKIS: But as far as hardware

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 is -- yes, sure.

2 MR. KURITZKY: And to short-circuit that
3 discussion, let's go right -- the areas of potential
4 additional research, which are very similar to the
5 ones we had in NUREG/CR-6962, we didn't learn a lot of
6 new stuff in going to the second NUREG that we didn't
7 identify in the first NUREG. Essentially the areas
8 where we need work are coming up with a means for
9 incorporating software failure into the models.

10 CHAIR APOSTOLAKIS: So all the work that
11 we discussed yesterday with EPRI this morning would
12 have stopped. Really it is irrelevant to what
13 Brookhaven has already done. It will be useful in
14 later tasks.

15 MR. KURITZKY: That is right. You kept
16 trying to say multiple times, can I stick that number
17 in the PRA. And there were no numbers that you saw
18 yesterday that can be stuck in the PRA.

19 CHAIR APOSTOLAKIS: I understand that.

20 MR. KURITZKY: Right.

21 CHAIR APOSTOLAKIS: But they are not even
22 giving insides to the Brookhaven group because these
23 are software related and you are focusing on hardware.

24 MR. KURITZKY: That's right. Now, when I
25 go to talk about the work that BNL is doing now and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 that we are planning to have them continue doing, then
2 it is going to be a different story. Then that
3 information is something that you can use.

4 CHAIR APOSTOLAKIS: Absolutely, yes.

5 MR. KURITZKY: Yes, right now, it is
6 hardware models so it is different.

7 CHAIR APOSTOLAKIS: And you mentioned that
8 in your introduction in your apps.

9 MR. KURITZKY: We have it mentioned in so
10 many places, don't worry about it.

11 CHAIR APOSTOLAKIS: In bold-face letters?

12 MR. KURITZKY: And how much the data is of
13 no value, we have that mentioned a thousand times.

14 CHAIR APOSTOLAKIS: Thank you, Alan.
15 Thank you. You are a good person.

16 MEMBER BLEY: Alan?

17 MR. KURITZKY: Yes.

18 MEMBER BLEY: My memory needs a little
19 help.

20 MR. KURITZKY: Yes.

21 MEMBER BLEY: Everything you have talked
22 about so far sounds like what we saw last time around.

23 MR. KURITZKY: Exactly.

24 MEMBER BLEY: Is that true?

25 MR. KURITZKY: Yes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BLEY: Okay.

2 MR. KURITZKY: Yes, this is just a quick
3 recap.

4 MEMBER BLEY: That is what I thought. I
5 was afraid I am missing something here.

6 MR. KURITZKY: The point being that is has
7 been 14 months since we have talked to you. And
8 really we --

9 CHAIR APOSTOLAKIS: We are older men, we
10 forget.

11 MR. KURITZKY: We are all older.

12 CHAIR APOSTOLAKIS: Thank you.

13 MR. KURITZKY: But really, we haven't
14 advanced the technical work that much in these areas.
15 You are documenting and preparing reports and
16 whatnot. But essentially --

17 CHAIR APOSTOLAKIS: I don't remember. Did
18 you have the failure modes the last time we met? I
19 don't remember.

20 MEMBER BLEY: Yes and there is one that is
21 simulation, tells you how to the fault here interacts
22 if it hits at the wrong time.

23 CHAIR APOSTOLAKIS: Oh, yes. How tedious
24 was it to do the FMEA?

25 MR. CHU: Okay, we started with reading.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 We had three guys sitting in a conference room reading
2 plant documents, including hazard analysis. This way,
3 we educate ourself to learn how the system work. And
4 look at the hazard analysis, see if we are agreed with
5 what is said there.

6 And we probably spent six months doing
7 that kind of work.

8 CHAIR APOSTOLAKIS: So it was six man-
9 months?

10 MR. CHU: Yes.

11 CHAIR APOSTOLAKIS: Is that what you are
12 saying?

13 MR. CHU: Yes, and doing that, the
14 difficulty was the information is scattered here and
15 there. There is some description in regular document
16 that give you some information and then you need to
17 get another piece of it from different documents.

18 Somehow, when you put together the two
19 pieces of information you found they seem to be
20 disagreeing. So there is that kind of a problem. And
21 very often we run into the situation that we say where
22 to read the software, see if the software will tell us
23 exactly how the system would respond in this
24 situation.

25 So you have situation where you actually

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 took the source code and read it, try to figure out.
2 Eventually we recognized we cannot do this manually or
3 it is going to take forever. So we think of
4 developing the automated system.

5 CHAIR APOSTOLAKIS: I would be curious to
6 see one instance, once case of this, how it was done.

7 But I also would like to be the one picking it. So,
8 I don't know how to do that.

9 I mean, if you come prepared, you are
10 going to give me a stylized thing. Anyway, I am very
11 curious how this was done. The way it was described,
12 what Louis just described. I mean, I don't know. I
13 have to think about it.

14 MEMBER STETKAR: Louis, was that -- you
15 started telling the story that you had. Was it
16 actually six man-months to produce the FMEA or six
17 man-months to understand the system or systems.

18 MR. CHU: Including understanding --

19 MEMBER STETKAR: Okay, but at the end of
20 that six man-months, you had the FMEA as well as the -
21 -

22 MR. CHU: The actual developing of the
23 simulation to and, you know, generating of all the
24 sequences to what longer time --

25 MEMBER STETKAR: Oh, but in terms of the -

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 - oh. You said you did a manual --

2 MR. KURITZKY: First pass at the FMEA.

3 MEMBER STETKAR: -- first pass FMEA. And
4 that was a six man-month level of effort.

5 MR. CHU: And then you know, we get to the
6 point of formulating the approach for developing --

7 MEMBER STETKAR: The simulation tool from
8 there.

9 MR. CHU: Right. Developing simulation
10 tool itself, you know, kind of once the idea is
11 formed, doing it took longer. We got a graduate
12 student into the programming. Maybe it took another
13 six month of calendar time to do.

14 MEMBER STETKAR: Well, in perspective
15 George, this is for a three-element feedwater control.
16 Although it is a digital system, this is a pretty
17 doggone simple device, in the grand scheme of the
18 world of control systems.

19 CHAIR APOSTOLAKIS: Right.

20 MEMBER STETKAR: So just think in terms of
21 --

22 CHAIR APOSTOLAKIS: I understand.

23 MEMBER STETKAR: -- level of EPRI, if you
24 are talking about something really interesting.

25 CHAIR APOSTOLAKIS: I'm sorry. Jack?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER SIEBER: It is three parameters,
2 complex control or one up or what?

3 MEMBER STETKAR: That's right. With some
4 automatic transfers and things like that.

5 CHAIR APOSTOLAKIS: At the end of the six
6 months, had you done any analysis that said this
7 little thing is down and this is what happens or you
8 were ready to start doing that? This is -- when did
9 the graduate student come in to actually do the
10 simulation? At the end of the three months.

11 MR. CHU: At the end of the two months,
12 that is after we set him up in the conference room
13 reading reports, trying to do the manual FMEA.

14 CHAIR APOSTOLAKIS: Yes. Manually you did
15 what? That is what I don't know.

16 MR. CHU: Manual FMEA. Effectively, we
17 had the hazard analysis, which caused component
18 failure modes and described its effect on the system.

19 CHAIR APOSTOLAKIS: Including the
20 software? Including the output? What happens to the
21 output? Because you said then that you start some
22 simulation. I am trying to understand what you did
23 before that and what you did after.

24 MR. KURITZKY: Louis, let me, if I can.
25 In the NUREG/CR-6962 that gave you draft of last time,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 there was an appendix in there where it had the FMEA
2 table for the main CPU. In the new report, we have
3 the FMEA tables for all the controllers and modules
4 that were evaluated. But even for the last report,
5 you had it for the main CPU and you see all the
6 different component failures that were considered.
7 You are really looking at signals, various component
8 signals coming and signals going out. And the third
9 mode really involved whether the signal comes out
10 correctly, etcetera.

11 And if you look in there it has the calm
12 of the effect and you can see exactly, you have got a
13 good idea of what they were considering when they were
14 looking at the various failures.

15 Now what that doesn't show you is that
16 after having done that, actually the new report will
17 show you a column that says did they have to stimulate
18 this one. Many of them they could tell just by
19 looking at it as Louis was saying by looking at
20 various plant documents, whether or not a particular
21 component failure led to a system failure.

22 For some it was too hard to tell so they
23 went and ran it through the simulation model. All of
24 the combinations, they also put through the simulation
25 model because the FMEA table is giving you a single

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 failure and always looking at one of them.

2 CHAIR APOSTOLAKIS: So these two failure
3 modes were identified after those two months?

4 MR. CHU: The first one --

5 CHAIR APOSTOLAKIS: And you said you --
6 I'm sorry I forgot that. Okay.

7 MR. CHU: And the fact that we used the
8 simulation tool, the fact that we are running the
9 actual control software. So there are detail features
10 n the software that is automatically captured. Like
11 the ability to detect all the range kind of visions,
12 deviations, and act accordingly.

13 CHAIR APOSTOLAKIS: But I, at some point
14 in the future, I think it will be very useful for the
15 subcommittee -- I am going a little away now from this
16 -- to understand what features say of the Ohio State
17 simulation your approach does not have and they do.
18 And maybe what you have and they don't.

19 I really would not want this to proceed
20 and say we did this and the rest of the world can go
21 do whatever they want. I mean, they are paying a
22 price in the sense that they are spending, I think,
23 much more time simulating the system. That is my
24 understanding. Usually, along with that, you have
25 some extra benefits that other methods that are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 perhaps simpler don't have.

2 So, I would like to understand that. The
3 same thing with DFM that Sergio has developed. What
4 is it that he is doing and what information is he
5 getting out of it that perhaps you are not getting out
6 and vice-versa? Okay? That will be, I think, a very
7 useful thing before we settle on a method. Because if
8 we do that, then perhaps we can do also what Alan said
9 earlier that maybe we can borrow from here, put it in
10 our method or whatever and come up with a hybrid that
11 will have all the good aspects and features of
12 everything.

13 MR. CHU: Let me suggest something. In
14 the latest NUREG/CR-6997, we have a chapter in which
15 we try to compare our model with the dynamic model.
16 We recognize, you know, the studies have very
17 different assumptions. We analyze different
18 situations but that dynamic model consider a power
19 transition going from certain level to another level
20 and consider time period of 24 hours.

21 Well, our folks had to calculate something
22 like initiating event frequency, loss of feedwater
23 due to failure of the feedwater control system. So
24 there are many different assumptions made in the two
25 different studies.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 And another difficulty in comparing the
2 two studies is that, you know, the detail of amount of
3 documentation and the amount of time we spend on
4 trying to compare it is another factor. Therefore, I
5 will say to go to a good comparison, we need to have
6 kind of the two team of people, each spending some
7 time looking at other people's model. And they will
8 sit down in a conference and argue, debate, and I
9 would say how did you model this, how did you model
10 that. And we may end up saying well, you didn't do
11 this right and they may tell us we didn't do certain
12 things right.

13 So, going through this process we can know
14 better and make better comparison.

15 CHAIR APOSTOLAKIS: Why don't you?

16 MR. KURITZKY: Someone has to pay for it.

17 CHAIR APOSTOLAKIS: You.

18 MR. KURITZKY: I left my wallet in my
19 other --

20 CHAIR APOSTOLAKIS: I think it would be a
21 big mistake saying this is our method. We recognize
22 our other methods but tough. No. I mean, we are
23 trying to build the best model we can. Maybe you can
24 play that role. Put some extra effort on the stand
25 where the other guy is doing. They did a feedwater

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 system, didn't they?

2 MR. KURITZKY: Yes.

3 CHAIR APOSTOLAKIS: Look at the
4 assumptions. I mean, you can figure it out. And then
5 compare. You don't have to bring them in.

6 MR. KURITZKY: Let me, if I can, as Louis
7 mentioned, in the new NUREG 6997, there is a chapter
8 where we try and compare between the two models. And
9 as Louis mentioned, there is some substantial
10 differences in the boundary conditions for those two
11 cases. So there is a limit to what they can compare.

12 However, when we come back to brief you in
13 more detail on this report, you will see that there
14 were some failure modes that we had difficulty
15 modeling with our approach. And we suspect, though
16 don't know, that it might be easier or we may be more
17 capable of modeling these particular failure modes, if
18 we had a dynamic model of the system, as was used in
19 the OSU, etcetera work. So, there may be some benefit
20 to that.

21 One of the questions that we have, if you
22 look at the very last bullet on this page, determining
23 if and when a dynamic model of the plant is necessary
24 for including the digital system PRA model. That is
25 an open issue. But you talk about, Professor

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Apostolakis, is whether or not there are pieces from
2 that one that we can use, whether we should consider
3 together what one has and one doesn't have.

4 We looked at a control system, a feedwater
5 control system. The reason we looked at a feedwater
6 control system, in fact going back to how we briefed
7 you a year ago, we were going to look at -- both
8 approaches we are going to look at two different
9 benchmark systems, a feedwater control system and a
10 protection system.

11 However, and we started looking at the
12 protection system. This is the one of most interest.

13 But because we were unable to procure the actual
14 system, the protection system, we were forced to
15 switch and do the feedwater control system first.

16 As it turned out, after many years and
17 millions of dollars of doing the benchmark systems, we
18 decide okay, maybe right now we know enough, we have
19 identified enough holes that need to be filled that
20 maybe we should be looking at, and we have got
21 feedback from the committee on some of these holes,
22 then maybe we should start looking at some of these
23 known gaps right now and not jump in with all the
24 money and time to do a second benchmark. We can learn
25 additional things from that second benchmark but maybe

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the debt isn't sufficient for the cost right now when
2 we have other things we can use that money for.

3 So therefore, we have focused on a control
4 system. With a control system, the dynamic model
5 might become more important, having a plant model.
6 However, when we go to protection systems, which are
7 really the biggest concern for plant PRAs because in
8 reality, in a plant PRA, we are not going to model the
9 digital feedwater control system with a fault tree.
10 You are going to have an issue of that frequency data
11 in there that is going to stick in. So we don't need
12 this model. It is really just an exercise and prove
13 the concept of being able to model a digital system.

14 For a protection system, which is an on-
15 demand system, maybe the need for a dynamic model
16 plant is not that great. We don't know for a fact.
17 We haven't done it yet. But as you will see, the
18 discussions in our international trip back in October,
19 as well as some of the other stuff that we have come
20 up with from our work says you know, we are not so
21 sure that that is necessary and it is a big expense.
22 You say that you get certain value for that expense.
23 Yes, you do, we are not sure yet now whether that
24 value is worth it. And it may be worth it in some
25 cases and not in other cases. So that is something we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 need to look at.

2 CHAIR APOSTOLAKIS: This is the idea
3 behind the request for you to develop categories of
4 software and applications, you know, to come up with
5 methods that are appropriate for each class. And Yes,
6 I agree that for actuation systems, you may not need
7 something very sophisticated. So there is nothing new
8 there. I am not saying do it for everything.

9 But coming back to Louis' comment, when
10 you say different assumptions, what exactly do you
11 mean? Different assumptions as to how the system
12 works or different assumptions in order to develop a
13 model.

14 MR. CHU: I guess maybe the way Alan
15 described it is more accurate. Different boundary
16 conditions. As I described it, we looked at it, we
17 tried to develop model to estimate how the control
18 system will fail causing a loss of feedwater control
19 and then we can calculate the frequency of this event.

20 A factor is the frequency of initiating event or the
21 loss of feedwater.

22 But the dynamic model considered a change
23 in power level in going from, I don't remember
24 numbers, say from 50 percent to 80 percent and stay
25 there for eight hours and come back to 50 percent. So

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the scenario that they model is like that. And then
2 there are a level of detail of modeling, I am sure.
3 Our model in terms of how the figure is more detailed
4 than the dynamic model.

5 CHAIR APOSTOLAKIS: Well and then the
6 question is, is there a need to worry about such a
7 scenario? Sure there was a reason why they did it.
8 And if there is a need, could you do it with your
9 method? You know, these are the kinds of, as you say,
10 different assumptions. But you can evaluate those
11 assumptions and say why did they make this assumption
12 and does it make sense to make this assumption?

13 MR. HECHT: It sounds like they were
14 different, they were models for different purposes.

15 MR. KURITZKY: That is how it turned out.
16 I mean, I think if it was coordinated better in the
17 beginning, we wouldn't have that situation.

18 MR. HECHT: They were answering different
19 questions.

20 CHAIR APOSTOLAKIS: All right.

21 MEMBER STETKAR: The bad state in either
22 model was no feedwater. I mean, what was -- I
23 understand the bad state in your model. It is no
24 feedwater.

25 MR. KURITZKY: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER STETKAR: What was the bad state in
2 their model?

3 MR. KURITZKY: I think the bad state in
4 their model was like Louis mentioned, they were
5 transitioning from power to I think 70 percent.

6 MEMBER STETKAR: I understand the boundary
7 conditions. What was the --

8 MR. KURITZKY: Well, I will assume loss of
9 feedwater.

10 MEMBER STETKAR: Loss of feedwater?

11 MR. CHU: And so they have two bad states.
12 One is high level in the generator and one is low
13 water.

14 MEMBER STETKAR: Okay, so theirs was
15 improper control.

16 MR. CHU: Right. So currently, we are
17 able to demonstrate the benefit of their modeling of
18 the control process. They can actually physically
19 calculate the level, dropping to low level or high
20 level point. So that is the apparent, you know,
21 benefit of being that kind of model.

22 MEMBER STETKAR: You mentioned we haven't
23 seen the NUREG. But you are saying that the
24 comparison that you did make, there seemed to be some
25 benefits of their process compared to yours and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 perhaps some benefit of your model compared to theirs.

2 Since they looked at a ramp up, apparently
3 a ramp up, and a reasonable steady state, and a ramp
4 down. Is the benefit of their model on the ramp
5 processes?

6 MR. KURITZKY: Well, again --

7 MEMBER STETKAR: Or did their model
8 actually show some benefits in that steady state?

9 MR. KURITZKY: Well, I think where we have
10 identified a potential benefit is really there was
11 certain failure modes and again, this is a little more
12 detailed than I was planning to talk about but there
13 were certain fire modes that we had a trouble
14 modeling, a signal drift. Okay? We assumed in our
15 model that if a signal drifted, that it ultimately
16 would drift out of range high or out of range low.

17 Okay, and it was easier to model once you
18 had out of range out of range low, you could monitor
19 it fairly easily. And the reality of it is that you
20 typically pick up that. If you had out of range
21 indication, it would pick that up.

22 But really the worse situation would be it
23 drifts but it stays in that range. So it is out of
24 range enough to cause you a problem but not enough
25 that you pick it up. But that was a condition that we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 couldn't really model very well.

2 MEMBER STETKAR: So you get a --

3 MR. KURITZKY: Right. So in fact we
4 modeled it, we really modeled it non-conservatively
5 because we assumed it would go out of range and that
6 is really not conservative. How much non-
7 conservative, I don't know. But so we felt that if
8 you had an actual model of the plant, you would be
9 tracking it and you would see if it gets to the point
10 where it actually causes a problem or not.

11 Okay, but there are also other factors
12 that that other model might not have even been able to
13 give us the right to fully correct the answer either.

14 But I think the point is, it is not a
15 competition between the two methods and it is not like
16 a race to be first in space, etcetera. We have two
17 different projects that we did and we learned many
18 things from doing both projects. And it is not that
19 we are discarding one and only moving forward with
20 another. We have done the two essentially hardware
21 projects, dynamic and traditional. We recognize that
22 there are other aspects and digital system monitoring
23 that need to be addressed and we are putting more of
24 an emphasis right now on some of those other aspects,
25 software reliability, failure mode identification.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Once we get a better handle on those and
2 assuming we move enough that we feel we can forward,
3 then we start to look back at the total models again
4 and then we may decide okay now that we are going to
5 try and put a whole model together, do we want to use
6 something that is more of a static model? Do we need
7 to have a plant dynamic model? It is going to be
8 case-by-case because some systems may need it, some
9 software platforms may need it. And again, that last
10 fold is really just a little bullet stuck at the
11 bottom of the slide but it is a pretty power packed,
12 potentially resource-packed bullet. I mean, that is a
13 question that we need to answer.

14 So I think a lot of your questions and
15 recommendations right now really apply to the point
16 when we get back to that bullet and look at
17 integrating the system.

18 MEMBER SIEBER: If you assume that the
19 controller does not fail and it is in proportionately
20 being reset with a bias on it and your level is the
21 bias, the only parameter that makes it a permanent
22 offset is an error from the bias signal. Right?
23 Which is the level signal.

24 MR. KURITZKY: Talk to Louis about that.

25 MEMBER SIEBER: Whereas, if I have an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 error in steam flow or feed flow, sooner or later,
2 somewhere out there, the bias will correct it. Now
3 the question is, does it hunt in between? Does it
4 trip? Does it starve the steam generator? Do you
5 overfill? And it is a dynamic setting where the
6 controller is set which tells you which way it is
7 going to go and how far and how fast. Right? And do
8 you model all of that?

9 MEMBER STETKAR: They didn't. I'm sure
10 they didn't.

11 MEMBER SIEBER: Okay well that tells you
12 whether it fails or not.

13 MR. KURITZKY: And again, that goes to
14 what we were saying. We just assumed that it would
15 eventually, if it was going off normal, it was going
16 to eventually fail high or low. In the dynamic model,
17 they can do it --

18 MEMBER SIEBER: The output, which is the
19 out portion.

20 MR. KURITZKY: Yes, right.

21 MEMBER STETKAR: In other words, they
22 would have taken the level bias and just failed at
23 high or low, rather than just a gradual offset.

24 MEMBER SIEBER: Well, regardless of
25 analogue or digital, it doesn't happen that way.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. KURITZKY: Right but in a PRA, there
2 are a lot of things that don't happen the way you have
3 them in the PRA.

4 MEMBER SIEBER: I just have to move to
5 another land --

6 MR. KURITZKY: Exactly.

7 MEMBER SIEBER: -- where things happen --

8 MR. KURITZKY: Never Neverland.

9 MR. HECHT: But the point is there a state
10 in which things are acceptable and then there is a
11 state in which things are not acceptable and that is
12 the failure state. That is basically the abstraction
13 or the simplification of that.

14 MEMBER SIEBER: I look at it from the
15 operator's viewpoint. Unless he has an instrument
16 that tracks each of the three parameters, he may not
17 know. He may not see the transient, except he may get
18 an alarm somewhere in there.

19 MR. KURITZKY: In fact, if you look at the
20 failure modes and effects tables --

21 MR. HECHT: Well, no, that is not moving.

22 MEMBER SIEBER: If you review your board
23 like you are supposed to, you will pick it up.

24 MR. KURITZKY: Again, if you look at the
25 failure modes and effects tables, which we have in the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 new report, and I am not sure if they are the same
2 detail level in NUREG 6962 but we talk about what
3 signals, when the failures occur, besides whether or
4 not it was also a loss of the automatic control. Also
5 whether or not there is some indication to the
6 operators that something has gone out.

7 MEMBER SIEBER: Yes, a smart controller
8 would probably flip the main somewhere in the process.
9 That would give them the warning.

10 MR. KURITZKY: Environmental failure.
11 Yes.

12 CHAIR APOSTOLAKIS: It seems to me that
13 Mr. Sieber just gave you what happens in real life.

14 MR. KURITZKY: Right.

15 CHAIR APOSTOLAKIS: And somehow, you have
16 to model that. You can't just say --

17 MEMBER SIEBER: This doesn't model real
18 life, as I see it.

19 MR. KURITZKY: Well again, it is a level -
20 - I only use it -- This is the first time I heard the
21 term level of abstraction. But they said level of
22 abstraction in the sense that, you know, we are
23 modeling it at a certain level. You are not going to
24 go into a PRA model and model the individual exact
25 perturbations of the entire plant in all situations.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Okay? It is an approximation of what is going on at
2 the plant.

3 CHAIR APOSTOLAKIS: But you have to
4 convince people like Mr. Sieber that your
5 approximation approximates what he says is going to
6 happen.

7 MR. KURITZKY: Yes. Exactly correct.

8 MEMBER SIEBER: Right now, I would say
9 whatever you want to do but this is sort of B.S.

10 CHAIR APOSTOLAKIS: Well that is --

11 MEMBER SIEBER: I think you can reach
12 conclusions from what you are doing about reliability
13 and risk. But it really doesn't model the plant the
14 way the plant runs.

15 CHAIR APOSTOLAKIS: Well that is a
16 decision made --

17 MEMBER SIEBER: You may get harsher
18 results. You may get harsher results than you would
19 out of actual operation at the plant from the model.

20 MR. KURITZKY: And again, I would stress
21 that from a PRA point of view, in a PRA, we are not
22 going to model a control system like this, with a
23 detailed fault tree. We are going to use operational
24 data, which for purposes of the PRA is sufficient. So
25 we don't need to know the exact operation. If we are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 going to model a protection system and the same issue
2 or something similar exists, then we have to worry
3 about it.

4 MEMBER SIEBER: Well, but you are setting
5 the framework now for how you are going to model a lot
6 of things in the future. And I think you are going to
7 have to grade modeling to meet the importance of the
8 system, in order to come up with a real risk number, I
9 think.

10 MR. KURITZKY: And that would be the
11 benefit if doing that second bench. Doing a benchmark
12 for protection system would allow us to see whether
13 those same types of issues are going to be --

14 MEMBER SIEBER: I would be interested in
15 thinking that one through.

16 CHAIR APOSTOLAKIS: Well, we do need the
17 subcommittee meeting I think to understand that a
18 little better. Because I am really disturbed when I
19 hear we are not modeling the actual situation. I get
20 very uncomfortable when I hear that.

21 Now you may be on your way. I can grant
22 you that. But so far you haven't done it.

23 MEMBER STETKAR: George, in deference, you
24 know, to people who really do risk assessment, there
25 are very few things in risk assessment that model

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 plant response in the way that you and Jack are
2 perceiving the level of detail at which things should
3 be modeled. There is essentially nothing. It is all
4 a discrete abstraction of a dynamic process. It is
5 all.

6 CHAIR APOSTOLAKIS: But it is incumbent
7 upon you to convince people who understand the plan
8 that what you are doing approximates --

9 MEMBER STETKAR: A risk assessment is not
10 a dynamic simulator.

11 CHAIR APOSTOLAKIS: I know that.

12 MEMBER STETKAR: And it never has been.

13 CHAIR APOSTOLAKIS: But it approximates
14 behavior. I mean the time --

15 MEMBER STETKAR: It approximates discrete
16 behavior. Two states, success or failed --

17 CHAIR APOSTOLAKIS: Right.

18 MEMBER STETKAR: -- with some likelihood
19 that you are in either of those states.

20 MEMBER SIEBER: The problem though is
21 there is a third state and that state is impaired, not
22 failed.

23 MEMBER STETKAR: For a risk assessment,
24 impaired doesn't make any difference.

25 MEMBER SIEBER: I understand that but the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 risk numbers end up when you count them that way, risk
2 numbers add up greater than they actually are in
3 reality because of the way it fails.

4 MEMBER STETKAR: That has been a problem
5 in the past when people have tried to develop, in some
6 cases, very, very --

7 MEMBER SIEBER: It is hard to do.

8 MEMBER STETKAR: -- simplifications of
9 very, very sophisticated models. I mean, this was
10 done 30 years ago when people first started to try to
11 evaluate reactor protection systems and determine
12 that, you know, plants would fail to trip one in five
13 times that they were challenged, which was a
14 simplification of a very, very difficult process that
15 was obviously wrong. But it was a very, very complex
16 model.

17 MR. KURITZKY: And just, if you look at
18 the insights that are in NUREG/CR-6997, I
19 specifically didn't include it here because I don't
20 want to get to this level of discussion. That was the
21 exact issue that I avoided. But it is probably the
22 longest written up insight in the report because it is
23 an area that we recognize we are not doing a very good
24 job on.

25 And again, I go down this last bullet that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 says well, do we need to or not, for protection
2 system. And that we have to go through and see. But
3 the point is extremely valid. We do talk about that
4 in the insight section of the report.

5 MEMBER SIEBER: Yes, the only thing that
6 bothers me is I don't hear anybody say that we are
7 going to improve it. I mean, that is the state-of-
8 the-art and there you are. And so you get a number
9 and march off.

10 MR. KURITZKY: Well we actually talk about
11 some ways at a very high level, saying here are some
12 possible ways to go about approving it. The dynamic
13 modeling was one that we speculate might be able to
14 shed more light on it. But again, we also speculated
15 on some of the limitations there, too. So, it is very
16 complex.

17 CHAIR APOSTOLAKIS: It seems to me that
18 John is right but that is not a license to do whatever
19 you like.

20 MR. KURITZKY: No.

21 CHAIR APOSTOLAKIS: Okay. So there are
22 many situations in PRA that a dynamic model would be
23 perhaps more accurate. And we approximate with
24 discrete states. But somebody takes the trouble to
25 show that the discrete approximation is meaningful, it

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 may not be exactly accurate but for certain purposes
2 it is good enough.

3 For example, you lose off-site power,
4 there is the competition you know, of restoring it.
5 If you go to an event tree, it says was it restore
6 three hours, in six hours, and assign certain
7 probabilities that came from someplace and that is
8 good enough for our purposes. You know, if it is the
9 same situation here, more power to you. But just to
10 say, now what we did was right because of discrete
11 approximation, I mean, I think you have to convince
12 people like Jack that it is an approximation. Then it
13 is okay.

14 MR. KURITZKY: But we agree with you. We
15 are not saying that it is right. In fact, our report
16 says that that scenario is not done right and that it
17 needs to be looked at in more detail.

18 CHAIR APOSTOLAKIS: Okay.

19 MEMBER SIEBER: I got to the first part,
20 which is I agree it is an approximation. I didn't get
21 to the second part yet which is, and it is right.

22 MR. KURITZKY: Yes.

23 MEMBER SIEBER: Okay, I didn't get there.

24 MEMBER STETKAR: One of the things that I
25 caution and you have perhaps thought about it, or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 maybe not, is that you are, this feedwater system
2 model you have developed, regardless of which of the
3 two approaches you take, is modeling a dynamic control
4 system. It is a constantly operating dynamic control
5 system. And obviously those have some very, very
6 distinct challenges to model. You know, can you
7 actually simulate it or model it or develop
8 reliability parameters or whatever.

9 You flipped and you said well, in a
10 protection system, those complications don't exit.

11 MR. KURITZKY: May. We don't know.

12 MEMBER STETKAR: Okay, may. But when
13 people think of protection systems, people immediately
14 think of trip the reactor, given something out of
15 bounds. I would throw in the fact that perhaps some
16 digital integrated protection ESFAS actuation systems
17 which are now not so clearly distinct between trip the
18 reactor and get things stated, are indeed a hybrid of
19 a dynamic control system and a digital on and off,
20 pass/fail-type protection system because there are
21 certain systems out there operating right now that do
22 have a dynamic behavior.

23 If level is decreasing at a certain rate
24 and temperature is doing this, then perhaps inhibit a
25 certain depressurization function, for example. That

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 is more of the nature of a dynamic control system.
2 But it is in a safety related, safeguards application
3 type function. So, a lot of the stuff that you are
4 doing just because it is feedwater and it is non-LE
5 and yadda, yadda, yadda, may in fact be very, very
6 relevant.

7 Well, don't toss it out and just say well
8 okay, we have determined that all of this dynamic
9 stuff may not be relevant for the protection thing.

10 MR. KURITZKY: Right.

11 MEMBER SIEBER: Well, if you get into some
12 little more complex system like PWR and flow versus
13 power, you know, that is a FERV, that is a dynamic
14 situation. You have to evaluate it in a more complex
15 way than an on and off switch, as far as protection.

16 I think the combustion core power
17 calculator is similar to that. Naval reactors had it
18 made. You know, if it reaches a set point, it trips.
19 And there is no dynamics or no calculator functions
20 or anything other than set backs. Right? You can't
21 tell me that.

22 MEMBER BROWN: I can only tell you you are
23 wrong. I can tell you that the reactors of 50 years
24 ago.

25 MEMBER BLEY: At one time. You have to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 say at one time.

2 MEMBER SIEBER: Reactors of 50 years ago
3 were that way.

4 MEMBER BROWN: But I will give you -- you
5 are talking about a point protection system, which is
6 what these plants have from a reactor protection.
7 Even your commercial plants are all point protection
8 systems.

9 MEMBER SIEBER: Yes, okay.

10 MEMBER BROWN: The power goes up, the
11 pressure goes down, the temperature hits a point, you
12 drop, you do something.

13 MEMBER SIEBER: That's right.

14 MEMBER BROWN: It is a point protection
15 system. An integrated protection system models the
16 protection analysis in the actual performance of the
17 algorithms that you do it. So you decide what you
18 want to do. They are very complex. You don't need to
19 do that in these plants. There is no reason to go to
20 that -- there may be some circumstances.

21 MEMBER STETKAR: There maybe some smarter
22 type safeguard systems out there.

23 MEMBER BROWN: I agree there are a couple
24 of that I have learned based on listening to what it
25 going on. But in general, these are static plants.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Base load, you have got a certain place you want to be
2 and therefore, your set points are fixed.

3 MEMBER SIEBER: And you can treat these in
4 a relatively simple fashion, but the dynamic systems,
5 I think you have to go a little further. I think.

6 MEMBER BLEY: I think what has got to
7 happen here is that they have got to do what they are
8 doing. They have got to go in more detail. And when
9 you first start doing this, you have to look, as Jack
10 says, a lot further. After you have done that a few
11 times, you might be able to generate simplified models
12 that you can use elsewhere. That is where it is going
13 to end up. But right now, you have to go into more
14 detail to understand how it is all working and
15 generate the simplifications.

16 CHAIR APOSTOLAKIS: This discussion does
17 not have the benefit of really knowing what you
18 actually did. So, I think it is time to move on.

19 MR. KURITZKY: Okay.

20 CHAIR APOSTOLAKIS: I think you got the
21 message.

22 MR. KURITZKY: Okay.

23 CHAIR APOSTOLAKIS: And maybe at the next
24 subcommittee meeting when we have more details, you
25 have an idea now what kind of questions you are going

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to get.

2 MEMBER BROWN: I would make -- can I make
3 one observation?

4 CHAIR APOSTOLAKIS: Sure.

5 MEMBER BROWN: Okay, because I am not --
6 how you model analogue vice digital type systems is
7 the only point that -- and this is just an experience
8 thing and it is general. So don't take it as all
9 truth. But in general, when we started putting
10 digital systems in service, you knew when they broke
11 they had discrete responses. If something didn't
12 respond, it popped up here. It popped up there. It
13 quit. Analogue systems, sometimes you weren't sure
14 whether it was working or not. It seemed to be going
15 with the flow and you couldn't -- they just, unless
16 you had something that really failed low, you know,
17 like a detector signal or something like that or a
18 busted amplifier that zoomed up, --

19 MEMBER SIEBER: Or a broken wire.

20 MEMBER BROWN: -- or a broken wire, that
21 is right. Other than that, you drift around, you
22 would think well everything is happy. But it really
23 wasn't. It wasn't responding right. It's response
24 wasn't right, what have you. It was ambiguous.

25 And whereas the digital systems, man, you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 are looking at it all of the sudden the meter,
2 instead of reading 200 is reading 700. It is not 210,
3 700. A control function, if it broke, bang. It
4 slammed it up. It slammed it down. Just because dip
5 flips or other software failures created large
6 dislocations in terms of the information being
7 processed.

8 Now, is that an absolute? No. But in
9 general that is kind of what we saw. It is kind of an
10 interesting thing.

11 I had to tell my bosses, generally, you
12 will know when the digital systems are broken. It
13 will be totally obvious. It is not so obvious with
14 the analogue ones. So don't -- you have got to be
15 careful how you model. That is the only point of the
16 long dissertation. That was somewhat incoherent.

17 MR. KURITZKY: No, I understand.

18 MEMBER SIEBER: Now let's move on.

19 MEMBER BROWN: Pardon?

20 MEMBER SIEBER: Now let's move on, --

21 MEMBER BROWN: Yes, thank you.

22 MEMBER SIEBER: -- as George suggested.

23 MR. KURITZKY: Okay. So that is all we
24 wanted to say about that NUREG right now. Like you
25 said, we will come back another time and go into it in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 more detail and address those issues.

2 Okay, back in 2007, here is an acronym,
3 the Organization of Economic Co-operation and
4 Development Nuclear Energy Agency/Committee For Safety
5 of Nuclear Installations/Working Group on Risk
6 Assessment was encouraged to undertake an activity
7 looking at digital I&C PRA. Since that was right in
8 line with the work we were doing, the NRC volunteered
9 to take the lead on that effort. So, with the help of
10 BNL, we took the lead on that. The objectives of that
11 activity were to identify and recommend current
12 methods and data for including digital systems in PRA
13 and to identify any short or long-term research
14 advancements that were necessary.

15 The meeting, we actually held a planning
16 meeting in October of 2007 here across the street at
17 the Marriott. We had about five international
18 colleagues participating in that planning meeting.
19 The focal point of the activity was decided to be a
20 technical meeting open to the entire WGRisk
21 membership, where everybody would discuss their
22 various experiences and models that they have been
23 working on or methods that they have been pursuing.

24 And that meeting was originally scheduled
25 to take place on Long Island in May of 2008. However

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 for various reasons, our international colleagues,
2 whether they balked at going to Long Island or whether
3 they didn't like the date, I don't know but we ended
4 up having to postpone the meeting and it was held,
5 instead last October in Paris. The meeting was well
6 attended.

7 (Laughter.)

8 MR. KURITZKY: In any case, the meeting
9 was well attended. We had participated in --

10 CHAIR APOSTOLAKIS: You can say that
11 again.

12 MR. KURITZKY: As Louis always mentions,
13 there is great fishing on Long Island Sound and you
14 have all of the fancy --

15 CHAIR APOSTOLAKIS: Wait a minute. The
16 meeting was in Paris, you said.

17 MR. KURITZKY: Right in defense of Long
18 Island.

19 CHAIR APOSTOLAKIS: Oh, the fishing is
20 good?

21 MR. KURITZKY: In any case, back to Paris.
22 In Paris.

23 CHAIR APOSTOLAKIS: Did anyone say, why
24 didn't we go to Paris?

25 MR. KURITZKY: So, back to Paris in 2008,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 we had participants coming from over 20 organizations
2 from 11 different countries. It was actually a fairly
3 productive meeting. There was a summer report on that
4 meeting that Brookhaven put together. It just
5 recently got the approval from CSNI to publish it.
6 There was just a few comments that they want the
7 WGRisk Secretary to clean up and so we hope to have
8 that report out publicly before the end of the year.

9 And at that meeting, there was a wide
10 spectrum of modeling methods and ideas put forth.
11 Very few people agreed on any particular aspect. We
12 were pretty much all over the map as far as what
13 people have done, what people think should be done,
14 what they are planning to do. It was very useful to
15 be able to share those experiences and learn about the
16 other things that people are doing. We did actually
17 find a couple of countries that were doing things more
18 in line with what we are doing.

19 But in general, the consensus or the
20 agreement among the participants was pretty much just
21 focused on things, their high level topics, like the
22 need to include software into PRA, the fact that data
23 is pretty weak and that we need better hardware data,
24 and that we should need to continue to address many of
25 the issues that we identify really in the NRC work

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 that we have done previously.

2 MEMBER STETKAR: Alan, we can read the
3 report when it comes out. Just quick curiosity. Were
4 there feedback from people who would actually tackle
5 the real modeling problems of real systems?

6 MR. KURITZKY: Yes, but on the other hand,
7 almost no one had to address software.

8 MEMBER STETKAR: Okay, but they had at
9 least --

10 MR. KURITZKY: The Koreans have put models
11 together. The Japanese have some very rudimentary
12 models that are fairly old. The French have a method
13 for addressing, which is a fairly simplified method.

14 MEMBER STETKAR: Not a method, a real
15 analysis.

16 MR. KURITZKY: Okay, sorry. Others are
17 considering that but these are actually models. The
18 French have a model. The Japanese have a model. The
19 Greens have a model. I don't Louis, there may have
20 been others. Those are the main ones that I remember
21 that actually have models.

22 MEMBER STETKAR: Thanks.

23 MR. KURITZKY: So in any case, I would say
24 that the meeting was relatively successful in the fact
25 that we got to exchange this information. Did we come

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 out with concrete actionable recommendations that will
2 help close all the gaps? No, not really.

3 The report does include some
4 recommendations. They are broken down into three
5 basic areas, method development, data collection and
6 analysis and international cooperation. Again, they
7 are very similar to the types of things we identified
8 in the NRC research work that we had done around the
9 same time.

10 One item that they did recommend was
11 developing a taxonomy of digital component failure
12 modes. This is also something that EPRI had talked
13 about a little bit in their meeting today but more in
14 the public meeting they had August 5th where they
15 mentioned that was one of the things I think that they
16 are considering for doing in their next fiscal year or
17 whatever, something along those lines.

18 The other ones are the same standard holes
19 that we know about. You know, methods for including
20 software, quantifying software failure probability,
21 getting data, dealing with fault tolerant features.
22 You know, modeling them and quantifying them.

23 Again, the need and approaches for
24 addressing dynamic interactions is the same issue. Do
25 we need these dynamic models to come up with an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 adequate model of the system?

2 Data collection, the same things. You
3 know, we need both independent and common cause
4 hardware failure. We need better data. Looking at
5 the operating experience to try and find out how
6 software can fail. It is the same thing.

7 MEMBER STETKAR: Let me ask you because
8 you have a little bit different perspective or
9 experience. This morning, I got a relatively
10 discouraging perspective on the prospects of being
11 able to glean real operating experience from
12 international partners. What is your take?

13 MR. KURITZKY: Well, and you will
14 appreciate my take. I divided it into two categories.
15 There is looking at the operational experience, to
16 learn from the events. In that regard, I personally
17 think data from non-1E systems, other industries, I
18 don't care where it comes from, you looked at it and
19 you see whether it teaches you something and whether
20 it is something that you may want to consider.

21 You were mentioning before, you have to go
22 through the data, one of you mentioned it.

23 MEMBER STETKAR: It was --

24 MR. KURITZKY: Dennis is being too quiet.

25 MEMBER STETKAR: It was the real Dennis of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the two Dennises.

2 MR. KURITZKY: And you have to determine
3 whether this stuff applies or not because in different
4 cases, it may apply and it may not. Even whenever
5 someone mentioned 50 rule data, may apply. Dr.
6 Apostolakis said data from the Middle Ages may apply.
7 You have to see. So I think --

8 CHAIR APOSTOLAKIS: No, no, I didn't say
9 Middle Ages.

10 MR. KURITZKY: Medieval? I thought --

11 CHAIR APOSTOLAKIS: No, that was classic
12 Apostolakis. 500 B.C.

13 MR. KURITZKY: In any case. But that is
14 learning about the learning about the experience and
15 getting insights from it. When it comes to plugging
16 numbers in the PRA, you need the denominator. That
17 was discussed earlier, too.

18 CHAIR APOSTOLAKIS: No, no. I think this
19 discussion is too high level, guys. I mean, can we go
20 on? Make your point.

21 MEMBER STETKAR: I am just trying to get a
22 feel for, he said he had a meeting with very, very
23 good participation and people from more than 20
24 countries and some people who were really doing things
25 and everyone agrees that we need to take better

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 advantage of operating experience.

2 CHAIR APOSTOLAKIS: Sure.

3 MEMBER STETKAR: This morning when I asked
4 what is Research's experience on being able to
5 actually -- if everyone agrees that we need it and it
6 is really important, what is the prognosis for
7 actually getting said operating experience in real
8 time. Do you have the same sense?

9 MR. KURITZKY: I will probably yield to
10 Louis to give you more detail.

11 I mean, my feeling was to have some plants
12 or some organizations actually have models. And they
13 --

14 MEMBER STETKAR: Not models. Real
15 operating experience.

16 MR. KURITZKY: No, I am saying they have
17 quantified those models. So they have data they have
18 used to quantify those models. Now that data, a) very
19 likely proprietary; but b) is it stuff that is
20 applicable? Again, depending on what level you are
21 putting the data in, determines whether the data from
22 this system can be used for this other model.

23 So you know, I didn't get the feeling that
24 there was a lot of readily usable data just sitting
25 out there for us to sign a bilateral agreement and get

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 a hold of.

2 MR. CHU: Yes, but my impression is the
3 same as yours, you know, Alan talk about, there are
4 occurrences that can be shared among different
5 countries but when it comes to estimating parameters,
6 you need a denominator or this is not clear.

7 MEMBER STETKAR: I am not really talking
8 about the denominator. I am just talking about if I
9 am operating a nuclear power plant in country East
10 Slabovia and --

11 MR. KURITZKY: I don't think they are
12 doing that.

13 MEMBER STETKAR: Not yet. And I have a
14 large number of digital control systems in my plant
15 and I have been operating said plant for ten years, I
16 must have some operating experience from my plant that
17 I could share with a greater international community
18 so that we could all learn about this.

19 CHAIR APOSTOLAKIS: Independently of
20 models.

21 MEMBER STETKAR: Independently of models.
22 Independently of denominators. At the same level
23 that EPRI was discussing.

24 MR. KURITZKY: Right. The operational
25 experience.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER STETKAR: The operational
2 experience.

3 MR. KURITZKY: Now the thing to keep in
4 mind is that the majority of the people at the meeting
5 were from regulatory agencies or the laboratories and
6 organizations that support them. So they don't really
7 have --

8 MEMBER STETKAR: Okay, thanks.

9 MR. KURITZKY: -- that access.

10 MEMBER STETKAR: Okay.

11 MR. KURITZKY: And I think it would be
12 difficult to get the other people to cough it up, if
13 they haven't.

14 MR. KURITZKY: Okay, again, a number of
15 recommendations.

16 CHAIR APOSTOLAKIS: The Koreans, as you
17 probably know, have been publishing many, many papers
18 on software, various aspects. What kind of models are
19 they using? I mean, are they drastically different
20 from that we have been doing here or are they
21 addressing different questions or what?

22 MR. KURITZKY: Well, it is a very timely
23 question because Louis and I were discussing this
24 earlier. Right now, the Korean models don't really
25 address software. They are mostly hardware models

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 also. But the Koreans are very interested in pursuing
2 software modeling. And when we had our software PRA
3 workshop, which I am going to talk about next, we had
4 a gentleman from KAERI who was there. He was also
5 someone who has been involved with some of our other
6 work. He was at the meeting in Paris. And they are
7 very anxious to pursue. They have I think a plan
8 within the next three years to come up with software,
9 failure probabilities to stick in their PRAs. So he
10 is anxious to go do that work. They haven't really
11 done, I don't think too much yet.

12 Louis, in fact, has been communicating
13 email by them but they are interested in doing some
14 type of cooperation. We haven't figured out exactly
15 what.

16 CHAIR APOSTOLAKIS: Can you do that? Can
17 the Agency --

18 MR. KURITZKY: It just showed up. We
19 talked about it at lunch today. So we have to go back
20 and see what is it they were thinking about doing.
21 Whether or not we need to have a signed, bilateral
22 agreement. I think there are certain agreements we
23 have with Korea already. But again, to the extent of
24 what we are going to do --

25 CHAIR APOSTOLAKIS: Because that would be,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 I think, a good step forward, to bring another group
2 into this.

3 MR. KURITZKY: I mentioned early on that
4 there were at least a couple of countries there that
5 seemed to be doing things that were more in line. And
6 Korea was the one that we identified as being our most
7 comparing, similar to what we are doing. So it is an
8 opportunity that we are going to look into.

9 CHAIR APOSTOLAKIS: Okay.

10 MR. KURITZKY: Okay, so the last thing
11 that I wanted to talk about was the software PRA
12 workshop that we held in Brookhaven in May. You saw
13 reference to this earlier. In '97, the NRC asked the
14 National Research Council to do a study on the use of
15 Digital I&C systems in nuclear plants.

16 One part of that study looked at
17 reliability and safety assessment. Two of the
18 recommendations from that section were one, that yes,
19 you should put software failures into your PRA models
20 and two, you should be able to at least come up with
21 bounding estimates for those events, using test data
22 and expert judgment.

23 Okay, so taking that, as well as the fact
24 that at this very subcommittee last year, it was
25 recommended that the staff, when they do digital

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 system, they integrate hardware and software.
2 Software needs to be part of the picture, as well as
3 the fact that we should go ahead and actually try and
4 establish the philosophical basis for modeling
5 software probabilistically.

6 Given that feedback, taking to heart, we
7 did go ahead and have a workshop at Brookhaven back in
8 May, gather experts to in fact some up with a
9 philosophical basis for modeling software
10 probabilistically.

11 What we did was, the objective of the
12 workshop, the primary objective of the workshop was to
13 come up with that basis. Since we are paying to bring
14 together this August body of experts, we also felt
15 that we would try and milk them for whatever we could
16 on just how you go about modeling software and how you
17 would quantify it.

18 And so we held that meeting in May. We
19 had to decide who was going to get invited to that
20 meeting. At first our inclination was to get people -
21 - historically there has been some long running
22 arguments between whether you can or cannot model
23 software failure probabilistically. And we thought we
24 would get a few people one side and a few people from
25 the other side and stick them in the room and let them

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 battle and see what the final answer is.

2 We later, on second thought, thought well,
3 you know, those are long-standing arguments that have
4 existed forever and if we bring them into a room for a
5 day and a half, we are going to walk out with nothing
6 further solved. And we are not really going to have
7 anything of value for our time and effort.

8 So we decided instead, let's get a bunch
9 of experts who are very experienced in the fundamental
10 principles and the application of software reliability
11 engineering and let them hopefully come up and
12 establish a philosophical basis for modeling software
13 failure probabilistically. We fed them many of the
14 arguments that are in the literature why you are not
15 able to do such a thing, so they could chew on those
16 also. And in doing so, we ended up coming up with a
17 core panel of seven researchers and professors from
18 renowned institutions with experience in software
19 reliability or software engineering. People have
20 published books in this area and/or published
21 extensively in journals and conferences and we brought
22 them together.

23 We also decided to capture the
24 perspectives and the experiences of the NRC. As well
25 a the nuclear industry, to include a member from each

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of those organizations. And so these nine people were
2 brought together to debate the issue of modeling
3 software probabilistically and to hopefully establish
4 a philosophical basis. Louis was the moderator for
5 the discussions. ACRS was hosting, Myron Hecht was
6 there. A number of other BNL, NRC observers such as
7 myself were there to observe the discussions.

8 And as hoped for, they were able to come
9 up with the philosophical basis for modeling software
10 failures probabilistically.

11 Again, we are going to come back to you
12 with the report. You can dig into it. You can give
13 us your opinions on it and argue back and forth. I
14 just want to give you just a quick overview. Today,
15 since that report is not complete yet but basically,
16 as everyone recognizes, software failure is a
17 deterministic process. However, due to a lack of
18 knowledge of exactly how the software fails or lack of
19 knowledge as to the number and types of residual
20 faults that may be in the software, the number and
21 occurrence of triggering events, we are not able to
22 fully account for all the aspects of the process for
23 software failure.

24 So therefore, we choose to model it
25 probabilistically. This is essentially the same basis

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 that is used for many other probabilistic processes.
2 The quintessential example of the random event is the
3 flipping of a coin. Okay, we assume okay, you flip it
4 50-50, whatever it could come up. Could it come up
5 heads, could it come up tails?

6 In fact, if you were able to totally
7 control --

8 CHAIR APOSTOLAKIS: This is not the
9 disagreement. I fully agree with the first bullet.
10 The question is how you do it. Can you assign a
11 failure rate or do you need to do something else?

12 The methodological issues are actually
13 estimating whatever you want to estimate. I debate
14 it. I fully agree that, you know, if you don't have a
15 complete state of knowledge you have to have some
16 probability some place. The question is how do you
17 get that.

18 MR. KURITZKY: Right.

19 CHAIR APOSTOLAKIS: Does it make sense to
20 assume failure rates for so few of our thoughts? That
21 is where people disagree.

22 MR. KURITZKY: Right. Well, actually --

23 CHAIR APOSTOLAKIS: The other difference
24 is that yes, I look at the record. I have so many
25 tests and five pump failures. Fine. Then I do my

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 song and dance and get a failure rate. The difference
2 here is that I find one fault and I fix the damn
3 thing. Now what do I do?

4 MEMBER SIEBER: You can't deduce anything.

5 CHAIR APOSTOLAKIS: Exactly. It is
6 supposedly not there anymore. This is the heart of
7 the problem, not the coin.

8 MR. KURITZKY: Right.

9 CHAIR APOSTOLAKIS: It is kind of what I
10 expected when I saw the list of names. We need to be
11 taught that we can do probabilistic. I mean, that is
12 childish.

13 MR. KURITZKY: Okay, so --

14 CHAIR APOSTOLAKIS: It is not your fault,
15 Alan. It is not your fault.

16 MR. KURITZKY: But nonetheless, I was
17 taught.

18 CHAIR APOSTOLAKIS: Continue.

19 MR. KURITZKY: As far as whether or not it
20 can be modeled probabilistically, you fix a fault but
21 yet we have not --

22 CHAIR APOSTOLAKIS: You have uncertainty
23 but the problem is you don't have a database now.
24 What kind of database do you have?

25 MR. KURITZKY: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: You might argue that
2 the fixing it might introduce other faults. Thank you
3 very much. Yes, I know people have argued those
4 things. But how do you actually do it in the real
5 environment with a real regulatory agency that has the
6 health and safety of real people in its hands? That
7 is where the problem is. What do you do?

8 MR. KURITZKY: So we are in agreement.

9 CHAIR APOSTOLAKIS: Maybe they go to
10 defense in that. I don't know. Maybe you
11 deterministic guys knew it all along.

12 MEMBER BROWN: Yes. Independence and
13 defense in-depth.

14 CHAIR APOSTOLAKIS: There you are.

15 MEMBER BROWN: And redundancy.

16 CHAIR APOSTOLAKIS: And diversity. Don't
17 forget that.

18 MEMBER BROWN: Where you need it.

19 CHAIR APOSTOLAKIS: Where you need it.

20 MR. KURITZKY: So we are in agreement that
21 you can probabilistically model that it makes sense to
22 probabilistically model software --

23 CHAIR APOSTOLAKIS: Makes sense.

24 MR. KURITZKY: It is how can you come up
25 with the value.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: That is right.

2 MR. KURITZKY: Okay.

3 CHAIR APOSTOLAKIS: What is the evidence?

4 MR. KURITZKY: All right. So we have that
5 first point taken care of.

6 So now how are we going to come up with
7 the value? And that is --

8 CHAIR APOSTOLAKIS: Or the model. Or the
9 model. But yes, I understand what you are saying.

10 MR. KURITZKY: So and we had some
11 discussions in the meeting of that because once we got
12 the coin toss out of the way, we focused on how we can
13 go about coming up with failure probabilities and
14 failure rates. And as expected with nine different
15 experts, we have many different ideas. And many of
16 your --

17 CHAIR APOSTOLAKIS: Two to the ninth.

18 MR. KURITZKY: And many of these articles
19 that you were so enamored of earlier in the day.

20 So nonetheless, so we have some ideas
21 about how to proceed. Again like you mentioned, you
22 find the failure, you fix it. So it is very difficult
23 to go on historical data to try and come up with the
24 data like we do for many hardware components in a PRA.

25 That doesn't necessarily mean that we have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 no possibility of coming up with a value. It means
2 that we may have to rely very heavily on expert
3 judgment. We have to rely on other types of
4 quantitative methods. It may have to be something
5 where you qualitatively look at pictures of the system
6 and somehow correlate them to some value.

7 Okay, there is no easy answer. That is
8 why we are doing the research. We are going to pursue
9 whether or not there are ways we can do it. In fact,
10 in the next slide, I will talk about what our near-
11 term work is and what our longer term work is going to
12 address. And the question is at the end of the day,
13 we may determine, we can come up with a value. I
14 mean, I could around this room and ask everybody to
15 give me their best estimate and divide it by seven. I
16 mean, we can come up with a value.

17 The question is, does the value we come up
18 with, is the level of certainty on that value
19 sufficiently constrained where we can actually use
20 that value for something. Can we use that result for
21 something?

22 CHAIR APOSTOLAKIS: Well also, is it
23 meaningful? Is it meaningful?

24 MR. KURITZKY: That is what -- if it is
25 not meaningful, we can't use it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: I don't see that your
2 role is one of being an advocate of a particular point
3 of view. In the past meetings, the comments that at
4 least I made was this is a different beast from other
5 things that we have done in the past in the
6 probabilistic area.

7 In the sense that the moment somebody says
8 this is the failure rate, you have to question what
9 exactly that means. Whereas, if you talk about pumps
10 and valves and so on, we don't. We have all agreed
11 and we do certain things.

12 So the difference here is that there is a
13 fundamental question as to whether a concept like a
14 failure rate is meaningful. That is all I said. You
15 may come back and say, no, it is not. We are not going
16 to do it that way for such and a such a reason. Fine,
17 then you have a point of view.

18 But to say, you know, failure rate because
19 of a do it in Hong Kong or somewhere else -- and
20 again, their knowledge is design errors even in
21 hardware. I do I model that? I don't know. Does
22 anybody know?

23 MR. KURITZKY: It is in the data.

24 CHAIR APOSTOLAKIS: Some of it is. Some
25 of it is. But if you go to the serious stuff that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 they found that would be realized only when you had a
2 strong earthquake, you have a big problem there
3 because you never had that earthquake and what if it
4 is there.

5 You know, so these kinds of things, I am
6 not sure. You have to ask these more fundamental
7 questions. Like now we are talking about new
8 reactors, like sodium-cooled reactors. We are going
9 to have, the guys who will do the PRA there will have
10 to do something that we don't do routinely for LWRs.
11 Namely, they all have to rethink the set of initiating
12 events. Whereas, now for LWRs we have pretty good
13 list, you know. A lot of groups have done it. You
14 may want to add something that is plant-specific. But
15 by and large, I can go to two or three PRAs and look
16 at the initiating events I have 95 percent of what I
17 need to do.

18 You go to a sodium reactor or something
19 even more exhaustive like lead-bismuth, you have to
20 start rethinking from the beginning now. You know,
21 what can go wrong and all that stuff.

22 MEMBER SIEBER: And how do you come up
23 with failure rates for equipment that you never built?

24 CHAIR APOSTOLAKIS: Yes, that is right or
25 passive systems and so on. So these create new

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 questions.

2 And all we were saying at the subcommittee
3 meeting saying that if you should take that attitude
4 then you have to question something that appears to be
5 routinely used somewhere else.

6 MR. KURITZKY: And we did. And the
7 question is whether or not software failure rates are
8 meaningful, software failure probabilities are
9 meaningful was a question we put to the panel. And
10 they believe, I think pretty much to a man, that yes,
11 indeed, they are meaningful.

12 Now, that leads to the next question. If
13 they are meaningful, how are you going to come up with
14 them? Okay, and that is again, as I was mentioning,
15 where we are trying to go forward with our research to
16 try and see how we can come up with them.

17 CHAIR APOSTOLAKIS: And why they are
18 meaningful.

19 MR. KURITZKY: Well, and that was part of
20 --

21 CHAIR APOSTOLAKIS: By failure rate, the
22 definition is minus DF over DP, or something like
23 that, which means that something happens in time and
24 then in the next delta T something may happen. And
25 then I look at this guide and it tells me there is a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 fault due to specification requirements.

2 So now I am trying to make the connection.

3 In the next delta T there will be another
4 specification fault? Come on. You know, so that is
5 the question. What does it mean?

6 MR. KURITZKY: Right. And unfortunately,
7 you don't have the benefit of the report because it
8 hasn't been published yet. But in the report, we go
9 over the expert's discussion of these very issues. So
10 we raised those exact issues with the experts. We
11 actually sent them questionnaires prior to the meeting
12 to get them on the right page, to have them start
13 thinking.

14 And some of these exact issues were put on
15 the questionnaire. We got detailed responses from
16 them. Those were further elaborated on during the
17 meeting in the discussions. The report that we will
18 be publishing, hopefully within the next couple of
19 months, will detail the results of those discussions.

20 Now, just because we got the --

21 CHAIR APOSTOLAKIS: So if there is failure
22 rate, I can work backwards and find a cumulative
23 distribution function. Right? I can always work
24 backwards, which means that the software, if I wait
25 long enough, will fail. Is that good? Is that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 reasonable, you guys could develop software?

2 If I sit back and wait, eventually the
3 probability is one.

4 MR. HECHT: Just like any other component
5 to the system.

6 CHAIR APOSTOLAKIS: Really?

7 MR. HECHT: Yes.

8 CHAIR APOSTOLAKIS: Well that is news to
9 me.

10 MR. HECHT: That program eventually is
11 going to fail. If I run the plant for a thousand
12 years, --

13 CHAIR APOSTOLAKIS: The program? Why
14 would the program fail?

15 MR. HECHT: Why would the program fail?

16 CHAIR APOSTOLAKIS: Random things?

17 MR. HECHT: Because eventually the
18 environment in which the program runs, will encounter
19 a set of inputs that would --

20 CHAIR APOSTOLAKIS: I don't know about
21 that.

22 MEMBER SIEBER: The interesting thing, the
23 software question is analogue controllers, to my
24 knowledge have been in the business 50 years. I have
25 never seen one fail. And so when you go from analogue

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to digital, you are introducing a failure rate that is
2 greater than the analogue failure rate. And ask
3 yourself why are you doing it. It is either for cost,
4 higher power output for a given size plant, lower fuel
5 costs, greater maneuverability. And so here is the
6 tradeoff, except some probably minuscule higher
7 failure rate to obtain more flexibility, more
8 efficiency, what have you. And that is what really
9 ought to be weighed.

10 MEMBER BROWN: You never had an analogue
11 controller failure?

12 MEMBER SIEBER: I can't remember any.

13 MEMBER STETKAR: I can.

14 MEMBER BROWN: That was a maintenance
15 issue.

16 CHAIR APOSTOLAKIS: So the report you are
17 about to publish will have all of this stuff in it?

18 MR. KURITZKY: Yes.

19 CHAIR APOSTOLAKIS: We are going to review
20 it and do whatever.

21 MR. KURITZKY: Right.

22 CHAIR APOSTOLAKIS: So maybe it is not
23 worthwhile spending too much time today.

24 MR. KURITZKY: I agree with that.

25 CHAIR APOSTOLAKIS: Because we haven't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 seen it.

2 MR. KURITZKY: Exactly. That's right.
3 Exactly.

4 New topic but really a follow-on to that
5 topic because given the fact that coming out of that
6 workshop, we felt that there was a consensus among the
7 participants that it did make sense to model software
8 failures probabilistically, you know, come up with
9 failure probabilities and failure rates. And they had
10 some ideas about how you might do it but they were
11 failure scattered.

12 Our next piece of work is to go ahead and
13 look at how we can take that next step. So, BNL is
14 pursuing a review of quantitative software reliability
15 methods. We mentioned this earlier the presentation.
16 They are basing it on stuff they had done previously,
17 adding in some other stuff has been done recently, as
18 well as some done by OSU, etcetera. And they were
19 going to try and identify one or two technically sound
20 approaches for modeling and quantifying software
21 failures. And again, it is debatable whether or not
22 this will be successful. When you get a chance to see
23 the report, you will have the opportunity to give us
24 feedback on what you feel the extra panel came up
25 with, what you think about it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 But based on the outcome of that meeting,
2 we feel confident that we are ready to take the next
3 step. And so we will move forward in that manner.
4 And if we are able to come up with one or two
5 technically defensible approaches or technically sound
6 approaches, the next step would be to apply those in a
7 proof of concept study similar to the benchmark
8 studies for the hardware models that we did. We would
9 take a protection system and see if we can, you know,
10 take the software from the protection system and see
11 if we can use those methods or approaches to come up
12 with a failure probability.

13 MEMBER BROWN: Why would we want to do
14 that? Are we trying to figure out how we can reduce a
15 four-channel protection system to one-channel because
16 we do a PRA on the one channel and determine that it
17 is going to have a failure probability of one times
18 ten to the minus seven? Is that it? Is that a cost
19 reduction? Is that goal?

20 MR. KURITZKY: No. This is the goal. The
21 goal is to be able to make risk-informed decisions on
22 digital systems because the Commission wants us to.
23 And the other goal is to be able to include those
24 models into those systems into plant PRAs because
25 plant PRAs need to reflect the as-built, as-operated

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 plant. And if those are going to be system in that
2 plant, they need to be in that PRA.

3 MEMBER BROWN: Did the Commission actually
4 say do this with Digital I&C systems or did they say
5 that they wanted PRAs used extensively by the state-
6 of-the-art for risk-informed decisions and --

7 MR. KURITZKY: They directly said the
8 latter. And if you look at some of the SRMs, you will
9 see that they infer the first. They say they want us
10 to look into risk modeling of digital systems.

11 MEMBER BROWN: I still, it doesn't tell me
12 what do I use that for? What is my end product? The
13 only thing I can see is I want to --

14 MEMBER SIEBER: Overall risk for the
15 plant.

16 MEMBER BROWN: What?

17 MEMBER SIEBER: Overall risk of the plant.

18 MEMBER BROWN: You know, am I going to
19 reduce the number of systems I have? That is the only
20 relevant reasons to do it. Am I going to -- I mean,
21 we determined years ago. We went from one out of two
22 protection systems to two out of three to two out of
23 four for good reason. For online reliability and for
24 the enhancement in terms of your ability to shut the
25 reactor down or, when it needs to, yes, or execute an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 ECCS system when it needs to.

2 MR. HECHT: Charlie, can I suggest one
3 reason?

4 MEMBER BROWN: Absolutely. That is why I
5 asked the question.

6 MEMBER STETKAR: Charlie, if you were a
7 regulator and had limited resources and you wanted to
8 do an inspection program, do you allocate 100 percent
9 o your available resources to inspect every last bit
10 of piece of equipment in the plant equally because it
11 is all equally important or do you, for example, use
12 some risk insights to look at stuff that might be more
13 significant?

14 MEMBER SIEBER: Or do you need to --

15 MEMBER BROWN: No. That is why I put in
16 four systems. I mean, I don't understand.

17 MEMBER STETKAR: No, no, no. You put in
18 four systems because that is the way you used to work.
19 You can't do that when you have got a bazillion
20 different systems and three inspectors. My tax
21 dollars don't pay for the amount of people you had to
22 look at your forces.

23 MEMBER SIEBER: When we conclude the
24 Commissioners said it is our policy to risk-inform.
25 We want a new safety clause.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. HECHT: I could suggest another
2 reason, with your permission, Jack.

3 MEMBER SIEBER: Okay.

4 MR. HECHT: And that is, is that let's
5 assume that we have some method to infer the failure
6 probability of the software, based on observation,
7 either tests or operating experience. And we can
8 assign an upper and lower confidence limit to that.

9 If we assume that and I think that is
10 ultimately if this research is successful, the more
11 resources we spend, the narrower that confidence
12 limit. But it costs money, and it takes time, and it
13 may mean that some things don't get done. A risk-
14 informed approach would tell you at what level you are
15 willing to accept some digital technology, some
16 software-based item, and at what point you need to
17 stop.

18 MEMBER BROWN: You mean, what point you
19 wouldn't use digital-based technology?

20 MR. HECHT: No. At what point something
21 that you don't know about that you don't have enough
22 insight into becomes acceptable. Because you have
23 somehow or other gotten more observations. You have
24 put more resources into valuating it so that you can
25 understand it better and the failure probability or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the overall risk goes down.

2 MEMBER SIEBER: It is the same argument as
3 the maintenance rule. The same argument that John put
4 forth a few minutes ago.

5 CHAIR APOSTOLAKIS: So the basic
6 regulatory guide, 1174 requires for any change, --

7 MEMBER SIEBER: It is policy.

8 CHAIR APOSTOLAKIS: -- you have to have
9 the basic risk of the plan.

10 MEMBER SIEBER: Right. It is policy.

11 CHAIR APOSTOLAKIS: Right now, they assume
12 that software doesn't fail, digital software doesn't
13 fail.

14 MEMBER BROWN: Who does that?

15 CHAIR APOSTOLAKIS: Oh, yes. Go and look.

16 MEMBER BROWN: Well who designs based on
17 software will fail? That is why you have your design
18 rules.

19 CHAIR APOSTOLAKIS: And then when you
20 apply those rules, they say that is it now. Now
21 failure.

22 MEMBER BROWN: No. Let's assume the
23 software does fail. That was the whole basis of all
24 the designs we did. We assumed the software would
25 fail.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: It is like other
2 systems, if you look at the ESBWR PRA, it says they
3 don't fail. Those days, it is a law of nature. Are
4 you questioning them?

5 MEMBER BROWN: USAPWR?

6 CHAIR APOSTOLAKIS: ESBWR. Yes, there was
7 a clear sentence there, which I cannot find again.

8 MEMBER BROWN: Well, I missed that
9 sentence.

10 CHAIR APOSTOLAKIS: I am looking for it.
11 We assume that passive systems do not fail, period.

12 MEMBER BROWN: Hold it. A protection
13 system is not a passive system.

14 CHAIR APOSTOLAKIS: No, but I am telling
15 you, there are certain things we cannot do. Yet, the
16 regulations require the complete risk from the plant.
17 And for those two items, the assumption there in the
18 risk assessment is that they don't fail or they fail
19 with ten to the minus a hundred.

20 MEMBER SIEBER: But that may not
21 accomplish your purpose.

22 MEMBER BROWN: But the protection is not a
23 passive system.

24 MEMBER SIEBER: Well, we are arguing about
25 it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 CHAIR APOSTOLAKIS: I am just saying that
2 there are these two areas, passive and digital, two
3 separate things. We don't know how to do it. They
4 never fail.

5 MEMBER BROWN: Moving on. I know you know
6 they say if you look at the software failure but you
7 design the overall systems and how you do it and the
8 number you have, the redundancies and independents, so
9 that when they do fail, you won't have so many of them
10 fail that you can't shut down the plant. That is the
11 point.

12 CHAIR APOSTOLAKIS: Maybe that is what I
13 mean.

14 MEMBER BROWN: That is the point.

15 CHAIR APOSTOLAKIS: Maybe that is what I
16 mean, that is my contribution.

17 MEMBER BROWN: You make an assumption. I
18 mean a fundamental assumption, I mean, I have got
19 these on every ship in the Navy and our fundamental
20 assumption is the software will fail.

21 So for critical systems, ECCS, where we
22 wanted to do it, protection systems, that is what we
23 did. On a turbine-generator set, we didn't do that.
24 Recently it failed. But we designed the hell out of
25 it so hopefully it wouldn't so we can keep power going

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 and the prop can continue to go around.

2 But that assumption that software will not
3 fail is to me, just that is somebody has got their
4 head -- I'm sorry. I won't go there.

5 CHAIR APOSTOLAKIS: Well but this is the
6 situation we want.

7 MEMBER SIEBER: You can always go and trip
8 the breaker.

9 MEMBER BROWN: Too late, maybe.

10 CHAIR APOSTOLAKIS: Okay. Are you done?

11 MR. KURITZKY: Just one point I want to
12 make. I alluded to it in part earlier and I want to
13 make it more completely now is that while we expect we
14 will be able to come up in some way, shape or form
15 with a digital system model, including software, the
16 bigger issue or issues are going to be, as we
17 mentioned before, is it something useful. Is the
18 model that we are going to come up with something that
19 can be used? Is the data that is used for the grammar
20 or the input to that model going to have sufficient
21 constrained uncertainty that this actually give you a
22 useful answer. And B, even if you can come up a
23 useful answer, is the level of effort that it requires
24 to come up with that answer, to develop that model,
25 is it practical? Is it something that you can have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 some PRA engineer or licensees go ahead and put
2 together this model.

3 So just the fact whether you can do it,
4 doesn't mean that it is necessarily something that we
5 would ultimately want to do or would necessarily get
6 done on a routine basis. It has to end up being
7 useful and it has to be practical. And those two
8 questions remain to be seen.

9 Last point. We alluded to many of these
10 milestones earlier. But the NUREG/CR-6997 should be
11 published in the next couple of months. The letter
12 report on the software PRA workshops should also come
13 out in the next couple of months.

14 The QSRM review that BNL was currently
15 undertaking, we should have a draft letter report out
16 for peer review at the beginning of next year and
17 issue the final report later in the year.

18 So that comes down to where would be the
19 best time to come back and give the subcommittee a
20 more detailed briefing on the work that we have been
21 doing. And I felt there is a possibly a target of
22 somewhere around February 2010 because at that point
23 in time, we will have the software PRA workshop letter
24 report that we can give to you. We will have the
25 draft letter report that BNL has done and look at the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

www.nealrgross.com

1 quantity of software reliability methods, as well as
2 probably some better update on the plans for our work
3 going forward.

4 So I think that is the kind of time frame
5 that I think would be beneficial to come back to the
6 subcommittee and let you see what went on at that
7 workshop, let you see what our thoughts are on
8 quantitative software liability methods. And then you
9 can give us your feedback as to whether or not you
10 think we are on the right path, whether there are
11 things we should be looking at or whether we were
12 totally off the wall or whatever.

13 But I think that is probably the time that
14 kind of balances getting our feedback to us in a
15 timely manner but also have the opportunity to get you
16 some products to sink your teeth into.

17 CHAIR APOSTOLAKIS: Well, first of all, do
18 the members want to go around again to comment just on
19 this? Because we are commenting on the plan. I think
20 a lot of the details were discussed the last couple of
21 hours probably should be postponed, --

22 MEMBER SIEBER: I agree.

23 CHAIR APOSTOLAKIS: -- until we know
24 really, until we have a document from you and we know
25 exactly what you are saying.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 So from the plan's perspective, there is
2 an item there that says we are continuing the work on
3 PRA. We will probably say okay. Right? Because we
4 cannot go into the details of what they are doing now,
5 unless somebody has an objection to that. So we are
6 really commenting on the plan and you gave it some
7 feedback a little earlier. And tomorrow we are going
8 to look at the two ISGs. And I guess it will be one
9 letter. Right?

10 MS. ANTONESCU: Two letters.

11 CHAIR APOSTOLAKIS: No, excuse me. Two
12 letters. Only one of the ISGs?

13 MS. ANTONESCU: We had plans for one
14 letter for the Digital Research I&C plan and the
15 second one for the ISG on fuel facility.

16 CHAIR APOSTOLAKIS: So I have three
17 letters?

18 MEMBER BROWN: No, no.

19 CHAIR APOSTOLAKIS: I was told two.

20 MEMBER BROWN: You were going to do one
21 letter on both ISGs, weren't you?

22 MS. ANTONESCU: Yes one letter on that.

23 MEMBER BROWN: So one letter on that and
24 one letter on the R&D plan.

25 CHAIR APOSTOLAKIS: And why can't we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 combine them and have one letter for everything?

2 MEMBER BROWN: Depending on the outcome of
3 the ISGs, peoples conclusions from reading and seeing
4 what they consist of, if we have general agreement
5 with where they are going, you probably could, unless
6 there is something that we consider that ought be re-
7 looked at.

8 CHAIR APOSTOLAKIS: Well anyway, whether
9 we have two letters or one letter is not that
10 important.

11 MEMBER BLEY: It would be essentially, if
12 it is one letter it would be the two pieces stuck
13 together.

14 CHAIR APOSTOLAKIS: Yes, that could be.

15 MEMBER BLEY: So, it could be two as
16 easily. It just seems that the plan ought to have its
17 own letter separate from the ISG.

18 CHAIR APOSTOLAKIS: If that is what you
19 want.

20 MR. HECHT: Among other things, it comes
21 earlier so you don't have to do it twice.

22 MEMBER BROWN: No, the plan letter is for
23 September. Oh, that is --

24 CHAIR APOSTOLAKIS: All critical support
25 letters.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BROWN: No, that is not what she
2 told me earlier.

3 MS. ANTONESCU: It is for September.

4 CHAIR APOSTOLAKIS: Which one is for
5 September?

6 MS. ANTONESCU: The plan.

7 CHAIR APOSTOLAKIS: How about the ISGs?

8 MS. ANTONESCU: October.

9 MEMBER BROWN: October.

10 MR. HECHT: So let's make it two letters.

11 MEMBER BROWN: It is two letters.

12 CHAIR APOSTOLAKIS: Oh, I thought it was
13 for this time.

14 MS. ANTONESCU: No.

15 MEMBER BROWN: If you look at the agenda.

16 CHAIR APOSTOLAKIS: Why do we?

17 MS. ANTONESCU: Because we planned to talk
18 about all these things for this upcoming.

19 MEMBER BROWN: It is a convenient
20 location. You agreed to that.

21 CHAIR APOSTOLAKIS: Oh, okay.

22 MS. ANTONESCU: It was the best time for
23 everybody.

24 CHAIR APOSTOLAKIS: I thought we were
25 commenting on both.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER BROWN: Yes, we will, eventually.

2 MEMBER BLEY: I don't think we had a day
3 in September to get together to go over the second
4 one.

5 CHAIR APOSTOLAKIS: Okay, so it is only
6 the plan.

7 MEMBER BROWN: Yes, for September. I
8 won't be here in October.

9 MS. ANTONESCU: What?

10 MEMBER BROWN: I'm going to Tokyo --

11 MS. ANTONESCU: Oh, yes.

12 MEMBER BROWN: -- under duress.

13 MEMBER BLEY: I thought you did something
14 wrong.

15 MR. HECHT: Alan, can I ask you a
16 question?

17 MR. KURITZKY: Yes.

18 MR. HECHT: With respect to the
19 quantitative, the QSRMs, we have heard that term
20 before, there are I think two parameters that you
21 need, at least for the state-based models that I am
22 used to. One is the failure rate and the other one is
23 the recovery probability or its converse failure
24 probability upon demand.

25 In other words, one is a rate over time

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 and I guess you might call it a failure intensity
2 function but it might not be a constant value. It
3 might have a certain upward or downward trend. And
4 the other one would be the probability of failure on
5 demand. Or like I say, its compliment, the
6 probability of successful operation upon demand.

7 Which do you plan to address or do you
8 plan to address both?

9 MR. KURITZKY: I will have Louis answer
10 it.

11 MR. CHU: I think we tried to address both
12 because both are needed in the PRA model.

13 MR. HECHT: Thank you.

14 CHAIR APOSTOLAKIS: The question now is
15 what should the staff present to the full committee in
16 September? Is it the plan only?

17 MS. ANTONESCU: We cannot schedule the
18 ISGs. We don't have time now for the ISGs in
19 September.

20 CHAIR APOSTOLAKIS: We have an hour and a
21 half for the plan.

22 MS. ANTONESCU: About an hour and a half.

23 CHAIR APOSTOLAKIS: Is that where we are?
24 I mean, the members agree?

25 MEMBER BROWN: It just came out for the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 meeting in September. I don't remember how much time
2 was in it.

3 CHAIR APOSTOLAKIS: It seems only an hour
4 and a half.

5 MEMBER BLEY: Well we lost that other
6 session.

7 CHAIR APOSTOLAKIS: Well they rearrange
8 things but they never do more than an hour and a half
9 on a particular topic.

10 MS. ANTONESCU: An hour and a half.

11 CHAIR APOSTOLAKIS: So it is always an
12 hour and a half.

13 MS. ANTONESCU: Do you know about the
14 plan, how much time we got?

15 MR. DIAS: It is probably an hour and a
16 half. I can check it.

17 CHAIR APOSTOLAKIS: So you guys will
18 present, repeat what you did here? I mean, here you
19 had a few hours.

20 MR. SANTOS: Yes, I think I can say
21 probably do it in less than an hour and a half.

22 CHAIR APOSTOLAKIS: So you will take out
23 some of the stuff you presented to us?

24 MR. SANTOS: Some where I said better.

25 MEMBER BROWN: Pick out some of the stuff.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. SANTOS: Right.

2 CHAIR APOSTOLAKIS: That is what I am
3 saying. You will take out some of the stuff.

4 MEMBER BROWN: Some of it was boilerplate.

5 MR. SANTOS: Yes.

6 MEMBER BLEY: Don't take out the part on
7 the interagency cooperation.

8 MR. SANTOS: Okay.

9 MEMBER BLEY: I think that will be very
10 interesting to the full committee.

11 CHAIR APOSTOLAKIS: I remember this one
12 that got stuck at the beginning there somewhere. What
13 was it about? Further communication.

14 MEMBER BROWN: Yes, that one. Don't mess
15 with that one.

16 CHAIR APOSTOLAKIS: Remember, there are
17 seven other members or whatever. They are not shy.
18 Well okay, then, if you feel you know what you want to
19 do. Is there anything else we want to bring up today?

20 (No response.)

21 CHAIR APOSTOLAKIS: Well, with that, thank
22 you very much. I thank the members. I guess the
23 industry is gone so anyway I thank them, too. And I
24 will see you tomorrow at 8:30.

25 (Whereupon, the meeting was adjourned, to

NRC Response to EPRI DAS and CCF OE Reports

Advisory Committee On Reactor Safeguards
Digital Instrumentation and Control Systems Subcommittee Meeting

August 19, 2009

Debra S. Herrmann, Senior Level Advisor for Digital I&C
Division of Engineering
Office of New Reactors

Topics

- Background
- General Comments on CCF OE Report # 1016731, final, dated 12/2008
- Results of NRC staff independent review of LER data
- General Comments on DAS Report #1016721, final, dated 12/2008
- Recommendations

Background

- NRC policy in this area, and how it was developed, is summarized in the letter from J. Grobe to NEI, dated 11/03/2008
- NRC policy has not changed
- Today we are providing our observations on the technical content of the EPRI reports

General Comments on CCF OE Report

- Fundamental concepts, definitions, and assertions:
 - “Software not a significant source of CCFs”
 - This question does not address the problem of a lack of understanding of digital system failure modes, particularly as related to the nuclear industry
 - A primary concern when migrating to digital technology is that a new source of failure may be introduced: software CCFs
 - Other sources of CCFs (human error, hardware, etc.) remain essentially the same.
 - The question licensees, applicants, and NRC need answered is the prevalence of software CCFs in digital systems, so that the appropriate prevention, mitigation, and verification activities can be taken during the system engineering lifecycle
 - Determining the percentage of software CCFs out of the total CCFs experienced plant-wide is not as useful to a digital system engineer.

General Comments on CCF OE Report

- Fundamental concepts, definitions, and assertions:
“Separation of 1E and non-1E events”
 - EPRI classified 1E software events separately from non-1E software events. EPRI then characterized the quality of non-1E systems as not being representative of the quality of 1E systems.
 - This classification assumption was questioned by the ACRS* and the NRC as being unrealistic compared to using a software integrity level categorization, which more realistically considers the effect of consequences on business operations as being nearly equivalent to consequences affecting safety.
 - *March 2008 Digital I&C Subcommittee Meeting, transcript pp. 216-285

General Comments on CCF OE Report

- Fundamental concepts, definitions, and assertions:
“Separation of 1E and non-1E events”
 - EPRI: 49 events are related to 1E systems, such as reactor protection (RPS), engineered safety features actuation (ESFAS), diesel load sequencer, post accident monitoring (PAM), etc.
 - NRC Response: There is a low number of safety-related digital systems in current operating reactors
 - There are relatively simple digital implementations of parts of protection systems (i.e. core protection calculator systems, engineered safety systems)
 - Eagle 21 is not a complete digital system (DSPs)

General Comments on CCF OE Report

- Fundamental concepts, definitions, and assertions:
“Failure mechanism v. failure mode”
 - The distinction between failure modes and failure mechanisms is an artificial boundary related to the level of abstraction
 - A digital system engineer should focus on failure modes which can affect the correct, and more importantly, the safe operation of a system

General Comments on CCF OE Report

- Fundamental concepts, definitions, and assertions:
 - “Potential CCF v. actual CCF”
 - The distinction between potential CCFs and actual CCFs is an artificial boundary
 - A potential CCF is a latent defect waiting to happen, it is not a near miss that has already occurred

General Comments on CCF OE Report

- Data integrity and data characterization
 - Of the 27 software failures reported in the LER database from 4/2009 through 11/1997 only one of these failures is included in the EPRI study
 - Data prior to 1996 is of questionable value or relevance today because of its age and the rapid evolution of digital equipment
 - Instead of using the LER abstracts verbatim, the abstracts were rephrased which occasionally led to a loss of data fidelity

General Comments on CCF OE Report

Data integrity and data characterization

– Root causes

- Categories of root causes are not mutually exclusive:
 - Ineffective change management, inadequate requirements, inadequate testing, inadequate CM, inadequate V&V, ...
- Occasionally the root causes listed are not consistent with the text in the abstract

– Corrective action

- Categories of corrective actions are not mutually exclusive
 - Analysis(?), corrective maintenance, software change, parameter change, design change, ...
- Occasionally the corrective actions listed not consistent with the text in the abstract

General Comments on CCF OE Report

- Data integrity and data characterization
 - Three events are not counted as a CCF in the statistics, even though the text describes the event as a CCF
 - Three events are not counted as potential CCFs in the statistics, even though the text describes the event as a potential CCF
 - Failure of an analog system is included in the data records
 - An event record is included that has bogus LER number: 00-000-00, this event cannot be traced

General Comments on CCF OE Report

- Because of our comments on data integrity and data characterization, NRC staff conducted an independent review of the LER data to see if we could reproduce the same results.
- Our findings in this area are presented next.
- Note: the threshold for reporting an LER is defined in Table 3 of NUREG 1022 (page 28 of back-up data)

Results of NRC Staff Independent Review of the LER Data

- **Approach**

- An independent analysis of software events reported in the LER database was conducted to determine the frequency with which software CCFs have been experienced by operating reactors.
- A search of the LER database using the keyword “software” within the LER title or abstract returned 200 records.
- To obtain the most relevant data, the most recent records were examined, those from April 2009 - November 1997.
- This set of operational experience is representative of the digital I&C equipment installed and being deployed today.
- The complete final LER report was examined, not just the abstract, to make a determination as to the type and cause of failure.

Results of NRC Staff Independent Review of the LER Data

- Software failures were defined to include:
 - Requirements errors
 - Design errors
 - Algorithm errors (calculation was incorrect)
 - Implementation errors (errors introduced when translating a design into code)
 - Interface errors
 - Parameter errors
 - Timing errors
- Human error, by operators or maintenance staff, was not considered a software failure or CCF.

Results of NRC Staff Independent Review of the LER Data

- Software was defined to include:
 - Operating systems
 - Utilities
 - Applications
 - Firmware (ASICs, PLDs, FPGAs, etc.)
 - Data
- Four categories of CCFs were recognized:
 - Failure of a primary and a back-up system
 - Failure of multiple systems operating in parallel
 - Failure of multiple units at a single location
 - Failure of a common vendor's product at multiple locations

Results of NRC Staff Independent Review of the LER Data

- During the timeframe of April 2009 - November 1997, 45 final LER records* were returned from the search. They were examined and classified as follows:

❖ Legitimate software failure, as defined above	27	60%
❖ Human error (operator or maintenance staff)	10	22.2%
❖ Hardware failure	1	2.2%
❖ N/A digital hardware or software	7	15.6%
❖ total	45	100%

*Only one LER record examined in this independent study was included in the EPRI report.

Results of NRC Staff Independent Review of the LER Data

- The 38 digital system failures were examined and classified as follows:

❖ Legitimate software failure as defined above	27	71.1%
❖ Human error (operator or maintenance staff)	10	26.3%
❖ Hardware failure	1	2.6%
❖ total	38	100%

Results of NRC Staff Independent Review of the LER Data

- The 27 legitimate software failures were examined and classified as follows:

❖ Common cause failure	21	77.8%
❖ Not common cause failure	6	22.2%
❖ total	27	100%

Results of NRC Staff Independent Review of the LER Data

- The common cause failures were examined and classified as follows:

❖ Failure of a primary and a back-up system	2	8.3%
❖ Failure of multiple systems operating in parallel	8*	33.4%
❖ Failure of multiple units at a single location	10*	41.7%
❖ Failure of a common vendor's product at multiple locations	4*	16.6%
❖ total	24	100%

*Note: 2 failures of multiple systems also involved failures of multiple units, 1 failure of multiple systems also involved failure of a common vendor product.

Results of NRC Staff Independent Review of the LER Data

- The types of software failures were examined and classified as follows:

❖	CCF		Non-CCF		Total	
❖ Requirements	1	4.8%			1	3.7%
❖ Design	10	47.7%	3	50%	13	48.2%
❖ Algorithm (calculation)	2	9.5%	1	16.3%	3	11.1%
❖ Implementation	0	0%	1	16.3%	1	3.7%
❖ Interface	2	9.5%	1	16.3%	3	11.1%
❖ Parameter	6	28.5%	0	0%	6	22.2%
❖ Timing	0	0%	0	0%	0	0%
❖ total	21	100%	6	100%	27	100%

Results of NRC Staff Independent Review of the LER Data

Examples of failures

Requirements	Rod Position Deviation Monitor alarm was defined to alarm from a “greater than” set point rather than a “greater than or equal to” set point.	Technical Specification shutdown
Design	Control rod drive (CRD) processor software was designed to expect the day of year field to roll over to one, not zero. In addition, the software was not designed to range check the day of year field (1-366).	Reactor Trip
Algorithm (calculation)	The Electro-Hydraulic Control (EHC) System microprocessor software divided the generator output power signal by 1.5 instead of the correct value of 1.15.	Reactor Scram
Interface	A communications software error was introduced when attempting to fix another communications problem (Arcnet coupler communication boards)	Reactor Scram
Parameter	To correct excessive RFP control valve oscillations, a time constant in the Digital Feedwater Control System (DFCS) software was changed, which had an unanticipated effect (downstream transmitter delay).	Operation prohibited by the plants' Technical Specifications

Results of NRC Staff Independent Review of the LER Data

- An equivalent analysis of the EPRI software failure data yields the following results

	CCF		Non-CCF		Total	
1E Software Events	1	25%	3	75%	4	100%
Non-1E Software Events	14	70%	6	30%	20	100%
Total	15	62.5%	9	37.5%	24	100%

Results of NRC Staff Independent Review of the LER Data

- If the software failure data from the EPRI study and the NRC staff review are combined, the following results are observed

	CCF		Non-CCF		Total	
EPRI software failures	15	62.5%	9	37.5%	24	100%
NRC LER software failures*	20*	76.9%	6	23.1%	26*	100%
Total	35	70%	15	30%	50	100%

*One LER software failure from the NRC staff review was included in the EPRI study. In order not to count it twice, that event is subtracted from the NRC LER CCF failures in this table.

General Comments on DAS Report

- Report is based on ISG-2 Revision 1 which was issued 9/07 and staff guidance on D3, including the 30-minute criterion
 - ISG-2 Revision 2 and ISG-5 Revision 1 are the current documents
 - They address several of the issues raised in the report

General Comments on DAS Report

- Report assumes automated backup systems would be subject to spurious actuations¹, which would defeat the benefits of automation
- This assumption is not valid
 - Automated backup systems have not yet been designed, especially for new reactors
 - Not all spurious actuations have the same consequences to the plant
 - There are solutions to prevent spurious actuations
 - The staff expects 'enhanced quality' for the diverse systems as stated in BTP-19 and ISG-2 Revision 2

¹ – A query of the LER database using “spurious actuation AND diverse actuation system” returned no records. A query of the LER database using “diverse actuation system” returned 1 record from 1991. See back-up data p. 38.

Recommended Next Steps

- Following the execution of the 5-Year Digital I&C Research Plan and the EPRI MOU, reassess policy in this area
- There is a small set of data at this time, so it is difficult to draw a valid conclusion. Therefore, industry and NRC should continue to collect data, including data from international sources, and analyze it as digital systems are installed in NPPs.
- Industry should find a more precise, accurate, and consistent way to collect, categorize, and analyze failure data.

Backup Data

- LER Reporting Threshold
- Specific Comments on OE CCF Report
- Specific Comments on DAS Report

Threshold for LER Reporting Criteria:

NUREG 1022, Table 3

- Plant Shutdown Required by Technical Specifications
- Operation or Condition Prohibited by Technical Specifications
- Deviation from Technical Specifications under § 50.54(x)
- Degraded or Unanalyzed Condition
- External Threat or Hampering
- System Actuation
- Event or Condition That Could Have Prevented Fulfillment of a Safety Function
- Common-cause Inoperability of Independent Trains or Channels
- Radioactive Release
- Internal Threat or Hampering
- Transport of a Contaminated Person Offsite
- News Release or Notification of Other Government Agency
- Loss of Emergency Preparedness Capabilities
- Single Cause that Could Have Prevented Fulfillment of the Safety Functions of Trains or Channels in Different Systems

Specific Comments on CCF OE Report

Chronological Distribution of
Software Failures: EPRI Data

Specific Comments on CCF OE Report

Chronological Distribution of
Software Failures: LER Data

Specific Comments on CCF OE Report

- Peaks in events EPRI evaluated between 2000 and 2006
 - EPRI: One likely explanation is that a large fraction of the reported events correspond to learning curve design errors and mistakes in first of a kind upgrades that are discovered and corrected in the first or second fuel cycle after initial installation, and once corrected, are not recurring
 - NRC Response: All new reactor designs and most current reactor upgrades will be using first of a kind systems. Therefore, should the public expect a similar peak in reported events as new, more complex systems are implemented?

Specific Comments on CCF OE Report

- Fig 3-1, Event Breakdown (page 3-3)
 - Failure Events for each class
 - 1E common defect event rate as a fraction of total 1E events are nearly 100% higher than the corresponding class of Non-1E common defect event rate.

System Class	Non-1E (273 Events)		1E (49 Events)	
Failure Type	Events	% of Non-1E Events	Events	% of 1E Events
SINGLE DEFECT	196	71.8%	22	44.9%
COMMON DEFECT	77	28.2%	27	55.1%

Specific Comments on CCF OE Report

- Fig 3-1, Event Breakdown (page 3-3)
 - Common Defect Events_for each class
 - 1E common defect event rates as a fraction of total 1E events is higher than the corresponding classes of Non-1E common defect event rates

System Class	Non-1E (273 Events)		1E (49 Events)	
Failure Type	Events	% of Non-1E Events	Events	% of 1E Events
SW	20	7.3%	4	8.2%
Non-SW	57	20.9%	23	46.9%

Specific Comments on CCF OE Report

- EPRI: “Reactor protection systems contain significant built-in diversity in the form of different input signals that can initiate trips, such that a software fault in the processing of any one of the signals has limited impact on overall safety function. For most events, at least two diverse signals can initiate a trip in time to avoid exceeding design basis acceptance criteria.”
- NRC Response: This conclusion may not be supportable for systems in which all trip functions are integrated into a single protective system component such that a failure in one part of the system might adversely affect the whole system.

Specific Comments on CCF OE Report

- EPRI: “. . .Software Changes are performed in twice as many events as those where Software Design issues were reported as causes (Figure 4-3). This trend suggests that licensees are using software to add features that protect against recurrence of non-software failures.”
- NRC Response: Industry has been adding complexity to safety systems to increase reliability. This trend contradicts the industry argument that diverse actuation systems would adversely affect safety and add more complexity to the safety systems and thereby reduce safety system reliability.

Specific Comments on CCF OE Report

- EPRI described an event in which the control element assembly (CEA) calculation software did not account for CEA slips and delayed Rx trip by 16 seconds.
 - The defect originated in a system design that allowed multiple RPCBs coupled with an incomplete understanding of specific details of rod drop phenomena, which was then reflected in the application software logic.
 - A claim is made that a diverse platform running the same logic would have had the same problem, compounded by increased complexity in its design, operation and maintenance.
- NRC Response: If the diverse platform was running the same design or logic, the diverse platform would not have been sufficiently diverse.

Specific Comments on DAS Report

- Report assumes automated backup systems would be subject to spurious actuations, which would defeat the benefits of automation
- This assumption is not valid (continued):
 - A query of the LER database using “spurious actuation AND diverse actuation system” returned no records
 - A query of the LER database using “diverse actuation system” returned 1 record
 - 2691991009, 7/03/1991, Oconee 1, 2, 3, title: “One of Two Diverse Actuation Systems for Loss of Main Feedwater Mitigation Systems Was Found Inoperable Due to a Design Deficiency”
 - The other two Oconee units were subject to the same potential problem.
 - The root cause of this event was a design deficiency, failure to anticipate the interaction of systems, during the original design of the these systems.
 - The design of a major EFDW modification in 1979 which added the motor driven pumps and upgraded the instrumentation and controls did not consider the role of HDPs.
 - Similarly, the installation of the loss of feedwater anticipatory RPS trip in 1981 also did not consider the role of the HDPs.

Specific Comments on DAS Report

- The 2nd paragraph of 6.1.2 states the failure probability for digital systems is 10^{-4}
 - No basis is given for this claim

Specific Comments on DAS Report

- Row 5 of Table 4-2 (BWR steam line break outside containment) shows 11 minutes to fuel damage, assuming no MSIV closure or reactor makeup
- The report states for this example:
 - “the proposed automated DAS is not needed for steam line break outside containment.”
- It is hard to make the conclusion that a DAS is not needed in the absence of a human factors analysis

Specific Comments on DAS Report

- For Table 5-6 CE #1, the spurious DAS CDF of $1.2\text{E-}8/\text{yr}$ can not be reproduced
- Spurious ECCS IEF of $0.0024/\text{yr}$ times $2.1\text{E-}5$ CCDDP should give $5\text{E-}8/\text{yr}$ not $1.2\text{E-}8/\text{yr}$
 - Correct math error -- there appears to be a transcription error between spurious ECCS and spurious SG isolation
 - Same error is in Tables E-2, E-4, and E-6

Specific Comments on DAS Report

- For Table E-8 CE #1, the spurious SG isolation CDF of $5E-8/\text{yr}$ can not be reproduced
- Spurious SG isolation IEF of $0.0024/\text{yr}$ times loss of FW CCDP of $5E-6/\text{yr}$ should give $1.2E-8/\text{yr}$ not $5E-8/\text{yr}$
 - Correct math error -- there appears to be a transcription error between spurious ECCS and spurious SG isolation

Specific Comments on DAS Report

- Two major human error probabilities are quantified
 - Case 1 is for operator to initiate low pressure injection for the RPV flooding contingency with a time window of 9 minutes and cognitive human error probability of 0.16
 - The second case is for RPV level control with a time window of 19 minutes and cognitive HEP of $1.2\text{E-}3$
- The performance shaping factors and type of response are basically identical. The analyses are based on T-H (MAAP) runs. The factor of 2 difference in time window results in nearly two orders of magnitude difference in HEP, indicating a hypersensitivity to available time and hence great sensitivity to the T-H analyses. The T-H analysis used as input to the HCR model is clearly a major source of uncertainty.
 - This source of uncertainty should be addressed in Section 6.1.4.

NRC DIGITAL SYSTEM RESEARCH PLAN FY 2010 THROUGH FY 2014

**Advisory Committee on Reactor Safeguards
Digital I&C Subcommittee
August 20, 2009**

**Russell Sydnor
Daniel Santos
Division of Engineering
Office of Nuclear Regulatory Research
(301-251-7405, russell.sydnor@nrc.gov)
(301-251-7664, daniel.santos@nrc.gov)**

AGENDA

- **Purpose and Objectives**
- **Background and the current FY05-FY09 Digital System Research Plan**
- **Development of the new FY10-FY14 Digital System Research Plan**
- **Proposed Research Programs**
- **Research prioritization, schedule, metrics, and tools**

Purpose and Objectives

- **To obtain a letter of endorsement from the ACRS for the FY10-FY14 Digital System Research Plan**
- **To discuss and obtain insights from ACRS members on the strategic direction of Digital System regulatory research and improving the research plan**
- **Help answer the question: Are we missing something?**

- **NRC reviews of digital I&C systems are challenging**
 - **Need to supplement and augment current review guidance**
 - **Need to develop technical bases to support risk-informed digital system reviews and operational assessments**

BACKGROUND, cont.

- **Issues include**
 - **Complexity and potential new failure modes**
 - **Enhancement of appropriate skills and knowledge base**
 - **Limited operating history**
 - **Higher level of system integration and complex communication schemes**
 - **Cyber vulnerabilities**

BACKGROUND, cont.

- **RES develops technical bases, guidance, and methods to support regulatory decisions**
- **Accomplished through**
 - **Confirmatory and anticipatory research**
 - **Testing and analyses**
 - **Development of tools, data, and analytical models**
 - **National and International Collaboration**

BACKGROUND, cont.

- **Research plans are a communication and planning framework to identify necessary research initiatives to support regulatory decisions**
- **NRC research collaborates with industry research when the research and products are complementary and beneficial**

BACKGROUND, cont.

- **1997 NAS report “Digital Instrumentation and Control Systems in Nuclear Power Plants: Safety and Reliability Issues”**
- **NRC Digital System Research Plan FY01 - FY04 focused on several 1997 NAS report recommendations and I&C vendor development efforts**

BACKGROUND, cont.

- **NRC Digital System Research Plan FY05 - FY09 continued previous research and added significant new research topics such as:**
 - **Cyber security**
 - **What constitutes adequate diversity?**
 - **What are the guidelines for developing FPGA-based safety systems?**
 - **Highly integrated control rooms**

- **NRC Steering Committee for Digital I&C established in 2007**
 - Created to address specific industry questions
 - Re-prioritization of research, with focus on supporting development of ISGs
 - Research provided technical support and information to various TWGs

FY05 - FY09 Digital System Research Plan

Covers Seven Research Programs

- Digital system research**
 - Diversity and Defense in Depth**
 - Highly Integrated Control Rooms**
 - Other issues**
- Software safety/dependability/reliability**
- Risk assessment of DI&C systems**
- Security of digital safety systems**
- Emerging technology research**
- Advanced reactor DI&C**
- Collaborative research and Standards development**

FY05-FY09 Digital System Research Plan

- **Status as of 8/09: 7 research programs made up of 29 research projects and tasks**
 - **In 21 of 29 areas - significant research progress**
 - **23 research products delivered**
 - **17 Projects in progress**
 - **7 expected to be completed by the end of 2009/early 2010**
 - **On-going projects carried over to the new plan**
 - **Research was not initiated in 8 project areas**
 - **3 carried over to the new plan**
 - **5 will not be pursued based on User Office input and re-prioritization**

- **FY05 – FY09 Projects that were not started and not selected for FY10 – FY14 scope**
 - **COTS Digital Systems**
 - **THD effects on DI&C**
 - **Radiation Hardened ICs**
 - **Smart Transmitters**
 - **Advanced NPP Digital Risk**

FY05-FY09 Digital System Research Plan

- **Challenges**
 - **Staff Turnover**
 - **Resource issues (e.g., continuing resolutions, DOE Lab COI)**
 - **Re-prioritization to support emerging needs**
 - **DI&C Steering Committee and TWGs**
 - **Licensing Office User Needs**
 - **New information on actual applications of the technology**

DIGITAL SYSTEM RESEARCH PLAN FY10- FY14

- **Collaborative efforts with supported Offices**
 - Multiple meetings and presentations with staff
 - Working drafts provided to solicit informal inputs
- **Current draft is the result of input from the I&C staff, I&C branch chiefs, and senior advisors from program offices (NRR, NRO, NSIR and NMSS)**

DIGITAL SYSTEM RESEARCH PLAN FY10- FY14

- **Comments, needs, and priorities of the various offices have been incorporated. Comments included**
 - **Include NRC training courses as an optional task for each research project statement of work**
 - **Avoid duplicate efforts, leverage information readily available in the public literature, and encourage industry to take the lead on research topics more applicable to industry (e.g., sustainability and obsolescence management)**

DIGITAL SYSTEM RESEARCH PLAN FY10- FY14

- **Comments included, cont.**
 - **Continue digital I&C PRA work**
 - **Evaluate the capabilities and limitations of automated tools used in various life-cycle activities**
 - **Improve understanding of digital technology failure modes and effects and their analyzes**
 - **Provide specific deliverables**
 - **Staff guidance, acceptance criteria, tools and methods, review procedures, training curricula**

RESEARCH PROGRAMS

Communications Among Plant-wide systems

- **Background**
 - 10CFR50, GDC 24 – “Separation of Protection and Control Systems”
 - IEEE Std 603 requirements for independence, etc.
 - ISG#4 provides guidance for interdivisional communications and network configurations
- **Technical Basis**
 - Address issues such as independence, interdivisional two-way communications, data density, communication protocols, and vulnerabilities through the development of a generic model

Communications Among Plant-wide systems

- **Outcome, cont**
 - **Additional regulatory guidance on DI&C network characteristics and communication protocols**
 - **Recognition of network-based challenges to reliability, redundancy, and independence among systems**
 - **Development of a generic model of plant-wide digital systems**

Safety Assessment of Tool Automated Processes

- **Background**
 - Lifecycle activities are becoming more automated (e.g., code generation, V&V)
 - “Proven in use” claims are not easily assessable
- **Technical Basis**
 - Shift in source of errors from the primary engineering activity (e.g., coding mistakes) to mistakes in the process design and tool automation
 - Lack of error detectability and errors could be exacerbated through other life-cycle phases

Safety Assessment of Tool Automated Processes

- **Outcome, cont**
 - **Regulatory guidance to provide acceptance criteria regarding the use of tool-assisted or tool-automated engineering activities**

Development of Benchmark Reliability Data

- **Background**
 - Continuation from the previous plan
 - UVA fault injection process to estimate digital system dependability for use in PRA models
- **Technical Basis**
 - High quality design, defensive measures, and rigor may not prevent or mitigate all faults
 - Invasive method to detect faults that were not discovered during the system development process
- **Outcome**
 - Develop a testing tool to augment determinations of “reasonable assurance” and develop a process for evaluating reliability

Integrated Plant & DI&C System Modeling

- **Background**
 - Digital I&C lacks supplementary tools and proven models for validation
- **Technical Basis**
 - An integrated plant model enables better simulation of overall plant response to digital systems failures
 - Assist in the validation and safety impact of proposed software based enhancements
- **Outcome**
 - Develop a model to assist reviewers in the validation and characterization of DI&C on reactor safety

Digital System PRA

- **Background**
 - **Need to establish processes to support risk informing regulatory reviews of digital technologies**
 - **Proof-of-concept benchmark studies conducted including various modeling methods**
 - **In May 2009 workshop, experts established philosophical basis for modeling software failures in a reliability model**
- **Technical Basis**
 - **Remaining long term issues (e.g., understanding of failure modes; failure propagation; quantification of reliability, including software; uncertainty analysis; human-reliability associated with digital systems; integration of risk insights)**

Digital System PRA

- **Technical Basis, cont.**
 - Lack of international consensus
 - Feasibility and practicality of methods and development of standard regulatory framework
- **Outcome**
 - Development of PRA methods, tools, and guidance, if practical, to support:
 - Nuclear plant licensing decisions using information on the risks of digital systems
 - Including models of digital systems into nuclear plant PRAs

Operating Experience Analysis

- **Background**
 - Ongoing project that responds to ACRS recommendation for the staff to evaluate the OpE with digital systems in the nuclear industry and other industries to gain insights regarding potential failure modes
 - Work to date has supported work on diversity strategies
- **Technical Basis**
 - Data from operational experience obtained and analyzed to date have been found to be inadequate and not statistically significant to identify and analyze failure modes, partially exacerbated by rapid changes and different application domains

Operating Experience Analysis

- **Technical Basis, cont**
 - What constitutes adequate Ope information that would support concluding that a component/system is acceptable? What meaningful information can be extracted from OpE?
- **Outcome**
 - Document insights gained from OpE data reviews
 - An improved failure reporting framework for DI&C related incidents and for “proven in use” claims
 - A digital component failure parameter database to support PRA research

Analytical Assessment of DI&C Systems

- **Background**
 - **ACRS 2007 recommendation – (inventory and classification of the various types of DI&C systems and components in use; EDO letter to the ACRS dated May 28, 2008 (ML081290195)**
 - **Staff Requirements Memorandum M080605B dated July 2008 (Identify failure modes; feasibility ... risk quantification)**
 - **Enable research in DI&C PRA and HF**
 - **Inadequate information from OpE**
 - **NRR need for analysis of 3 pre-approved platforms in highly integrated environment**

Analytical Assessment of DI&C Systems

- **Technical Basis**
 - **Advancement in understanding DI&C failure modes**
 - **Feasibility of applying failure analysis in risk quantification**
 - **Focus: Application domain characterized by currently approved + emerging systems.**
 - **Framework useful in analyzing OpE for root cause**

Analytical Assessment of DI&C Systems, cont.

- **Outcome**
 - **Inventory and classification/characterization of DI&C systems for safety functions in NPPs**
 - **Identification of credible systematic failure and fault modes typical of software-intensive DI&C systems**
 - **Framework of contributing factors**
 - **Support for other research projects**

- **Background**
 - Proper use of diagnostics, prognostics, and self-testing techniques in non-safety systems has shown improvements in reliability and availability
 - Expect use on safety systems and in more integrated systems (e.g., new and advanced reactor designs)
- **Technical Basis**
 - Need to assess the safety impact of these systems and techniques and their impact on equipment operability
- **Outcome**
 - Regulatory acceptance and review criteria

Security of Digital Platforms

- **Background**
 - Ongoing project by Sandia National Laboratories
 - Conducting cyber-vulnerability assessments on NRC approved digital platforms
- **Technical Basis**
 - Cyber vulnerabilities, if exploited, represent a source of potential failures that could lead to safety significant consequences
- **Outcome**
 - Gain an understanding of cyber vulnerabilities in approved platforms
 - Investigate the appropriate elimination and mitigation of potential security hazards

- **Outcome, cont**
 - **Provide additional regulatory guidance and acceptance criteria to support assessments of digital systems in nuclear facilities and applications**

Network Security

- **Background**
 - Ongoing projects by Sandia and Oak Ridge National Labs
 - ORNL Letter Reports on Wireless Network security
- **Technical Basis**
 - Cyber vulnerabilities, if exploited, represent a source of potential failures that could lead to safety significant consequences
 - Networks can present additional vulnerabilities as network architectures increase in complexity and system reach
- **Outcome**
 - NUREG/CRs discussing wireless and wired network security vulnerabilities and mitigation strategies

Network Security

- **Outcome, cont**
 - **Additional regulatory guidance for identifying potential vulnerabilities and performing network security assessments**

Security Assessments of EM/RF Vulnerabilities

- **Background**
 - Ongoing project by Sandia National Laboratories
 - NUREG/CR Study of EMP from early 1980s
 - Preliminary Reports to date evaluate two NPPs
 - The Commission has not specifically identified EM/RF emitting weapons as a credible threat to nuclear stations, however, some limited anticipatory research is considered prudent
- **Technical Basis**
 - Digital technologies tend to have a higher vulnerability to EMP than analog systems due to different operational environments (voltage, current, frequencies, materials)
 - The nature of EM/RF weapons continues to evolve

Security Assessments of EM/RF Vulnerabilities

- **Outcome, cont**
 - **Support a new regulatory position on EM and RF**
 - **Recommendations for potential mitigations, as appropriate**

Advanced Reactor Instrumentation

- **Background**
 - **Need to conduct anticipatory research to analyze the requirements and potential safety issues involved with instrumentation of advanced reactors**
- **Technical Basis**
 - **Advanced reactors (high temperature gas cooled and liquid metal) will operate in conditions different from the current generation of reactors.**
 - **Different transducers may require different approaches for accuracy assessments and compensation methods**

Advanced Reactor Instrumentation

- **Outcome, cont**
 - **Regulatory guidance for reviewing advanced instrumentation for use in advanced reactor (e.g., HTGR) safety systems**

Advanced Reactor Controls

- **Background**
 - Anticipatory and exploratory research for increased use of automation and advanced control algorithms in safety systems
- **Technical Basis**
 - Increased use of automation in control rooms including startup, shutdowns, and operating mode changes would present new regulatory review challenges
- **Outcome**
 - Identify key areas that may become important in the future

Survey of Emerging Technologies

- **Background**
 - Ongoing and periodic series of reports on emerging capabilities that have potential applicability for safety systems
 - Results have been helpful in reducing the time required to identify emerging technology that may require regulatory review in the digital area
 - Examples include FPGAs, wireless technologies
- **Technical Basis**
 - Identify key areas on R&D stage and early adoption that may become important in the future
 - Help develop and maintain staff capabilities to support identification and resolution of issues that develop as the nuclear industry employs state-of-the-art digital technologies

Survey of Emerging Technologies

- **Outcome, cont**
 - Additional reports and training modules for staff

Collaborative and Cooperative Research

- **Background**

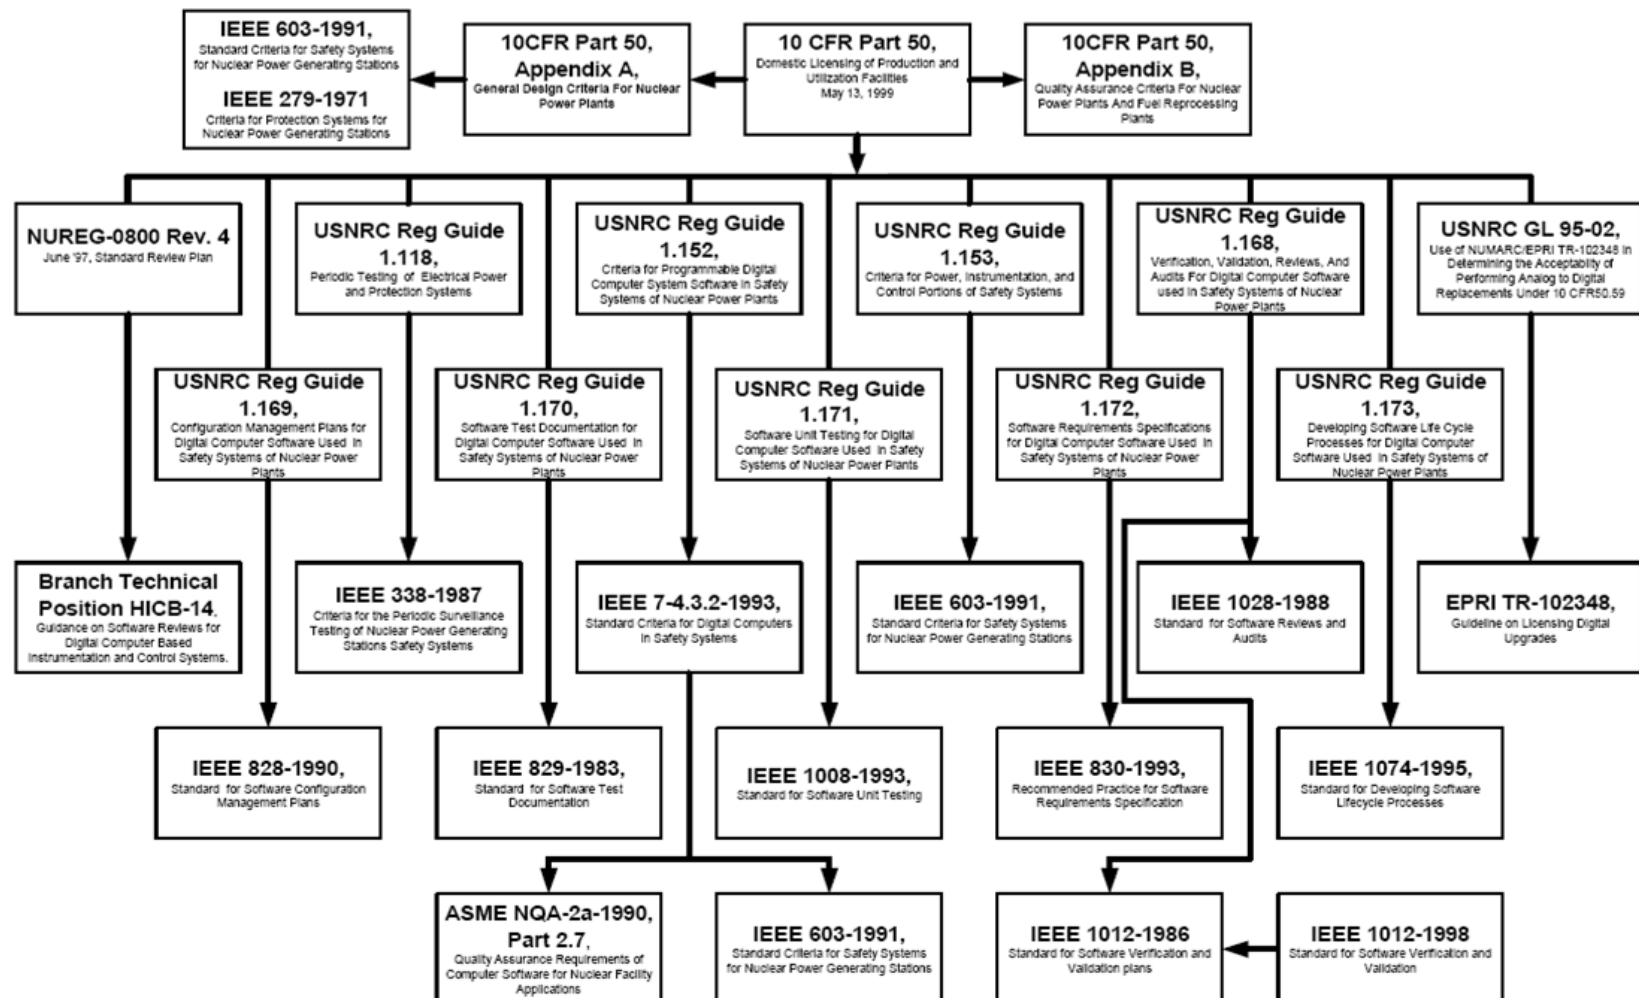

- **Ongoing collaboration with other Federal agencies for research in safety assessment & security assurance of DI&C systems (e.g., NITRD program, DOD, NASA)**
- **COMPSIS project to collect international operational experience**
- **Halden Reactor Project**
- **Addendum to the MOU between EPRI and RES that includes specific DI&C and Human Factors research activities such as:**
 - **Digital I&C system operational experience**
 - **Digital I&C time responses for manual actions and effects of degraded I&C on human performance**

Collaborative and Cooperative Research

- **Technical Basis, cont**
 - Need to leverage the capabilities and products of other agencies and organizations to keep up with the rapidly changing DI&C technologies and to better understand best practices and lessons learned with the deployment of digital technologies
- **Outcome**
 - Technical reports, workshop results, and training modules for staff

- **Background**
 - Ongoing effort to understand, evaluate, and participate in national and international standards
- **Technical Basis**
 - Globalization of nuclear power technology and previous application of digital technologies by other industries (e.g., aviation) with their own sets of standards may provide important insights and relevant guidance that could be leveraged to complement NRC reviews
- **Outcome**
 - NUREG providing an evaluation of relevant standards and guidelines, as applicable to regulatory activities concerning safety systems. Work will leverage on-going efforts such as the MDEP program and IAEA working groups

Organization of Regulatory Guidance Knowledge

Electromagnetic Compatibility

- **Background**
 - **Carry-over of project that remained unfinished. Portions were conducted by Oak Ridge National Laboratories**
 - **Regulatory Guidance 1.180 provides guidance for the required confirmation that safety-related I&C systems are compatible with the EM environment at nuclear facilities**
- **Technical Basis**
 - **Industry claims that the high-frequency conducted susceptibility limits are overly conservative because the NPP emissions data upon which the test limits were based should not have included capture power transients (which are addressed in separate tests)**

Electromagnetic Compatibility

- **Outcome, cont**
 - **Interact with EPRI via the MOU and update the guidance in Reg Guide 1.180, if necessary**

- **Background**
 - Need to address degraded power grid effects and power fluctuations (e.g., overvoltage spikes) on digital components
 - Project stems from the 2003 power blackout in the northeast
- **Technical Basis**
 - Increase used of power electronics and its risks are not well understood.
 - Dependencies on power supplies across distributed networks are not well understood
- **Outcome**
 - Develop models, tools, and regulatory guidance to better understand the effects of power fluctuations on digital equipment

Operating Systems

- **Background**
 - Evaluation criteria for operating systems likely to be used in NPPs
 - Will leverage existing research from other sectors
- **Technical Basis**
 - Increased complexity, capability, “proven in used” claims for proprietary versions complicates reviews
 - Added features that may not be necessary to support the safety functions
 - Safety impact of self-testing features
- **Outcome**
 - Tools and review guidance to evaluate operating systems including self-testing features

PRIORITIES FOR CONDUCTING THE RESEARCH

- **Inputs included**
 - **Completing ongoing work**
 - **Commission Direction, Program Office inputs, ACRS recommendations**
- **Based on 3 categories for developing the research products**
 - **Support development of a new regulatory position**
 - **Improving quality, clarity, and consistency of regulatory guidance**
 - **Improving efficiency, effectiveness, and timeliness of regulatory reviews**

PRIORITIES FOR CONDUCTING THE RESEARCH, cont

- **Incorporated in the Plan as**
 - **Relative priority (high, medium and low)**
 - **Determined based on program office requests and likely application schedule**
 - **Projects scheduled based on priority and available resources**
- **Used to support RES budget process**

SCHEDULE

- **The draft plan was made publicly available on July 29th, 2009 and is on NRC's ADAMS under accession number ML082470725**
- **As of August 17, 2009, the staff had not received any public comments**
- **Public and stakeholder commenting period until September 20th, 2009**
- **Plan is to go into formal NRC concurrence (office director concurrence) following incorporation and resolution of all ACRS and public comments**

SCHEDULE, cont

- **The staff aims to have the research plan published by the end of calendar year 2009**
- **Working under a MOU between EPRI and RES, the parties intend to use the research plan to help identify areas for potential collaborative research**

Schedule for Research Projects

	FY10	FY11	FY12	FY13	FY14
New Start	4	2	2	1	1
Finish	2	3	2	7	6

METRICS

- **RES programmatic, schedule, and budget metrics**
- **RES peer review process**
- **NRC concurrence process including surveys**
- **Licensing offices periodic assessments of RES**
- **ACRS quality reviews**
- **New technical metrics to measure success of RES digital I&C products**
 - **RES will consider establishing new metrics**
 - **Based on your experience are there any proven technical metrics to measure success of a project that you would recommend?**

TOOLS

- **Use of NRC internal website and internal Microsoft Sharepoint environment to communicate seamlessly with internal customers**
 - **Baseline and current resource loaded schedules (updated periodically and with new information)**
 - **User needs and source requests**
 - **Research priorities and selection criteria**
 - **List and links to each research SOW and deliverables**
 - **RES points of contacts and associated contractors**
 - **Access to performance metrics**
 - **Capability mapping and common templates to improve effectiveness and efficiency of initiating and modifying work**

TOOLS, cont

- **Working to improve Research section in the NRC public website to improve visibility, organization, and timeliness of research deliverables and information**

RES - Office of Nuclear Regulatory Research - Microsoft Internet Explorer provided by USNRC

Email: Russell.Sydnor@nrc.gov
Phone: 301-251-7405

Mission Statement

The United States Nuclear Regulatory Commission (NRC) Office of Nuclear Regulatory Research (RES) Digital Instrumentation and Control (DI&C) Branch develops and applies methods, data, tools, standards, and guidance to assess the adequacy of DI&C systems. Our mission is to develop and implement a broad research program in the area of DI&C addressing digital system contributions to risk, software attributes that can affect safety or security, new reactor designs, and development of consensus standards. The DI&C Branch coordinates research and development activities with the program offices and external stakeholders (e.g., Universities, National Labs). It also maintains expertise in Instrumentation and Control (I&C) Engineering to support the identification and resolution of I&C issues important to nuclear power plant safety.

Welcome Message

Welcome to the Digital Instrumentation and Controls Branch (DICB) Internal Web Page. This page is intended for the use of the DICB staff. It is to be used as part of the implementation of the "Hub and Spoke" Program model. It will be used to track programs and projects internally prior to updating the rest of the agency and the public. Please note that this is a tool to be used by the branch. It is not a substitute for agency accepted methods for archiving documents.

Russell.Sydnor@nrc.gov

SUMMARY

- **NRC Digital System Research Plan FY10 - FY14 provides a flexible, adaptable framework for supporting NRR, NRO, NMSS and NSIR regulatory bases**
 - **Broad-based program oriented toward providing more consistent processes for regulating nuclear applications**
 - **Improving review methods for new applications of existing technologies, advanced technologies and new issues**
 - **Developing regulatory acceptance criteria**

SUMMARY, cont

- **The staff requests that the ACRS endorse the plan and continue to provide inputs on how to improve the research plan**
- **RES is looking forward to working closely with the ACRS as the research is implemented**

Glossary

- **Common Cause Failure** - A single event that causes failure of two or more components at the same time.
- **Defect (software)** A product anomaly. Examples include such things as omissions and imperfections found during early life cycle phases; and faults contained in software sufficiently mature for test or operation
- **Dependability** –
 - a) A broad concept that incorporates various characteristics of digital equipment, including reliability, safety, availability, and maintainability. (NRC RIS 2002-22)
 - b) The collective term used to describe the availability performance and its influencing factors: reliability performance, maintainability performance and maintenance support performance. (IEC 50-191)
- **Error** – A discrepancy between a calculated, observed, or measured quantity and the true or theoretically correct value or condition. (IEEE)

Glossary, cont

- **Failure – The termination of the ability of an item to perform a required function. (IEEE)**
 - **Note: “Failure” is an event, as distinguished from “fault” which is a state. (IEC 50-191)**
- **Failure Effect - A description of the events that occur because of a specific Failure Mode**
- **Failure mode - The physical or functional manifestation of a failure. For example, a system in failure mode may be characterized by slow operation, incorrect outputs, or complete termination of execution**

Glossary, cont

- **Fault – The state of an item characterized by inability to perform a required function, excluding the inability during preventive maintenance or other planned actions, or due to lack of external resources.**
 - **Note 1: Item (or entity): Any part, component, device, subsystem, functional unit, equipment, or system that can be individually considered. An item may consist of hardware, software, or both, and may also, in particular cases, include people.**
 - **Note 2: A fault is often the result of the failure of the item itself, but may exist without prior failure (as in the case of software).**

Glossary, cont

- **Latent fault** – an existing fault that has not yet been recognized (IEC 60050-191).
- **Mistake** –
 - a) A human action that produces an unintended result (electronic computation, IEEE).
 - b) A human action that produces an incorrect result (software, IEEE).
- **Probabilistic risk analysis** – A systematic method for addressing risk as it relates to the performance of a complex system to understand likely outcomes, sensitivities, areas of importance, system interactions, and areas of uncertainty.
- **Random hardware failure** – A failure, occurring at a random time, which results from one or more of the possible degradation mechanisms in the hardware. (IEC 61508-4, section 3.6.5)
- **Reliability** – The ability of an item to perform a required function under stated conditions for a specified period of time. (IEEE)
- **Risk** – Combination of the probability of occurrence of loss and the severity of that loss [ISO/IEC Guide 51:1990]

Glossary, cont

- **Risk analysis** – A procedure to develop probability estimates of occurrence of each specific hazard. (IEEE)
- **Risk assessment** – The overall process of identifying all the hazards in a system (internal and external), estimating the risk from each hazard and the overall risk resulting from their combination. See also: Risk estimation.
- **Risk estimation** – The process of assigning values to the severity of loss and the probability or likelihood of its occurrence. See also: Risk assessment.
- **Risk-Informed** – An approach to decision-making in which risk insights are considered along with other factors such as engineering judgment, safety limits, and redundant and/or diverse safety systems. Such an approach is used to establish requirements that better focus licensee and regulatory attention on design and operational issues commensurate with their importance to public health and safety. (NUREG 1614)

Glossary, cont

- **Safety – Adequate protection of public health and safety and the environment. (NUREG 1614 p. 4)**
 - **Note 1: Adequacy is determined with respect to the safety goals for a NPP defined in the Commission policy statement [17] in terms of a broadly defined acceptable level of radiological risk. This policy statement enables a mapping of the NRC definition of safety to that in ISO/IEC Guide 51:1999 and IEC 61508-4, viz. “freedom from unacceptable level of risk.”**
 - **Note 2 relevant to DI&C PRA: The NRC policy statement defines “acceptable level of risk” in terms of individual risk and societal risk (life and health) goals and quantitative targets. Guidelines relevant to NPP PRA map the policy level health goal into performance objectives such as “core damage frequency” from which the performance objective (“risk budget”; “risk responsibility”) can be derived and allocated for a reactor safety DI&C system.**

Glossary, cont

- **Safety-related** – In the regulatory arena, this term applies to systems, structures, components, procedures, and controls of a facility or process that are relied upon to remain functional during and following design-basis events. Their functionality ensures that the key regulatory criteria, such as levels of radioactivity released, are met. Examples of safety related functions include shutting down a nuclear reactor and maintaining it in a safe shutdown condition.
- **Systematic failure** – A failure related in a deterministic way to a certain cause, which can only be eliminated by a modification of the design of the manufacturing process, operational procedures, documentation or other relevant factors. (Adapted from IEC 61508-4, Section 3.6.6)
- **Systemic cause** – A cause related in a deterministic way to an effect or result.
 - **Note: Related term & definition: Failure cause:** The circumstances during engineering, manufacturing, installation, configuration, usage, or maintenance leading to a failure deterministically. (Adapted from IEC 60050-191)

Digital I&C PRA

Advisory Committee on Reactor Safeguards
Digital Instrumentation and Control Subcommittee
August 20, 2009

Alan Kuritzky
Division of Risk Analysis
Office of Nuclear Regulatory Research
(301-251-7587, Alan.Kuritzky@nrc.gov)

Outline of Presentation

- Background
- Objective
- Previous research
- OECD/NEA/CSNI/WGRisk technical meeting
- Software reliability quantification
- Milestones and future interactions

Background

- Current licensing process for digital systems is based on deterministic engineering criteria
- Commission's 1995 probabilistic risk assessment (PRA) policy statement encourages use of PRA to the extent supported by the state-of-the-art
- Risk-informed analysis process for digital systems has not yet been satisfactorily developed

Objective

- Identify and develop methods, analytical tools, and regulatory guidance to support:
 - Nuclear power plant (NPP) licensing decisions using information on the risks of digital systems
 - Incorporation of digital system models into NPP PRAs

Previous Research

- Previous RES projects (2004-2009) have:
 - Identified a set of desirable characteristics for reliability models of digital systems
 - Applied various probabilistic reliability modeling methods (traditional and dynamic) to an example digital system
- This research is documented in a series of NUREG/CR reports
 - Traditional reliability modeling methods (NUREG/CR-6962 [2008], draft NUREG/CR-6997 [2008])
 - Brookhaven National Laboratory (BNL)
 - Dynamic reliability modeling methods (NUREG/CR-6901 [2006], NUREG/CR-6942 [2007], NUREG/CR-6985 [2009])
 - Ohio State University, ASCA, University of Virginia

Key Findings

- The level of detail of the digital feedwater control system (DFWCS) model is adequate for capturing many of the system design features, while not being too complicated to be developed and solved.
- However, at this level of detail, the study requires a deterministic simulation tool (model) to determine the component-level sequences resulting in system failure.
- The use of the simulation model to determine component-level failure sequences reduces the event tree/fault tree and Markov models solely to means for quantifying system reliability.
- Performing a failure modes and effects analysis and running the simulation tool revealed two failure scenarios (one involving differences in signal delay times, and the other involving both CPUs operating in tracking mode) that were not identified by the plant hazards analysis.

Key Findings (Continued)

- The order in which component failure modes occur can affect the impact the failures have on the system.
- The Markov method can easily account for the order in which component failure modes occur, and was used for quantification.
- Due to modeling limitations (including lack of a model for incorporating software failure), as well as the weakness of publicly available digital component failure data, the current model and results cannot be used to support decision making.
- The approach applied in this study to the DFWCS should also be applicable to protection systems.

Areas of Potential Additional Research

- Improved approaches for defining and identifying failure modes of digital systems
- Software reliability methods for quantifying software failure rates and probabilities, and addressing software common cause failure (CCF)
- Better data for hardware failures (both independent and common cause) and a break down of the failure rates by failure modes of digital components
- Methods and parameter data for modeling self-diagnostics, reconfiguration, and surveillance, including using other components to detect failures
- Methods for human reliability analysis (HRA) associated with digital systems
- Determining if and when a dynamic model of controlled plant processes is necessary in developing a reliability model of a digital system

OECD/NEA/CSNI/WGRisk Technical Meeting on Digital System Reliability

- NRC (with support from BNL) led an Organisation for Economic Co-operation and Development (OECD)/Nuclear Energy Agency (NEA)/Committee on the Safety of Nuclear Installations (CSNI)/Working Group on Risk Assessment (WGRisk) activity on digital system reliability.
- Objectives: Make recommendations regarding current methods and information sources used for quantitative evaluation of digital system reliability for PRA applications and identify, where appropriate, the near and long term developments that would be needed in order to improve reliability assessments
- Technical meeting with participants from over 20 organizations and 11 countries held in Paris during October 21-24, 2008
- Summary report of technical meeting prepared by BNL and recently approved for publication by CSNI

WGRisk Meeting Results

- Useful forum for sharing and discussing respective experiences
- Spectrum of opinions on methods for modeling digital systems
- Wide variation in terms of scope and level of detail for existing models of digital systems
- General agreement on need to account for software failures
- General agreement on need to address scarcity of probabilistic data
- General agreement on need to continue research to address technical challenges

Recommendations (1 of 2)

- Method development
 - Develop a taxonomy of digital component failure modes for common use
 - Develop methods for quantifying software reliability, capturing benefits of fault tolerant features, and addressing human-system interfaces unique to digital systems
 - Evaluate the need and approaches for addressing dynamic interactions
- Data collection and analysis
 - Collect hardware failure data, including CCF data, that can be used for PRA purposes
 - Use operating experience for identifying software failure modes to be included in reliability models

Recommendations (2 of 2)

- International cooperation
 - Share approaches, methods, probabilistic data, results, and insights gained from relevant projects among NEA members
 - Jointly develop methods on software modeling (including CCF), quantification of software reliability, assessing the effect of failures of components of a digital system on the system, reliability modeling of a digital system, and HRA
 - Perform benchmark studies of the same systems to share and compare methods, data, results, and insights
 - Publish technical documents, such as “CSNI Technical Opinion Papers”

Software Reliability Quantification (1 of 2)

- In 1997, a National Research Council committee completed a study requested by the NRC on application of digital instrumentation and control (I&C) technology to commercial nuclear power plant operations. It concluded that:
 - 1) *“Explicitly including software failures in a PRA for a nuclear power plant is preferable to the alternative of ignoring software failures”*
 - 2) *“As in other PRA computations, bounded estimates for software failure probabilities can be obtained by processes that include valid random testing and expert judgment.”¹*
- In April 2008, the ACRS Subcommittee on Digital I&C Systems recommended:
 - 1) *“The staff should explore the fundamental philosophical aspects of software failures and their use in developing a probabilistic model of a digital system.”*
 - 2) *“The staff should consider the relevant aspects of developing and evaluating a reliability model of a digital system that integrates hardware and software failures...”*

¹Committee member Nancy Leveson did not concur with this conclusion.

Software Reliability Quantification (2 of 2)

- NRC/BNL organized and convened a workshop involving experts with knowledge of software reliability and/or NPP PRA in May 2009.
- Workshop objectives:
 - Obtain a consensus, or at least agreement among the majority of workshop participants, on the “philosophical basis” for incorporating software failures into digital system reliability models for use in PRAs.
 - Discuss issues associated with methods for modeling software in a reliability model and quantifying software failure rates and probabilities.

Panel of Experts

- Mr. Steven A. Arndt, NRC
- Mr. Bob Enzinna, AREVA
- Dr. Hyun Gook Kang, Korea Atomic Energy Research Institute
- Prof. Michael R. Lyu, Chinese University of Hong Kong
- Prof. Bev Littlewood*, City University, London
- Dr. Allen P. Nikora, Jet Propulsion Laboratory, California Institute of Technology
- Prof. Martin L. Shooman, Polytechnic Institute of New York University
- Prof. Nozer D. Singpurwalla, George Washington University
- Prof. Kishor S. Trivedi, Duke University

*Prof. Littlewood was unable to attend the meeting, but did provide responses to the questionnaire.

A Philosophical Basis for Modeling Software Failures Probabilistically

- Software failure is basically a deterministic process. However, because of our incomplete knowledge, (e.g., the number and nature of residual faults, and occurrence and timing of fault-triggering inputs) we are not able to fully account for and quantify all the variables that define the failure process. Therefore, we use probabilistic modeling to describe and characterize the software failure process.
- The above basis is essentially the same basis for many other probabilistic processes, e.g., tossing a coin. In the case of a coin toss, if one can control all aspects of the toss and repeat it each time, the result will always be the same. However, due to our inability to precisely repeat all aspects of the toss, the outcome is uncertain and can be modeled as a random variable.

Current and Near-Term Activities

- Due to resource limitations and competing priorities, not currently pursuing hardware models of an example protection system or integration of digital system models into an NPP PRA
- Instead, NRC/BNL currently pursuing software reliability quantification
 - Workshop on philosophical basis (completed)
 - BNL preparing letter report
 - Reviewing quantitative software reliability methods (QSRMs)
 - Building upon BNL's earlier reviews of software reliability methods
 - Including more recently completed studies
 - Plan to develop one or two technically sound approaches to modeling and quantifying software failures in terms of failure rates and probabilities
 - Assuming such approaches can be developed, plan to apply them to an example software-based protection system in a proof-of-concept study
- Bottom line: It is expected that detailed reliability models of digital systems (including software) can be developed and quantified; the lingering question is whether it is practical and useful to do so.

Milestones and Future Interactions

- Publish NUREG/CR-6997 (Sep/Oct 2009)
- Issue final letter report on software PRA workshop (Oct 2009)
- Issue draft letter report on review of QSRMs for peer review (Jan 2010)
- Issue final letter report on review of QSRMs (Jun 2010)
- Brief ACRS Digital I&C Subcommittee (~Feb 2010?)
 - Final letter report on software PRA workshop
 - Draft letter report on review of QSRMs
 - Project plans for developing candidate QSRMs

Back-Up Viewgraphs

Summary of Dynamic Methodologies

- Two dynamic methodologies, Markov/Cell-to-cell-mapping technique (CCMT) and Dynamic Flowgraph Methodology (DFM), were applied to the benchmark digital feedwater control system
- These dynamic methodologies have ability to include timing and order of component failures by using multi-valued logic representation of system components and states
- Results are generated to demonstrate incorporation into a traditional PRA framework
- Ability to account for dynamic process interaction
 - may not be necessary for all digital I&C systems (i.e., protection systems)
 - requires interfacing with process simulator (i.e., steam generator simulator)
- Documented in NUREG/CR-6985 (February 2009)

NUREG/CR-6985 (1 of 2)

Assumptions

- Plant assumed to have 2 identical steam generators - one of which is analyzed. Physical behavior of this steam generator is assumed to be well represented by a simulator developed to support this research.
- Benchmark model based on assumed set of failure modes from supporting analyses (FMEA)
- Assume the model's required failure rates can be obtained using fault coverage estimates

Limitations

- Software design errors, common cause failures, and communications are not modeled
- Application methodologies raised concerned about the computational practicality and usability
 - Markov/CCMT model construction requires high level of user skill and has computational limitations due to the large number of possible system states and transitions which must be reduced by the user
 - DFM has a more developed software implementation tool

Key Findings

- Results are demonstrative in nature and cannot be used for decision making
- Dynamic interaction between the process and the control system may be important for certain systems (e.g., feedwater control system)
- The application to the Benchmark raises some serious doubts about the usability and computational practicality of the dynamic methods, especially Markov/CCMT
- Work relies greatly on the use of coverage to estimate component failure rates - this topic warrants further discussion and evaluation
- Further investigation on data acceptability and failure modes is being conducted
