EPPs address a range of actions needed to implement the contents of this Plan. The EPPs address, at a minimum, the following topics:

EPP Topic	Corresponding COL Emergency Plan Section(s)
Assessment of Emergency Action Levels, Emergency Classification and Plan Activation Notifications	Section II.D
Emergency Communications Systems and Equipment	Sections II.A.1, II.E, II.L.1 Section II.F
Protective Action Recommendations	Sections II.J.7, II.J.10
Activation and Operation of the Technical Support Center (TSC)	Sections II.A.1, II.B, II.E.2, II.H.1
Activation and Operation of the Operations Support Center (OSC)	Sections II.A.1, II.B, II.E.2, II.H.1
Activation and Operation of the Emergency Operations Facility (EOF)	Sections II.A.1, II.B, II.E.2, II.H.1
Activation and Operation of the Joint Information Center (JIC)	Section II.G.3
Evacuation and Accountability	Sections II.A.1, II.J.2, II.J.4, II.J.5
Core Damage Assessment	Section II.I
On-Site/In-Plant Radiological Surveys and Off-Site Radiological Monitoring	Section II.B.5, II.I.7
Use of Thyroid Blocking Agents	Section II.J.6
Emergency Exposure Guidelines and Personnel Dosimetry	Sections II.K.2, II.K.3
Decontamination	Sections II.K.5, II.K.7
Obtaining and Analyzing High Activity Samples Under Emergency Conditions	Section II.I
Emergency Media Relations	Section II.G
Reentry, Recovery, and Closeout	Section II.M
Duties and Responsibilities of the Emergency Coordinator / Recovery Manager	Sections II.B, II.M
Emergency Repair and Damage Control and Immediate Entries	Section II.O
Security Events	Section II.E.1

Additional plant procedures address various activities that are required to support the ongoing maintenance of emergency preparedness. These supporting procedures are not included within the body of the EPPs. These supporting procedures address, at a minimum, the following topics:

- Emergency Equipment Inventory and Operational Tests (see Plan Section II.H.10)
- Conduct of Emergency Drills and Exercises (see Plan Section II.N)
- Testing of Emergency Communications Systems (see Plan Sections II.N, II.F)
- Emergency Preparedness Training (see Plan Sections II.G.5, II.O, II.P.1)
- Maintaining Emergency Preparedness (see Plan Section II.P)

COL Application
Part 5 - Emergency Plan**

Appendix 6 – Emergency Equipment and Supplies

Comanche Peak Nuclear Power Plant, Units 3 & 4
COL Application
Part 5 - Emergency Plan

Luminant establishes and maintains inventories of emergency response equipment and supplies in on-site and off-site facilities, cabinets, and footlockers for use by emergency response personnel in the ERFs and by Luminant's off-site field monitoring teams. On-site, this equipment is stored in such places as the CR, TSC, OSC, EOF and NOSF. Off-site, this equipment is staged in such places as County Emergency Operating Centers (EOCs), hospitals, and reception centers.

Self-Contained Breathing Apparatus (SCBAs) and supplementary SCBA bottles are maintained for the CR. SCBAs are also maintained at the NOSF.

Luminant vehicles equipped with radiological monitoring equipment are available for use by Off-site Field Monitoring Teams. Off-site field monitoring kits are located in the NOSF. The kits contain supplies and equipment listed below.

The specific type and amount of equipment and supplies in each on-site or off-site facility, location, or kit is identified on a facility inventory worksheet. The inventory worksheet is prescribed by and maintained in accordance with an EPP. The actual inventories are based on the activities that occur in, or are dispatched from, each individual facility.

The following listing, by category, represents typical emergency response equipment and supplies maintained:

Personal Protection and Dosimetry

Coveralls, shoe covers, gloves, hoods
Thyroid Blocking Drugs (KI)
Thermoluminescent Dosimeters (TLDs), dosimeters
Respiratory Protection Equipment
Extra Clothing

Radiological Monitoring

Geiger-Mueller (GM) and Ionization Chamber instruments (e.g. count rate and dose rate survey instruments)
Air Sampler, equipped with sampler head for particulates and silver zeolite collectors
Particulate filter and silver zeolite cartridges

Contamination Control

Modesty clothing, plastic bags, signs/barricades, Step-Off Pads, tape, decontamination supplies

Communications

Vehicle-installed radios, base stations, handheld radios

Miscellaneous

Portable Lights
Computer equipment

CERTIFICATION OF EMERGENCY PLANNING ACTIVITIES

RECEIVED

JUL 28 2008

M. L. Lucas

Dear Mr. Colley:

As previously indicated in public announcements and meetings, Luminant Generation Company LLC (Luminant Power) is developing a Combined License (COL) application for submission to the U.S. Nuclear Regulatory Commission (NRC), consistent with the requirements of 10 CFR 52, for two additional units at Comanche Peak Nuclear Power Plant near Glen Rose, Texas. The purpose of this initiative is to develop a COL application that will ultimately lead to NRC approval to construct and operate two commercial nuclear generating units at the site.

A key part of this COL application is the development of emergency plans which provide information sufficient to demonstrate compliance with pertinent regulatory requirements. These plans take credit, to the extent practical, for the site, federal, state, and local plans already in place for the operating units at the Comanche Peak site. With the cooperation of affected state and local agencies, Luminant Power has developed Part 5 of the COL application, the "Comanche Peak Nuclear Power Plant Units 3 and 4 Combined License Application Emergency Plan," Revision C dated May 2008. The emergency plan includes the emergency classification system required by 10 CFR 50. Luminant Power used nuclear industry guidance to develop a set of initiating conditions and emergency action levels consistent with this emergency classification system and appropriate to the proposed nuclear plant design.

In addition to the COL Emergency Plan, evacuation time estimates have been developed with input from various state and local government agencies. The evacuation time estimate report is included in Part 5 of the COL application.

These products have been presented to and discussed with representatives from the Texas Department of State Health Services and your organization.

Emergency planning provisions of 10 CFR 52 and the COL application process require that Luminant Power make good faith efforts to obtain certifications from the local and state governmental agencies

with emergency planning responsibilities. At this time, we are seeking certification from the Governor's Division of Emergency Management (GDEM), Texas Department of Public Safety that:

- o the proposed emergency plans are practicable;
- o it is committed to participating in any further development of the plans, including any required field demonstrations; and
- o it is committed to executing its responsibilities under the plans in the event of an emergency.

The actual emergency planning arrangements would be finalized in a letter of agreement at a later stage in the new facilities' licensing process.

GDEM's participation in these emergency planning efforts is greatly appreciated. Please sign and return the attached certification. Your signature also indicates that you concur with the emergency classification system, initiating conditions, emergency action levels, and evacuation time estimates proposed in the Comanche Peak Units 3 and 4 Combined License Emergency Plan .

Sincerely,

Luminant Generation Company, LLC

Comanche Peak Nuclear Power Plant Units 3 and 4
Combined License Application Emergency Plan

The Governor's Division of Emergency Management (GDEM), Texas Department of Public Safety has reviewed the emergency plan supporting the Combined License Application for two new nuclear generating units at the Comanche Peak Nuclear Power Plant site and certifies that:

- o although this reactor design has not been built and operated in the United States, the proposed emergency plans are practicable;
- o GDEM is committed to participating in further development of the plans, including any required field demonstrations; and
- o GDEM is committed to executing its responsibilities under the plans in the event of an emergency.

Furthermore, GDEM concurs with the proposed emergency classification system, initiating conditions, emergency action levels described in the Combined License Application Emergency Plan and evacuation time estimates provided in "Comanche Peak Nuclear Power Plant Development of Evacuation Time Estimates" dated April 2008.

It is my understanding that the specific nature of arrangements in support of emergency preparedness for operation of the proposed new nuclear units will be clearly established in a properly executed and binding letter of agreement that will be included in the Comanche Peak Units 3 and 4 Emergency Plan if and when Luminant Power proceeds with construction and operation of this nuclear facility.

Comanche Peak Nuclear Power Plant Units 3 and 4
Combined License Application Emergency Plan

The Chisholm Trail Chapter of the American Red Cross intends to work with Luminant Power to extend our existing agreement for the Comanche Peak Nuclear Power Plant site to include the two additional proposed units prior to operation of these units.

The specific nature of arrangements in support of emergency preparedness for operation of the proposed new nuclear units will be clearly established in a properly executed and binding letter of agreement that will be included in the Comanche Peak Units 3 and 4 Emergency Plan if and when Luminant Power proceeds with construction and operation of these nuclear plants.

Comanche Peak Nuclear Power Plant Units 3 and 4

Combined License Application Emergency Plan

The City of Granbury intends to work with Luminant Power to extend our existing agreement for the Comanche Peak Nuclear Power Plant site to include the two additional proposed units prior to operation of these units. The existing agreement allows for the use of space within Granbury City Hall during the event of an emergency. This concurrence statement regarding the extension of the existing agreement does not constitute the City's comprehensive support of the addition of the units. Rather, the City intends to work with Luminant Power to derive adequate and appropriate emergency plans and infrastructure to support the addition of the 2 units prior to the expansion of the Comanche Peak Nuclear Power Plant.

The specific nature of arrangements in support of emergency preparedness for operation of the proposed new nuclear units will be clearly established in a properly executed and binding letter of agreement that will be included in the Comanche Peak Units 3 and 4 Emergency Plan if and when Luminant Power proceeds with construction and operation of these nuclear plants.

(Sheet 1 of 6)**

I. INTRODUCTION	ETE Section
This section of the report should make the reader aware of the general location of the nuclear power plant and plume exposure pathway emergency planning zone, and generally discuss how the analysis was done.	Section 1
<p>A. <u>Site location and emergency planning zone</u></p> <p>A vicinity map showing the plant location shall be provided along with a detailed map of the plume exposure pathway emergency planning zone (EPZ). The map shall be legible and identify transportation networks, topographical features and political boundaries. (See planning element J.10.a)</p>	Section 1, Figures 1-1, 3-1 and 6-1.
<p>B. <u>General Assumptions</u></p> <p>All assumptions used in the analysis shall be provided. The assumptions shall include such things as automobile occupancy factors, method of determining roadway capacities, and method of estimating populations.</p>	Section 2
<p>C. <u>Methodology</u></p> <p>A description of the method of analyzing the evacuation times shall be provided. If computer models are used, a general description of the algorithm shall be provided along with a source for obtaining further information or documentation.</p>	Section 2, Appendices B,C and D
II. DEMAND ESTIMATION	
The objective of this section is to provide an estimate of the number of people to be evacuated. Three potential population segments shall be considered: permanent residents, transients, and persons in special facilities.	Section 3, Section 8, Appendix E
Permanent residents include all people having a residence in the area, but not in institutions.	Section 3, Table, 3-1, Figures 3-2, 3-3
Transients shall include tourists, employees not residing in the area, or other groups that may visit the area.	Section 3, Non-EPZ resident employees and transients treated separately. Figures 3-4, 3-5, 3-6, and 3-7.
Special facility residents include those confined to institutions such as hospitals and nursing homes.	Section 8, Appendix E
The school population shall be evaluated in the special facility segment. Care should be taken to avoid double counting.	Section 8, Appendix E
<p>A. <u>Permanent Residents</u></p> <p>The number of permanent residents shall be estimated using the U. S. Census data or other reliable data, adjusted as necessary, for growth. (See planning element J.10.b.).</p>	Section 3, Tables 3-1 and 3-2
This population data shall then be translated into two subgroups: 1) those using autos and those without autos.	With autos – Section 3 Transit Dependent – Section 8
The number of vehicles used by permanent residents is estimated using an appropriate auto occupancy factor. A range of two to three persons per vehicle would probably be reasonable in most cases.	Telephone survey of EPZ Residents – Appendix F

**Comanche Peak Nuclear Power Plant, Units 3 & 4
COL Application
Part 5 - Emergency Plan**

**Table A8-4 Evacuation Time Estimate Cross-Reference
(Sheet 2 of 6)**

An alternative approach is to calculate the number of vehicles based on the number of households that own vehicles assuming one vehicle per household is used in evacuation. Regardless of the approach used, special attention must be given to those households not having automobiles. The public transport—dependent population must, therefore, be considered as a special case.	Households with autos – Section 3, Transit Dependent Households – Section 8											
B. <u>Transient Populations</u>												
Estimates of transient populations shall be developed using local data such as peak tourist volume and employment data for large factories.	Section 3, Appendix E											
Automobile occupancy factors would vary for different transient groups. Tourists might have automobile occupancy factors in the range of three to four while a factory would probably have a factor of less than 1.5 persons per vehicle.	Section 2, Section 3, Appendix E											
This population segment along with the permanent population subgroup using automobiles constitutes the general population group for which an evacuation time estimate shall be made.	Section 6, Table 6-4 summarizes vehicles evacuating											
C. <u>Special Facility Population</u>												
An estimate for this special population group shall usually be done on an institution-by-institution basis.	Section 8, Appendix E											
The means of transportation are also highly individualized and shall be described.	Section 8											
Schools shall be included in this segment.	Section 8											
D. <u>Emergency Planning Zone and Sub-areas</u>												
The sub-areas for which evacuation time estimates are required must encompass the entire area within the plume exposure EPZ.	Section 6, Appendix L											
Additionally, evacuation time estimates are also required for simultaneous evacuation of the entire plume exposure pathway.	Section 7, Appendix J											
The areas to be considered are as follows:												
<table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 30%;">Radius</td> <td style="width: 30%;">Area</td> <td rowspan="5" style="width: 40%; vertical-align: top;">3 sector approach suggested in NUREG/CR-6863 was used. Table 6-1, Appendix H.</td> </tr> <tr> <td>about 2 miles</td> <td>four 90 degree sectors</td> </tr> <tr> <td>about 5 miles</td> <td>four 90 degree sectors</td> </tr> <tr> <td>about 10 miles (EPZ)</td> <td>four 90 degree sectors</td> </tr> <tr> <td>about 10 miles (EPZ)</td> <td>entire EPZ</td> </tr> </table>	Radius	Area	3 sector approach suggested in NUREG/CR-6863 was used. Table 6-1, Appendix H.	about 2 miles	four 90 degree sectors	about 5 miles	four 90 degree sectors	about 10 miles (EPZ)	four 90 degree sectors	about 10 miles (EPZ)	entire EPZ	
Radius	Area	3 sector approach suggested in NUREG/CR-6863 was used. Table 6-1, Appendix H.										
about 2 miles	four 90 degree sectors											
about 5 miles	four 90 degree sectors											
about 10 miles (EPZ)	four 90 degree sectors											
about 10 miles (EPZ)	entire EPZ											
When making estimates for the outer sectors, assume that the inner adjacent sectors are being evacuated simultaneously.	Section 2, Figure 2-1											
The boundaries of the sub-areas shall be based upon the same factors as the EPZ, namely demography, topography, land characteristics, access routes, and local jurisdictions. To the extent practical, the sector boundaries shall not divide densely populated areas.	Figure 6-1, Appendix L											
Where meteorological conditions such as dominant wind directions, warrant special consideration, an additional sub—area may need to be defined and a separate estimate made for this case.	3 sector approach suggested in NUREG/CR-6863 was used. Table 6-1, Appendix L											

**Comanche Peak Nuclear Power Plant, Units 3 & 4
COL Application
Part 5 - Emergency Plan**

**Table A8-4 Evacuation Time Estimate Cross-Reference
(Sheet 3 of 6)**

The EPZ and its sub-areas shall be identified by mapping on United States Geological Survey (USGS) 7-1/2-minute series quadrant maps when available.	Highly detailed Geographical Information Systems (GIS) maps provided. Figures 3-1 and 6-1; Appendix H.
Special facilities shall also be noted on these maps, to the extent that their locations can be geographically specified.	Appendix E – location of facility given by compass direction and distance from the plant
Populations shall be provided by evacuation areas as specified in planning element J.10.b.	Table 3-1 – permanent resident population by ERPA
For the purpose of determining evacuation times it may also be useful to summarize population data by sector and distance from the plant. Figure 1 is an example of such a summary.	Figures 3-2, 3-4, and 3-6 – population rose for residents, transients and employees, respectively
Separate totals shall be provided for the three population segments. Figure 2 shows the population totals translated into the number of vehicles estimated to be used in evacuation.	Figures 3-3, 3-5, and 3-7 – vehicle rose for residents, transients, and employees, respectively
III. TRAFFIC CAPACITY	
This section of the report shall show the facilities to be used in evacuation. It shall include their location, types, and capacities.	Section 4, Appendix K
A complete review shall be made of the road network. Analyses shall be made of travel times and potential locations for serious congestion in potential corridors. (The analyses may be simplified in extreme rural areas.)	Section 1.3. Detailed road survey conducted.
The entire road network shall be used but local routes shall be carefully selected and analyzed to minimize their impact on the major routes should queuing or cross traffic conflicts occur. Care shall be taken to avoid depending only on high-capacity interstate and similar type routes because of limitations of on-ramp capacities.	Figure 1-2.
Alternatively, special traffic management plans may be developed to effectively utilize available capacity. Evacuation shall be based on general radial dispersion.	Section 9, Appendix G
<u>A. Evacuation Roadway Network</u> A map showing only those roads used as primary evacuation routes shall be provided. Figure 3 is an example. The map need not show local access streets necessary to get to the evacuation routes.	Section 10
Each segment of the network shall be numbered in some manner for reference.	Appendix K
The sector and quadrant boundaries shall also be indicated. (See planning elements J.10.a and b.).	Appendix H
<u>B. Roadway Segment Characteristics</u> A table such as example Table 1 shall be provided indicating all the evacuation route segments and their characteristics, including capacity. The characteristics of a segment shall be given for the narrowest section or bottleneck if the roadway is not uniform in the number of lanes throughout the segment.	Appendix K
IV. ANALYSIS OF EVACUATION TIMES	

**Comanche Peak Nuclear Power Plant, Units 3 & 4
COL Application
Part 5 - Emergency Plan**

**Table A8-4 Evacuation Time Estimate Cross-Reference
(Sheet 4 of 6)**

<p>As indicated previously, evacuation time is composed of several components. Each of these components shall be estimated in order to determine the total evacuation time.</p> <p>A. <u>Reporting Format</u></p> <p>Table 2 shows the desired format for presenting the data and results for each type of evacuation. Each of the evacuation time components is presented along with the total evacuation time.</p>	<p style="text-align: center;">Section 7, Appendix J. Results provided in tabular and graphical format</p>
<p>Two conditions -- normal and adverse--are considered in the analyses. Adverse conditions would depend on the characteristics of a specific site and could include flooding, snow, ice, fog or rain. The adverse weather frequency used in this analysis shall be identified and shall be severe enough to define the sensitivity of the analysis to the selected events. These conditions will affect both travel times and capacity. More than one adverse condition may need to be considered. That is, a northern site with a high summer tourist population should consider rain, flooding, or fog as the adverse condition as well as snow with winter population estimates.</p>	<p style="text-align: center;">Good weather, rain, and ice (where applicable) considered. See Section 2.</p>
<p>The text accompanying the table shall clearly indicate the critical assumptions which underlie the time estimates; e.g., day versus night, workday versus weekend, peak transient versus off—peak transient, and evacuation on adjacent sectors versus nonevacuation.</p>	<p style="text-align: center;">Figure 2-1 – voluntary and shadow evacuation considered. Sections 2.2 and 2.3 list all assumptions. Table 6-3 details evacuation percentages by Scenario.</p>
<p>The relative significance of alternative assumptions shall be addressed, especially with regard to time dependent traffic loading of the segments of the evacuation roadway network. Some modification of the reporting format may be appropriate, depending on local circumstances.</p>	<p style="text-align: center;">Appendix I presents several sensitivity studies.</p>

**Comanche Peak Nuclear Power Plant, Units 3 & 4
COL Application
Part 5 - Emergency Plan**

**Table A8-4 Evacuation Time Estimate Cross-Reference
(Sheet 5 of 6)**

<p>B. Methodology</p> <p>The method for computing total evacuation time shall be specified. Two approaches are acceptable. The simplest approach is to assume that events are sequential. That is to say, for example, that no one begins to move until all persons are warned and prepared to leave before anyone starts moving. The time is estimated by simply adding the maximum time for each component. This approach tends to overestimate the evacuation time.</p> <p>The second approach, which is more complex and will be discussed further, is to combine the distribution functions for the various evacuation time components. This second approach may result in reduced time estimates due to more realistic assumptions. The added complexity of analysis, therefore, may be warranted at sites with long evacuation times.</p> <p>When distribution functions are used, estimates are made of the likelihood that each stage in an evacuation sequence will be accomplished within a given period of time. These conditional probabilities depend upon completion of the preceding stage. For example, formulation of family units or other evacuation groups does not commence until notification is received. Some of these distribution functions must be based on the judgment of the estimators.</p> <p>Computation of the joint distribution functions of evacuation times are made. Typically, the joint distribution assumes the form of an S—shape curve as shown in Figure 4. The evacuation time function is fairly smooth for large homogeneous population segments such as the general public. Special facilities, such as hospitals and industrial centers, produce less smooth functions, or discontinuous ones. The assessment of evacuation time may be easily updated should further analyses be conducted, assumptions changed, or new plans developed. When distributions are used, distribution functions for notification of the various categories of the evacuee population shall be developed.</p> <p>The distribution functions for the action stages after notification predict what fraction of the population will complete a particular action within a given span of time.</p> <p>There are separate distributions for auto—owning households, school population, and transit dependent populations. These distribution functions can be constructed in a variety of ways, depending greatly on the kinds of data available for the actual site being studied. The previously developed conditional distributions are combined to develop the time distributions for the various population segments departing their home or other facility from which they are being evacuated. For example, for the auto—owning population segment¹ these vehicles are then loaded onto the roadway network in order to compute travel times and delays.</p>	<p>Section 5 and Appendix F – trip generation curves are based on the results of a telephone survey of EPZ residents. Figures 5-2 and 5-3 show the S-curves used, while Table 5-8 details the trip generation rates.</p>

COL Application
Part 5 - Emergency Plan**

**Table A8-4 Evacuation Time Estimate Cross-Reference
(Sheet 6 of 6)**

<p>Regardless of the means by which the time and amount of traffic to be loaded on the network is determined (i.e., sequentially or using distribution functions), it is necessary to calculate the on—road travel and delay times. In this step, traffic from each sector is assigned to available evacuation routes, and, if assigned volumes exceed capacity, delay times must be calculated using a queuing analysis. Traffic queue (backup) locations and estimated delay times should be indicated on the area map.</p>	<p>Section 7 – Congestion diagrams provided. Section 4 details how the model (PC-DYNEV) handles delay calculations.</p>
<p>An estimate of the time required to evacuate that segment of the non— car—owning population dependent upon public transport shall be made, in a similar manner to that used for the auto-owning population. This estimate shall include consideration of any special services which might be initiated to serve this population subgroup. Such services might include fixed-route departures from designated assembly points. Estimates for special facilities shall be made with consideration for the means of mobilization of equipment and manpower to aid in evacuation and the needs for designated employees or staff to delay their evacuation in order to shut down industrial facilities.</p>	<p>Section 8.4 details evacuation for transit-dependent population. Figure 8-2 provides proposed bus routes. Table 8-7 provides ETE for transit dependents for good and adverse weather.</p>
<p>Each special facility shall be treated on an individual basis. Weather conditions and time of day conditions shall be considered. Consideration shall be given to the impact of peak populations including behavioral aspects.</p> <p>All of the results shall be reported in the format previously indicated. This format summarizes the maximum time for each component and for each sector. The components may or may not be directly additive based on the methodology used and stated in the report. Where distribution functions are used the percentage of the population as a function of time should be reported (See Figure 4 for an example format).</p>	<p>Schools and Medical Facilities are handled on an individual basis. See Section 8.</p>
V. OTHER REQUIREMENTS	
<p>The time required for confirmation of evacuation shall be estimated. Candidate methods include visual confirmation by aircraft or ground vehicles and telephone confirmation.</p>	<p>Section 12</p>
<p>Specific recommendations for actions that could be taken to significantly improve evacuation time shall be given. Where significant costs may be involved, preliminary estimates of the cost of implementing these recommendations shall be given.</p>	<p>Section 9 and Appendix G provide a detailed traffic management plan which has been reviewed with state and local law enforcement officials</p>
<p>A review of the draft submittal by the principal organizations (State and local) involved in emergency response for the site shall be solicited and comments resulting from such review included with the submittal.</p>	<p>This is not included in the text of the report; however, we have documentation of the comments received and the corrective actions taken</p>
