U.S. ELECTRICITY CAPACITY AND GENERATION

U.S. electric generating capacity totaled approximately 1,010 gigawatts in 2008 (see Figure 8), down slightly from 2007 (1,088 gigawatts). In 2008, the existing nuclear generating capacity totaled 100 gigawatts, which translates to 10 percent of total electric capacity. Since the 1970s, the Nation's utilities have used power uprates as a way to generate more electricity from existing nuclear plants. By January 2010, the NRC had approved 124 power uprates, resulting in a gain of approximately 5,726 megawatts electric (MWe) at existing plants. Collectively, these

uprates have added the equivalent of five new reactors worth of electrical generation at existing plants. The NRC is reviewing or anticipating uprate applications totaling another 3,564 MWe (see Figure 9). In addition, license renewals will also add to projected electric capacity as shown in Figure 10.

As of April 2010, the 104 nuclear reactors licensed to operate accounted for approximately 20.2 percent of U.S. net electric generation at 799 billion kilowatt-hours (kWh) (see Figure 11).

As of April 2009, four States (New Jersey, South Carolina, Connecticut, and

Figure 8. U.S. Electric Existing Capacity by Energy Source, 2008

Total Existing Capacity: 1,010 Gigawatts Electric (GWe)

* Gas includes natural gas, blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuel.

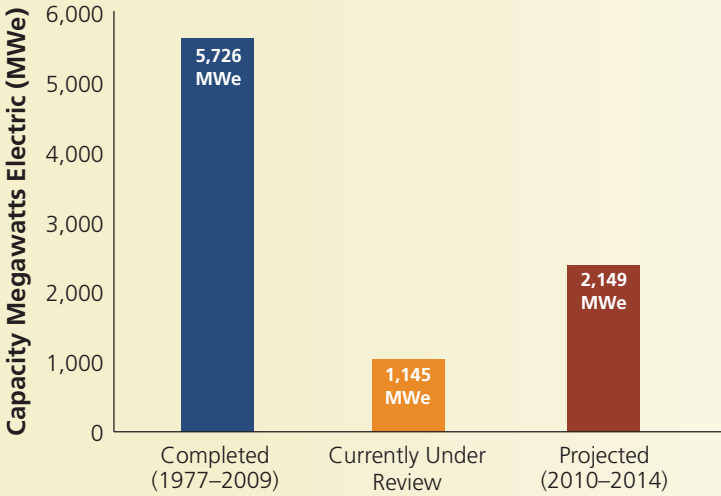

** Hydroelectric includes conventional hydroelectric and hydroelectric pumped storage.

*** Renewable energy includes geothermal, wood and nonwood waste, wind, solar energy, and miscellaneous technologies.

Note: Totals may not equal sum of components because of independent rounding. The amounts in parentheses are measured in gigawatts (a gigawatt is equal to 1,000 million watts), and the data used is summer existing capacity.

Vermont) relied on nuclear power for more than 50 percent of their electricity. The percentages cited reflect the percentages of the total net generation in these States that were from nuclear sources. An additional 12 States relied on nuclear power for 25 to 50 percent of their electricity (see Figure 12).

Since 1999, net nuclear electric generation has increased by 9.7 percent, and coal-fired electric generation has decreased by 6.2 percent (see Figure 13 and Table 1). All other electricity-generating sources have increased by 36.6 percent.

AVERAGE PRODUCTION EXPENSES

The production expense data presented in Table 2 and Figure 14 include all nuclear and fossil utility-owned steam electric plants.

In 2008, production expenses averaged \$21.16 each megawatthour for nuclear power plants and \$35.67 each megawatthour for fossil fuel plants.

U.S. ELECTRICITY GENERATED BY COMMERCIAL NUCLEAR POWER

In 2009, net nuclear-based electric generation in the United States produced a total of 799 billion kilowatthours (see Table 3). In 2009, the average U.S. net capacity factor was 90.5 percent. Average U.S. net capacity factor—the ratio of electricity generated to the amount of energy that could have been generated—has increased by approximately 16 percent since 1998. In 2009, 98 percent of U.S. commercial nuclear reactors operated above an average net capacity factor of 70 percent (see Table 4).

WORLDWIDE ELECTRICITY GENERATED BY COMMERCIAL NUCLEAR POWER

As of 2010, there were 438 operating reactors in 30 countries and Taiwan with a total installed capacity of 373,006 gigawatts electric (GWe) (see Figure 15). In addition, five nuclear power plants were in long-term shutdown, and 54 nuclear power plants were under construction.

See Appendix J for a list of the number of nuclear power reactors by nation and Appendix K for nuclear power units by reactor type, worldwide.

WORLDWIDE NUCLEAR PRODUCTION

The United States produced approximately 27 percent of the world's gross nuclear-generated electricity in 2009 (see Figure 16). France was the next highest producer at 17 percent. Based on preliminary data in 2009, France had the highest nuclear portion (75 percent) of total domestic energy generated. In the United States, nuclear energy accounted for 20 percent of the domestic energy generated (see Figure 17).

Countries with the highest average gross capacity factor for nuclear reactors in 2009 include South Korea at 90 percent, the United States at 89 percent, Russia at 73 percent, and France at 71 percent (see Table 5).

Table 5. Commercial Nuclear Power Reactor Average Gross Capacity Factor and Gross Generation by Selected Country, 2009

Country	Number of Operating Reactors	Average Gross Capacity Factor (in percent)	Total Gross Nuclear Generation (in billions of KWh)	Number of Operating Reactors in Top 50 by Capacity Factor	Number of Operating Reactors in Top 50 by Generation

Source: Excerpted from *Nucleonics Week*®, March 5, 2009, by McGraw-Hill, Inc. Reproduced by permission. Further reproduction prohibited. Licensee data as compiled by the U.S. Nuclear Regulatory Commission.

Reactors in the United States had the greatest gross nuclear generation at 842 billion kilowatthours. France was the next highest producer at 410 billion kilowatthours (see Table 5).

See Appendix L for a list of the top 50 reactors by gross capacity factor worldwide, and refer to Appendix M for a list of the top 50 reactors by gross generation worldwide.

Over the past 10 years, the average annual gross capacity factor has increased 3.5 percent in the United States and 2.7 percent in France. In the same period, the average annual gross capacity factor has decreased 21.5 percent in Japan and 16 percent in Germany (see Table 6).

INTERNATIONAL ACTIVITIES

The NRC must perform certain legislatively mandated international duties. These include licensing the import and export of nuclear materials and equipment and participating in activities supporting U.S. Government compliance with international treaties and agreement obligations. The NRC has bilateral programs of assistance or cooperation with 40 countries and Taiwan (see Table 7). The NRC has also supported U.S. Government nuclear safety initiatives with countries in Europe, Africa, Asia, and Latin America. In addition, the NRC actively cooperates with multinational

organizations, such as the International Atomic Energy Agency (IAEA) and the Nuclear Energy Agency (NEA), a part of the Organisation for Economic Co-operation and Development. The NRC also has a robust international cooperative research program.

Since its inception, the agency has hosted over 300 foreign nationals in on-the-job training assignments at NRC Headquarters and the regional offices. The NRC's Foreign

Assignee Program helps instill regulatory awareness, capabilities, and commitments in foreign assignees. It also helps to enhance the regulatory expertise of both foreign assignees and NRC staff. Additionally, the program improves international channels of communication through interaction with the international nuclear community and development of relationships with key personnel in foreign regulatory agencies.

* In negotiation

Note: The NRC also provides support to the American Institute in Taiwan. Egypt's agreement has been deferred until its regulatory body requests reinstatement. Russia's agreement is still in negotiation. The country's short-form name is used.

EURATOM—The European Atomic Energy Community

Through its export/import authority, the NRC upholds the U.S. Government goals of limiting the proliferation of materials that could be used in weapons and supports the safe and secure use of civilian nuclear and radioactive materials worldwide. In addition to its direct export/import licensing role, the NRC consults with other U.S. Government agencies on international nuclear commerce activities falling under their authority. The NRC continues to work to strengthen the export/import regulations of nuclear equipment and materials, and to improve communication between domestic and international stakeholders.

The NRC assists in implementing the U.S. Government's international nuclear policies through developing legal instruments that address nuclear nonproliferation, safety, international safeguards, physical protection, emergency notification and assistance, spent fuel and waste management, and liability. The NRC also participates in the negotiation and implementation of U.S. bilateral agreements for peaceful nuclear cooperation under Section 123 of the U.S. Atomic Energy Act of 1954, as amended. The NRC also ensures licensee compliance with the U.S. Voluntary Safeguards Offer agreement with IAEA. This agreement was amended on December 31, 2008, when the United States signed the "Protocol Additional to the U.S.-International Atomic Energy Agency Agreement for the Application of Safeguards in the United States." The Additional Protocol entered into force on January 6, 2009, and the United States submitted its first annual declaration to IAEA in July 2009.

The NRC also participates in a wide range of mutually beneficial international exchange programs that enhance the safety and security of peaceful nuclear activities worldwide. These low-cost, high-impact programs provide joint cooperative activities and assistance to other countries to develop and improve regulatory organizations. The NRC engages in the following activities:

- Cooperates with countries with mature nuclear programs to ensure the timely exchange of applicable nuclear safety and security information relating to operating reactors and consults with these countries on new reactor-related activities.
- Ensures prompt notification to foreign partners of U.S. safety issues, notifies NRC program offices about foreign safety issues, and shares security information with selected countries.
- Initiates bilateral discussions in such regulatory areas as licensing, inspection, and enforcement with countries that have recently built facilities or have vendors of equipment that may be imported to the United States during the anticipated construction of new nuclear power plants.
- Participates in the Multinational Design Evaluation Program, which leverages the resources of interested regulatory authorities to review new designs of nuclear power reactors.
- Assists other countries to develop and improve regulatory programs through training, workshops, peer

review of regulatory documents, working group meetings, and exchanges of technical information and specialists.

- Assists countries to ensure regulatory control over radioactive sources through development of standards and provision of training and workshops through a pilot program begun in 2008.
- Participates in the multinational programs of IAEA and NEA concerned with safety research and regulatory matters, radiation protection, risk assessment, emergency preparedness, waste management, transportation, safeguards, physical protection, security, standards development, training, technical assistance, and communications.
- Participates in the International Nuclear Regulators Association meetings to influence and enhance nuclear safety from the regulatory

perspective. Its members are the most senior officials of well-established independent national nuclear regulatory organizations. Current members are Canada, France, Germany, Japan, South Korea, Spain, Sweden, the United Kingdom, and the United States.

- Meets through the NRC's Advisory Committee on Reactor Safeguards with other international advisory committees every 4 years to exchange information.
- Participates in joint cooperative research programs through approximately 100 multilateral agreements with 23 countries to leverage access to foreign test facilities not otherwise available to the United States. Access to foreign test facilities expands the NRC's knowledge base and contributes to the efficient and effective use of the NRC's resources in conducting research on high-priority safety issues.

NRC staff participates in an international exchange seminar to learn about the construction experience of the Finnish regulatory agency.
