8:30 a.m.

CHAIR DIMITRIJEVIC: Good morning. It's 8:30, according to my time, so this meeting will now come to order. This is the Reliability and PRA Subcommittee Meeting in preparation for the Advisory Committee on Reactor Safeguards Review of the NSC Level 3 PRA project.

I'm Vesna Dimitrijevic, Chairman of today's Subcommittee meeting. Members in attendance are Bob Martin, Dave Petti, Joy Rempe, Matt Sunseri, Ron Ballinger. I saw the message from Vicki Bier that she was able to sign in. Vicki, are you there?

MEMBER BIER: Yes, I'm on, Vesna.

CHAIR DIMITRIJEVIC: Wonderful.

MEMBER BIER: Thank you.

CHAIR DIMITRIJEVIC: Wonderful. Okay. Did I miss anybody?

MEMBER MARCH-LEUBA: Yes, Jose. Jose is here too.

CHAIR DIMITRIJEVIC: Oh yes, Jose.

MEMBER ROBERTS: Yes, Tom Roberts is here too.

CHAIR DIMITRIJEVIC: Okay. All right, excellent. Tom Roberts and Jose March-Leuba are also

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 joining us. So some of our members are traveling so  
2 will not be able to join us.

3 We hold this open meeting to gather  
4 information to support our review of the NSC Level 3  
5 PRA projects. The ACRS section of the U.S. NRC public  
6 website provides our charters, bylaws, agendas,  
7 reactor reports and full transcripts of all full and  
8 subcommittee meetings, including slides presented  
9 there. The meeting notice and agenda for this meeting  
10 were also posted there.

11 The Subcommittee will gather information,  
12 analyze relevant issues and facts and formulate  
13 proposed position and action is appropriate for  
14 eliminating by the Full Committee. A transcript of  
15 the meeting is being kept and will be made available.

16 Today's meeting is being held virtual with  
17 remote Microsoft Teams capability. There is also a  
18 bridge line allowing participants over the phone.

19 When addressing the Subcommittee,  
20 participants should first identify themselves and  
21 speak with sufficient clarity and volume so that they  
22 may be readily heard. When not speaking we require  
23 the participants mute their computers, microphone or  
24 phone.

25 Okay. So we will now proceed with the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 meeting. And I call up on Jonathan Evans, PRA Branch  
2 Chief for NRC Office of Nuclear Regulatory Research to  
3 begin today's presentation. Jonathan?

4 MR. EVANS: Hi, good morning. Thank you,  
5 Vesna.

6 CHAIR DIMITRIJEVIC: Good morning.

7 MR. EVANS: So good morning to everybody.  
8 My name is Jonathan Evans. I am the Branch Chief for  
9 the Probabilistic Risk Assessment Branch in the Office  
10 of Nuclear Regulatory Research. I just want to thank  
11 the ACRS for the opportunity just to have us present  
12 and have this opportunity to discuss the Level 3 PRA  
13 project overview on the Volume 4 reports.

14 What I wanted to do is just a few moments  
15 just to thank the Staff in PRAB, and also in the rest  
16 of just the Agency who contributed to this project.  
17 This has been a very herculean effort and just wanted  
18 to say that we appreciate your efforts. And we look  
19 forward to answering your questions today from the  
20 ACRS. And with that, I'll turn it back over to Vesna  
21 or to Alan.

22 CHAIR DIMITRIJEVIC: Okay, thank you.  
23 Alan?

24 MR. KURITZKY: Thank you. Thank you very  
25 much, Vesna. Dr. Dimitrijevic and Jonathan. I just

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 want to echo, you know, Jonathan's sediments. We very  
2 much appreciate the opportunity to brief the  
3 Subcommittee. I recognize that you guys have your  
4 hands full with all kinds of exciting new and advance  
5 reactor work, and so we welcome, or appreciate the  
6 fact you're able to make time for us today.

7 We also had, oh. My name is Alan  
8 Kuritzky. I'm from the division of risk analysis in  
9 the office of research. I am the program lead for the  
10 Level 3 PRA project.

11 And we briefed the Subcommittee last year,  
12 I think in June, about Volume 3 of the Level 3 PRA  
13 project. Today we're back to review on, essentially  
14 an update on the project task, and also Volume 4 of  
15 the project.

16 And let me just get here. So what we hope  
17 to do today is to go over quickly the status of where  
18 the project stands near to the end of the project.  
19 Also, go over what public reports we have issued and  
20 what other ones will be coming forward.

21 I want to discuss, to some level of  
22 detail, but probably not excruciating detail, but the  
23 information that's in the overview report for Volume  
24 4 which is the report that addresses the reactor at-  
25 power, PRA models for internal fires, seismic events

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 and high winds. And also addresses other hazards  
2 which we didn't model. And then the last thing we  
3 want to discuss today will be future interactions  
4 between the project and the Subcommittee and the Full  
5 Committee.

6 With that, I do want to acknowledge that  
7 a lot of work has gone into this project over the  
8 years. We've had some really excellent support from  
9 a number of organizations. Both within and without,  
10 outside the NRC.

11 So inside the NRC, NSIR, NRR, NMSS, the  
12 regions, TTC, everybody has had a hand in this and we  
13 greatly appreciate their work. Some of these  
14 organizations have had more input to the project than  
15 others, but everyone, all of these organizations have  
16 really done a great job in helping us out.

17 In terms of national labs, Idaho has been  
18 our main contractor. Our National Lab for this work.  
19 But also we've gotten a lot of support from Sandia  
20 National Laboratories, Pacific Northwest National Lab,  
21 and Brookhaven.

22 In terms of commercial contractors, NRG  
23 Research Incorporated has been our major contractor,  
24 but we also have gotten support from Applied Research  
25 Associates. And also IESS, Innovation -- Innovative

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 Engineering and Safety Solutions I think.

2 The PWR Owner's Group also support us  
3 later on supporting, organizing and running and  
4 funding some, a PRA standard based peer reviews for  
5 some of our early models. And Westinghouse and EPRI  
6 have both been supportive of the project. In fact,  
7 they have members on our technical advisory group for  
8 the project.

9 And of course the ACRS. We've gotten a  
10 lot of feedback. We've had, I've lost track now, this  
11 is probably close to 20 minutes that we've had with  
12 the ACRS since joining the project. Many of them were  
13 early on pre-pandemic when we were doing a lot of  
14 technical work. We had a lot of meetings to go over.  
15 And closed meetings because of the proprietary  
16 information. We had closed meetings to go into the  
17 technical details of every aspect of the project. And  
18 we greatly appreciate the time and the feedback we  
19 received from ACRS members.

20 CHAIR DIMITRIJEVIC: Alan, sorry for  
21 interrupting you --

22 MR. KURITZKY: Yes.

23 CHAIR DIMITRIJEVIC: -- but I noticed that  
24 you have the slides acknowledgments. Have we uploaded  
25 the slides because I don't see any slides?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. KURITZKY: Oh, these are not being --  
2 oh, wait a minute. I'm not sharing this with you?

3 CHAIR DIMITRIJEVIC: No. I don't see them  
4 so --

5 MR. KURITZKY: Oh. No, you're right.  
6 You're right, I have them on my screen but I didn't  
7 share. Hold on one second. I apologize.

8 MR. BLEY: We are seeing you, Alan.

9 CHAIR DIMITRIJEVIC: We see you very  
10 nicely.

11 MR. KURITZKY: Okay, sorry.

12 CHAIR DIMITRIJEVIC: Okay. So I heard  
13 that Dennis is also here with us today.

14 MR. KURITZKY: Yes. Yes, I forgot to do  
15 the share. My apologies. I'm glad you mentioned it  
16 now and not ten slides into the presentation.

17 CHAIR DIMITRIJEVIC: Okay.

18 MR. KURITZKY: All right, thank you very  
19 much. Okay, does everybody see the slides now?

20 CHAIR DIMITRIJEVIC: Yes.

21 MR. KURITZKY: Okay. Okay, fantastic.  
22 Oh, also, that reminds me too. Because the slides are  
23 on my laptop right in front of my face, that's where  
24 the camera is so I'm facing that direction, so I do  
25 not see all the other stuff like the Teams Meeting

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 window and stuff, people raise their hands, et cetera.  
2 That's all to the side so I don't see that in my field  
3 of view.

4 So, Jonathan, if I could again impose upon  
5 you to let me know if anybody raises their hands or  
6 makes a comment, and if you could just interrupt me  
7 and pass it along. And everybody else, please feel  
8 free to interrupt me, I don't mind interruptions. So  
9 since I don't see the Teams screen, by all means feel  
10 free to verbally jump in with any questions or  
11 comments you may have.

12 MR. EVANS: All right, no problem.

13 CHAIR DIMITRIJEVIC: I think probably we  
14 will help you with this.

15 MR. KURITZKY: Okay, thank you. Okay, so  
16 now that we can see the slides, let me move on to, one  
17 caution I want to bring out up front is that the Level  
18 3 PRA project study is basically a state of a practice  
19 study.

20 There were some areas where we had to push  
21 the state of the art just because there was no real  
22 state of practice. For instance post-core damage,  
23 human reliability analysis.

24 However, because of limitations, either in  
25 time, resources or the fact that we didn't have enough

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 information, we did have to make some simplifications  
2 or assumptions in some areas and so therefore it's  
3 important to recognize that even though we address  
4 something a certain way in the study, that does not  
5 mean that that's the way everybody else should do it.  
6 And it's particularly if you're talking about a  
7 regulatory application.

8 Just because we do something a certain way  
9 in this study does not necessarily mean that it's okay  
10 for regulatory purposes. So we just want to have that  
11 caveat. And this caveat of course shows up in every  
12 report of the project we have. A couple places in the  
13 report.

14 MR. BLEY: Alan?

15 CHAIR DIMITRIJEVIC: Alan.

16 MR. KURITZKY: Yes?

17 CHAIR DIMITRIJEVIC: Okay, Dennis, go.  
18 Go.

19 MR. BLEY: Yes, Dennis Bley. Two things.  
20 And we have talked about this in the past with you  
21 folks. With this published and on the street,  
22 essentially disavowing it for regulatory purposes  
23 seems a little strange. And I can't imagine that  
24 people won't look to it to see what NRC is considering  
25 as state of the practice approaches. I guess all

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 you're telling them is just look at the guidance,  
2 don't look at this.

3 The second thing along this line, we got  
4 to look at your slides a little ahead of time. I  
5 don't see any that really talks about your first  
6 bullet there. Summarizes what things you intended to  
7 do and we were expecting to see that are not going to  
8 be part of this study. And if you can address that  
9 one I'd appreciate it.

10 MR. KURITZKY: Okay. And thank you, Dr.  
11 Bley. And yes, you're right, this is something we've  
12 wrestled with throughout the project as, you recognize  
13 that this project will be looked at to people in the  
14 technical community as to ways to address a whole, a  
15 spectrum of PRA related issues. Particularly in those  
16 areas that have not been routinely practiced before.

17 Obviously Level 1 and LERF PRAs.  
18 Everybody and their brother have done them, and their  
19 sister, had done these things for years and so they're  
20 not necessarily looking to this project to tell them  
21 how to do those. There are standards out and  
22 everything else.

23 But some of the more novel areas that  
24 we've included, like spent fuel pool and multi and  
25 risk. Obviously people will be looking to that to see

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 what the NRC has done. And we do want them to look to  
2 this report to see what we've done.

3 It is a state of practice study but it  
4 does roll up all that state of practice in one big  
5 study that looks at all of different scope elements.  
6 And as I said, in some areas we have advanced the  
7 state of the practice which is good for people to be  
8 aware of.

9 But we do have to caveat the fact that, as  
10 I just said, there are some areas, hopefully not a  
11 lot, but some areas where we had to make assumptions  
12 or do something in a more simplified manner and so we  
13 don't want to have a blanket, we want to make sure  
14 that there is no blanket expectation that whatever it  
15 is in this study is okay for people who want to, you  
16 know, for instance, submit a risk-informed license  
17 amendment. You know, it's not necessarily that what  
18 we did in this approach is applicable or appropriate  
19 for that application.

20 In many cases it should be, and hopefully  
21 will be. But as you just mentioned, regulatory  
22 guidance supersedes. There is nothing in this study,  
23 this research study, is not intended to supplant  
24 regulatory guidance.

25 There may be a time when the NRC looks at

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 the results of the study and decides to amend the  
2 regulatory guidance, in which case then that will  
3 filter out to people wanting to use the approaches  
4 that are in this study, but unless and until that  
5 occurs, existing regulatory guidance is much to be  
6 followed.

7 So again, much of what's in this study, we  
8 want people to look to the study. Much of what's in  
9 the study should be useful and educational and  
10 beneficial to people doing PRA in many of these areas,  
11 but we just don't want there to be the expectation  
12 that just something is done a certain way in this  
13 study that it's necessarily appropriate for a  
14 regulatory purpose. That's the response --

15 MR. BLEY: Thank you.

16 MR. KURITZKY: -- to the one comment. The  
17 idea of what things that are covered and what are not.

18 This category is really more at a lower  
19 level to how we treated specific items. So there is  
20 no rule up to that, except in the fact that there are  
21 many areas, each of the detailed topical reports has  
22 sections on the areas where there is modeling  
23 uncertainties, which is really where these things  
24 would fall under. Or candidates for future research  
25 or additional investigation, which is the other place

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 where you would see these things and those two lists  
2 overlap significantly.

3 So that's where you'd see these things.  
4 But there is many of them, each aspect of the study.  
5 Not all of them are simply locations or limitations  
6 but they are areas that we've identified and have been  
7 either accepted as uncertain elements of PRA to date  
8 or new ones that we've ran into as we did this work.

9 CHAIR DIMITRIJEVIC: Alan --

10 (Simultaneously speaking.)

11 CHAIR DIMITRIJEVIC: --- has raised their  
12 hand. Joy?

13 MEMBER REMPE: Oh yes, thank you. When I  
14 was looking through the summary report in Section 4 I  
15 got the impression that you were going to get a lot of  
16 great insights that could be used to maybe simplify  
17 future PRAs when people looked at it and said, well,  
18 this wasn't found to be important. And I, maybe it's  
19 coming later in another report, but I didn't see any  
20 specific list of items that said, okay, you know, we  
21 spent a lot of time modeling something or other and it  
22 wasn't that important and it doesn't need to be model  
23 of that detail. Did I just get the wrong impression  
24 or is it going to be something that comes later?

25 MR. KURITZKY: So yes. Partly yes and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 yes. It is something that's going to come later. The  
2 summary NUREG volume is where we're going to take a  
3 look at the various insights from the study.

4 Right now, any insights that we've gleaned  
5 are more, for lack of a better term, stovepipe to the  
6 specific models that we're looking at. And  
7 particularly for those areas where many PRAs, I just  
8 recently mentioned have been done already, like Level  
9 1 internal event LERF, internal event type PRAs, there  
10 are not a lot of earth shattering insights that are  
11 coming from this work, as this work, this is well trod  
12 ground.

13 But there are going to be some novel areas  
14 where we hope to have learned things that we can share  
15 and would be insights that would be useful for the  
16 technical community at large. And that, and  
17 particularly we start to look at the medical level  
18 and, for instance, how things for reactor at power  
19 compare to reactor at shutdown or how things for the  
20 reactor compared to the spent fuel pool, the fuel pool  
21 to dry cask storage, et cetera.

22 And those types of items will not come  
23 until we do this more project-wide analysis at the  
24 end. And will be documented in that summary NUREG  
25 volume which I'll talk about in a minute. But Volume

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 1 will be the summary NUREG. And that will address  
2 more of these higher level items.

3 In terms of specifically insights that  
4 would lead us to, say hey, here is something that you  
5 did a lot of work on, it didn't really make much  
6 difference, it's not worth paying attention to in the  
7 future. I don't know if we call out things  
8 specifically in that way.

9 I think if people look through the list of  
10 results and insights they may see where we mentioned  
11 certain things did not tend to be important. It was  
12 something that we were uncertain about, we evaluated,  
13 it did not end up showing to be important,  
14 particularly we have sensitivity analyses to kind of  
15 demonstrate the impact --

16 (Off microphone comments.)

17 MR. EVANS: Hey, I'm sorry, it looks like  
18 not everyone is on mute. Can we make sure that we're  
19 all on mute for this? Thank you.

20 MR. KURITZKY: So, in any case, so if you  
21 look at some of the sensitivity studies or some of the  
22 discussion on areas of uncertainty, that's where you  
23 might be able to find something and say, hey, we don't  
24 really need to focus too much and this isn't really  
25 showing to be important. But it's not like we're

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 going through an existing, using existing PRA and  
2 saying, okay, here is Item 1, 2, 3, 4, 5, all these  
3 things, take it out of the PRA because they're just  
4 not important.

5 That really wasn't the goal though. That  
6 might fall out in just looking at some of the results.  
7 It might seem that certain things aren't as important.  
8 And it wouldn't be that you would necessarily rule  
9 them out of the PRA but you might not put much, you  
10 weren't worry about doing a lot of rigorous analysis  
11 to refine the numbers for some things just because  
12 they don't make that much difference.

13 But again, there is a difference between  
14 what is important for this PRA, which is based on a  
15 specific reference site and plant, and what might  
16 apply to other plants. So things that we discover in  
17 this study certainly apply to the reference plant.

18 They may in fact apply to many, the  
19 reference plant is a PWR Westinghouse four loop plant  
20 large dry containment. So other plants of that design  
21 might also think things may apply to them. Not  
22 necessarily but might.

23 Less likely, but still possible, it might  
24 apply to PWRs as a whole or all reactors as a whole.  
25 So again, you just have to be a little careful that

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 the insights that we get from this study, some of them  
2 we think will be applicable for the industry at large  
3 or other sub-populations of plants or sites. But  
4 they're not necessarily going to be universal, many of  
5 them might be site specific or plant specific.

6 MEMBER REMPE: So, Alan, I was just trying  
7 to cite an example, but I guess where I'm going with  
8 my comment is that yes, I realize there may be some  
9 caveats but there is such a large amount of material.  
10 I would encourage you to think, waiting to the final  
11 summary report might make it difficult and may miss  
12 some things.

13 If there had been some more summary  
14 highlights in this volume, that's the summary for the  
15 Section 4 of external events and things, I think it  
16 would have helped readers and others to say that, you  
17 know, some, to have an interim summary insight that,  
18 you know, with some caveats that it may not apply to  
19 everything, but it's very hard to get, to extract that  
20 is where I was trying to go with my comment, okay?

21 MR. KURITZKY: Yes. And I appreciate  
22 that, Dr. Rempe. And I agree. I mean, that's  
23 something, again, that we've wrestled with because we  
24 don't necessarily have anything just to wait till the  
25 very end, but the problem is that, as I said, many of

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 the insights are going to be more project-wide, which  
2 do have to wait till kind of the end. Even the ones  
3 that would apply to some of these areas.

4 The first reports that we had done, again,  
5 are areas that are well trod and there is not a lot of  
6 earthshattering new insights. Also, as I went to look  
7 at some of the material to try and extract some  
8 elements it really, you know, there is just so much,  
9 as you mentioned, there is so much material that is  
10 not going to be some like quick list of like five,  
11 here is the five. So here is the big five and boom,  
12 boom, and so everybody can see that.

13 There is just lists and lists and every,  
14 not just in every report but, and often times multiple  
15 sections of report because there is so many different  
16 areas covered. And every area could have a fairly  
17 extensive list of areas of either modeling uncertainty  
18 or key assumptions that in some cases we try to give  
19 relevant importance to them, high, medium, low. Other  
20 cases it's more of just a list.

21 And to try and extract those and compare  
22 it to each other, like this item for the Level 2 PRA,  
23 how important is that compared to this item we have  
24 here for the Level 1 intro fire PRA. You know, it's  
25 just an exercise that we just didn't have time for

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 right now. And we're hoping that when we get to the  
2 focus on the summary NUREG we can sit back and now  
3 look at a more holistic way and try and identify some  
4 of those things.

5 But again, we're almost handicapped by the  
6 sheer volume of information we have. As you mentioned  
7 it's difficult for the reader of course to try to suss  
8 out that information. It's honestly difficult for us  
9 too.

10 And to echo your concern about waiting  
11 till the end, not only does that make the stakeholders  
12 or the readers of the reports wait a longer time to  
13 get that information, but unfortunately many of the  
14 technical leads for this work, the ones who really  
15 know it, have since moved on. Either they've left the  
16 project, they've left the agency, so there is, yes,  
17 we're losing some of the information with the exit of  
18 those people too.

19 So I'm very sensitive to your concern. I  
20 just, we just haven't really had the ability, as we're  
21 trying to crank these things out, to step back and do  
22 that at this point because it would not be an easy  
23 exercise. But I am very sensitive, and I agree with  
24 your concern.

25 MR. BLEY: Alan?

1 MR. KURITZKY: Yes.

2 MR. BLEY: Dennis Bley. I've got three or  
3 four things, kind of high level. But I want to follow  
4 up Joy's questions.

5 And, you know, one thing is that after 50  
6 years doing PRAs of one kind or another, we've seen  
7 that risk is very much plant specific, even with  
8 similar kind of facilities. I think being able to say  
9 X, Y and Z are not important, don't look at them, is  
10 probably not the answer.

11 But one thing you might have insight into,  
12 and might include in your summary report, are if  
13 you've actually done this. If you looked at some of  
14 these issues to decide if you would include them or  
15 not and came up with some approximate approaches that  
16 were helpful in eliminating some things or de-  
17 emphasizing some things from the scope, I think that  
18 could be very helpful to most practitioners.

19 The real question I wanted to get to, well  
20 the three, were, you mentioned the opportunities for  
21 future research that you point out. Are any of those  
22 active at the current time or are these things that  
23 will be a follow-on at some point in the future?

24 MR. KURITZKY: Well, the intention for us  
25 is just that these are things that would be done in

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 the future. So out of, in other words, they're really  
2 just out, we're specifying that they're out of the  
3 scope of this project. Now whether some of them are  
4 already being worked on, some are.

5 And there are different some areas that  
6 we've acknowledged. And this is an area that current  
7 research is ongoing and so it's acknowledged that  
8 there is current research in the area. Others are,  
9 here is something that would benefit from additional  
10 research. Most of those may not have started yet,  
11 though so many have. It depends.

12 If it was just purely associated with this  
13 project it's not like that it's been started already,  
14 but if it already was something that was being thought  
15 about in other areas of the Agency and they already  
16 may have started work on that, in that area, then it  
17 would be ongoing.

18 MR. BLEY: Okay.

19 MR. KURITZKY: But we, you know, we have  
20 not initiated follow-on projects based on the results  
21 of this project yet.

22 MR. BLEY: Okay.

23 MR. KURITZKY: That's something that  
24 would, the Agency as a whole, other decision makers  
25 would weigh in on probably after the project is

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 completed.

2 MR. BLEY: You mentioned something that  
3 many of the members might not be familiar with because  
4 they weren't here in the early says of this work. The  
5 reference plant. And we were involved in discussions  
6 with you about how you would select that plant.

7 I think some caveats for the Committee  
8 would be helpful. I know we can't identify the  
9 reference plant at this point any longer.

10 You and I had had quite a bit of  
11 discussion with them. I'm wondering if you and your  
12 reference plant PRA people ever came to a meeting of  
13 the minds. I know there were some areas where there  
14 was real dispute about things you were including that  
15 they didn't include. If you can talk about that a  
16 little bit I think that would be useful to all of us.

17 And the last thing is, one of your goals  
18 early on was training the Staff at NRC on performing  
19 PRAs so I'm a little, unhappiness is probably not the  
20 right word, when you say many of your key people are  
21 leaving or have left and the knowledge is gone, I sure  
22 hope they did enough training that maybe the knowledge  
23 isn't gone. You have others who can follow on with  
24 that. So if you can talk about those two I'll get out  
25 of your hair for a while.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. KURITZKY: Oh no. and I thank you,  
2 Dr. Bley. Please stay nearby and I always welcome  
3 your comments.

4 So I'll hit one and then the other and  
5 hopefully I'll remember the second one while I'm  
6 talking about the first one. So let me jump first to  
7 the knowledge transfer one. And that is a, that is a  
8 very good point.

9 One of the main focus of this work has  
10 been to bring up the state of practice. The  
11 capabilities of staff in PRA, particularly as we  
12 become a more risk informed regulator we want to have  
13 ample PRA capabilities on staff to process and  
14 evaluate risk-informed applications and other risk-  
15 informed issues. Or policies.

16 We have a new project that lasts a long  
17 time. I mean, people are constantly cycling. That's  
18 the nature of the beast. Whether they're getting at  
19 the end of their career and retiring, whether they  
20 find better opportunities in other agencies or outside  
21 the government or just move on in order to get, in  
22 reality, in order to get promotions in much of the  
23 agency or any other agency you have to move to a  
24 different organization within the agency in order to  
25 get a promotion so there is going to be constant flux

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 in turn. That's the reality of it.

2 But yes, we have tried to focus on making  
3 sure that when people go that there are other people  
4 to fill in. That's, in the macro, that was the whole  
5 idea. Was as more of the senior PRA people retired  
6 over the years that there would be this new crop of  
7 people to take over. And that's really happening in  
8 the climate with microcause and with people leaving  
9 the project over the last few years.

10 So we have had people that have come in.  
11 In some cases the change has been fairly abrupt and  
12 we've had, lucky to people that are still in the  
13 agency, in different organizations. We've been very  
14 fortunate that those organizations and those people  
15 have agreed to continue to support the project, that's  
16 helped us a lot.

17 And then therefore that knowledge does  
18 stay here in the agency. But there are other cases  
19 where we have had to bring in new people and bring  
20 them up to speed. Or at least get them as familiar as  
21 possible with this stuff.

22 My point was, the person who actually did  
23 the study, did the work, did the PRA model with all  
24 the thought thinking and documenting assumptions and  
25 everything else, they're going to know the stuff a lot

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 better than someone who comes along and is told about  
2 or taught about or plays around with it a little bit.  
3 So there is just natural leakage of knowledge when you  
4 go from someone who did the work to someone who now is  
5 familiar with the work or has been trained in that  
6 area.

7 Also, we've unfortunately, no secret, the  
8 agency has struggled to stay properly staff. We in  
9 PRA-B are very understaffed. And so because of that  
10 it's just a body count limitation in terms of people  
11 to be able to pick up and take over certain tasks.  
12 But that's certainly a priority.

13 We are trying to bring in people to fill  
14 in the rolls. We have brought in people just recently  
15 that are taking over more and more of the rolls and  
16 picking up information from more experienced people in  
17 the project and in the field of PRA.

18 And so, that's something we're always  
19 working at. And just because some of the people that  
20 did the actual initial studies, or models, have left,  
21 that doesn't leave us totally empty handed. We have,  
22 you know, success in many cases. We've had people  
23 that have just moved in seamlessly and taken over when  
24 one person has left.

25 And so I don't want to sound like

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 everybody has jumped ship and now we don't know  
2 anything that's happening on the project, I'm just  
3 saying for some of the details, even for people that  
4 are still here, I mean, they did the work five, six  
5 years ago, they're not going to remember every little  
6 detail, but there are some people that have left the  
7 agency and so it's just, it's a little more difficult  
8 to create every single thought process once people  
9 have moved on and new people have inherited the work.

10 But the other item? I knew I'd forget  
11 that.

12 MR. BLEY: Reference plants.

13 MR. KURITZKY: Oh yes. Thank you very  
14 much. So the reference plant. Yes, so, you know, I  
15 think I know what you're referring back to. We did  
16 have, early on, some disagreements and some modeling.  
17 This goes back to the Level 1 internal event PRA. It  
18 really was the only case where we ran into technical  
19 disagreements with how things are modeled in the  
20 reference plant PRA versus our own.

21 And those cases we just, we work with them  
22 to see if they could justify to our satisfaction what  
23 they did. We were never quit comfortable and so we  
24 relied on our own modeling and approach. And that's  
25 what the results show. So if the reference plant PRA

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 was compared to our PRA results you would see that our  
2 results differ, to some extent, because of the  
3 difference in how we treat those issues.

4           Primarily, I don't want to go into the  
5 technical details, but it primarily dealt with how we  
6 were modeling station blackout sequences. How we were  
7 modeling recovery of AC power. How we were modeling  
8 failures of certain emergency AC power components. As  
9 well as certain, quantification of certain human  
10 reliability actions. Not human, operator actions.

11           So that led to a difference in station  
12 blackout related core damage frequency, which is the  
13 main driver at this plant. Particularly in our model.  
14 And so you see some differences there.

15           But that was really, I think, the only  
16 area that we had any significant technical  
17 disagreement. Is that what you were referring to, Dr.  
18 Bley?

19           MR. BLEY: Yes, it was. And thanks for  
20 that answer. The other thing was, since many of the  
21 members weren't around at that time I guess the only  
22 thing is we cannot talk about who the reference plant  
23 is, so it's just a note to everybody.

24           MR. KURITZKY: Yes. And I appreciate that  
25 caution, yes, for those who don't realize that yes.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 It's, we don't mention that now. Because in reality  
2 this model doesn't actually reflect an exact plant  
3 anymore anyway.

4 I'll get into this a little bit later, but  
5 this was based on the design operation of the  
6 reference plant in 2012, which is far different than  
7 in 2023. And in addition, we made other modeling  
8 decisions and other used various modeling technics  
9 from our SPAR models, et cetera, that would lead us to  
10 have different results that what the reference plant  
11 does.

12 So it doesn't really reflect any existing  
13 nuclear power plant, it's based heavily on a reference  
14 plant and site. But it doesn't really reflect any  
15 existing plant so it's legitimate to just refer to it  
16 as a reference plant.

17 Okay. Other questions?

18 CHAIR DIMITRIJEVIC: Now that I think of  
19 it, this has taken enough time now. I just want to  
20 mention that this is a Subcommittee meeting and all  
21 which we discuss here with you is our personal  
22 opinions and, you know, insights as we see them now.  
23 And our official suggestions will be provided in the  
24 latter, so, you know, all these discussion is based on  
25 our personal views of the things.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           So, all right. I mean, you hear there a  
2 lot of comments. And, I mean, I had the, I mean,  
3 Dennis and Joy expressed a lot of what I wanted to say  
4 about these things, but in this moment we are not  
5 going to, at least in my opinion, we are not here to  
6 comment on the technical aspects of your work because  
7 this work is done and documented in so many volumes,  
8 so not any changes reasonable or should be discussed.

9           But we are sort of looking on how will all  
10 of these things be presented and documented. And, you  
11 know, and this is where most of our suggestions are.

12           And when I was reading all of these  
13 volumes I felt like, you know, I was in the, like a  
14 diamond mine. I would occasionally run into something  
15 which made me think, oh wow, this is really  
16 interesting, you know. But the thing is, there is so  
17 much material and those things are spread and sprinkle  
18 through the report, you know. So in the, what would  
19 you subtract to the summary report, which I guess you  
20 will now talk about structure, will be very important  
21 from the, you know, point of the project point of  
22 view. Okay, please continue.

23           MR. KURITZKY: Yes, I was thinking. Oh,  
24 okay. And thank you all for that. I appreciate that  
25 because that's exactly what we're looking for now.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           You're right, the technical work has long  
2 since been done for the most part. We'll mention a  
3 few things shortly that are still being worked on.  
4 Much of this work has already been completed. So the  
5 work here on the Volume 4 models is done and so, yes,  
6 the messaging and the presentation information is  
7 really what we're looking for feedback on, so thank  
8 you.

9           Okay, so moving forward. I want to now  
10 just go over the project status. Oh, I'm sorry, one  
11 thing that is my mind, Doctor, because I got  
12 distracted when we were talking about the  
13 acknowledgments section.

14           So one thing that I did want to say and  
15 mention is, again, I am the program manager, I'm  
16 presenting this information today, but I'm not the one  
17 who did this work. As you just mentioned, there was  
18 a ton of work. And there's a ton of great technical  
19 work on the, work we're doing today as well as the  
20 project as a whole.

21           I've been very fortunate that we've had a  
22 tremendous number of really topnotch technical experts  
23 working on this, both within the NRC and also with  
24 National Labs and commercial contractors. And I've  
25 been very fortunate to be able to work with these

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 people and get their support.

2           And there are way too many names for me to  
3 individually list. I do suggest that if people get a  
4 chance, go look at those individual technical volumes,  
5 look at the title pages for the authors, look into the  
6 acknowledgment pages for other people that have  
7 supported the work and you can see all the people in  
8 there that have really just done some tremendous work.

9           And some of them have left the agency, but  
10 many of them are still here. And that gives me a lot  
11 of confidence that we will have a lot of PRA  
12 capability going forward.

13           So with that, let me just mention for a  
14 few minutes where we stand in terms of the project  
15 status. I want to focus, figure up, it's a figure  
16 that probably many of you have seen before. It's in  
17 most of my presentations. But I just want to, just  
18 to, I'm not going to go in detail here, but just to  
19 kind of refresh people's ideas in terms of the work  
20 being done.

21           All the models and internal reports are  
22 done in two phases. Phase 1 is where the bulk of the  
23 work is done. And that's the initial model and the  
24 initial report, internal report. And then Phase 2 is  
25 where we finalize the model and update the reports

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 based on some review feedback from external to the  
2 project reviews.

3 And so that's, there is Phase 1 and there  
4 is Phase 2. Phase 1 being the much bigger phase. And  
5 I just want you to have that in mind as we go to the  
6 next slide.

7 CHAIR DIMITRIJEVIC: So, Alan, before you  
8 leave --

9 MR. KURITZKY: Yes.

10 CHAIR DIMITRIJEVIC: -- there is a color  
11 code here, right? Is there some color code of what is  
12 green, what is orange and, or is that for artistic  
13 purposes?

14 MR. KURITZKY: Yes. The only color thing  
15 here is green, is actually the work on the models.  
16 And really models, well, documentation is kind of like  
17 a download, but that's models and documentation. And  
18 the orange is the reviews. So the green is really the  
19 work that the project team is doing, and the orange is  
20 the various reviews.

21 CHAIR DIMITRIJEVIC: So remind me again,  
22 where you are with this PWR peer review? Is that the  
23 finished --

24 MR. KURITZKY: The PWR Owner's Group led  
25 peer review?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 CHAIR DIMITRIJEVIC: Yes.

2 MR. KURITZKY: Okay. So yes, that was  
3 something that early in the project we were very  
4 fortunate that PWR Owner's Group was willing to  
5 support us on doing some standard based peer reviews,  
6 just like they do for licensee PRAs.

7 So they did that for us for the Level 1  
8 PRA for internal events, and the Level 1 PRA for  
9 internal floods. And then also for the Level 2 PRAs,  
10 Level 2 and Level 3 PRAs, provincial events and  
11 floods.

12 And they are, I think they also, they  
13 supported a, it wasn't a peer review, but they came up  
14 with criteria for us to evaluate the dry cask storage  
15 PRA because there was no standard for dry cask  
16 storage, they, we had kind of like an expert meeting  
17 that the PWR Owner's Group was in charge of where we  
18 came up with criteria for which to evaluate the dry  
19 cask storage PRA.

20 And I think we may also have had some  
21 support for them and some of the other hazards work.  
22 There was, or -- I can't remember. For some reason  
23 there was another, I think there was another thing  
24 they supported us on but I can't remember offhand.

25 But anyway, it was primarily the initial

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 PRAs that they did. Unfortunately budget constraints  
2 and other issues led to that, eventually stopping that  
3 work. But the initial models we were very fortunate  
4 to have. Those owners who led peer reviews.

5 Both because we got a lot of good feedback  
6 from them on those reviews. Also, they allowed NRC  
7 Staff to both be on the peer review panel as well as  
8 observe, which normally people don't do.

9 But they allowed us to observe some of the  
10 peer review proceedings and so we both got a very good  
11 understanding of what that process is, which is  
12 beneficial. As well getting the input on our specific  
13 PRA models, which sort of helped us in two different  
14 ways.

15 CHAIR DIMITRIJEVIC: And --

16 MR. KURITZKY: And it was also beneficial  
17 for them because some of those were trial used  
18 standards and so they got a lot of use from us as we  
19 allowed them to pile up those standards. Like for  
20 Level 2 and Level 3. Sorry, go ahead.

21 CHAIR DIMITRIJEVIC: Are you planning to  
22 document some of those results because you didn't in  
23 Volumes 2 and the, you know, the 4th. I mean 3 and 4.  
24 You didn't document, I didn't see any, the commutation  
25 on results of those peer reviews.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. KURITZKY: Yes, that's all internal  
2 information. All those, the studies they were  
3 reviewing were official use only. They had a lot of  
4 proprietary information. And the reviews themselves  
5 from the PWR Owner's Group are identified as, what do  
6 they call it, confident, I'm drawing a blank on the  
7 word. Not, you know, proprietary. They were  
8 proprietary.

9 CHAIR DIMITRIJEVIC: Oh, proprietary.  
10 Okay.

11 MR. KURITZKY: So we have them internally  
12 but we don't, they have not been --

13 CHAIR DIMITRIJEVIC: You can't share the  
14 results. Okay.

15 MR. KURITZKY: Right.

16 CHAIR DIMITRIJEVIC: Okay.

17 MR. KURITZKY: Right. Okay. So that's  
18 Phase 1 and Phase 2, just to keep in mind as we go to  
19 the project status dashboard. This is how I kind of  
20 keep track of where things stand.

21 On this dashboard, which you guys have  
22 probably see at some point before, but along the top  
23 you see the various PRA levels, one, two and three, as  
24 well as the last column, 2020, as we work to support  
25 the overview reports. Which because the base model,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 the model is based on the plant, the reference plant  
2 as designed and operated back at the project cutoff  
3 date, which was in August of 2012.

4 So there's a lot of features that are  
5 currently in the plant that were not reflected so we  
6 went and did an updated. Essentially a sensitivity  
7 study where we incorporate some of these more recent  
8 features.

9 And those are documented in the overview  
10 report, and so therefore there was a lot of internal  
11 calculation notes, Level 1, 2 and 3 PRA calc files to  
12 support that. So that was something that was added to  
13 the scope of the project afterwards, and that's in  
14 that last column. And we'll discuss more about that  
15 in a few slides.

16 So those are the four columns on top. The  
17 rows going down are the different rheological sources  
18 on the site, as well as different plant operational  
19 states and the different hazard groups.

20 So if you kind of step back and look at  
21 the whole picture, we pretty much completed most of  
22 the technical work. The only areas that really have  
23 technical work left, you know, the phase one work is  
24 just in, there is yellow boxes.

25 So for the low power shutdown there is the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 2020 FLEX sensitivity case which we've completed for  
2 the Level 1 shutdown PRA, but we still have to  
3 complete for the Level 2 and Level 3 shutdown PRAs.  
4 Also, for the spent fuel pool, the Level 3 work for  
5 the spent fuel pool still has to be completed. And we  
6 were doing active work on the integrated site risk  
7 task.

8 So outside of those three there is not  
9 that much more that has to be done. You'll see a few  
10 of these boxes in blue. Those, for the shutdown PRA.  
11 Spent fuel and dry cask storage. There is some  
12 additional tie-up documentation items and reviews that  
13 have to be completed, but the technical work is  
14 essentially done.

15 MR. BLEY: Alan?

16 MR. KURITZKY: Yes.

17 MR. BLEY: It's Dennis again. So as I  
18 understand you, and you'll talk about this more at the  
19 end I think, the three that are Phase 1 will  
20 eventually become Phase 2 when they complete?

21 MR. KURITZKY: Yes.

22 MR. BLEY: Okay.

23 MR. KURITZKY: God willing, yes.

24 (Laughter.)

25 MR. BLEY: And you'll talk about the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 schedule for that before you're done today?

2 MR. KURITZKY: Yes. I'm going to talk  
3 about the schedule because, so just to be clear, this  
4 is all, the technical work and internal reports have  
5 to be done.

6 And then, the one thing that remains, and  
7 thank you for reminding me, the only thing that  
8 remains after all this is converting them into public  
9 reports which really is just scrubbing out proprietary  
10 information. That's really the bulk of it. And  
11 formatting for, editing and formatting for NUREG  
12 publication. So that's the piece that will come out.

13 And that's what happens before they come  
14 out to the public and before we come back to brief the  
15 ACRS on those. And so I'll go over the schedule for  
16 those being released publicly.

17 MR. BLEY: Well I'm pleased to hear that.  
18 I heard rumblings that you kind of given up on anybody  
19 that cited risk, and we were very interested in that.  
20 So we look forward to when you wrap that up.

21 MR. KURITZKY: Yes. And just to be clear,  
22 because I'm not discussing integrated at-risk at this  
23 meeting, but just for your information, I don't know  
24 where the grumblings came from, but we have recognized  
25 that we are not going to a full quantification

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 integrated site risk for this study. What we'll end  
2 up doing is, more of a proof of concept.

3 We have some Level 1 multi-unit core  
4 damage frequency results for this referenced site.  
5 But for Level 2 and 3 multi-unit core results as well  
6 as integrated site risk. We bring in the spent fuel  
7 and dry cask storage. Those will mostly be just some  
8 pilot applications or some discussions because we  
9 recognize that the level of effort required to do that  
10 work completely unfortunately we just don't have the  
11 time or resources left to do it.

12 Just to kind of give you the concept, when  
13 you go look at multi-unit core damage frequency in the  
14 Level 1 space, if core damage results for one unit,  
15 you can have core damage results for the second unit  
16 and you can combine them together for a core damage  
17 result that involve both units. But again, you have  
18 one metric, it's core damage.

19 When you go to the Level 2 space, and we  
20 have 16 release categories. So when you have a  
21 release category, and it's not even the fact that if  
22 you have at least Category 1 for Unit 1 that you'll  
23 have released Category 1 for Unit 2, and so you have  
24 16 now instead of one metric, you actually could have  
25 cross combinations. So you could have really 16 times

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 16, minus some duplications, but you end up having, I  
2 can't remember, but a hundred plus different  
3 combinations. So it really wasn't practical for us to  
4 do all that here. But we do it for --

5 The good thing is having the Level 3  
6 results for the single unit we know which are the more  
7 important release categories, and so we are doing a,  
8 kind of a pilot application, looking at some of the  
9 more important release category combinations. Which  
10 should actually give us a fair idea of what type of  
11 Level 2, and then possibly Level 3 risk, multi-risk is  
12 involved. But we will not be doing the complete soup  
13 to nuts.

14 So that may be what they're grumbling.  
15 We're not doing a full qualification but we are going  
16 to have a lot to say about integrated service.

17 MR. BLEY: Okay. And we look forward to  
18 seeing that. I think it's going to be important for  
19 other plants in the future. And anything that we've  
20 learned that can be passed on will be very helpful.

21 MR. KURITZKY: Yes, thank you. Okay, I  
22 think that's it's for project status. Let me now move  
23 on, as I was mentioning, the public reports because  
24 that's, the public facing information.

25 And so, what we intend to do is produce

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 the work in eight different volumes, including, or  
2 consisting of, probably more than 20 individual  
3 reports, as you can see on this diagram. This summary  
4 report. Let me see if my mouse will work. Summary  
5 report here Volume 1.

6 And that's the one I was mentioning  
7 before, is going to capture the overall results and  
8 the insights. It's going to look into things like  
9 perspectives, comparisons, maybe other studies.  
10 Recommendations for future work. Identifying what are  
11 the areas that, you know, drive the risk or areas that  
12 we're uncertain about. So that all will show up in  
13 the summary volume, which is I believe the final  
14 volume that we produce.

15 Volume 2 is the background volume that --

16 CHAIR DIMITRIJEVIC: Alan, sorry to  
17 interrupt you.

18 MR. KURITZKY: Yes.

19 CHAIR DIMITRIJEVIC: You know, you always  
20 talk about the four main goals on this project, you  
21 know. And the last one there is to, you know, to the  
22 realistic cost of developing levels to be PRA. Will  
23 that also be part of the summary Volume 1?

24 You know, because, you know, this is your  
25 Number 4 goal. First is, you know, develop these new

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 methods, get new insights, train the staff, you know.  
2 And then the fourth one is sort of summarize the  
3 extent of this effort. So, are you planning to  
4 include that in the Volume 1?

5 MR. KURITZKY: Yes. Volume 1 will address  
6 all the four main objectives of the project. But just  
7 to be clear, that last objective will be the one that  
8 probably gets the least amount of space in the report  
9 because it was something that initially, I think there  
10 was some thinking amongst the Commission at the about  
11 whether or not we have Level 3 PRAs performed by other  
12 plants and so they wanted to understand what the level  
13 of effort and cost would be.

14 I don't think there is really that much of  
15 a, you know, with the current Commission I don't think  
16 there is that much of interest in that. Pursuing  
17 that.

18 And also, the one thing that we realize  
19 too is that the cost of doing this is very project  
20 specific because it depends on a lot of key factors.  
21 It depends on how many of the, what's the extent of  
22 the PRA models that the plant already has? Do they  
23 already have a very well developed Level 1 PRA, do  
24 they have a Level 2 PRA? Have they looked at, you  
25 know, what type of hazards are we currently, are we

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 looking just at internal events and internal floods,  
2 are we also looking at fire and seismic wind? Are we  
3 looking at shutdown, are we looking at just plant, you  
4 know, at full power? And so there are a lot of  
5 factors involved.

6 Are the people that did those earlier  
7 models, are they available to the organization doing  
8 the study or do they have to have other people try and  
9 understand what's done before them and come up to  
10 speed and further that work? How much access do they  
11 have to the plant and to get plant information? There  
12 is just a lot of factors.

13 Is the team that's going to be working on  
14 it, are they dedicated to just getting that done? Are  
15 they experienced people? There is a lot of factors  
16 that go into it.

17 And the way we approached it here with NRC  
18 is very different than the way, versus a private  
19 organization would go about it. One of the things  
20 that many of you have heard me discuss it over the  
21 years is the fact that we don't have a dedicated team  
22 for this project and so we get people's time when it's  
23 available. There is other higher priority work we'd  
24 have to work on and so they are constantly cycled in  
25 and out of this project.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           Because the project is one that a lot of  
2           interconnected steps where things build on each other  
3           so that if someone, at some point, is pulled off and  
4           doesn't get their stuff done then the person who  
5           needed their input can no longer do their work. And  
6           that person comes back, they may finish their work  
7           after some runup speed again, but now the other person  
8           is no longer available to do it.

9           And so, we also, again, as you mentioned  
10          before, one of the things we wanted to bring up and  
11          train lots of people, we used a lot of junior and mid-  
12          career staff. We didn't have a team of just experts  
13          working on this.

14          And whereas a private organization might  
15          higher a consulting company or higher their own staff  
16          that are just focused, better experienced PRA people.  
17          So there are so many variables that our experience,  
18          particularly with this project, wouldn't really  
19          extrapolate to other organizations.

20          So we'll probably talk quantitatively  
21          about some of the experiences we had with this  
22          project, but there is not going to be a lot of our  
23          number type information that we can say, hey, this is  
24          what it takes to do this type of work and if you want  
25          to do it expect this is what you would have to put

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 forward to doing it. So yes, it's something that will  
2 get addressed but probably not in --

3 CHAIR DIMITRIJEVIC: Not for the --  
4 (Simultaneously speaking.)

5 MR. KURITZKY: -- detail.

6 CHAIR DIMITRIJEVIC: All right, thanks.

7 MR. KURITZKY: Yes. Okay, so again,  
8 Volume 2. The background volume. So that kind of  
9 just describes the background of the project. It also  
10 describes the reference plant insight. And includes  
11 at a high level the technical approach for the various  
12 aspects of the study. The overall study.

13 And volume, then the rest of the volumes  
14 hit more of the detailed technical information.  
15 Volume 3 is the reactor at power for internal events  
16 and internal floods. And we have separate Level 1  
17 reports for internal events and internal floods for  
18 Level 2 and 3, they're combined together. And then we  
19 have also the overview report that came later.

20 Same idea for internal fires and external  
21 events for Volume 4. We have separate Level 1 reports  
22 for fire, seismic and a combined high wind and other  
23 hazards report.

24 And then for Level 2 and 3 it's all  
25 combined into a single report. And again, an overview

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 report, low power shutdown, separate Level 1, 2 and 3  
2 reports, we just look at internal events.

3 By the way, that goes back to a question  
4 that I, I can't remember if it was Dr. Bley, but, you  
5 know, what stuff did we, what do we no longer look at.  
6 And individual items, too difficult for me to say  
7 offhand, there is a million things that we did or  
8 didn't do. We either didn't look at or did a separate  
9 occasion for all the different parts of the study.

10 But one thing that was major on a scope  
11 level is we decided not to, the reason we're going to  
12 do shutdown for all hazards also. And we realize,  
13 Don, that we just didn't have the time or resource to  
14 do everything in the original scope so we had to  
15 decide what to cut back on.

16 And it was decided that we would not  
17 pursue the low power shutdown for the other hazard  
18 just because that was one that we didn't really, that  
19 was one of the areas that we really didn't have a lot  
20 of experience with. There was a lot of open issues  
21 that would have to be addressed in order to move  
22 forward with that work, so if we did it, it wouldn't  
23 have been that complete of a job and so it was felt  
24 that the ACRS, actually the Subcommittee I think  
25 agreed with us that if we couldn't really do it, a

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 really good job, I thought that was probably something  
2 we best to leave off.

3 So now the low power shutdown just looks  
4 at internal events. So that's what will be in Volume  
5 5.

6 Volume 6 is the spent fuel pool. We have  
7 a combined Level 1, Level 2 PRA, which will be in one  
8 report. And then the Level 3 in another report.

9 We may in fact not actually have an  
10 overview report for spent fuel pool because we're  
11 probably not going to have a FLEX sensitivity case for  
12 that. But our dry cask storage will be in Volume 7.  
13 Everything together. Level 1, 2 and 3 PRA and all  
14 hazards, and then integrates that risk that's in  
15 Volume 8. So that's all the reports we'll be  
16 producing publicly.

17 So far, the Level 3 reports, they went out  
18 for public comment back in April of '22. We've since  
19 gotten the public comments back, updated those  
20 reports. And they have been submitted to the Office  
21 of Administration for final publication as NUREGs.

22 Volume 2 was also something that we set  
23 out for public comment in April of '22, but we have  
24 not submitted that one back for final publication  
25 because we realize that it references all the other

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 reports and so we can't really put the bow on that one  
2 until we know the reference information from the other  
3 reports. So those are actually going to get published  
4 at the end of the project when all the other reports  
5 are going out too.

6 And then Volume 4, which is the subject of  
7 today's presentation, those reports went out for  
8 public comment back on August 18th. I think the  
9 public comment period ends tomorrow, so I'm interested  
10 to see what comments we receive on those reports.

11 And then the remainder of the reports I  
12 have on this list right here. You can see if you look  
13 down, for the third bullet and further down, these are  
14 the ones that have yet to be completed. And they have  
15 various dates in calendar date year 2024. So they'll  
16 be released at various times in 2024.

17 Those dates are in gray to indicate that  
18 there is great uncertainty with the dates for anything  
19 that's more than a few months away, particularly  
20 because, as I mentioned before, we don't have a  
21 dedicated team so it really depends on how much time  
22 the various technical leads can spend on this work  
23 will determine how fast those reports can get out.  
24 But again, we're targeting to have them all done, for  
25 our calendar year, 2024.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           Okay, so that's the overview of where we  
2 stand on the technical work and the public reports.  
3 I now want to spend the bulk of the remainder of the  
4 presentation, let me just do a time check, 9:30. So  
5 we're going to discuss Volume 4. So particularly the  
6 overview report for Volume 4, which is the reactor at-  
7 power results for fire, seismic and wind.

8           MR. EVANS: Yes, Alan?

9           MR. KURITZKY: Yes.

10          MR. EVANS: Before you get started it  
11 looks like we have a question from --

12          MR. KURITZKY: Okay, sure.

13          MR. EVANS: -- Dr. Rempe.

14          MEMBER REMPE: It's Joy.

15          MR. KURITZKY: Yes.

16          MEMBER REMPE: And I'm a little late in  
17 raising my hand, I apologize. But could you talk a  
18 little bit about the public comments you did receive  
19 on Volume 3, just at a high level?

20                 Were they in the weeds about you, you  
21 didn't have a component accurately modeled or were  
22 they high level concerns?

23          MR. KURITZKY: So thank you, Dr. Rempe,  
24 that was something I was thinking of mentioning and I  
25 appreciate you bringing that up.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           So yes, the comments that we received on  
2 Volume 3 were more high level, they really weren't, we  
3 had a few technical questions from the PWR Owner's  
4 Group, but mostly they were higher level. They were  
5 essentially like, well, first let me mention that we  
6 got comments only from three stakeholders.

7           Which would be an individual stakeholder  
8 that was more concerned about the consequences and the  
9 focus, our focus on just radiological consequences  
10 when Fukushima and other accidents show that the  
11 biggest health concerns are associated with the  
12 evacuation, more than the radiological exposure. And  
13 so we were able to respond to that one because our  
14 Level 3 reports, not only do we calculate risk  
15 measures or consequence measures for health effects,  
16 but we also look at things like affected population.  
17 Which is kind of a surrogate for the impact on people  
18 having to evacuate. And we also lack contamination  
19 and economic costs, et cetera. So that was one  
20 comment.

21           But the other two organizations that  
22 submitted comments were NEI and the PWR Owner's Group.  
23 NEI comments were more of the line of, hey, we agree  
24 with the results you came out with, your Level 3  
25 results for the internal event and floods.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           And basically they felt that, hey, you've  
2 done enough, there is no real need to keep doing work,  
3 we don't agree, we're completing the project. I think  
4 that was more of, in a nutshell, in a higher level.

5           The PWR Owner's Group also had some higher  
6 level comments and some, as I mentioned, some more  
7 technical comments. But their basic thing was, hey,  
8 we see the margins that you're showing in the Level 3  
9 space to the QHOs, has there been some thought about,  
10 you know, how that would roll back into regulatory  
11 guidance? And that's something that is not something  
12 we're addressing as part of this project.

13           So when we, when the reports finally do  
14 get published, when Volume 3 gets published as final  
15 NUREGs, like I said, they're with our publications  
16 department in the Office of the Administration right  
17 now, when they come out there is also going to be a  
18 file in the package that has a table with all the  
19 comments and our proposed responses to them. So  
20 you'll see some of our responses there.

21           But basically, any impact that the results  
22 of this study has on regulatory applications, it will  
23 be done, not by the project team, but will be done by  
24 the cognizant organizations and the agency, so that's  
25 basically what, in a nutshell, what the comments were.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MEMBER REMPE: Great, thank you.

2 MR. KURITZKY: Sure. Okay. So in terms  
3 of the Volume 4 results, I do want to mention up-front  
4 that, well, as I mentioned earlier, the base case  
5 model for the study, which we refer to as the Circa-  
6 2012 case, is based on the design and operation of the  
7 reference plant back in, at the cutoff PRA study  
8 cutoff date of August 2012. And so there is a lot of  
9 more recent changes to the plant and other aspects  
10 that have not included in this study.

11 So we decided to do a, essentially a  
12 glorified sensitivity case. We call it the 2020 FLEX  
13 case, in where we incorporate certain things that have  
14 changed since that time.

15 And specific are the items you see right  
16 here on this slide. We now incorporate the passive  
17 shutdown seals for the reactor coolant pumps. These  
18 are Westinghouse reactor coolant pumps. And we also  
19 include the FLEX strategies. Particularly for dealing  
20 with an extended loss of AC power or relap.

21 And then if FLEX were to not be  
22 successful, we also credit the continued operation of  
23 the turbine-drive aux feed for secondary side cooling  
24 given that you lose all installed AC and DC power  
25 essentially referred to as blind feeding of the steam

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 generators. So those are the things that we include  
2 in this 2020 FLEX case.

3 CHAIR DIMITRIJEVIC: Alan --

4 MR. EVANS: Hey, Alan, before you move on  
5 it looks like we have a, yes.

6 CHAIR DIMITRIJEVIC: Yes. From Tom  
7 Roberts. Go ahead please.

8 MEMBER ROBERTS: Yes. Alan, if you go  
9 back to the slide you just had up? The last bullet  
10 gives me the chance to ask the question I wanted to  
11 ask about operator actions. The credit for a  
12 continued turbine-drive aux feed pump operation seems  
13 to credit the ability of the operators to continue  
14 operating that system after the releases are modeled  
15 in Level 2 and Level 3, is that right?

16 MR. KURITZKY: So thank you for that  
17 question. You for me to go into a little bit of  
18 technical detail here. And also expose some laundry,  
19 dirty laundry. I don't know.

20 So here mentioned, in the Level 1 PRA we  
21 did not, in the base case Level 1 PRA we did not  
22 create continued turbine-drive aux feed in the absence  
23 of installed AC and DC power. And that was for  
24 several reasons. We felt that it was just too  
25 uncertain about success.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           When you have those conditions there is a  
2           possibility to over or under feed the steam  
3           generators. You can end up tripping off the turbine  
4           generator from getting water in the steam lines. And  
5           given the conditions we felt that it was not  
6           appropriate to give credit for that and so we didn't  
7           in the Level 1 base case model.

8           However, in the Level 2 base case model we  
9           did credit that. The Level 2 team did create that for  
10          its effect on acts and timing. They did give a very  
11          high failure probability. I think the failure  
12          probability was something around .6, so it wouldn't  
13          have made that much difference on the results whether  
14          they credited you or not, but they do have that in  
15          there.

16          So in fact, when we go in and credit here  
17          for this 2020 FLEX case, we had to strip out its use  
18          in the original Level 2 model and replace it with this  
19          new FLEX model, which actually credits it for Level 1  
20          and then therefore propagates the Level 2 and Level 3.

21          So I don't know that I directly addressed  
22          your question. Do you want to just repeat this to  
23          make sure I --

24          MEMBER ROBERTS: Yes, right. I have a  
25          more general question that this just offers a chance

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 to ask which is the role of operator action in the  
2 Level 2 and 3 progression after the release becomes  
3 significant to the environment.

4 And we had a meeting yesterday on the high  
5 burn-up fuel rulemaking where there was some  
6 discussion on control room dose. And there was a  
7 footnote in that report, I'm not sure if you're  
8 familiar with the footnote that says that, basically  
9 risk analyses don't care about the operator dose, that  
10 they don't model the change in errors of a commission  
11 or omission caused by, you know, whatever the dose  
12 rate environment might be.

13 Yes, I was wondering, a, if that's  
14 accurate, and then b, just your general thoughts on  
15 the role of operator action in the control room and in  
16 the old site technical support center during the  
17 release phases of a Level 2 and Level 3 PRA because it  
18 would see like the presence of operators in the  
19 facilities could be helpful in terms of accident  
20 management. And if it's not modeled in the PRA I'm  
21 just wondering how you account for that?

22 MR. KURITZKY: Okay. Thank you for that  
23 question. So I'll probably give you a partial  
24 response and maybe I can phone a friend for more  
25 details.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           So this treatment was done pre-core  
2 damage. It's a Level 1 treatment so it has impacts  
3 for Level 2 and 3 but the actions occur pre-core  
4 damage. So they're not impacted by any radiological  
5 effects in the control room.

6           We do have, as I mentioned before, the  
7 areas we kind of pushed to the state of the art was we  
8 do have a post-core damages HRA that we performed and  
9 we do credit certain mitigation actions in the Level  
10 2 space. You know, in post-core damage. Up to a  
11 certain point.

12           But the, and I don't know specific, I  
13 think we considered all aspects, including  
14 habitability concerns which would directly include not  
15 just temperature and steam but also possibly  
16 radiological concerns. And for Level 3 I don't think  
17 we considered specific operator actions in the Level  
18 3 space, we considered things more broadly about just  
19 assuming certain evacuation things.

20           So most of the stuff with the TSC or other  
21 things could be in the Level 2 space as part of that  
22 post-core damage HRA. I think we consider things like  
23 that, but I don't specifics.

24           I don't know if Susan Cooper is on the  
25 line and is able to answer any more on that. I don't

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 like to put people on the spot because, again, Susan  
2 was just one of three people that worked on that and  
3 they did it many, many years ago so I don't know --

4 MEMBER PETTI: She put it in the chat,  
5 Alan. So you can --

6 MR. KURITZKY: Oh, okay.

7 MS. COOPER: Yes, I can --

8 MEMBER PETTI: That doesn't help, say it  
9 on the record, Susan.

10 MS. COOPER: Okay. Susan Cooper, Office  
11 of Research. Yes, the Level 2 HRA approach addressed  
12 many aspects with respect to environmental hazards,  
13 and habitability was one of those. So that was  
14 addressed.

15 We had a lot of information from the  
16 larger Level 2 PRA about different areas of the plant  
17 that would impact operators and equipment and its  
18 availability to perform. So that was definitely part  
19 of it.

20 I will say that we found out somewhat late  
21 that there were some areas of the plant that we didn't  
22 have radiation information. We did chase that a bit  
23 at a site, plant site visit. And worst case we  
24 decided that probably maybe they would do a survey  
25 first so it would slow things down.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           But one of the things that we did in the  
2 Level 2 HRA was say, hey, don't give us some made up  
3 time we'll estimate how long it's going to take these  
4 actions to be performed and then figure out where that  
5 levels you so far as containment end states. So it  
6 might have stretched the time some, but the general  
7 answer is yes, we considered habitability, including  
8 radiation, among other things.

9           MEMBER ROBERTS: Thank you very much,  
10 Susan. I assume that's a report that was issued that  
11 we could probably get access to?

12           MR. KURITZKY: Susan, I'll jump in for  
13 that one. So there are two reports that document our  
14 work on the post-core damage HRA. There was one that  
15 addresses the approach and there is one that addresses  
16 the implementation.

17           The approach report I think will be made  
18 publicly available, but I can't remember where that  
19 stands. But the implementation one will not. So  
20 possibly we're re-discuss the specifics and what we  
21 consider for this study will probably not be publicly  
22 available because there is a lot of proprietary plant  
23 specific information in it.

24           MEMBER ROBERTS: You'll get that one.

25           (Simultaneously speaking.)

1 CHAIR DIMITRIJEVIC: That one may include  
2 action discussion. You say that those, you know,  
3 actions you use the simplified method so that was the  
4 one, it was one of the products you're not endorsing,  
5 right, when we were discussing introduction.

6 One of the things you mentioned analyzing  
7 this accident management action was something that you  
8 didn't have too much guidance and the simplified  
9 approach was developed. Is that a true statement?

10 You said that in the introduction when we  
11 were discussing what approach, you know, what  
12 approaches you don't want to endorse.

13 MR. KURITZKY: Yes. Actually, I apologize  
14 because I don't think I was very clear about  
15 discussing that. That was, at the beginning of that  
16 bullet when I was talking that was an example of an  
17 area we advanced the state of the art. And so that is  
18 an area where we would like people to look.

19 We don't expect that our approach for  
20 post-core damage HRA is going to be the official final  
21 approach that all post-core HRAs have done for the  
22 rest of PRA eternity, but we think we put a pretty  
23 good beachhead down for how to do this. And hopefully  
24 people as they, like other areas in PRA and everything  
25 else, people will work with it, build on, improve it,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 you know, whatever and hopefully it will find, you  
2 know, widespread acceptance.

3 But it something that we do want people to  
4 look at and work with. So that was -- and that's the  
5 example of something we did push to the state of the  
6 art and we do want people to use as opposed to the  
7 simplifications that we don't necessarily want people  
8 to use. So no, that wasn't an example of the  
9 simplification, that was an example of an area that we  
10 did push the state of the art and we're very happy to  
11 work with and critic it and improve it.

12 CHAIR DIMITRIJEVIC: Okay. Because in  
13 this Volume 4, the actions which were discussed, you  
14 know, connected in preventing corrosion events or  
15 controlling containment pressure or flooding cavities,  
16 they all come with the number one or a 01. And also  
17 there is mention that those HRA analyses didn't  
18 include equipment. And Susan just said that that  
19 actually, the state of the severability of equipment  
20 was also analyzed.

21 So I guess we will have to wait for your  
22 report on this HRA, right?

23 MR. KURITZKY: Well, so again, I apologize  
24 because maybe that wasn't as clear as it should be.  
25 So the zero and the one for, like for instance,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 containment venting and preventing base mat melt  
2 through, and there was another one, I think  
3 controlling hydrogen, et cetera, that was probably a  
4 sensitivity study that I did.

5 I'm going to get to that when we talk  
6 about the Level 2 results, but just since you bring it  
7 up now, so we credit, in the post-core damage HRA we  
8 credit actions in the short time frame. We credit  
9 actions up around the time or shortly after vessel  
10 breach. Okay? And generally at most two actions per  
11 sequence.

12 But we carry on this severe accident  
13 analysis generally for up to seven days. And so what  
14 happens, we don't credit other mitigation action in  
15 that longer time frame. So what we wanted to do is  
16 just see if we did credit additional actions how much  
17 impact could that have on the result.

18 So that table you're referring to that has  
19 the ones and the zeros, I think that just shows up in  
20 Volume 3 on internal event, internal flood --

21 CHAIR DIMITRIJEVIC: Right. Right.

22 MR. KURITZKY: -- report. So that is  
23 just, it's just a sensitivity case to see what  
24 potential impact it would have.

25 And we show that there was some of those

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 things could actually be very beneficial. I think  
2 particularly the one where we control containment  
3 pressure. It was very influential. And then as it  
4 was combined with the control of hydrogen combustion  
5 even more so. So that was just a sensitivity study.

6 In the actual evaluation for the base case  
7 model we do HRA analysis and consider the specifics of  
8 the SAMGs and the severe accident management  
9 guidelines and the extensive damage mitigation  
10 guidelines at the reference plant to come up with  
11 fairer probabilities. So that was more of a --

12 CHAIR DIMITRIJEVIC: We have a bunch of  
13 questions. I think Joy was first, then Dave, then  
14 Dennis, all right?

15 MR. KURITZKY: Okay.

16 MEMBER REMPE: Oh, sure. Thank you. Back  
17 when the industry decided to implement FLEX there was  
18 always an interesting characteristic that the  
19 building, as I recall, the building or house that the  
20 equipment is housed in, is not required to withstand  
21 a higher seismic load or wind loads, flooding.

22 I'm not sure about what the situation was  
23 at the reference plant, but how did you address this  
24 in the study and did you consider, as you've talked  
25 about, that you've tried to broaden it beyond to the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 reference plant. Did you do sensitivities to say,  
2 okay, yes, there is the FLEX equipment but the  
3 building may not be able to withstand the wind loads  
4 or the seismic loads and did you look at that issue?

5 MR. KURITZKY: Thank you, Dr. Rempe. Yes.  
6 So as I'll discuss, we're going to get in just a few  
7 minutes here to the FLEX case, and we did not do a  
8 rigorous detailed analysis of the FLEX fire  
9 probability we did a parametric study. But in doing  
10 so we considered the impacts of, for instance the  
11 hazards, and also considered whether or not if the bio  
12 was higher or lower what would be the impact on the  
13 results. So we did address that topic. And I'll go  
14 into more specifics in a couple slides.

15 MEMBER REMPE: Great, thanks.

16 MR. KURITZKY: Yes.

17 MR. EVANS: Next?

18 CHAIR DIMITRIJEVIC: Dave?

19 MEMBER PETTI: I think you're going to get  
20 there. I was just interested in some of the FLEX  
21 results and the human reliability aspect of it and  
22 whether or not you accounted for if they failed the  
23 first time that they try again and again, because  
24 that's what operators will do, if you just assumed  
25 they failed and that, you know, you only get one

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 chance to, you know, to implement it. So when you get  
2 there, I'd like to sort of understand that.

3 Because I think what struck me, again, not  
4 being an expert, is the letter on its face, FLEX  
5 doesn't seem effective. That's what I took away from  
6 reading the summary report. Now I'm sure that's not  
7 what we want to say, but again, I could have misread  
8 it, but that's the impression I have, so.

9 MR. KURITZKY: Yes, I think we are going  
10 to get to the results in the next slides and so --

11 MEMBER PETTI: Right.

12 MR. KURITZKY: -- you'll see that, no,  
13 FLEX does have, the reference plant does have  
14 significant impacts.

15 But just not to jump the gun, but again,  
16 we did not do a detail analysis for FLEX there  
17 probably so we don't have extensive detailed HRA on  
18 the actions it's more of a, like I said, a parametric  
19 study. But I'll go into that --

20 MEMBER PETTI: Okay.

21 MR. KURITZKY: -- probably in the next  
22 slide or two.

23 MR. BLEY: Alan, it's Dennis.

24 MR. KURITZKY: Yes.

25 MR. BLEY: Your discussion with Susan

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 irked my interest. You went through the eight volumes  
2 of your study earlier, but you didn't mention side  
3 technical reports. And it sounds like there is at  
4 least one for HRA, or at least level 2 HRA. And I'm  
5 wondering if there are others? Maybe things you did  
6 with success criteria or is that all included in the  
7 main eight reports?

8 MR. KURITZKY: So success criteria is  
9 included in the reports themselves. Particularly, for  
10 instance, for the Level 1 for intro management. There  
11 is a Chapter 4 which goes into detail about all the  
12 MELCOR runs and work that we did. And the reference  
13 plants max, not max, map runs --

14 MR. BLEY: Yes.

15 MR. KURITZKY: -- and stuff. So that's  
16 all integral to the reports.

17 But the, just making a note about, so the  
18 other reports, and particularly the one is the HRA  
19 reports. You know, that is one that we had, we had  
20 these two reports. They were internal reports.

21 The one is, doesn't really have  
22 information that would preclude it from being publicly  
23 released, so we had someone work to pull together some  
24 of the HRA from all the different parts of the study  
25 including that, into, well that was a Level 2 report,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 but even the Level 1 HRA stuff into some kind of  
2 document which, unfortunately that person has since  
3 left the agency, but we have it in some kind of form.  
4 And it just hasn't, like folks on the other reports we  
5 haven't done much with it.

6 But that's one of the decisions we have to  
7 make when we get near the end of the project is, which  
8 of these other reports, besides the exact volumes you  
9 saw, what, if any other reports, should we put out?  
10 Mostly we would like to attach these things as  
11 appendices to the existing report so that it's --

12 MR. BLEY: Sure.

13 MR. KURITZKY: -- easier for people to  
14 find them and then they don't have to, like hey, how  
15 do I find this, I'll just get a report, you know, it's  
16 in ADAMS dockets, how do I know that. But the, so we  
17 have to figure out exactly what we're going to do  
18 there.

19 I'm trying to think now. Yes, the Level  
20 2 report, we added a number of appendices to it from  
21 other supporting reports that we had internally, but  
22 we did not have the HRA report as one of them. So  
23 that's a good point. We may have to, that's one that  
24 we might just have to put out as a separate report,  
25 but that's a decision we're going to make a little bit

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 further down the road.

2 MR. EVANS: We've got a comment --

3 (Simultaneously speaking.)

4 CHAIR DIMITRIJEVIC: Susan has --

5 MR. EVANS: -- by Susan.

6 CHAIR DIMITRIJEVIC: Susan? Susan, we see  
7 your hand up.

8 MS. COOPER: Okay, thank you. Thank you,  
9 Vesna.

10 So, not for FLEX because was a different  
11 case. And Alan is going to talk about that in a  
12 minute. But since we're talking about the Level 2  
13 HRA, yes, I think there is an awful lot about the  
14 Level 2 HRA that would be good to get out and a lot,  
15 unfortunately the specifics are always going to be  
16 proprietary, but there is some good information in  
17 there.

18 And we did address things, Dave said a  
19 moment ago about operators trying multiple times to  
20 get equipment going. I mean, that was in fact the  
21 rationale, the reason behind us saying, we're going to  
22 estimate how long the operators might need to get the  
23 equipment, you know, transported from the warehouse to  
24 near the water tanks and connect up the hoses and pull  
25 the hoses where they need to go and get pumps started

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 and all that kind of stuff.

2 We recognize that that was not going to be  
3 just like pushing a button in the control room because  
4 we walked it down. We talked with the operators and  
5 so forth. So that is part of the underlying HRA,  
6 Level 2 HRA method for the Level 2 PRA. But that's  
7 not what was done for FLEX, as Alan is going to  
8 explain.

9 I did do a paper with my coauthors for one  
10 of the PSA conferences way, way back when. I don't  
11 know if it was, I don't know what year it was, but, I  
12 mean, it does explain something about the method and  
13 something about what we learned from the plant site  
14 visits that shaped how we developed the method. But  
15 until then I think that's the only thing that's out  
16 there. Thanks.

17 MR. KURITZKY: And thank you for that  
18 comment too because, yes, I've highlighted that needs  
19 to arise further on my radar. The idea of how we're  
20 going to get that post-core damage HRA report into the  
21 public domain. So thank you for that feedback.

22 MR. EVANS: Alan, we have another hand up.  
23 Dr. Roberts.

24 MR. KURITZKY: Okay.

25 MEMBER ROBERTS: Yes. Just to close out

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 my question. That was very helpful, Susan, in terms  
2 of explaining the Level 2 HRA. I wonder if there is  
3 any thought on Level 3? Whether there is some  
4 influence in the ability to make better decisions on  
5 protective actions based on having people available in  
6 the control room with the technical support center or  
7 whether that's stuff we didn't factor in at all?

8 MR. KURITZKY: Well, my, the quick answer  
9 is, I don't think that is something that we  
10 specifically focused on. But if Keith Compton is here  
11 he's our Level 3 expert and so he can speak to it more  
12 intelligently. But I don't think we got to that level  
13 of detail. Keith, are you on the line?

14 MR. COMPTON: Yes, I'm on the line. This  
15 is Keith Compton from the Office of Research. Can you  
16 hear me?

17 MR. KURITZKY: Yes, we can hear you.

18 MR. COMPTON: Okay. I just wanted to make  
19 sure. Yes. No, that's an interesting question. I  
20 have to be honest, I hadn't really thought that much  
21 about it. So that implies that the answer is no, we  
22 didn't include it. But I'm intrigued by the thought  
23 so I'll take that thought back.

24 MEMBER ROBERTS: Okay. Yes, thank you,  
25 Keith. And this relates a little bit to a discussion

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 we had yesterday on the high burn-up fuel rulemaking.  
2 Again, they're looking at changing the allowable  
3 control room dose for the design basis cases.

4 And a question I had asked, whether that  
5 has any implication on some of the work in the Level  
6 2, 3 space because that's not a direct requirement  
7 anywhere that, at least that I'm aware of. So again,  
8 it probably is worth some thinking about so thank you.

9 MR. COMPTON: Sure.

10 MR. KURITZKY: Okay, thank you for the  
11 question. And, again, Keith and Susan, thank you very  
12 much for your responses. Okay, so are we clear to  
13 move forward? I'm assuming no more hands up. Okay.

14 So just one thing I do want to mention  
15 about the FLEX case. For those who are as familiar  
16 with FLEX so, it involves a three-phrase approach.  
17 Phase 1 is where the plant will initially cope to,  
18 with ELAP by relying on installed plant equipment and  
19 resources.

20 There may be some different strategies.  
21 For instance, shedding, load shedding for the safety  
22 batteries, but you're using the existing normal  
23 equipment. And Phase 2 you start to rely on the FLEX  
24 equipment. Which would be your backup pumps and  
25 diesel generators, et cetera. And batteries.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           And then Phase 3 is when you start to, in  
2           the longer term, you need to bring in additional  
3           resources and equipment from offsite. For instance,  
4           one of the SAFER Centers that have been established in  
5           the country.

6           This analysis, our 2020 FLEX case, only  
7           considers those first two phases. We don't go into  
8           the long-term phase in bringing stuff in from offsite.

9           CHAIR DIMITRIJEVIC: Alan?

10          MR. KURITZKY: Yes.

11          CHAIR DIMITRIJEVIC: I just want to do  
12          some clarification. Since you have this separate  
13          slide on the FLEX.

14          You're 2020 FLEX case is only partially  
15          connected with FLEX. To other important parts of the,  
16          you know, the design change on RCP seals, and also  
17          crediting these auxiliary feedwater extended  
18          operation.

19          So, the changes which we see in the tables  
20          when you consider the FLEX case, you know, 2012 case,  
21          are combination of these three, and we don't really  
22          know how much of that change can be contributed to  
23          FLEX and how many do the very important change in RCP  
24          seals or crediting the extended, to the auxiliary  
25          feedwater operation?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. KURITZKY: That's correct. And we  
2 don't have specific sensitivity studies to break that  
3 out, that was, because we had it limited to exactly  
4 what we were going to evaluate. We thought that one  
5 wasn't as essential to breakout, but you're right, it  
6 includes all those three things.

7 The FLEX and the extended turbine-drive  
8 aux feed are really two sides of the same coin in the  
9 sense that they're doing the same function. You just  
10 need one or the other. And so that's why, as I'm  
11 about to describe on the next, maybe the next slide,  
12 or sometime in the next couple of slides, this whole  
13 idea of this Parameter P that combines the two  
14 together.

15 And the actual, the other item, which was  
16 the new passive shutdown seals, that one we did  
17 evaluate as a sensitivity in the original study for  
18 the Level 1 internal events. And we showed that it  
19 reduced core damage frequency by around ten percent.

20 And what it really addressed was the  
21 scenarios involving loss of nuclear service coolant  
22 water. Because those, you lose all the cooling for  
23 the seals. As well as the makeup systems that you  
24 would need in the case of an RCP seal LOCAL.

25 So those loss of service water scenarios

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 contributed around more or less 14 percent to core  
2 damage frequency for the internal events. Level 1  
3 internal events.

4 And so, the use of the new RCP seals  
5 reduce core damage frequency around ten percent or so.  
6 Maybe a little more. So that's kind of like  
7 ballparking it back then, if you want to kind of carry  
8 that ten percent thing along.

9 And you'll see when we show some of the  
10 results, as we go forward, you can see that the, in  
11 general the reductions are more than that in the 2020  
12 FLEX case because of the FLEX pieces to this. The  
13 FLEX in the extended turbine-drive aux feed as opposed  
14 to the seals, but they both contribute.

15 And when we get into, it's hard to  
16 partially get to Level 2 and 3 results because now you  
17 know and see the nuclear service clean water versus  
18 the other scenarios. But much of the reduction is  
19 occurring because of station blackout scenarios which  
20 more is attributable to the FLEX and extended turbine-  
21 drive aux feed. But again, even in those scenarios  
22 you do result in RCP seal LOCAs many times but in  
23 those cases --

24 CHAIR DIMITRIJEVIC: Right.

25 MR. KURITZKY: -- even if you didn't have

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 an RCP seal LOCA, if you have, essentially an  
2 recoverable station blackout, you're going to end up  
3 having core damage anyway. You may have a slightly  
4 different flavor of core damage and different timing  
5 of core damage but you're getting there anyway.

6 So I think the bulk of the reduction in  
7 the Level 2 and 3 arena really comes from the  
8 combination of the FLEX strategies and extended  
9 turbine-drive aux feed. Though there is contribution  
10 from the new shutdown seals too.

11 CHAIR DIMITRIJEVIC: Okay. I just want to  
12 point out that it's not really clear, you know, to  
13 say, okay, with introduction of the FLEX strategies  
14 that's what happened to model because it's a little  
15 more complex mix of the changes.

16 MR. KURITZKY: Yes. Yes, thank you. And  
17 just going back to the previous slide, so that's why  
18 I tried to, I tried to refer to it as the 2020 FLEX  
19 case in the discussion just because of human nature to  
20 shortcut things sometimes I might talk about FLEX.

21 Usually if I'm talking about FLEX I mean  
22 the 2020 FLEX case so it's more than FLEX, it's these  
23 other items too. But I'll try and say the 2020 FLEX  
24 case to be clear. But yes, even the fact that we call  
25 it the 2020 FLEX case is a little bit misleading but

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 we need some shorthand way of referring to it and so  
2 that's just what we came up with.

3 Okay. So moving on to the result for the  
4 2020 FLEX case. First, looking at Level 1 PRA. So if  
5 you look at the table here, down at the bottom the  
6 total for all hazards. For the Circa-2012, the base  
7 case, the total hazard CDF is around one and a half  
8 ten to the minus four. In the 2020 FLEX case it drops  
9 almost 40 percent down to a little over nine ten to  
10 the minus five.

11 And so again, the bulk of that reduction  
12 is because of the FLEX and turbine-driven aux feed.  
13 Changes go, part of it is also due to the new RCP  
14 shutdown seals.

15 If you look at the different hazards  
16 individually you can see that the internal events and  
17 floods and the high winds have reductions of around  
18 60, in the ballpark of 60 percent, while the fires,  
19 internal fires and seismic events, is much lower. And  
20 the reason for that is that the internal events and  
21 the high winds have a large contribution from a  
22 station blackout sequences. And those are the  
23 sequences, the types of scenarios that FLEX has been  
24 designed for so they're fairly effective there.

25 For the fire and seismic you also, there

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 are a lot of station blackout type sequences for those  
2 hazards too, but we gave less credit for the FLEX  
3 strategies and the turbine-drive aux feed, et cetera,  
4 in those cases because of the direct impact of those  
5 hazards on both the equipment itself, as well as the  
6 operators who have to take, whether it's accidents in  
7 the main control room or local FLEX actions.

8 So, and that goes back to, I think it was  
9 Dr. Rempe's question, do you consider the fact that,  
10 hey, in this case the reference plant, EDMG pump,  
11 there is two, but the one that's most readily  
12 available is in a warehouse which is not seismically  
13 qualified. So we intentionally gave less credit for  
14 the FLEX in those cases because of the more  
15 significance of the hazard itself. And I'll talk a  
16 little bit more about that in a couple of slides.

17 Looking at these pie charts, just to kind  
18 of get a breakdown of what hazards are contributing,  
19 the base case, Circa-2012 on the left, FLEX on the  
20 right. So you can see, if you squint, you can see  
21 that internal events and internal fires are the  
22 dominate contributors for the base case. Which one  
23 contributes around 40 percent.

24 And if you go over to the FLEX case and  
25 you see that now internal fires has really jumped

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 ahead, and that's because, as we just mentioned, we  
2 gave more credit to FLEX for the internal events so  
3 you see a bigger reduction there. You don't see as  
4 much of a reduction on, for the fire, so now the fire  
5 has become essentially twice as important as the  
6 internal events.

7           You also see something similar with the  
8 high winds and seismic events. In the base case on  
9 the left you can see the high winds is around nine  
10 percent of total CDF and seismic is seven, but when  
11 you go to the FLEX case it flips and you have seismic  
12 at nine and wind around five. And again, it's because  
13 the FLEX was much effective. In our assumptions it  
14 was much more effective for the high wind than it was  
15 for seismic.

16           One thing you don't see on these charts,  
17 again, you see these four hazard categories, you don't  
18 see all the other hazards. So again, we did, and I  
19 think someone asked about this earlier on, we did go  
20 through and evaluate and screen out either through  
21 qualitative or semi-qualitative analysis all the other  
22 hazards based on the criteria in the PRA standard.

23           However, there were some external hazards  
24 or other hazards that we did not, we did not screen  
25 per say by those criteria, but we just were not able

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 to, we did not include qualification for it either  
2 because there was ongoing active research in those  
3 areas, going back to a question, a comment someone had  
4 before about whether there was active research in some  
5 of these, active research in some areas so we were  
6 not, we did not address those items because the  
7 information was changing.

8 And also, things that were just beyond the  
9 state of the art. For instant, space weather. So  
10 things like solar flares. It was something that  
11 definitely could be of concern, and no question. In  
12 fact, that's actually one of the public comments we  
13 just got today on these reports. But it's just  
14 something that's beyond the standard. We don't have  
15 any way of evaluating that right now.

16 So most the other hazards were all  
17 screened out by the criteria in the standard, but  
18 there were a few things that we just had to leave off  
19 the table because they are beyond our capability right  
20 now. Or they were subject to ongoing research.

21 Okay, moving on to --

22 MEMBER REMPE: This is Joy.

23 MR. EVANS: Alan, we have a question.

24 MR. KURITZKY: Sure.

25 MR. EVANS: Go ahead, Joy.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           MEMBER REMPE: I just want to make sure I  
2 understand you. I did see something in the report  
3 saying what you've said here about that they did  
4 realize in higher seismic events that the building  
5 wasn't qualified.

6           What about wind, was the building  
7 qualified for high winds at the reference plant?

8           MR. KURITZKY: I don't remember. You  
9 know, honestly we ended up having a very top notch,  
10 five research associates, a very top notch wind curate  
11 outfit come in and do walk-downs and evaluations for  
12 us.

13           I don't know if they actually walked down  
14 that building because it wasn't part of the, in this  
15 case PRA, so I don't think we ever got an actual  
16 evaluation of that building.

17           But, again, as I am going to mention, and  
18 we can go back to, or on the next slide, we don't go  
19 into a very detailed analysis of FLEX, and so this P  
20 value that we pick for the different hazards -- Well,  
21 actually, let me just, because I was going to this  
22 anyway, so if you look at this slide, again, we did  
23 not do a detailed analysis.

24           We did a parametric study using  
25 engineering judgement. We used P as the parameter of

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 merit and we defined P down below here as the  
2 probability of the FLEX failing and the probability of  
3 the extended turbine-driven aux feed failing, because  
4 you just need one or the other.

5 And so you see that, you know, for P for  
6 internal events we had a value of 0.09, but for these  
7 other hazards the values are higher, 0.50 for fire and  
8 seismic and 0.25 for wind.

9 So, again, the fire and the seismic have  
10 fairly high values because of what we were just  
11 mentioning, that the impact, the potential impact of  
12 these hazards that they'll be able to implement FLEX  
13 or the turbine-driven aux feed leads us to think that  
14 they, you know, would be much higher than just a sunny  
15 day internal event type situation.

16 The high winds was not as extreme of  
17 conditions that you would get for some seismic so we  
18 picked a value that's kind of in between internal  
19 event and seismic event.

20 So to go to your question, Dr. Rempe, we  
21 didn't do a detailed analysis and we I don't think we  
22 did an evaluation of the fragility of that maintenance  
23 building to wind, but we have picked a value that  
24 says, hey, there is a much better chance that you are  
25 going to have problems under a wind condition than you

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 would just for an internal event but maybe not as much  
2 as if you had a seismic event.

3 As you are going to see in the next slide,  
4 let me just go to the next slide, because of the fact  
5 it was just a parametric uncertainty and we did not do  
6 a rigorous analysis, so we wanted to see what would be  
7 the impact of using other values.

8 Now in the internal event case in Volume  
9 3 we actually had a more detailed look at different  
10 values for P for internal events.

11 Here we looked at just a few cases, but in  
12 this graph right here you can see that the three  
13 points that are on it are if we give no credit at all  
14 to FLEX and the turbine-driven aux feed, and then you  
15 have the base case, which is really the 2020 FLEX  
16 case, that means the base case of the FLEX case, of  
17 the 2020 FLEX case, and then the last one is if FLEX,  
18 well either FLEX or turbine-driven aux feed were  
19 perfectly reliable, and so you could 100 percent rely  
20 on them.

21 What you see here is that the slope of the  
22 lines from the base case to the perfect case are  
23 fairly flat, and so this shows you that doing a more  
24 detailed rigorous analysis wouldn't really buy you a  
25 lot more in terms of CDF reduction.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           By the same token, for the purposes of our  
2 study, for our study, this really supports our  
3 decision not to do a lot more work to get a more  
4 refined number because it really wouldn't, it wouldn't  
5 really change things for us.

6           Now that's not to say that for some other  
7 applications, for our regulatory application, for  
8 instance an event assessment type of application, that  
9 you wouldn't want to have a much more detailed and  
10 rigorous analysis.

11           In that case you might want to do  
12 something like a detailed HRA and also incorporate  
13 operational experience, you know, operational  
14 equipment failure data for the FLEX equipment, to get  
15 a much more accurate number.

16           So that's something that you probably  
17 would want to do, but for the purposes of our study it  
18 wouldn't make much difference in the insights. Again,  
19 this is just a sensitivity case. This is not part of  
20 our base study, so as a sensitivity analysis there was  
21 no need for us to put that much more effort into it.

22           MEMBER REMPE: Okay.

23           MR. KURITZKY: But if you do -- I guess  
24 more to your question, Dr. Rempe, it's the other side,  
25 it's going from no credit to base case, so, yes, you

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 do see if we did not -- If we assume that the failure  
2 of probability for high wind was, you know, even  
3 higher than that 0.25, you can see from that lower  
4 gray line at the bottom that you do see an increase.

5           Again, this is -- No. Actually, no, this  
6 is an arithmetic scale, it's not logarithmic, so, yes,  
7 you see some increase but it's not substantial and you  
8 wouldn't expect it to go to one in either case, so --  
9 Because, again, this is a, another simplification is  
10 in reality you would have a value of P, you know, a  
11 failure of probability for FLEX and a failure of  
12 probability for the extended turbine-driven aux feed  
13 that was contingent on the exact magnitude of the  
14 event.

15           You know, with seismic in our study we had  
16 eight seismic bins and in wind we have multiple bins  
17 for straight line winds and tornados, et cetera. So  
18 you would expect for the lower bins the probability  
19 would be close to what you have for internal events  
20 and for the higher bins it would be getting closer to,  
21 you know, the no credit line or failure of probability  
22 of one.

23           But what we have done is actually picked  
24 values as kind of like in the middle that is kind of  
25 a hedge and then this parametric study to look at what

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 happens when you move it up or down.

2 If you are looking at seismic, the very  
3 high seismic bins like seven and eight, which have  
4 widespread destruction, we don't credit the FLEX at  
5 all anyway so we wouldn't have to worry about being  
6 non-conservative for those.

7 But, again, to the extent that we were  
8 doing a sensitivity study just to see the general  
9 impact, we were comfortable with what we have done  
10 here.

11 So, again, 0.09 for internal events, 0.50  
12 for fire and seismic, and 0.25 in the middle for high  
13 winds. While we recognize that for everything except  
14 probably the internal events these are probably  
15 pessimistic values in reality.

16 We do that to be, okay, just because, as  
17 I mentioned, there is a lot of uncertainty associated  
18 with these types of hazards and both of their impacts  
19 on equipment and the OP interactions both in the  
20 controlment and locally, so we felt justified using,  
21 you know, higher values for P for those hazards.

22 MEMBER PETTI: So, Alan, this is Dave.

23 MR. KURITZKY: Mm-hmm.

24 MEMBER PETTI: Again, this is where I got  
25 really confused because if you would incorporate the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1       uncertainties as you note and put some error bars on  
2       these is there really that big of difference in FLEX?

3               I mean I look at the seismic case, which,  
4       you know, you think about FLEX being born out of  
5       Fukushima, this says it won't, it may not help in a  
6       seismic event, a severe seismic event at least.

7               So that's where I am -- I just -- Yes, I  
8       mean I look at these numbers and, again, I'm not a  
9       risk person, but, you know, 30 percent doesn't sound  
10      to me in light of the uncertainties as being  
11      significant.

12              Am I wrong there? Is that really from a  
13      risk perspective an important reduction? I can see  
14      when you get, you know, 50, 60, 70 percent, but help  
15      sort of calibrate me on what's the, you know, when is  
16      something significant versus insignificant in light of  
17      uncertainty.

18              MR. KURITZKY:       That's a very good  
19      question. We have -- So specifically for the  
20      uncertainty analysis I think in the actual reports, I  
21      don't know, it may not have made it to the, I don't  
22      think we had it in the overview reports, they are in  
23      the supporting internal calculation files we did, you  
24      know, we propagate uncertainties.

25              We assigned uncertainty bound to these

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 values and propagated them through the model just like  
2 we do for all the other basic events in the PRA model  
3 to come up with a parametric uncertainty balance.

4 But, more specific to your question, yes,  
5 when you're talking about 10, 20 percent, given the  
6 uncertainties it is not significant, you are correct,  
7 and it goes back again to what Dr. Rempe had  
8 mentioned, that because the design specs or whatever,  
9 requirements for the FLEX equipment, was that not that  
10 it had to be in a, you know, seismically robust  
11 structure.

12 So when you look at seismic events you  
13 have to accept the fact that there's a good chance  
14 it's not going to work. Yes, it was born out of  
15 Fukushima, but as Dr. Rempe pointed out, they are not  
16 required to being seismically qualified structures.

17 So, you know, there is only so much credit  
18 you can give for not -- I don't know whether, if a  
19 licensee were to come in with a detailed analysis,  
20 again, remember, we're doing a very crude parametric  
21 study, but if a licensee were to come in with a more  
22 detailed analysis for some type of regulatory  
23 application or some type of event assessment or  
24 whatever, it would be interesting to see what kind of  
25 credit they gave to it for seismic events.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           And it may be that, you know, some plants  
2 might have it, even though it's not required they  
3 might have it in a seismically qualified structure,  
4 others may not, so, you know, it's going to be  
5 somewhat case by case.

6           But in terms of just a general idea of  
7 uncertainty and results, you are correct, a 10 to 20  
8 percent difference is -- We report them because we do  
9 the study, but are they significant in terms of the  
10 overall uncertainties, no, probably not substantial,  
11 I agree. A 60 percent change --

12           MR. BLEY: Alan, this is Dennis.

13           MR. KURITZKY: Okay. Yes?

14           MR. BLEY: You know, the assumption that  
15 it sounds like is in there because the shed they keep  
16 this stuff in isn't seismic that it gets wiped out and  
17 you can't use the stuff, I don't know if you did it  
18 but the Committee went out to visit the SAFER site out  
19 in Phoenix some years ago and what we learned out  
20 there was SAFER can deliver all of that equipment to  
21 any site in the country in less than 72 hours,  
22 substantially less in many cases, and that there are  
23 agreements among the people who belong to SAFER and  
24 FLEX that nearby or reasonably nearby plants would  
25 share their equipment if a particular plant was

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 affected.

2 So I think that's a grossly simplified  
3 assumption I think that if the shed fails you don't  
4 have any of this FLEX equipment.

5 MR. KURITZKY: Okay. So, Dr. Bley, thank  
6 you very much for that because, again, I want to -- It  
7 got lost through all the discussion, so I want to  
8 reiterate that our 2020 FLEX case only focuses on  
9 Phase 1 and 2 of the FLEX response.

10 We specifically do not consider the  
11 offsite resources, so, yes, the fact that we have  
12 minimum credit for FLEX in a seismic event in this  
13 study for Phase 1 and 2, for the onsite FLEX  
14 equipment, is not to say that FLEX as a whole is not  
15 more effective.

16 Yes, with the SAFER Centers and also  
17 figuring that, you know, whatever hazard is impacting  
18 the site is very unlikely to impact the SAFER Center,  
19 you know, except for maybe if there happens to be a  
20 plant in the near vicinity of it, but I think there is  
21 only a couple of sites in the country.

22 MR. BLEY: Well and they are widely  
23 separated.

24 MR. KURITZKY: Yes, and they are widely  
25 separated, so there is always going to be something

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 available, except for the solar flare, but, anyway, I  
2 am not going there.

3 So in any case, yes, thank you very much  
4 for pointing that. We are talking just about the  
5 impact of FLEX Phase 1 and 2 using onsite equipment,  
6 not the overall benefit of FLEX when you consider  
7 offsite resources also.

8 MR. BLEY: And I think you were clear  
9 about that, but the discussion implies -- The reader  
10 is not always aware of the significance of those  
11 assumptions and limitations.

12 MR. KURITZKY: Right. Let me just make a  
13 note on that to see if we can iterate that in other  
14 points in the report.

15 MEMBER PETTI: Yes, thanks, Dennis. That  
16 was my concern as sort of misinterpreting what you are  
17 really trying to say.

18 CHAIR DIMITRIJEVIC: Okay. This could be  
19 -- Because we are going to switch from Level 1 to  
20 Level 2 in the next slide, this could be a good time  
21 for us to take a break.

22 We are back on the schedule, so let's take  
23 the 15 plus minutes break and let's get back together  
24 at 10:35 and resume our meeting, all right. Thank  
25 you.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. BLEY: Bless you, Vesna.

2 CHAIR DIMITRIJEVIC: Mm-hmm.

3 (Whereupon, the above-entitled matter went  
4 off the record at 10:18 a.m. and resumed at 10:35  
5 a.m.)

6 CHAIR DIMITRIJEVIC: Okay. It's now 10:35  
7 so we will resume back our meeting. Scott Moore  
8 expressed the desire to make some remarks. Scott, are  
9 you there?

10 MR. MOORE: Yes, I am. Thank you,  
11 Chairman Dimitrijevic. Just a brief comment to  
12 everybody that's online, please do not use the chat  
13 feature in Teams.

14 The chat does not get recorded in the  
15 transcript and we're trying to keep, you know, a  
16 running transcript for the meeting.

17 The one thing you can use chat for is if  
18 you are having audio or visual or computer problems,  
19 but if it's related to the content of what is being  
20 presented or discussed please don't use chat. Thanks.  
21 That's it, Chairman.

22 CHAIR DIMITRIJEVIC: Okay. Thank you,  
23 Scott. All right, Alan, so now we can see you again.  
24 We hope to see slides soon, too.

25 MR. KURITZKY: Oh, okay, I forgot. Thank

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 you for reminding me. Let's see.

2 CHAIR DIMITRIJEVIC: Excellent. We see  
3 them now.

4 MR. KURITZKY: Okay, good. Thank you. I  
5 don't know why they disappeared, but, anyway. Okay,  
6 so I hope everybody had a good break. Thank you for  
7 coming back. Now we will move on to the Level 2 and  
8 Level 3 results.

9 First, for the Level 2 PRA you can see  
10 here on this table there is a comparison between the  
11 circa 2012 case and the 2020 FLEX case for three  
12 different surrogate risk metrics.

13 LERF, L-E-R-F, which is Large Early  
14 Release Frequency, which has been defined for this  
15 study as the frequency of a large release that occurs  
16 early enough that there is the expectation of the  
17 possibility of early fatalities.

18 Then we have LRF, or Large Release  
19 Frequency, which has been defined as the frequency of  
20 any large release that occurs prior to the termination  
21 of the severe accident analysis for the study.

22 Then, lastly, CCFP, Conditional  
23 Containment Failure Probability, which is just the  
24 conditional probability if the containment fails given  
25 core damage.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           So looking at those three results, for  
2 LERF, first off, you can see that in the base case,  
3 circa 2012, it's 1.9 e minus 6 per reactor critical  
4 year for all hazards combined and if you recall the  
5 core damage frequency for all hazards combined was 1.5  
6 10 to the minus 4, so it's a little over 1 percent  
7 that's LERF.

8           The reason why LERF is so low in this case  
9 is the fact that the accidents that do not involve,  
10 the severe accidents that do not involve containment  
11 bypass occur slowly enough that evacuation would be  
12 effective. So that leaves with you containment bypass  
13 events which are primarily three types.

14           There is interfacing system LOCAs, loss of  
15 coolant accidents, and then there is also pressure  
16 induced steam generator tube ruptures which occur  
17 primarily after an ATWS event and you end up having a  
18 pressure induced steam generator tube rupture prior to  
19 core damage and that rupture occurs at a level above  
20 any water, so there is no scrubbing of the release.

21           Also, that scenario involves at least one  
22 secondary side relief valve, either intensity being  
23 opened or it being in the stuck open position.

24           The third primary contributor to LERF is  
25 temperature induced steam generator tube ruptures and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 these are post-core damage steam generator tube  
2 ruptures.

3 All three of those cases, all three of  
4 those scenarios, have very low frequencies and so  
5 that's why you don't see a very large LERF  
6 contribution.

7 If you look at the 2020 FLEX case you see  
8 that it drops down to 1.3 minus 6, around a 30 percent  
9 reduction, but the same types of scenarios are  
10 contributing with the primary reduction being in the  
11 category of those post-core damage thermally induced  
12 steam generator tube ruptures which often result from  
13 station blackout scenarios.

14 The other two categories, the FLEX and  
15 turbine-driven aux feed, et cetera, had very little  
16 impact on it.

17 Moving to the second, well actually the  
18 second and third, the late release frequency and the  
19 CCFP, both of those you see a fairly high value,  
20 particularly in comparison to core damage frequency.

21 The reason there is because most, a large  
22 contributor to those are station blackout sequences  
23 and station blackout sequences you tend to not have  
24 containment heat removal, so eventually those  
25 sequences would tend to lead to over-pressurization of

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 the containment.

2 So you have a fairly high conditional  
3 probability of containment failure and, therefore,  
4 large release for those sequences.

5 Again, looking at the FLEX case you see  
6 that FLEX is effective in reducing them by nearly 40  
7 percent. If we recall that's kind of the same  
8 reduction you saw for CDF for all hazards and that's  
9 because, again, it's the similar profile, risk  
10 profile, it's primarily driven by station blackout  
11 sequences.

12 CHAIR DIMITRIJEVIC: Alan?

13 MR. KURITZKY: Yes?

14 CHAIR DIMITRIJEVIC: Okay, so here is  
15 where I was really, my first really big surprises came  
16 looking in the results. This is an awfully high large  
17 release frequency, right?

18 MR. KURITZKY: Mm-hmm.

19 CHAIR DIMITRIJEVIC: That technically is  
20 different than it was reported for the new reactors,  
21 right, because new reactors reported large release  
22 frequencies, not the large early release frequencies,  
23 and also CCFP and the requirement there was, you know,  
24 to meet the safety goal the same as the LERF.

25 So here there is a lot of question

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 actually how we define large release frequency. I  
2 notice that there is a lot of -- you have some  
3 consideration, you know, for that the radiological  
4 release is either seven days or two days timeframe.

5 So can you discuss that and what does that  
6 actually mean? Is this actually new mission time for  
7 Level 2? Actually, can you actually discuss really  
8 why is this LERF so big, how does it differ from the  
9 one which was reported for advanced reactors, what are  
10 those different timeframes considered in this?

11 They make actually a pretty big difference  
12 but still LERF is very large. All right.

13 MR. KURITZKY: Okay. So let me just go on  
14 to the next slide because that's where I am going to  
15 really get into that and the timeframe.

16 So as you mentioned the LRF is relatively  
17 large here. It's, I don't know, 70 percent of core  
18 damage frequency. Well, inconsistent with the CCFP.  
19 So because of that -- So with -- In order to get a  
20 better, a more complete understanding of long term  
21 severe accident progression and radiological release  
22 considerations, we took the severe accident analysis  
23 out to a stable state with a 7-day backstop.

24 But as I mentioned earlier, we credit post  
25 core damage and mitigative actions up to, around, or

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 slightly after vessel breach, but we don't consider  
2 additional actions in the longer timeframe after that.

3 So because of that and because there is no  
4 consensus mission time for severe accident analysis  
5 for core damage frequency, there is a generally  
6 understood mission time of 24 hours.

7 You might take a little bit longer for  
8 certain sequences, you know, especially if they are  
9 coming up to a cliff edge effect, but, you know, there  
10 is kind of a consensus around 24 hours.

11 Well there is no such thing for Level 2  
12 space for severe accident, so given that we wanted to  
13 look into what would be the impact on the results if  
14 we used a shorter time, if we terminated the severe  
15 accident analysis earlier.

16 So we looked at two different cases, both  
17 of them peg to when you enter the Severe Accident  
18 Management Guidelines, SAMG entry, which essentially  
19 is when core damage occurs.

20 So we looked at one case where we stopped  
21 the analysis 36 hours after SAMG entry and in another  
22 case it was 60 hours after SAMG entry. As you  
23 mentioned in terms of the timeframe from event  
24 initiation, so the base case was seven days after  
25 event initiation, the time of core damage will change

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 depending on the sequence but it's generally going to  
2 be somewhere between a few hours after event  
3 initiation up to maybe around 12 hours after event  
4 initiation.

5 So if you just want to kind of get a  
6 ballpark idea for comparison, SAMG plus 36 hours is  
7 more or less two days after event initiation and SAMG  
8 entry plus 60 hours is roughly three days after event  
9 initiation, so you are looking at two, three, and  
10 seven days after event initiation here.

11 If you look -- First let me just mention  
12 just to get it off the table, large early release  
13 frequency you see no change in the numbers, either for  
14 the base case or the 2020 FLEX case, and that's  
15 because by definition those releases are occurring  
16 early on and are occurring before you even get to 36  
17 hours after SAMG entry, so the shorter timeframes make  
18 no difference on the results.

19 But that's certainly not the case for the  
20 large release frequency. If you look at an LRF in the  
21 top table for the circa 2012 case you can see that in  
22 the SAMG plus 60 hours case, well, you know,  
23 essentially both of the shorter timeframes, you have  
24 a significantly reduced large release frequency.

25 The reason for that is the large release

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 frequency of course is composed of all the different  
2 release categories in the study, but one of the major  
3 drivers of large release frequency is a release  
4 category that we call LCF, or Late Containment  
5 Failure, and what it really involves is a containment  
6 failure tens of hours after vessel breach. It's a  
7 quantity static over-pressurization failure of the  
8 containment.

9 The representative sequence for that  
10 release category in MELCOR shows that the release is  
11 occurring by SAMG, by 60 hours after entering the  
12 SAMGs, but it hasn't, the cumulative release hasn't  
13 risen to the threshold that we call large, which I  
14 think is, I don't remember, it was something like 4  
15 percent of cesium or -- It was some fraction of I  
16 think it was cesium source term, but it hasn't gotten  
17 to that level yet that we would call large.

18 In fact, it doesn't get to that level  
19 until almost right before the seven days, in fact. So  
20 that's why you see a substantial reduction in LRF for  
21 those shorter timeframes.

22 But if you look down at the conditional  
23 containment failure probability you see actually that  
24 drop off doesn't occur, it only occurs for the 36  
25 hours after SAMG entry and that's because that same

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 representative sequence for the late containment  
2 failure release category has, at 36 hours after  
3 entering the SAMGs it hasn't even failed containment  
4 yet.

5 The containment fails sometime between 36  
6 and 60 hours after SAMG entry and so that's why you  
7 then have the jump up in conditional containment  
8 failure probability and then the actual release  
9 becomes what we call large near the end of the 7-day  
10 period and that's why you see the bump up in LRF only  
11 for the 7-day after event initiation.

12 So, again, it's tied to the fact that we  
13 had that 7-day severe accident analysis termination  
14 time that leads to such a large contribution.

15 Now, again, other plants might have it  
16 different, and this is based on the profile, this is  
17 based on the dominance of station blackout type  
18 scenarios, which without containment heat removal it  
19 will slowly build pressure to your failed containment  
20 and then the release starts off small and slowly  
21 builds up over time, so, of course, other plants might  
22 have different results, but this is what we see with  
23 this study.

24 But what this also leads us to is the fact  
25 that because we don't credit any additional mitigative

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 actions after that shortly after vessel breach, so it  
2 does tell you that if someone were to credit actions  
3 or able to implement some type of actions to prevent  
4 containment failure in say two days, within the two  
5 days after the event initiation, by for instance  
6 recovering containment heat removal or containment  
7 venting, then they can prevent a large release because  
8 they will prevent the containment from failing and  
9 prevent the eventual large release.

10 Well, on the other hand, the flip-side of  
11 that, the other big takeaway is that if a licensee or  
12 some other applicant were to come in with a Level 2  
13 analysis and they generally only carry out their  
14 severe accident analysis for let's say 48 hours after  
15 event initiation or 72 hours after event initiation,  
16 they may very underestimate what the plant risk is  
17 because they would not capture some of these longer  
18 term issues or longer term failures. So that's the  
19 two sides of it.

20 The fact that the shorter timeframes means  
21 that you do have an opportunity to take additional  
22 action to prevent the large release, on the other hand  
23 if you can't prevent it and you don't model it you are  
24 going to underestimate what the actual event risk is.  
25 Did that address your --

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 CHAIR DIMITRIJEVIC: Oh, yes. Well, this  
2 is extremely, I mean, in my opinion, extremely  
3 important. Because it may have a really regulatory  
4 impact, you know, because the -- okay, so here you  
5 consider 72 hours Level 1 mission time. And most of  
6 the new advanced plants consider 72 hours mission time  
7 for both Level 1 and Level 2.

8 But what you are telling us, that this  
9 severely underestimates large release frequency. And  
10 also, you know, the silent CCFP of 0.1, which is one  
11 of the safety goals, if you extended this timeframe to  
12 the, you know, seven days after that event, you may  
13 not satisfy the surrogate measures for advanced  
14 reactors. So in your opinion is this how you see  
15 implication of this result?

16 MR. KURITZKY: Well, I'm not in a position  
17 to say, because I don't know the -- obviously this  
18 very design-specific, the new reactor designs. This  
19 is an artifact of the large drive containment design,  
20 and the station blackout sequences, and their impact.  
21 And some should be going what mitigated activities did  
22 you take.

23 But yes, for these types of plants, if you  
24 don't mitigate the station blackout, and it just keeps  
25 on going, you get containment over pressure, you will

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 eventually fail the containment and get a large  
2 release.

3 But I don't know the design of the new  
4 reactors or the advanced reactors, whether the same  
5 types of sequences occur, whether the design features  
6 of their containments, et cetera. You know, I can't  
7 really extrapolate or speculate what the impact would  
8 be for them.

9 (Simultaneous speaking.)

10 MR. KURITZKY: But the overall insight is  
11 that, yes, make sure that they are looking at a  
12 sufficiently long timeframe that they're not clipping  
13 higher potential failure probabilities, containment  
14 failure probabilities because they just arbitrarily  
15 terminated their analysis at some point in time.

16 Sorry, go head --

17 (Simultaneous speaking.)

18 MEMBER PETTI: This is Dave. Just, you  
19 know, many of the advanced reactors do not require  
20 power from safety functions. And so the whole station  
21 blackout picture looks very, very different, I think,  
22 when we actually get, you know, an application.

23 But at least the stuff that I've seen,  
24 that's when I was reading it, that's how I was kind of  
25 trying to think about it, put it in that context. In

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 kind of many of these cases, there are, quote, "cliff  
2 edge" effects in some of the designs. Here you're  
3 just seeing all the cliff edge effects coming to the  
4 fore, right. So, yes.

5 CHAIR DIMITRIJEVIC: All right. Well, I  
6 think that this is, I mean, a lot of those plants have  
7 a passive feature. I happen to work with one which is  
8 very similar to this which is APR. It's very off-site  
9 power dependent, in fact there are very similar  
10 issues, like the four-loop with Westinghouse.

11 So there this is very applicable stuff.  
12 But also the most important point is that maybe those  
13 mission times cannot be prescribed in advance. You  
14 know, they should be sort of related to what's  
15 happening in the severe accidents in the plant  
16 afterwards. So you cannot just say, okay, we're going  
17 to use either 24 hours or 72 hours, because that's how  
18 it is done.

19 So from my point of view, it's very  
20 interesting that this brings up also how long you're  
21 going to look in the containment response after the  
22 initiation of the event. So I think that will  
23 definitely -- I hope you will definitely, you know,  
24 have a prominent place in your summary report on the,  
25 you know, compare it with the coolant practice.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 Well, okay. So all right, well thanks for  
2 the discussion.

3 MR. KURITZKY: Okay. And again, thank you  
4 for the question. And let me also just mention just  
5 two quick follow-up things. One is in this case it's  
6 station blackout that's driving that result. But the  
7 overall concept that you've got to be careful about  
8 how long you run the analysis out is important.

9 It would take me too long to find the  
10 actual MELCOR output graph. I'm not even sure it's  
11 publicly available. But you see, in the graph you can  
12 see, after the containment fails, you see measuring  
13 the source term, and I think, again, I think it was  
14 the cesium pressure, cesium release. And you see it  
15 slowly going up.

16 And so it actually is right before, really  
17 something like 6.9 days that you get to what we happen  
18 to call, though again that's an arbitrary number too,  
19 right, I mean whether you're a few, you know, periods  
20 below, or above, or whatever, that's not important.  
21 But nonetheless, it's a slow progression.

22 And so if we only did the analysis for two  
23 or three days, we would see it never getting near the  
24 threshold for large. But as we did do it to seven  
25 days, you do see it, you could get that far.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           So any type of analysis, and recognizing  
2           that I know the NRC is not going to see these detailed  
3           analyses from applicants, but I think they have the  
4           right to go look at them, you want to see what kind of  
5           -- if they do have such analyses, and I guess there's  
6           might be with MAP or something.

7           But if the source terms are trending  
8           upward, and they just happen to cut the analysis at  
9           that point, you know, a fair question is well, hey,  
10          what if you extend this thing out? That would just  
11          keep going up. Eventually you're going to get to a  
12          problem.

13          So the concept about when to terminate the  
14          severe accident analysis I think is important because  
15          of what the design of the plant is.

16          MR. BLEY: Alan, this is Dennis.

17          MR. KURITZKY: Yes.

18          MR. BLEY: I'm going to emphasize that  
19          even more. There ought to be a physical reason for  
20          where you stop the analysis, something you can tie  
21          back to what's happening in the plant and what might  
22          be happening externally that you could use.

23          Just in an aside, 24 hours came about back  
24          during WASH-1400 times. People sat around the room  
25          and said, well, after about a day you could probably

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 get help from other places that bring you stuff, so  
2 you probably don't need to go beyond that. There's no  
3 reason for that to hang on as long as it has. There  
4 ought to be a basis in physics and physical attributes  
5 that determines when you stop that analysis.

6 MR. KURITZKY: And thank you, Dr. Bley.

7 (Simultaneous speaking.)

8 MR. KURITZKY: You're probably one of the  
9 only people that were around back then to be able to  
10 tell us that.

11 CHAIR DIMITRIJEVIC: And that is also, I  
12 don't really -- I was going to go back to the  
13 standards, PRA standards. I don't remember what do  
14 they say about the mission time, and especially for  
15 the Level 2.

16 MR. BLEY: I don't remember exactly, but  
17 I know it had some element of, you know, it's not a  
18 fixed number. You want to base it on what the  
19 analysis is telling you.

20 CHAIR DIMITRIJEVIC: Okay. That would be  
21 good then.

22 MR. KURITZKY: Yes, actually I could --  
23 two points here. So yes, Dr. Bley, this is an example  
24 of the 24 hours. It's one of those things where if  
25 you say something and repeat it enough it just becomes

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 fact of type of thing, right, even if there's no basis  
2 for it. But I think the standard says you need to  
3 reach a safe and stable state.

4 And so you'll see in our Level 1 PRA  
5 provincial events, Line 3A, we have a whole discussion  
6 on safe and stable. We went back to our event trees  
7 and we added some additional nodes for -- and this  
8 particularly became important with RCPC LOCAs, because  
9 we had cases where we were not getting core damage at  
10 24 hours.

11 But you were not in a stable state. The  
12 leak was increasing, and you were eventually, if you  
13 couldn't take action to ameliorate it, you were going  
14 to get to core damage. And so for those cases we  
15 added these extra nodes to, you know, make up,  
16 consider alternative ways to rod cooling or make up  
17 charging to the primary system.

18 And so we added several nodes for that on  
19 the basis of getting to a safe and stable state. So  
20 I think really, the standard I think leads you to go  
21 to a safer, stable state. But there's no definition  
22 of what safe and stable means.

23 MR. BLEY: It's certainly not a case where  
24 things are continuing to get worse.

25 MR. KURITZKY: Right, exactly.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. BLEY: The pressure is still going up,  
2 temperature is still going up, that sort of thing.

3 So I'm going to have to go back and look  
4 at the Level 1, because I don't remember that when I  
5 reviewed it. And I don't think I've gone back to take  
6 a look to see what you added in. So that might be  
7 something worth pointing out in your final summary  
8 report, when it's reasonable to stop the timeframe of  
9 an analysis.

10 MEMBER REMPE: But, Dennis, along the same  
11 point, when you stopped it back at 24 hours, not  
12 including the offsite equipment, you're going for  
13 seven days, is that not a bit misleading?

14 (Simultaneous speaking.)

15 MR. KURITZKY: I'm sorry, is that  
16 question to me or Dr. Bley?

17 MEMBER REMPE: I'll give it to both of  
18 you. But to me that seems a bit misleading.

19 MR. BLEY: Can you sat it again? I didn't  
20 parse it --

21 MEMBER REMPE: Well, it didn't include the  
22 offsite FLEX equipment, and why go for seven days if  
23 you're not including something that could perhaps  
24 mitigate what was going on, or at least say it's there  
25 and say a 50 percent chance to get flown in, and get

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 it installed, and it does something. It sounds like  
2 it was totally neglected. But you went for seven  
3 days, right?

4 MR. BLEY: No. I agree with you. I mean,  
5 they told us what they did. And what they did says  
6 under this condition here's what the results are. My  
7 worry, that I stated earlier, is because of those  
8 assumptions it can be misinterpreted. And it's hard  
9 to put warnings about results that are coming because  
10 of assumptions. It's hard to put enough warnings  
11 there that people really pay attention to them. So,  
12 yes, it's a little misleading.

13 MR. KURITZKY: So here's my crack at it,  
14 Dr. Rempe. So we recognize that the whole reason for  
15 this thing you're seeing on the slide right now is  
16 because we recognize that in doing it for seven days  
17 we haven't credited other actions beyond essentially  
18 the time of the vessel breach or shortly thereafter.

19 So we recognize that there are other  
20 actions that could be taken. That was the thing that  
21 Dr. Dimitrijevic was mentioning from the Volume 3  
22 Report where we had the sensitivity of looking at  
23 other potential mitigative actions in the longer  
24 timeframe and see what the impact of those were. And  
25 that's why we look at these shorter timeframes here.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           So we recognize that we're not considering  
2 all the things you could do in that longer timeframe.  
3 But as it specifically refers to FLEX, and the fact  
4 that we only consider those first two phases, and we  
5 don't consider the long term phase, is the fact that  
6 FLEX is primarily focused on preventing core damage.

7           So the strategies from FLEX aren't really  
8 intended to deal with a post-core damage environment  
9 and mitigate releases. They're really set up to  
10 prevent core damage.

11           (Simultaneous speaking.)

12           MR. BLEY: I've got to jump in, if you  
13 don't mind?

14           MR. KURITZKY: Sure.

15           MR. BLEY: Originally that was true. And  
16 when representatives of industry came to the ACRS and  
17 described these, they were very adamant about that.  
18 And as more and more individual plants began to look,  
19 they began to see that this would be very useful in  
20 other ways.

21           And eventually people backed off of that  
22 only consider it pre-core melt. And we've got some --  
23 well, I'll leave it there. That's just based on what  
24 people brought to ACRS and talked about.

25           I agree with you that that's the way it

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 started. I think owners of these plants saw that they  
2 could get a lot more out of FLEX than not. And, you  
3 know, some of the things that were walked through in  
4 meetings with the ACRS and with the industry, and we'd  
5 only done that for BWRs, really showed that value. In  
6 any case, I think that's not a good argument anymore.

7 MR. KURITZKY: Okay. Also appreciate  
8 that, but again, if they want credit for that in the  
9 PRA, and certainly we were going to credit it in the  
10 PRA, something would have to be showing up in their  
11 FLEX implementation plan or procedures to take credit  
12 for that, not just that, hey, we would do something.

13 And the second thing is we do, and I think  
14 it's in the older report, I know it's in the  
15 supporting calculus, but I think it's in the older  
16 report too for where they talk about with the Level 2  
17 and Level 3 cases.

18 We mentioned that the FLEX, as we're  
19 applying it into this sensitivity case, really only  
20 impacts the core damage frequency. And so we're not  
21 really -- it could be potential things that they could  
22 do in the later timeframe in Level 2 or 3 space, but  
23 we're not actually crediting them in this particular  
24 sensitivity study.

25 And I don't know -- in the internal report

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 I know we identify some of the potential things that  
2 could be done in Level 2 space. I don't know if  
3 that's in the overview report or not, but it would be  
4 in the chapter on Level 2 modeling for the sensitivity  
5 case.

6 But anyway, the points are all valid.  
7 There are definitely things that can be done beyond  
8 what we've credited here up until the point,  
9 especially you talk about these things that don't  
10 become large until seven days.

11 But really, your best shot of avoiding  
12 something is preventing the core damage, excuse me,  
13 preventing the containment failure. Once the  
14 containment has failed, if you're just marking time  
15 until the release gets big enough, there's not a heck  
16 of a lot you could do.

17 I mean, you can spray on the outside of  
18 the wall, right, if you know where the leak is, et  
19 cetera. But the bulk of what you can do, the most  
20 stuff you can do is before core damage. The next most  
21 things you can do is before the containment fails.  
22 After that, your tool box is getting thin. And if you  
23 wanted to create something at that point, you would  
24 have to have procedures for it.

25 MR. BLEY: I'd almost say the most

1 satisfying things you could do, rather than the most  
2 things you can do. Okay, ha, ha.

3 MR. KURITZKY: All right. I'll go with  
4 that. Okay, let's see, I think we've finished this  
5 slide, right? Yes, exactly, we were --

6 CHAIR DIMITRIJEVIC: I think we did, yes.

7 MR. KURITZKY: Yes, I think we --

8 CHAIR DIMITRIJEVIC: I mean, you point to  
9 this interesting thing there like the CCFP was always,  
10 you know, measures the core damage frequency over the,  
11 you know, lot of, or a lot of, because nobody was ever  
12 sure about the things. But here you have a very good  
13 point, and that's a separate measurement.

14 MR. KURITZKY: Right.

15 CHAIR DIMITRIJEVIC: You know, so you  
16 point that in the regs. So I think we are done with  
17 the slide.

18 MR. KURITZKY: Okay, good, thank you.

19 Moving on to Level 3, it's a Level 3  
20 period study, we've got to have Level 3 results. So  
21 in this presentation, in the overview report we  
22 focused on two specific risk metrics, the two that  
23 are associated with the quantitative health  
24 objectives, the Commission's safety goal policy  
25 statement. And so that's individual early fatality

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 risk and individual latent cancer fatality risk.

2 That's not to say that we haven't perused  
3 a lot of other measures. Actually in the Level 3  
4 report which is Volume 4(e), I think, in the current  
5 set, it was 3(d) for internal events, we report  
6 results for over, I think, I dozen different risk  
7 metrics. And so there's a lot more information there  
8 than I'm going to talk about here. But we only did  
9 the FLEX evaluations for these two risk metrics.

10 So looking for individual early fatality  
11 risk, if you look at this chart you can see that the  
12 quantitative health objective is up at the top, the  
13 dashed line, 5(e) minus 7.

14 And then down at the bottom you have all  
15 the contributors for the different hazards. The blue  
16 bars are for the base case, circa 2012. The green  
17 bars are for the 2020 FLEX case, and each pair of bars  
18 is associated with a different hazard. You have  
19 internal events and floods in the beginning and then  
20 fire, seismic, wind, and then all hazards combined.

21 And so if you look at these bars, you can  
22 see that the biggest contributors to individual early  
23 fatality risk come from the internal events and the  
24 seismic events. And that's because internal events  
25 you have --

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 CHAIR DIMITRIJEVIC: Alan?

2 MR. KURITZKY: Yes?

3 CHAIR DIMITRIJEVIC: I always said  
4 incredible, this is totally personal, but I have an  
5 incredible problem with presenting such low numbers.  
6 You know, we are talking here in something that is  
7 three trillion years, you know, one event in three  
8 trillion years. And the age of universe or big bang  
9 is, like, three billion years.

10 So I mean, you know, introducing such  
11 small numbers in many period study, I'd really, you  
12 know, couldn't we just say negligible or something.  
13 Do we really gain anything? And then we compared  
14 those ten to minus 30 numbers to each other.

15 That's really something I have a really --  
16 it's totally, you know, it's totally, it doesn't make  
17 sense, in my opinion. So I don't know how to avoid  
18 that. I can see you are showing that you did the  
19 calculation, and there is a difference.

20 All right, Tom has raised his hand. Tom?

21 MEMBER ROBERTS: If I could, just for a  
22 minute --

23 MR. KURITZKY: Yes.

24 MEMBER ROBERTS: Yes, I'd like to add to  
25 that question, right, before you answer it.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. KURITZKY: Okay.

2 MEMBER ROBERTS: It wasn't clear in my  
3 reading the report how those numbers came about.  
4 Usually there's about a six order of magnitude plus  
5 reduction between the larger release frequency and  
6 these early fatality risks.

7 So in pouring through the reports, the  
8 only thing I found was very deep in the Volume 4 (e)  
9 was a discussion about meteorology and wind. And it's  
10 kind of hard to imagine that you get six orders of  
11 magnitude reduction from meteorology and wind.

12 So I just wondered if you'd, not to get  
13 beyond Vesna's point about showing such low numbers,  
14 how do you calculate them, and how have you concluded  
15 they're reasonable?

16 MR. KURITZKY: Okay. So a good question,  
17 and that's one where I'm going phone a friend and.  
18 And I'm sure the friend knows who is going to get  
19 tapped in a second. But before I go there, you know,  
20 I do echo your concern, Dr. Dimitrijevic, about the  
21 low numbers. But as you said, you know, what's the  
22 alternative?

23 I do know that in the actual overview  
24 report, in the summary table we have up in the key  
25 messages, you know, the Section 2 both for the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 internal event and the fire, seismic, wind one, we put  
2 in the table. We put in approximately zero as opposed  
3 to Action Number 4 in that exact reason because, you  
4 know, such low numbers look odd.

5 Then we have a footnote that I think  
6 actually provides the actual numbers down in the fine  
7 print. But in the table itself, we just put  
8 approximately zero, because the numbers are so low.  
9 But nonetheless, I mean, that's what the calculation  
10 shows.

11 If you want to know exactly, going to the  
12 question about why they're so low, Dr. Compton, are  
13 you ready to jump in? There's more factors than just  
14 wind that are involved. But, Dr. Compton, are you  
15 online?

16 MR. COMPTON: Sure. I will jump in. I  
17 don't know if I can fully answer the question, because  
18 I can speak about this for hours when I want to. But  
19 I will highlight a few things that maybe will hit some  
20 things.

21 And one of the things, I do understand  
22 these are really low numbers, and interpreting them in  
23 kind of, I don't know, a realistic or actual point of  
24 view, it's hard to understand what they mean.

25 They're useful, the actual numbers are

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 useful to me as an analyst, because it helps me to  
2 discern, hopefully a reader who spends a lot of time,  
3 to discern why the numbers are that low. And it's  
4 hard to do that when you're giving kind of  
5 inequalities, you know, less than.

6 So anyway, so there's -- and I'm glad you  
7 found it, it was buried in the, as you mentioned, in  
8 the Level 3 report. There's basically four reasons  
9 why the early fatality risk is so low. Actually, it's  
10 not really just the early fatality risk, it's these  
11 are the reasons why high doses, whether they lead to  
12 early fatalities or not, these are the reasons why  
13 high doses are low.

14 So the first reason is just that, as Alan  
15 said, they only arise under bypass scenarios. You  
16 only get those high doses under bypass scenarios which  
17 are, you know, very large and very fast releases. And  
18 there are some tables and figures in the report, I  
19 won't go through them right now unless you ask, but  
20 they can kind of illustrate that.

21 The second is the fact that there is a  
22 pretty low, a very low frequency of what I call  
23 adverse meteorology, even for those cases that lead to  
24 early health effects. Only about one percent of the  
25 weather, you know, trials, the actual weather

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 conditions, led to early fatalities in those, I think,  
2 three or four cases.

3 So another factor is the fact that the  
4 range at which you can get those early fatalities is  
5 very short. And at least at this site the population  
6 is very sparse. There is only, I think within one  
7 mile of the site boundary, there is only kind of one  
8 out of the 64 directions has a populated sector, one  
9 or two. I don't remember the exact number. But the  
10 point is that you have to be downwind. And if there's  
11 not a lot of people downwind, that will drive the risk  
12 lower.

13 And then the final factor is there's a  
14 very low likelihood of delayed or slow evacuation of  
15 the populations close to the site. We looked at, in  
16 this study, we looked at a pretty fine grain detail  
17 about, you know, the early evacuees, kind of the  
18 medium evacuees, the late evacuees, the non-evacuees.

19 And so again, it doesn't, even if you met  
20 the other conditions, you had a bypass, and you had  
21 the right weather condition, even only the very late  
22 evacuees, or those who don't evacuate, show any non-  
23 zero or early fatality risk.

24 So I think if you start adding all those  
25 pieces together, and you look at the actual numbers,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 and you can see that they kind of hang together when  
2 you slow the evacuation down, those low numbers get a  
3 little bit larger.

4 And then if you start, you know, kind of  
5 adding in things, you can see what's going to make  
6 those numbers go up. And to me that's what's  
7 important, is not just the low number but kind of  
8 understanding that the story hangs together and what  
9 could defeat that story.

10 That's all I have. Hopefully that is  
11 helpful in some way.

12 MR. KURITZKY: It looks like we have a  
13 question. Dr. Bley?

14 MR. BLEY: Yes. Not so much a question as  
15 a comment. This same issue, of course, came up with  
16 WASH-1400. And the primary authors of that report  
17 testified before Congress, and they did something  
18 similar to what Keith did. They wrote it out as a  
19 product and showed these various things.

20 I think if you're going to keep something  
21 like this in the report, even if it's in a subtle  
22 place, having that litany of three things that all  
23 have to occur to get fatalities makes it a lot easier  
24 to see why there's, you know, another ten to the minus  
25 six added onto the numbers we saw earlier.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           And Keith did it really well. And I think  
2           it's just a sentence or a note to do that. But I  
3           think it really helps a lot.

4           MEMBER ROBERTS: Yes, Dennis, I agree with  
5           that. I think it's important to understand the plant-  
6           specific nature of a very large part of that delta.  
7           You know, one concern I'd have is somebody  
8           interpreting this report as refuting the NUREG 1860  
9           discussion of why LERF is a reasonable surrogate  
10          metric for the early fatality risk. Because you can  
11          interpret this plot that that number should be a lot  
12          higher and it maybe not even be a concern.

13          Because for any reasonable value of LRF  
14          you're still going to meet the QHO for early fatality.  
15          So I think it's important to have that perspective,  
16          that there's a site-specific nature to this. And if  
17          you have a slightly more adverse situation at the  
18          site, or a different meteorology, these numbers change  
19          by orders of magnitude. So again, just to, you know,  
20          just a thought.

21          CHAIR DIMITRIJEVIC: Okay. If you just  
22          point out exactly what I was, and I'm actually  
23          questioning how the surrogate things makes -- because  
24          it was based on the old study data. And you cannot  
25          really avoid to question this, because we are not

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 talking one order of magnitude. You know, we are  
2 taking about like five orders of magnitude.

3 So I don't know what kind of the wind, the  
4 population will change that. But basically, based on  
5 this, maybe some evacuation probability. So this is  
6 why -- I talked directly with Dennis. You should  
7 really present -- you know, you claim a small  
8 probability, which I can also question why is the  
9 LOCA, you know, re-sequenced as such a small  
10 probability?

11 But he said that we're not going to go in  
12 technical details. And that could be part of  
13 uncertainty analysis. But this has all started with  
14 probably something, you know, the one E to the minus  
15 six. And then we are adding now ten to the minus five  
16 factors based on evacuation, wind and population.

17 I would like to see how those factors add  
18 up. Or otherwise I definitely will plan to question,  
19 and I already do this, connection of QHOs to the  
20 surrogate measures.

21 MR. KURITZKY: Okay. Well, thank you all  
22 for those comments.

23 MR. EVANS: It looks like Keith has his  
24 hand up. I'm sorry, Alan.

25 MR. KURITZKY: Oh, sure.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. COMPTON: Sure. I would just, I  
2 appreciate all the comments. And I have struggled for  
3 a long time to try to really understand why we get  
4 such different results in this study than we get in  
5 NUREG 1150. I think is very much related to these  
6 three things.

7 I have looked at the, you know, looked at  
8 the specific source terms in NUREG 1150. And I've  
9 been trying, and I'm still working on it, I haven't  
10 come to really a clear exposition but, you know, to  
11 try -- it's hard to compare them and do this  
12 percentage of the reduction comes from this factor.

13 But the modeling was very different, you  
14 know, the number of population sectors were different.  
15 The meteorology was different, the approach to  
16 modeling evacuation was different. And all that is  
17 simply saying is that it is an important thing. It  
18 may take some time to do that comparison and that  
19 evaluation properly. But I do think it's important to  
20 do.

21 CHAIR DIMITRIJEVIC: Well, and therefore  
22 you still, if this plant was going to submit under  
23 the, you know, the QHO requirement, it could make a  
24 case that don't really -- that can have a, you know,  
25 as Jon point out in some of his comments we exchanged,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 we can have a little fun. This is for this specific  
2 plan, because all of those submittals will be based on  
3 the plant, you know, specific locations and cases.

4 All right. Okay. I mean, I think this is  
5 very interesting and really different for what was in  
6 the original NUREG. So definitely it deserves a lot  
7 of discussions.

8 MR. KURITZKY: I think it also, just to  
9 mention too, I don't think he -- I think he's still  
10 out of the country, but Sunil Weerakkody, he has been  
11 also looking into, you know, as I'll get to in the  
12 final slide in this part of the presentation, we'll  
13 talk about the difference in margin to the QHOs versus  
14 the surrogate risk metrics.

15 And he is fond of pointing out that the  
16 safety goal policy statement doesn't just talk about  
17 the quantitative health objectives. You know, it  
18 talks about qualitative objectives too.

19 And it talks specifically about the need,  
20 you know, for the nuclear industry to -- if any type  
21 of severe accident, so it says that the staff, I  
22 guess, the administrator, I don't remember the exact  
23 word, should be striving to have no severe accidents.  
24 So it's not just a question of meeting one QHO number  
25 or another QHO number. The striving should be to have

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 as low a CDF as possible, to have no core damage.

2 So, you know, it's one of these cases  
3 where I think the QHOs have kind of taken on -- I  
4 mean, they're certainly important. There's no  
5 question about it. But they're not the end all and be  
6 all and the single thing by which all things should be  
7 measured. So we just have to, you know, keep that in  
8 mind too.

9 But again, as Keith said, we will try to  
10 dig up some more information that we can describe how  
11 you get from, for instance, a lower frequency or a  
12 core damage frequency to the individual early fatality  
13 risk numbers and kind of show all the multipliers that  
14 bring the value down, to the extent that we can.

15 CHAIR DIMITRIJEVIC: Well, you know, I  
16 have this discussion with my colleagues in ACRS about  
17 the safety goals ongoing. And I have not been really,  
18 I have to say, I have not been very successful in  
19 explaining well my concerns. So to be honest with  
20 you, I was counting with your staff showing them you  
21 know, and also when comes to uncertainties associated  
22 with these quantifications. So I am sort of, like,  
23 very interested in this results.

24 MR. KURITZKY: Okay. Well, thank you very  
25 much. Hopefully this will provide some information

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 for you.

2           Going back now, if I could just wrap up  
3 this slide, so as I was mentioning, the drivers here  
4 are internal events and seismic provincial events, as  
5 we were discussing before, the interfacing system  
6 LOCAs, particularly those where you have the auxiliary  
7 building failed, so you don't have any retention  
8 really of the source, the radionuclides.

9           And then for seismic, it's primarily two  
10 types of steam generator tube rupture. I think we may  
11 have already mentioned them. It was the pressure  
12 induced steam generator tube ruptures that occur prior  
13 to core damage that generally come about because of an  
14 ATWS event. And then there are the -- and in this  
15 case the seismic leads to a higher frequency of ATWS,  
16 that you get for internal events.

17           And then there's also the post core  
18 damage, thermally induced steam generator tube  
19 ruptures, which also come about for a number of the  
20 sequences under the seismic initiator. So that's why  
21 the internal event and the seismic are the drivers  
22 here.

23           You certainly can't tell by the  
24 logarithmic curve, you know, plaque, but if you look  
25 at the numbers you see there's not very much

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 reduction. The FLEX case doesn't really reduce  
2 individual early fatality risk much. And that's,  
3 again, because these types of sequences that I just  
4 mentioned, they're not the ones that the FLEX guides  
5 used in the turbine driven aux feeder are targeted  
6 towards.

7 The one area where you do see that  
8 reduction is for the wind. If you look at the wind  
9 you see that it drops from roughly 90 minus 14 to 40,  
10 minus 14. And the reason the wind drops so much is  
11 because the early fatality risk for wind is almost  
12 entirely made up of station blackout sequences where  
13 the wind causes a loss of offsite power.

14 And then you have a combination of wind  
15 induced or random failures of emergency AC components  
16 leading to station blackout sequences that eventually  
17 propagate to these post core damage thermally induced  
18 steam generator tube ruptures.

19 And so those are things that the FLEX and  
20 turbine driven aux feed, extended turbine driven aux  
21 feed, can ameliorate. And so you see that reduction  
22 for the wind. Overall, you just see a 12 percent  
23 reduction for all hazards combined. But again, as we  
24 were just mentioning, there's a huge margin to the --  
25 for the reasons that Keith specified a few minutes

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 ago.

2           Okay. If we've beaten the early fatality  
3 risk horse enough, we'll move on to latent cancer  
4 fatality risk, the other QHO. And here we see that  
5 the QHO is up at the top at 210 to the minus 6. You  
6 see that you don't really have the same type of  
7 margins you did for early fatality risk, but they're  
8 not insignificant.

9           The drivers here, again a little difficult  
10 to see because of the logarithmic scale, but the  
11 drivers here are internal events and internal fires.  
12 And they actually combine. You can't really tell from  
13 here, but I know the numbers. And they combine to  
14 about 80 percent of individual latent fatality risk.

15           And if you recall, that's essentially what  
16 they were in terms of a contribution to core damage  
17 frequency. And then that's for the base, the circa  
18 2012 case. And the reason that you have that time is  
19 because both of these, the latent fatality risk from  
20 these two types of initiators are based on two primary  
21 release categories.

22           And those are the ones that are driven by  
23 station blackout sequences, so you get that same type  
24 of profile in there for the same type of impact from  
25 FLEX and the turbine driven aux feed as you do for

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 core damage. And so that's why they're very analogous  
2 in terms of the impact of FLEX.

3 If you look at the overall drop, you see  
4 it goes from 6.5(e) minus 8 to 4(e) minus 8, a drop of  
5 just under 40 percent, again, very similar to the  
6 total CDF reduction for all hazards for FLEX.

7 And again, Keith mentioned too that the  
8 reasons we still have a fairly good margin to the QHO  
9 here is some of the same reasons that we have a lot of  
10 margin from the early fatality risk. And that's the  
11 fact that we really don't have many sequences that  
12 provide dose -- the frequency of sequences that  
13 provide dose in the early phase are very low, okay,  
14 it's those bypass sequences that are very low  
15 frequencies.

16 And effective protective actions are taken  
17 that minimize how much exposure you receive at a later  
18 phase too, essentially to the habitability criterion.  
19 So it's not until people move back later that they get  
20 really that exposure.

21 They're not getting exposed right after  
22 the accident from the radioactive cloud, let's say.  
23 It's more exposure when they move back later in time.  
24 So that's why you still have a fairly good margin to  
25 latent cancer fatality QHO.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           Okay.    But for latent fatality risk,  
2           there's also a number of key assumptions that were  
3           made or boundary conditions that we wanted to look to  
4           see what the impact of those would be.  So looking at  
5           this chart, the first two columns you see base case  
6           and the 2020 FLEX case that was -- the circa 2012 case  
7           has a margin of around 30 to the QHO.  The 2020 FLEX  
8           case, that increases to around 50.

9           So we also wanted to look at the accident  
10          termination timing.  Remember, that was the thing we  
11          were discussing back in Level 2 space where we run the  
12          accident analysis out to seven days, but we also  
13          looked at a couple of shorter timeframes.

14          So we wanted to see what was the impact on  
15          latent fatality risk if we terminated the severe  
16          accident analysis, therefore the releases, at 36 hours  
17          after SAMG entry.  And so that's this third bar that  
18          you see.  And in doing so, latent fatality risk, now  
19          you have a margin of about 150 to the QHO.  So it  
20          definitely makes an impact.

21          It doesn't look as big on here, because  
22          it's a logarithmic scale, but it's a significant  
23          impact if you terminate those accidents at 36 hours  
24          after SAMG entry.

25          And then the other thing we really wanted

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 to look at was the low dose model. In the base case,  
2 what we used is the linear no-threshold, LNT model for  
3 low dose exposure. And that is something that is  
4 consistent with how the NRC, you know, that we  
5 generally use the LNT in regulatory applications  
6 involving dose modeling.

7 But there's also a lot of -- there isn't  
8 really consensus in, let's say, the health physics  
9 community or the technical community about how you  
10 should be treating low doses. And is there some  
11 threshold below which it's not meaningful to expedite  
12 a number of statistical cancers that may increase and  
13 statistical cancers that may occur?

14 And so we did an example where we found a  
15 threshold, we actually picked one from a 2010 Health  
16 Physics Society paper. And it had some thresholds for  
17 low dose to low dose modeling, and we applied those.  
18 And here you see a very substantial reduction in  
19 individual latent fatality risk.

20 And the reason, it's not surprising  
21 because, as I was just mentioning, the risk really  
22 comes, the latent cancer fatality risk really comes  
23 when people move back. And they spend the rest of  
24 their lives with a very minimal increase in background  
25 radiation.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           So it doesn't take much of a threshold to  
2 eliminate those increases in statistical cancer  
3 deaths. So if you do have some kind of threshold,  
4 even if it's a fairly low one, you can have a very big  
5 impact on the calculations.

6           CHAIR DIMITRIJEVIC: Yes, I find this also  
7 very interesting, Alan. And I appreciate that you  
8 guys say, no, we got material from Scott and to show  
9 the Commissioners, they're not ready to consider this.  
10 You know, they're staying with a non-threshold models.

11           But you pointed in those volumes that  
12 those, you know, this alternative, those truncation  
13 have a scientific merit and should be considered. And  
14 this is very interesting since utility study is  
15 showing the, you know, two order of magnitude is  
16 reducing latent risk. So I appreciate that you  
17 considered that. That was very interesting from my  
18 point of view too.

19           I see that Keith has his hand raised.

20           MR. COMPTON: Yes, thank you. This is  
21 Keith Compton from the Office of Research. And I did  
22 want to emphasize one of the things. I think this  
23 particular sensitivity analysis can be very  
24 insightful.

25           It can be a bit challenging to interpret,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 because it is mathematically a threshold model, but  
2 it's not a model that's -- it's not implying that  
3 there is a biological threshold. It's simply a model  
4 where we don't quantify the risk below the threshold,  
5 if that makes sense.

6 In other words it's not -- and that's kind  
7 of the challenge, is that what it's really telling you  
8 is how much of the risk is coming from, you know,  
9 doses that are significantly higher than background.  
10 How much of it is coming from moderate or high doses.  
11 So I just wanted to --

12 CHAIR DIMITRIJEVIC: Right, yes. And  
13 that's, as Alan pointed out, they're just really  
14 important, because this is where you are allowed to  
15 return. You know, background radiation is acceptable  
16 for people to return to the zone. And also, so it's  
17 basically low. The big influence comes from those  
18 long term long doses.

19 MR. COMPTON: That's exactly right.

20 CHAIR DIMITRIJEVIC: Yes. And also I  
21 notice that you also for this, the late fatalities,  
22 you considered this release category which is  
23 basically intact containment, you know, so basically  
24 just based on the tech specs leakage. It also has  
25 contribution to this latent fatality risk. You know,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 obviously this is very interesting question to  
2 discuss.

3 Ron, you have your hand raised and --

4 MEMBER BALLINGER: Yes. It's likely to be  
5 way, way too early, but is there any data that's  
6 coming out with respect so Fukushima and Chernobyl  
7 where people have moved back into the area? Is there  
8 any data that suggests that there'll be a big  
9 reduction?

10 (Simultaneous speaking.)

11 MR. KURITZKY: Keith, I don't have any  
12 information on that.

13 MR. COMPTON: Is the question is there  
14 information from Chernobyl or Fukushima suggesting  
15 that there would be a big reduction in kind of cancer  
16 risk?

17 MEMBER BALLINGER: Right.

18 MR. COMPTON: So yes, so I guess the  
19 question would be, or a way to put that is, you know,  
20 tracking what the cancer fatality risk coefficients  
21 are for exposures that are in those, you know, low  
22 dose ranges, whatever works.

23 MEMBER BALLINGER: Yes. You would have an  
24 expectation based on an LMT model. And then you could  
25 compare it with what actually happens.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. COMPTON: Right. So I'm going to be  
2 careful, because I used the results of the health  
3 physicists and the radio biologists, but I'm not an  
4 expert on it. But I have not -- I know that, you  
5 know, there's a lot of factors that or there's a lot  
6 of cohorts that do contribute to generating the cancer  
7 risk coefficients.

8 I don't know off the top of my head if  
9 Fukushima or Chernobyl cohorts have been studied and  
10 their doses quantified, and their cancer risk tracked  
11 enough --

12 (Simultaneous speaking.)

13 MEMBER BALLINGER: The Fukushima ones  
14 might have been, but I don't know.

15 MR. COMPTON: Yes. So I don't know. But  
16 the way that it would feed in, again, to me, because  
17 I would want to be careful about staying within my  
18 subject matter expertise, that would feed through the,  
19 you know, we would look for -- is there consensus  
20 guidance on what the cancer risk coefficients would  
21 be, if that makes sense. So I would still follow,  
22 kind of, the guidance of federal guidance reports and,  
23 you know, those who are qualified to make those  
24 judgements.

25 MEMBER BALLINGER: You know the old

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 saying, if you have the data use it. If you don't  
2 have the data use color.

3 (Laughter.)

4 MR. COMPTON: We do have a lot of colors  
5 in our report, so we've at least done that.

6 CHAIR DIMITRIJEVIC: Okay, Dennis, you  
7 have a hand up.

8 MR. BLEY: I couldn't get my mic open.  
9 This is follow-up probably for Keith, maybe others.  
10 Some time ago I thought I'd seen a draft Br8 report  
11 from the National Academy. But there was never a Br8  
12 published. Do you know anything about that? Is there  
13 something underway? I'm not sure of that.

14 And the second thing is who are the dose  
15 experts at NRC? I'm not sure I know.

16 MR. COMPTON: Well, again, I'll be  
17 cautious. I've not heard anything about a Br8. I do  
18 know that there was a Br7.

19 MR. BLEY: That's been over ten years ago.

20 MR. COMPTON: Yes. And the question is  
21 who much do things, you know, change. They changed a  
22 lot back in the early decades, and then they're  
23 continuing to get reexamined.

24 We're basing our models of some reports  
25 that were done by Keith Eckerman for the SOARCA

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 project, which are kind of circa 1990s, early 2000  
2 vintage, that were used for Federal Guidance Report  
3 13. So in answer to -- so hopefully that somewhat  
4 responds to that question.

5 But in terms of who are the people at the  
6 NRC, I will say that the person at the NRC that I  
7 typically talk to, to kind of make sure that we're  
8 staying reasonably abreast with the professional  
9 community, would be Terry Brock. I know that there is  
10 others that also have some expertise, but Terry is the  
11 one that I kind of rely on to keep me honest.

12 MR. BLEY: Okay. Thanks. You said  
13 Federal Guidance Report 13? Is that the name of it?

14 MR. COMPTON: Federal Guidance Report 13,  
15 it's an EPA publication. It's a federal guidance  
16 report published in 1999. Some extra detail came out  
17 a few years later. And, again, I need to be careful,  
18 to not misspeak. But I think it's, I'll just say  
19 broadly consistent with ICRP 60.

20 So it's, you know, it's produced by the  
21 same community, the same technical community that  
22 works on the ICRP reports. And I think that there's  
23 probably overlap. And, you know, that community is  
24 much more tied into the BR community.

25 So the sources, communities of expertise

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 would be, to me, would be ICRP, EPA's Federal Guidance  
2 Report, they produce WISC coefficients for  
3 radionuclides, and then also the BR community. So we  
4 try to, you know, keep an eye out to see if there's a  
5 big shift in those. But I'm not aware of any, you  
6 know, kind of, no pun intended, no seismic shifts --

7 (Laughter.)

8 MR. COMPTON: -- in how that, you know, in  
9 the numbers or how that would be done. But we're  
10 always trying to make sure we're not surprised by  
11 anything.

12 MR. BLEY: Okay, thank you. And I  
13 personally have never seen that EPA report, so I'll go  
14 look for that. Thank you.

15 MR. COMPTON: Yes. Federal Guidance  
16 Report 13, and then, yes, it's in the references. It  
17 should be in the references. I should just double  
18 check that.

19 MR. KURITZKY: Yes, I think in Volume  
20 4(e). I think Volume 4(e) or certainly Volume 3(d),  
21 I think you'll see a reference to those, to federal  
22 guidance.

23 MR. COMPTON: Yes. And that would also  
24 give the reference to, I think, the Eckerman report  
25 that we, you know, so you can follow the reference

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 chain back from what we did to where it came from.

2 CHAIR DIMITRIJEVIC: Okay. Scott has a  
3 hand raised. Scott, please?

4 MR. MOORE: Yes. Thank you, Chairman.  
5 Just in answer, Dennis, to your question, there are  
6 radiation protection experts, senior level radiation  
7 protection experts, HPs, throughout the agency in the  
8 office of Research, in NMSS, and in NRR. And in some  
9 of those organizations, they're actually sub-units  
10 that specialize on Rad Pro. So it's throughout NRC.

11 MR. BLEY: Thank you.

12 CHAIR DIMITRIJEVIC: Thanks. Okay, next  
13 slide, Alan?

14 MR. KURITZKY: So this is the last slide  
15 for this presentation. It's just really a roll up of  
16 the results that we have discussed over the previous  
17 couple of hours. So this summarizes the Level 1, 2,  
18 and 3 results. We have core damage frequency, we have  
19 the LRF, the L-R-F, individual early fatality risk and  
20 individual latent cancer fatality risk for both the  
21 circa 2012 and 2020 FLEX cases.

22 And you can see from this chart that the  
23 core damage frequency, the large release frequency,  
24 and the individual latent cancer fatality risk all  
25 reduced by just about the same amount. And again,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 that goes back to what I was saying before.  
2 Essentially the profile of accidents contributing to  
3 these are pretty much the same as mostly these station  
4 blackout sequences. You have the same general effect  
5 on, you know, the FLEX has generally the same effect  
6 on these, all three of these metrics.

7 For large early release frequency, it's a  
8 little bit lower. It's 29 percent. Again, that has  
9 to do with some of the fact that, as we mentioned  
10 before, you have contributions from some of the techs  
11 in sequences that FLEX is not really designed for, and  
12 even moreso for individual early fatality risk where  
13 you're really being driven here by those containment  
14 bypass, you know, the interfacing system LOCAs that  
15 don't -- for which the FLEX and the extended turbine  
16 driven aux feeder don't have much impact.

17 So I think that the bottom line is that  
18 all these results show that, when you consider this  
19 plant at this site, there was substantial margin to  
20 the QHOs. There was those green numbers you see down  
21 in the bottom two rows.

22 But you also have to recognize that,  
23 looking at the purple numbers up above, that there is  
24 a lot less margin to the surrogate risk metrics, you  
25 know, CDF and LRF. Now what you make of that and what

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 you want to do with that information is not part of  
2 this project. But it is certainly interesting  
3 information, as I think, Dr. Dimitrijevic, you had  
4 mentioned before. It's certainly interesting insight.

5 CHAIR DIMITRIJEVIC: Exactly, very  
6 interesting insight. This slide is actually telling  
7 us a lot. Well, okay. Great, I want to thank you so  
8 much. I just want to point something which was  
9 missing from our discussion.

10 You know, you said there were numerous  
11 meetings, and Hossein has summarized history of our  
12 interaction. But we only wrote the one letter after  
13 the first meeting when this project was approved. And  
14 there we said that -- one the things that ACRS said in  
15 this letter that this project needs to have an  
16 extensive characterization and quantification of  
17 uncertainties.

18 And we have not touched uncertainties in  
19 this presentation. So I hope we will change that when  
20 you present to us in the full committee in November.  
21 Because it is -- some very interesting things happened  
22 there which are really mind-boggling for me. And I'm  
23 very curious what's going on.

24 And it's one that you have concluded that  
25 too many -- including too many basic events,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1       uncertainties, masks events, masks parameters which  
2       breed uncertainties. Because all uncertainty results,  
3       as you presented with those volumes, are very narrow.  
4       There is no large uncertainty which is really strange,  
5       and especially I know that you address some modeling  
6       uncertainties through the sensitivity study, so  
7       alternative studies.

8                   But these conclusions, the number of the  
9       basic event uncertainties which include the masks, the  
10      large uncertainties is extremely interesting to me.  
11      So I hope that we will have a chance to have a  
12      discussion on your uncertainty results and what does  
13      this actually mean.

14                   And also I'm very curious, you know, how  
15      did you consider the modeling uncertainties. And are  
16      the sensitivity studies on the different assumptions  
17      enough to address that. So if you want to just tell  
18      me this conclusion on the too many uncertainties mask  
19      the large ones, ha, ha, I am very curious about it.

20                   MR. KURITZKY:    Okay, so fair enough.  
21      We're at a loss for time, but I don't want to go into  
22      a lot of detail. And honestly I probably -- even if  
23      I had more time there's only so much detail I can go  
24      into. This is not my area of expertise.

25                   But in discussing this at the time I was

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 with Saleem, who knows much more about it than I do,  
2 but our pre-supposition, you know, we were trying to  
3 figure out why we were having such a tight parameter  
4 on uncertainty distributions.

5 And we had supposed that it might be due  
6 to, as you were mentioning, the fact that there are so  
7 many basic events, and when you're sampling from so  
8 many events, that it tends to mask, even if you were  
9 to pull something from the tail of one event, you have  
10 other things that have to fail in the cut-set and you  
11 can generally pull more from the -- statistically  
12 you'll pull more from the center of those  
13 distributions, and it kind dampens out, you know, the  
14 tails on the distribution.

15 If that's true, why is that not true for  
16 every PRA? That one I have a hard time answering. So  
17 is it --

18 CHAIR DIMITRIJEVIC: Because logically it  
19 doesn't make sense, because we could just do  
20 uncertainty distribution just based on those  
21 requirements, then don't consider the other ones which  
22 we don't think they contribute. And then we try to  
23 reach results of two.

24 You know, you don't have to have 1,000  
25 basic events. If we are concerned, like your

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 parameter for ELAP, and to the agreement extended to  
2 the driven operation, this P obviously has a large  
3 uncertainty. It's probably uniformly distributed  
4 between zero and one.

5 That itself has a big impact on the result  
6 distribution. Do we gain by including the 2,000 other  
7 basic events. I mean, you know, there are so many  
8 questions to address that.

9 MR. KURITZKY: Right. And the whole idea  
10 of uncertainty analysis, and in this particular case  
11 for parametric uncertainty analysis, it is something  
12 that would be its own project. It's not something  
13 we're going to resolve here. We just notice that the  
14 results are very tight. We took a little look into  
15 it. We tried to figure out, you know, guess why we  
16 thought it was happening.

17 There are a couple of things that we  
18 thought about. The one about the basic events, we did  
19 do a, you know, Saleem had done a little bit of  
20 checking that by -- you know, the whole model for  
21 internal events, I think, the ratio from the 95th to  
22 fifth percentile was like around a factor of eight.  
23 And Saleem went and did it for just the weather  
24 related loop events. So we greatly reduced the size  
25 of the model.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           And when he ran the uncertainty analysis  
2           for that, he got a ratio from the 95th to the fifth  
3           percentile almost a factor of six -- around a factor  
4           of 16, so twice as wide a distribution. And so that,  
5           in that one case, which could be an anomaly, but in  
6           that one case it made us, like, hey, the more you  
7           reduce the size of the model, now you're starting to  
8           get that bigger spread in the results.

9           But that's far from a scientific proof.  
10          We don't have anything written up on that, because,  
11          you know, it's just one example. And we have no idea  
12          whether that would hold in a more broad sense. So  
13          unfortunately we're not, as far as this project, going  
14          to have a good answer for that.

15          I did take a look at to see what type of  
16          spread you had 95th to fifth for some other periods.  
17          I looked at the NUREG 1150 models, and those, for the  
18          PWRs you were, you know, Surry, Sequoyah and Zion, you  
19          were looking at numbers that were in that ballpark  
20          somewhere between eight and 20. And we had, you know,  
21          our spread was eight.

22          For the BWRs, Peach Bottom and Grand Gulf,  
23          you had much bigger ones. You had, I think, 40 for  
24          Peach Bottom, and I think 70 for Grand Gulf. And they  
25          have much lower CDFs, but also they have much bigger

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 spreads. So I don't know exactly why ours is on the  
2 low end of that. But it's not unrealistic compared to  
3 what we've seen for the other PWRs and NUREG 1150.

4 I couldn't find that information in the  
5 NUREG 1560 in the IPEs but --

6 CHAIR DIMITRIJEVIC: I know that we  
7 haven't too much time now left for us, but I think  
8 that's one of the discussions I would like to have,  
9 because I think the uncertainty treatment in the PRA  
10 is one area which definitely can benefit from the many  
11 insights.

12 You know, I noticed that you didn't really  
13 consider the uncertainties in max input parameters, in  
14 that, you know, the uncertainties connected with,  
15 like, containment failure location, size, things like  
16 that. I'm very curious how they can be considered.

17 Sometimes we do, like, it will be nice to  
18 see the summary sensitivity cases. The sensitivity  
19 cases just show us something sensitive or not. But it  
20 doesn't really address uncertainty associated with  
21 that.

22 Because they somehow stand on the side of  
23 the -- and this is one of the issues which I have in  
24 many of our reviews, is what is the good uncertainty  
25 analyzed, you know, if you do the 20 sensitivity

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 cases, each for each other, but they don't show as  
2 uncertainty contributor, you know.

3 Because we see a lot of the passive  
4 systems which we don't really have enough data. But  
5 then we show very -- model uncertainly distribution.  
6 And there is a -- I think the uncertainty analysis can  
7 contribute a lot from this project and others maybe.  
8 So maybe that's too much burden for this project. But  
9 anyway, okay.

10 So Members, do we have any additional  
11 comments?

12 Should we call for public comments? The  
13 people on the public line, if you would like to make  
14 a comment, then unmute yourself, and introduce  
15 yourself. I see two people, Edwin and Victoria.  
16 Edwin Lyman, please?

17 MR. LYMAN: Yes, hi. This is Ed Lyman  
18 from the Union of Concerned Scientists. Can you hear  
19 me okay?

20 CHAIR DIMITRIJEVIC: Yes.

21 MR. LYMAN: All right, thanks. Yes, a  
22 couple of comments. The first, on the issue of the  
23 LRF versus the QHOs, and it seems to me, I didn't hear  
24 this brought up, maybe I wasn't listening, but the  
25 working definition of LRF, and I'm reading it here

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 from NRC document, is that it's core damage accidents  
2 that can lead to large unmitigated releases from  
3 containment before effective evacuation of the nearby  
4 population.

5 But it sounds like, from Dr. Compton's  
6 response, that they are considering essentially an  
7 effective evacuation and crediting it. So if that's  
8 true, it seems like there's an inconsistency between  
9 what they call LRF and what the standard definition  
10 is. So I'd appreciate some clarification on that.

11 MR. KURITZKY: So if I could, just on the  
12 one first, Dr. Lyman, so what Keith is talking about  
13 is in the --

14 CHAIR DIMITRIJEVIC: Alan, we don't really  
15 necessarily respond here --

16 MR. KURITZKY: Oh, okay.

17 CHAIR DIMITRIJEVIC: -- to outside  
18 comments. We will just accept them. But we don't  
19 really get in discussions.

20 MR. KURITZKY: Okay, sorry.

21 CHAIR DIMITRIJEVIC: Sorry about that, and  
22 sorry I didn't -- So Victoria?

23 MR. LYMAN: No, I'm sorry, ma'am. I have  
24 a couple more questions.

25 CHAIR DIMITRIJEVIC: Oh, sorry.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. LYMAN: Sorry. You know, on the use  
2 of thresholds and the general application of risk  
3 coefficients, it seems like this work is rapidly going  
4 in the direction of the dinosaurs.

5 Well, first of all, as it was pointed out,  
6 the Commission itself rejected a petition on  
7 revisiting the meaning of threshold model. And it  
8 would seem like why are any offices in the NRC still  
9 continuing to use that, even in sensitivity cases.

10 I'd also like to point out that a recent  
11 study, a very large study in the British Medical  
12 Journal, the INWORKS study, is now suggesting not only  
13 is there no apparent threshold but the use of a dose  
14 and dose rate effectiveness reduction coefficient may  
15 not be appropriate. It's not being seen in the data.

16 And that is pretty much uniformly tied in  
17 the MACCS models that are used to estimate these  
18 risks. So there may be something like a factor of two  
19 already that's being underestimated.

20 And finally, given that the agency is  
21 supposed to be taking a harder look at environmental  
22 justice issues, and I've raised this in other venues  
23 before, the use of these average risk coefficients  
24 which make assumptions about the ratio of mortality,  
25 cancer mortality to cancer incidents, are very much

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 dependent on the population that you're considering.  
2 And there are disadvantaged groups where the potential  
3 for a cancer mortality, given cancer incidents, could  
4 be much greater than is assumed on the average.

5 And by not taking these factors into  
6 account, the NRC is really becoming out of step with  
7 the greater emphasis on environmental justice in  
8 regulatory analysis for our federal government.

9 One other factor is cardiovascular risk  
10 which is not being considered, but again, there is  
11 emerging data. Another British Medical Journal study  
12 is indicating that the cardiovascular mortality risk  
13 from low level ionizing radiation may be on the same  
14 order of magnitude as the cancer mortality risk.

15 So there are several factors that aren't  
16 being accounted for. And given what's already been  
17 pointed out, the safety margin, you don't know what  
18 the safety margin is -- if you don't really know or  
19 quantify the uncertainties, these safety margins are  
20 meaningless unless you have better uncertainty  
21 quantification, also taking into account these other  
22 emerging factors.

23 Thank you, those are my comments.

24 CHAIR DIMITRIJEVIC: Thank you. Victoria?

25 MS. ANDERSON: Yes, Victoria Anderson, for

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 the Nuclear Energy Institute. I wanted to reflect  
2 some of the feedback we'd gotten from our members in  
3 the nuclear industry. One thing that we notice is  
4 that a lot of the insights from this project were  
5 achieved without exercising the Level 3 portion of the  
6 study. So in other words, they were produced during  
7 the Level 1 and Level 2 PRA portions of the work.

8 This really illustrates to us that there  
9 may not be any insight to be gained from devoting  
10 resources to doing a Level 3 PRA for an operating  
11 reactor at this time.

12 We also noted that the insights from the  
13 study can necessarily be applied on a generic basis,  
14 particularly the FLEX insights. And I appreciate that  
15 the committee picked up on that. But I think it is  
16 extremely important that, as they say, this is just  
17 one plant, one study. And we can't necessarily draw  
18 wide conclusions on it.

19 CHAIR DIMITRIJEVIC: Thank you. Thank you  
20 very much. Any more comments from the members?

21 Okay. Well, actually this was all of the  
22 technical part. Alan, you still have a slide on our  
23 future interactions, right, if I'm right.

24 MR. KURITZKY: Yes. Yes, we do.

25 CHAIR DIMITRIJEVIC: Yes, let's --

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MR. KURITZKY: So I guess first off,  
2 there's a number of meetings that we, both  
3 subcommittee and full committee meetings that we  
4 discussed previously about adding, with the whole  
5 project being now condensed into essentially one more  
6 year.

7 So it's going to get tough to do all these  
8 meetings. So we may have to do some further co-  
9 actions. You know, we don't have to come up with a  
10 decision now, but it might be that we want to take  
11 Volumes 5 -- just like they were going to do with the  
12 full committee, combine Volumes 5, 6, and 7 all  
13 together and then have Volume 8 and 1 together, just  
14 to reduce the number of meetings. But that we can  
15 interact and discuss later, though I'm open to any  
16 comments you have.

17 But the one thing I do want to get out  
18 before we run out of time is for next week, or not  
19 next week, but our November 1st full committee  
20 meeting. You know, I think it's going to go for two  
21 hours which is not that much different than this  
22 meeting. Well, it's definitely shorter than this.

23 So did you want -- what would you be  
24 looking for for that meeting? Do you want a  
25 presentation similar to the one that I had for this

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 meeting? Are there things that we should leave out of  
2 that meeting? I know you wanted --

3 CHAIR DIMITRIJEVIC: Yes.

4 MR. KURITZKY: -- a board discussion.

5 CHAIR DIMITRIJEVIC: I would sort of  
6 concentrate on the, I mean, obviously some of the  
7 summary slides, you know, the sky level summary  
8 slides. But I would like more to concentrate on how  
9 you're planning to satisfy your Goal Number 2, what is  
10 the important insights from those.

11 Okay. So one of things is uncertainty  
12 analysis which was one of our first comments which we  
13 didn't touch in this in this meeting.

14 Another thing is the important insights  
15 and maybe important sensitivity studies, more  
16 concentrating on the things which will make to your  
17 summary report from those volumes.

18 MR. KURITZKY: Okay. So we can definitely  
19 talk about some of that. Much of that information we  
20 will not have yet. Much of that information is not  
21 going to be generated until we start doing the summary  
22 of --

23 CHAIR DIMITRIJEVIC: Right. But you have  
24 it through those reports. You have an important  
25 insight, you have things which have not been done, you

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 have things which require future work. I notice these  
2 things all, you know, sprinkled, as I said, through  
3 the report.

4 MR. KURITZKY: Right.

5 CHAIR DIMITRIJEVIC: So if you can sort  
6 of, like, from those sections -- I am not interested  
7 in errors made in the things like that, but some  
8 things which, in your opinion, require the future  
9 work, which are important insights, and some of the  
10 important conclusions from dose alternative around  
11 what your sensitivity runs.

12 MR. KURITZKY: Okay.

13 CHAIR DIMITRIJEVIC: And then uncertainty,  
14 you know, even in this uncertainty, so not finish in  
15 one direction and removing.

16 So, you know, the thing is maybe this will  
17 require some effort. And I'm sorry about that, but  
18 definitely will be helpful for you also when planning  
19 your summary report.

20 MR. KURITZKY: No, it definitely will.

21 CHAIR DIMITRIJEVIC: Yes.

22 MR. KURITZKY: The timeframe --

23 CHAIR DIMITRIJEVIC: So something that  
24 would not be, you know, worked on in vain, you know,  
25 something which would be useful for you too in that.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           And also when you are writing the shutdown  
2 spent fuel pool you will see we can see what type of  
3 insights and conclusions are coming from here. And  
4 that will be, you know, maybe we can discuss that next  
5 week also. And I may send some email to --

6           MR. KURITZKY: Hossein?

7           CHAIR DIMITRIJEVIC: Hossein. So I  
8 already sent one, but it was too late for this. I  
9 only sent this after I saw the slides, because in this  
10 moment discussing that difference between, you know,  
11 base model and FLEX, you know, we saw some summary  
12 results. But now I'm more interested in how are we  
13 going to meet the Goal Number 2, you know, to expect  
14 new insights and enhance the general knowledge of a  
15 PRA. Okay.

16           MR. KURITZKY: Okay. So thank you for  
17 that. That'll help us prepare for next weeks meeting.  
18 Again, with the limited time involved, we will --

19           CHAIR DIMITRIJEVIC: Right.

20           MR. KURITZKY: -- start to dig up some  
21 that information.

22           CHAIR DIMITRIJEVIC: I'm sorry about that.  
23 And if you don't have a time to do this too much,  
24 that's all right. I mean, we will plan, you know, to  
25 write the letter saying anything further, how much you

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 can do good, so will be interesting to have a  
2 discussion about it.

3 MR. KURITZKY: Okay. Yes, we'll  
4 definitely try, we'll have that in. And as far as the  
5 existing presentation, do you want me to still include  
6 the project status information for the full committee,  
7 you know, at the beginning at the presentation?

8 CHAIR DIMITRIJEVIC: No, no, no.

9 MR. KURITZKY: Okay, don't need that.

10 CHAIR DIMITRIJEVIC: We have distributed  
11 it.

12 MR. KURITZKY: Okay. And then for the  
13 other stuff just kind of, just cut it down to just  
14 have the high level insights, right, that was -- for  
15 all the --

16 CHAIR DIMITRIJEVIC: Yes, high level  
17 insights, yes.

18 MR. KURITZKY: Okay. And that's all I  
19 had. If there's anything else that the subcommittee  
20 wants to mention --

21 MEMBER REMPE: Vesna, just to make it  
22 clear, since we are writing the letter on Volumes 3  
23 and 4, he should include these higher level -- I  
24 support what you're saying big time about the higher  
25 level insights, but he should think about that for

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 Volume 3 and 4, right?

2 CHAIR DIMITRIJEVIC: Well, I just connect  
3 it to this work which is the, you know, Level 1, Level  
4 2 for internal events and hazards.

5 MEMBER REMPE: Yes.

6 CHAIR DIMITRIJEVIC: Just for the Level 3  
7 and Level 4, I mean the Volume 3 and Volume 4.

8 MR. KURITZKY: Yes. So, Dr. Rempe, yes,  
9 the answer is yes to that question, yes.

10 MEMBER REMPE: That's what I heard Vesna  
11 say, but I just wanted to make sure we're all on the  
12 same page. Thank you, Alan.

13 CHAIR DIMITRIJEVIC: I just thought that  
14 would also help thinking for the next volumes. You  
15 know, when you think of documentation and organization  
16 you will see how easy it will be to extract this now  
17 for this one. And you say all right, maybe we can do  
18 the better job in Volume 5.

19 All right. Well, thank you so much. For  
20 me that was very enjoyable. And I really appreciate  
21 your incredible work in this presentation. So thank  
22 you very much.

23 MR. KURITZKY: Our pleasure, and thank you  
24 very much. Thanks to the subcommittee for all your  
25 feedback.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 CHAIR DIMITRIJEVIC: Okay. All right,  
2 guys. So enjoy your afternoon, all right.

3 MR. KURITZKY: Take care.

4 MEMBER REMPE: So members, could I ask you  
5 to stay on the line for just a minute for a discussion  
6 about this afternoon. But I'll be careful to make  
7 sure that someone else is listening that we don't say  
8 anything we shouldn't. But it shouldn't take more  
9 than a couple minutes. I just want to make sure we're  
10 all on the same page of what we're going to do this  
11 afternoon, okay.

12 CHAIR DIMITRIJEVIC: All right.

13 MEMBER REMPE: So as you probably know, we  
14 have two retreat items we're going to be discussing.  
15 And I don't want to say what they are. But there's  
16 one that Alicia sent out that started actually at  
17 noon.

18 And I guess I'd like to make sure members  
19 are okay. Do you want to take a break for an hour and  
20 come back at 1:00 and we'll start with the new member,  
21 the solicitation discussion? Or do you want to --

22 MR. MOORE: Joy, can I interject for a  
23 second, please?

24 MEMBER REMPE: Yes.

25 MR. MOORE: There are people online that

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 are not members, or NRC, or ACRS employees. So if  
2 you're still online, please log off.

3 MEMBER REMPE: And the court reporter, of  
4 course, we're done for the day for you.

5 MR. MOORE: Thank you, court reporter.

6 CHAIR DIMITRIJEVIC: Thank you.

7 (Whereupon, the above-entitled matter went  
8 off the record at 12:05 p.m.)

# **Level 3 PRA Project Overview for Internal Fires, Seismic Events, and High Winds**

Advisory Committee on Reactor Safeguards  
Reliability and PRA Subcommittee

October 19, 2023

Alan Kuritzky

Division of Risk Analysis

Office of Nuclear Regulatory Research

(301-415-1552, [Alan.Kuritzky@nrc.gov](mailto:Alan.Kuritzky@nrc.gov))

# Outline

- Level 3 PRA project (L3PRA project) status
- L3PRA project public reports
- L3PRA project overview report for reactor, at-power, internal fires, seismic events, and high winds
- Future interactions

# Acknowledgements

- NSIR, NRR, NMSS, Regions, TTC
- National Laboratories (INL, SNL, PNNL, BNL)
- Commercial Contractors (ERI, ARA, IESS)
- PWR Owners Group
- Westinghouse
- EPRI
- ACRS

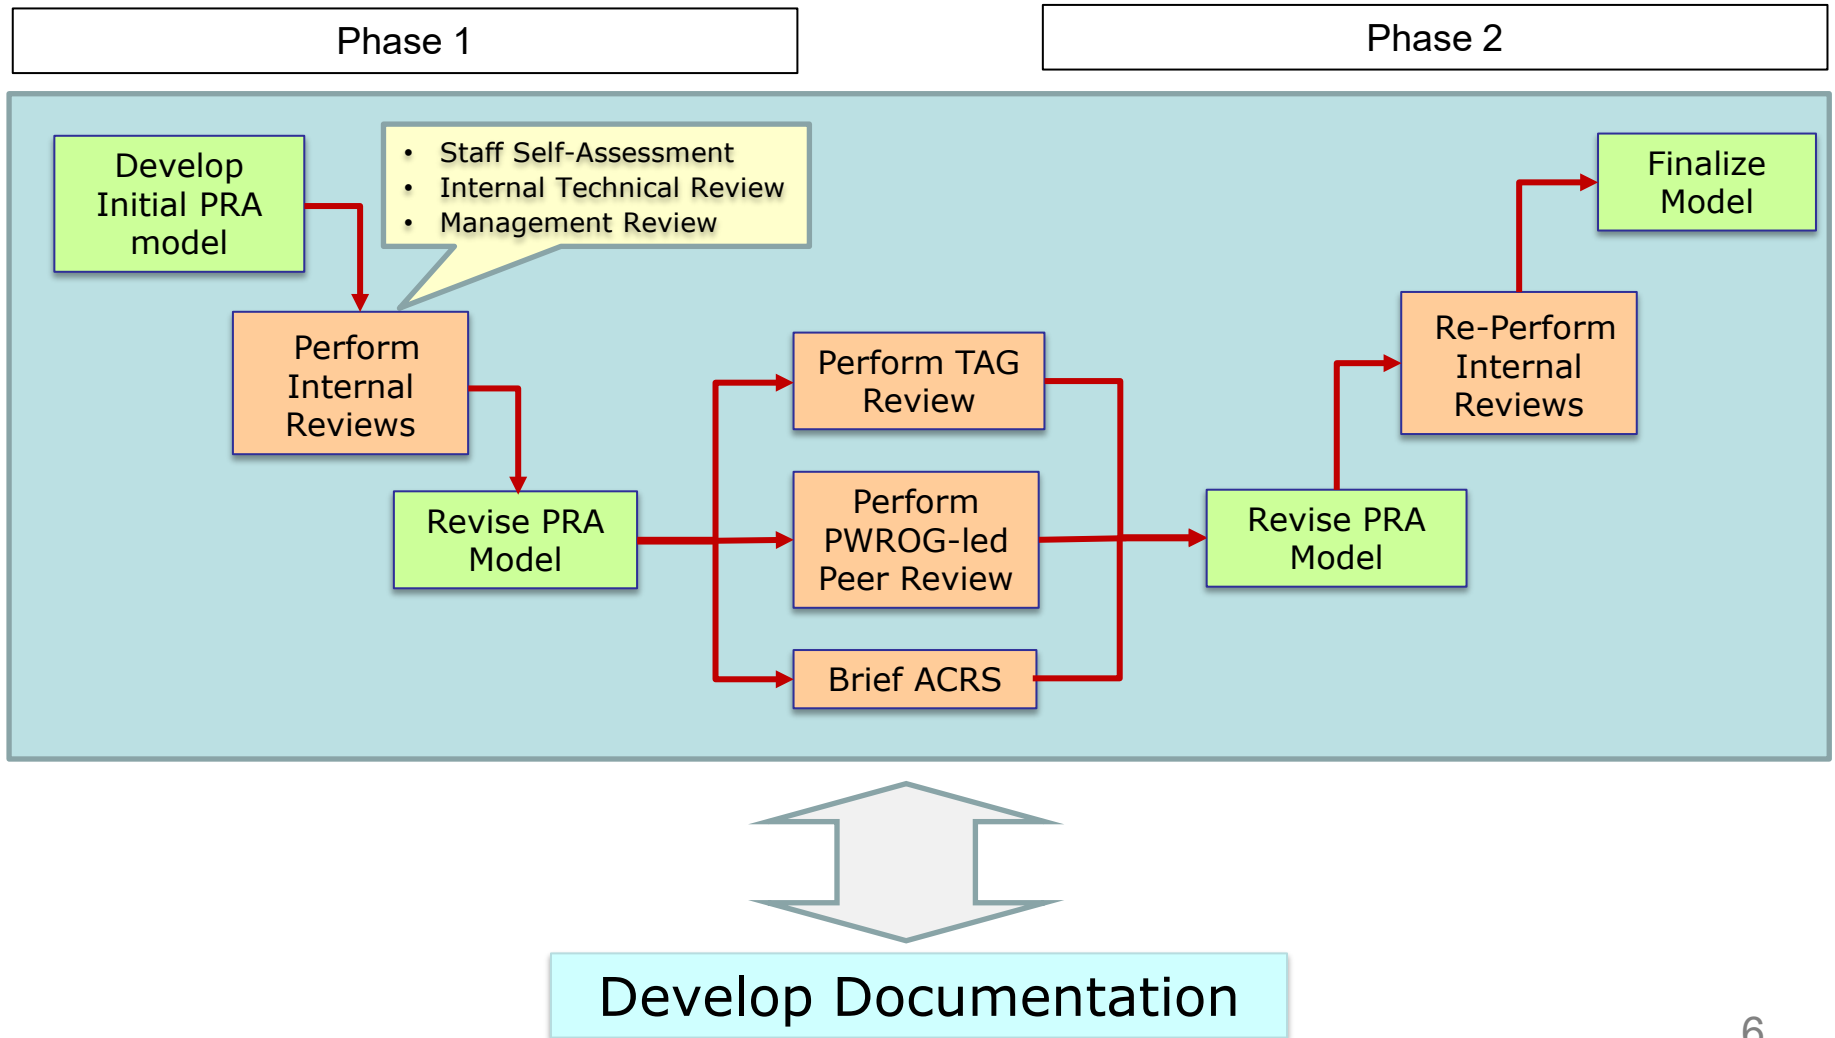

# Caveat

- The L3PRA project adheres to the state-of-practice for most technical aspects; however, due to limitations in time, resources, or plant information, some aspects of the study were subjected to simplifications or were not fully addressed.
- As such, inclusion of approaches in the L3PRA project documentation does not necessarily imply endorsement of these approaches for regulatory purposes.

# **Project Status Overview**

# Generic Process for PRA Model Development

# Preliminary Schedule for Releasing Draft L3PRA Reports for Public Comment

- Reactor, at-power, internal events and internal floods (**Vol. 2 and Vols. 3x, 3a-3d**) (4/22/2022) – **comments resolved and currently with ADM for final publication**
- Reactor, at-power, internal fires, seismic events, and high winds (**Vols. 4x, 4a-4e**) (8/18/2023)
- Reactor, low-power and shutdown, internal events (**Vols. 5x, 5a-5c**) (Q2-2024)
- Spent fuel pool, all hazards (**Vols. 6x, 6a-b**) (Q3-2024)
- Dry cask storage, all hazards (**Vol. 7**) (Q1-2024)
- Integrated site risk (**Vol. 8**) (Q4-2024)
- Summary report (**Vol. 1**) (Q4-2024)

# **Overview of Reactor, At-Power PRA Results for Internal Fires, Seismic Events, and High Winds**

# 2020-FLEX Case

- Base case model (Circa-2012 case) reflects plant as designed and operated in 2012
- 2020-FLEX case includes:
  - New RCP seals (shutdown seals)
  - FLEX strategies and equipment for responding to an extended loss of AC power (ELAP)
  - Credit for continued turbine-driven auxiliary feedwater (TDAFW) pump operation given a complete loss of all installed AC and DC power

# FLEX Strategies

- FLEX strategies for coping with the plant conditions that result from an ELAP event involve a three-phase approach:
  - Phase 1 - Initially cope by relying on installed plant equipment and on-site resources
  - Phase 2 - Transition from installed plant equipment to on-site FLEX equipment
  - Phase 3 - Obtain additional capability and redundancy from off-site equipment and resources until power, water, and coolant injection systems are restored or commissioned
- 2020-FLEX case only considers Phases 1 and 2

# 2020-FLEX Case Results

## Level 1 PRA (1 of 4)

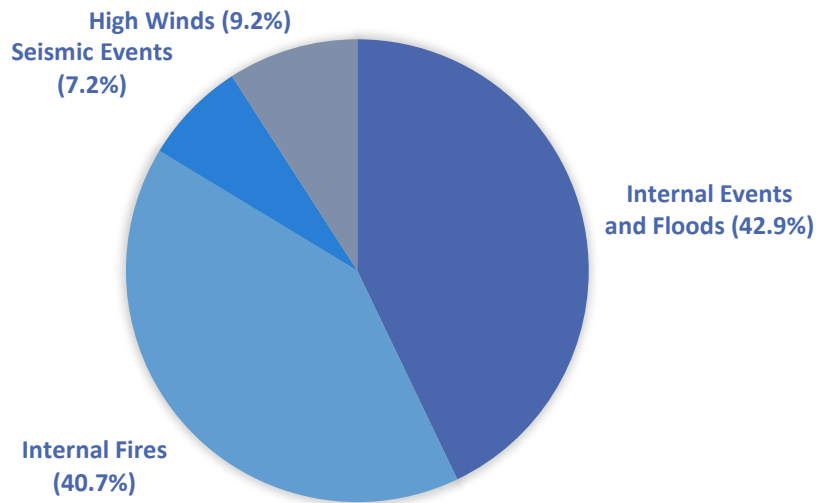

### CDF by Hazard Category

Hazard Category	Circa-2012 CDF (/rcy)	2020-FLEX CDF (/rcy)	CDF Reduction
Internal events and floods	6.47E-05	2.67E-05	59%
Internal fires	6.14E-05	5.34E-05	13%
Seismic events	1.08E-05	8.49E-06	21%

Level 2 PRA Surrogate Risk Metric	Time at which airborne radiological releases are terminated		
	7 days after event initiation	SAMG entry + 60 hours	SAMG entry + 36 hours
LERF	1.3E-06/rcy	1.3E-06/rcy	1.3E-06/rcy
LRF	<b>6.7E-05/rcy</b>	<b>2.6E-05/rcy</b>	2.6E-05/rcy
CCFP	0.764	0.679	<b>0.309</b>

# Level 3 PRA Results (1 of 3)

Individual Early Fatality Risk  
(0-1.8 miles)

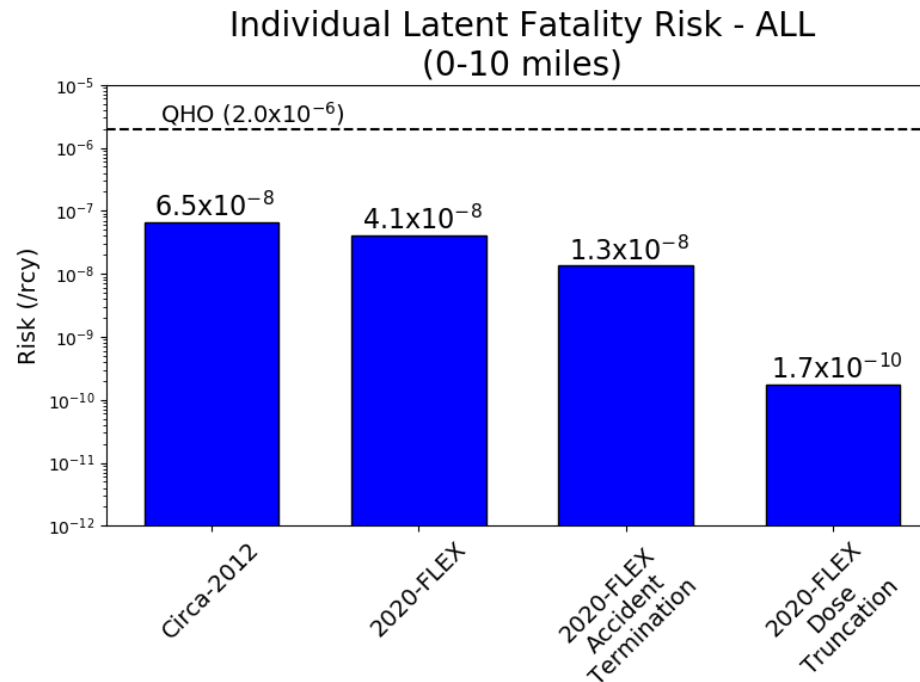

# Level 3 PRA Results (2 of 3)

Individual Latent Fatality Risk  
(0-10 miles)

# Level 3 PRA Results (3 of 3)

- Accident truncation – airborne radiological release termination time reduced from 7 days after accident initiation to 36 hours after SAMG entry
- Dose truncation – changed from linear no-threshold (LNT) to model based on Health Physics Society position paper, “Radiation Risk in Perspective: Position Statement of the Health Physics Society” (PS010-2), 2010

# Summary of Results (All Hazards Combined)

Risk Metric (per reactor-year)	QHO or Subsidiary Risk Metric	Circa-2012 Case	2020-FLEX Case	Risk Metric Reduction
Core damage frequency	1E-04	1.5E-04	9.3E-05	38%
Large early release frequency	1E-05	1.9E-06	1.3E-06	29%
Large release frequency	N/A	1.1E-04	6.7E-05	38%
Individual early fatality risk	5E-7	7.5E-13	6.6E-13	12%
Individual latent cancer fatality risk	2E-6	6.5E-08	4.0E-08	37%

Overall, the results show that the combination of this plant design and site location has **substantial margin to the QHOs associated with the NRC's safety goal policy (51 FR 28044)**, when considering all hazards combined, though the **margins are noticeably less for the surrogate risk metrics of CDF and LERF** that were endorsed by the Commission when it approved the issuance of Regulatory Guide 1.174 ([SRM-SECY-98-015](#)).

# Future Interactions

# Future Interactions

- Subcommittee meetings
  - Reactor, LPSD, internal events (**Vol 5**) – **TBD**
  - Spent fuel pool (**Vol. 6**) and dry cask storage (**Vol. 7**) – **TBD**
  - Integrated site risk (**Vol. 8**) and summary report (**Vol. 1**) – **TBD**
- Full Committee meetings
  - Reactor, at-power, all hazards (**Vols. 3 and 4**)  
– **Nov. 1, 2023**
  - Reactor, LPSD, internal events (**Vol. 5**), spent fuel pool (**Vol. 6**), and dry cask storage (**Vol. 7**) – **TBD**
  - Integrated site risk (**Vol. 8**) and summary report (**Vol. 1**) – **TBD**

# Acronyms and Definitions (1 of 2)

AC	alternating current
ACRS	Advisory Committee on Reactor Safeguards
ARA	Applied Research Associates
BNL	Brookhaven National Laboratory
CCFP	conditional containment failure probability
CDF	core damage frequency
DC	direct current
ELAP	extended loss of AC power
EPRI	Electric Power Research Institute
ERI	Energy Research, Inc.
IESS	Innovative Engineering & Safety Solutions, LLC
INL	Idaho National Laboratory
L3PRA	Level 3 PRA (project)
LERF	large early release frequency
LNT	linear no-threshold
LPSD	low power and shutdown
LRF	large release frequency
PNNL	Pacific Northwest National Laboratories
PRA	probabilistic risk assessment

# Acronyms and Definitions (2 of 2)

PWR	pressurized-water reactor
PWROG	PWR Owners Group
QHO	quantitative health objective
RCP	reactor coolant pump
RCY	reactor-critical-year
SAMG	severe accident management guideline
SNL	Sandia National Laboratories
TAG	Technical Advisory Group
TDAFW	turbine-driven auxiliary feedwater
