#### **DRAFT DISCLAIMER**

This contractor document was prepared for the U.S. Department of Energy (DOE), but has not undergone programmatic, policy, or publication review, and is provided for information only. The document provides preliminary information that may change based on new information or analysis, and is not intended for publication or wide distribution; it is a lower level contractor document that may or may not directly contribute to a published DOE report. Although this document has undergone technical reviews at the contractor organization, it has not undergone a DOE policy review. Therefore, the views and opinions of authors expressed do not necessarily state or reflect those of the DOE. However, in the interest of the rapid transfer of information, we are providing this document for your information, per your request.

| Manager       Deals W. Gwyl       Wild W. W. W.       973/49         12. Remarks:       This analysis contains To Be Verified (TBV) design input as follows: TBV-460.         The Document Identifier for this document previously was BCA000000-01717-0200-00038 REV 00.         This analysis bases the classification of Monitored Geologic Repository structures, systems and components on the criteria of proposed rule 10 CFR 63 (64 FR 8640). A review has determined that the changes made to proposed rule 10 CFR 63 by Interim Guidance Pending Issuance of New U. S. Nuclear Regulatory Commission (NRC) Regulations for Yucca Mountain, Nevada (Dyer 1999) do not impact the classifications made in this analysis.         FOR INFORMATION FORMATION (NRC) Regulations for Yucca Mountain, Nevada (Dyer 1999) do not impact the classifications made in this analysis. |   |  |             |  |  |  |  |

| 1. Waste Emplacement System QA Classification |  |
|---|--|
|---|--|

#### 1. PURPOSE

The purpose of this analysis is to document the Quality Assurance (QA) classification of the Monitored Geologic Repository (MGR) waste emplacement system structures, systems and components (SSCs) performed by the MGR Safety Assurance Department. This analysis also provides the basis for revision of YMP/90-55Q, *Q-List* (YMP 1998). The Q-List identifies those MGR SSCs subject to the requirements of DOE/RW-0333P, *Quality Assurance Requirements and Description* (QARD) (DOE 1998).

This QA classification incorporates the current MGR design, as modified through the application of an MGR preclosure safety strategy, and the results of the *Preliminary Preclosure Design Basis Event Calculations for the Monitored Geologic Repository* (CRWMS M&O 1998a).

#### 2. QUALITY ASSURANCE

This analysis is subject to the requirements of the QARD (DOE 1998) as determined by procedures QAP-2-0, Conduct of Activities, and NLP-3-18, Documentation of QA Controls on Drawings, Specifications, Design Analyses, and Technical Documents. Design Basis Event Definition & Analysis/QA Classification Analysis (1.2.1.11) Activity Evaluation (CRWMS M&O 1999a) presents the QAP-2-0 activity evaluation addressing the QA classification of MGR SSCs. This analysis is performed in accordance with procedures QAP-2-3, Classification of Permanent Items, and AP-3.10Q, Analyses and Models, and provides input to the design of SSCs included on the Q-List (YMP 1998). Unverified design inputs are identified and tracked in accordance with NLP-3-15, To Be Verified (TBV) and To Be Determined (TBD) Monitoring System.

## 3. COMPUTER SOFTWARE AND MODEL USAGE

This analysis uses no software which is required to be controlled in accordance with procedure AP-SI.1Q, *Software Management*.

#### 4. INPUTS

#### 4.1 PARAMETERS

The offsite radiological consequences of MGR Category 1 and 2 design basis events (DBEs), as calculated in *Preliminary Preclosure Design Basis Event Calculations for the Monitored Geologic Repository* (CRWMS M&O 1998a), are utilized in the QA classification of MGR SSCs. These results represent a conservative evaluation of MGR DBEs and the best information available. As discussed in Section 6.1 of this analysis, NUREG-1318, *Technical Position on Items and Activities in the High-Level Waste Geologic Repository Program Subject to Quality Assurance Requirements* (NRC 1998, Section 4.2(a)) allows the use of engineering judgement and conservative bounding assumptions in the QA classification of facility SSCs when data sources are limited. Also, procedure YAP-2.7Q, *Item Classification and Maintenance of the Q-List* (Attachment 3, Section a), directs the use of the highest level of detail available to support the conclusion of the QA classification analysis.

#### 4.2 CRITERIA

The criteria used in the QA classification of MGR SSCs are provided in procedure QAP-2-3 as discussed in Section 6.1. These criteria satisfy the requirement of Section 2.2.2, *Classifying Items*, of DOE/RW-0333P (DOE 1998).

# 4.3 CODES, STANDARDS, AND REGULATIONS

10 CFR 20. Energy: Standards for Protection Against Radiation. January 1, 1999.

64 FR 8640. Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada. Proposed rule 10 CFR 63. February 22, 1999.

#### 5. ASSUMPTIONS

The following assumptions were made in the performance of this analysis.

- 5.1 This analysis assumes that system design and SSC functions are established by the text and description of the system in the *Waste Emplacement System Description Document* (CRWMS M&O 1998c). This assumption is based on the fact that this type of information is found in this System Description Document (SDD). This analysis also assumes that the MGR architecture is established by *Monitored Geologic Repository Architecture* (CRWMS M&O 1999b) and that MGR operations are described by *Monitored Geologic Repository Concept of Operations* (CRWMS M&O 1998b). This assumption is utilized in Section 6.2 to define the system design configuration and system functions.
- 5.2 This analysis assumes modification of the MGR design configuration by the "Strategy to Mitigate Preclosure Offsite Exposure" (Hastings 1998, Attachment 2 [all]), hereafter referred to as the "safety strategy." The safety strategy proposes general design guidance focused on reducing the risks associated with the handling of spent nuclear fuel, high-level waste and the associated casks, canisters, and containers. This analysis assumes that the MGR design is changed to implement the safety strategy. In the case of the waste emplacement system, the safety strategy assumes that the system design prevents impacts which exceed the waste package design basis. As a result, the waste package maintains primary confinement of radioactive material. (TBV-460)

### 6. ANALYSIS

#### 6.1 METHOD

The basic process for classifying MGR permanent SSCs is provided by procedure QAP-2-3. Guidance provided by procedure YAP-2.7Q is also used in this analysis. The process consists of establishing the configuration and function of MGR SSCs and the effect of the SSC on MGR radiological safety. This information is then evaluated against criteria provided in QAP-2-3 to determine the QA classification of the particular item. The classification criteria are provided in the form of checklists in procedure QAP-2-3. A copy of these criteria checklists is provided in Attachment II. The following classification categories are specified by QAP-2-3 to meet the requirements of Section 2 of the QARD (DOE 1998).

<u>Quality Level 1 (QL-1)</u> Those SSCs whose failure could *directly* result in a condition adversely affecting public safety. These items have a high safety or waste isolation significance.

<u>Quality Level 2 (QL-2)</u> Those SSCs whose failure or malfunction could *indirectly* result in a condition adversely affecting public safety, or whose *direct* failure would result in consequences in excess of normal operational limits. These items have a low safety or waste isolation significance.

<u>Quality Level 3 (QL-3)</u> Those SSCs whose failure or malfunction would not significantly impact public or worker safety, including those defense-in-depth design features intended to keep doses ALARA (As Low As Reasonably Achievable). These items have a minor impact on public and worker safety and waste isolation.

<u>Conventional Quality (CQ)</u> Those SSCs not meeting any of the criteria for Quality Levels 1, 2, or 3. Conventional quality items are not subject to the requirements of the QARD.

This analysis method is based on an iterative design-classification process where each analysis iteration is considered a final product for that phase of design. In this case, the system design and the DBE analysis are evaluated to determine which of the system's SSCs require design control under the QA program. The analysis presented in this document, therefore, will be reevaluated as necessary using a methodology appropriate to the level of DBE analysis and system design detail. This approach is consistent with NUREG-1318, *Technical Position on Items and Activities in the High-Level Waste Geologic Repository Program Subject to Quality Assurance Requirements* (NRC 1998, Section 4.2(a)), which allows engineering judgement and conservative bounding assumptions to be used in cases where data are limited.

# 6.2 MGR DESIGN CONFIGURATION AND ARCHITECTURE

Prior to the QA classification of MGR SSCs, the system design configuration as well as the function of the system's SSCs are established. This classification analysis is based upon the system design

and functions as established by the *Waste Emplacement System Description Document* (SDD) (CRWMS M&O 1998c) and the *Monitored Geologic Repository Concept of Operations* (CRWMS M&O 1998b). In the process of QA classification, if two or more subsystems perform similar functions or are similarly classified, these subsystems are classified as a group under the higher level system and not listed individually.

## 6.3 MGR SAFETY STRATEGY

The MGR safety strategy is a proposed approach for developing an MGR design that limits or reduces the risks associated with the receipt, handling, packaging and emplacing of spent nuclear fuel and other high level wastes in the planned repository. The strategy is described in "Strategy to Mitigate Preclosure Offsite Exposure" (Hastings 1998 [all]) which suggests a combination of containment and event prevention concepts for the following functional areas of the MGR: (1) receipt of waste, (2) transfer of waste to the waste package (WP), (3) packaging/sealing waste in WP, (4) transfer of the WP to the emplacement drift, and (5) emplacement of the WP.

The safety strategy is utilized as guidance to modify the MGR design (TBV-460). The facility design as modified by the safety strategy is then evaluated in Section 6.5 to determine the SSC QA classifications. If the proposed safety strategy is not or cannot be implemented, the QA classification of the affected SSCs will be reviewed and the SSCs reclassified appropriately.

The waste emplacement system functions to transport WPs from the waste handling building (WHB) to subsurface emplacement drifts and place the WP on pedestals within the emplacement drift. The preclosure safety strategy (Hastings 1998) assumes that WP breach as a result of transporter accidents in the north emplacement ramp area is prevented through transporter and/or locomotive design. Specific methods for preventing the breach may include one or a combination of the following:

- Design the transporter to withstand the worst case impact without breaching the WP.
- Design the locomotive/transporter with redundant and diverse braking systems to prevent the runaway at a frequency of <1E-06/yr.

It is expected that some portion of the locomotive/transporter combination will be Important to Safety. The preclosure safety strategy also assumes that during the emplacement of the WP in the drift, lifts or transports above the design basis drop height for a WP will not be performed. As a result of the above assumptions, the WP is assumed to maintain containment of radioactive material.

### 6.4 DESIGN BASIS EVENT ANALYSIS

A preliminary analysis of MGR DBEs (CRWMS M&O 1998a) has been performed to determine the effects of internal and external events on facility radiological safety and is utilized by this analysis in the classification of MGR SSCs. The DBE analysis addresses both the DBE frequencies and dose

consequences at the site boundary. This analysis utilizes the results of the DBE analysis to evaluate MGR SSCs against the classification criteria of procedure QAP-2-3.

### 6.5 QUALITY ASSURANCE CLASSIFICATION OF MGR SSCs

The MGR SSCs are evaluated against the criteria of QAP-2-3 to determine the item QA classification level. The results of the MGR preliminary DBE calculations (CRWMS M&O 1998a) are utilized in this evaluation.

#### 7. CONCLUSIONS

#### 7.1 MGR QA CLASSIFICATION

The results of this QA classification analysis are provided in Table 1. This analysis is based on current MGR system design and the preliminary DBE analysis (CRWMS M&O 1998a). As the design of the MGR proceeds and further analyses of MGR hazards are performed, this classification analysis will be reviewed for impact and revised as necessary. The MGR classification checklists included in procedure QAP-2-3 are reproduced in Attachment II. The basis for the classification evaluation is provided in Attachment III. The impact of important assumptions made in this analysis and the associated TBVs are discussed in the following section.

### Table 1. Waste Emplacement System QA Classification

| Waste Emplacement System (WES) | Emplacement System (WES) QL-1 |   |  |   | TBV |
|--------------------------------|-------------------------------|---|--|---|-----|
| Emplacement Gantry             |                               | X |  |   | 460 |
| Gantry Carrier                 |                               |   |  | x | 460 |
| Locomotives                    | X                             |   |  |   | 460 |
| Rail Car                       |                               |   |  | X | 460 |
| Waste Package Transporter      | X                             |   |  |   | 460 |

#### 7.2 IMPACT OF UNVERIFIED DATA

#### 7.2.1 TBV-460

This analysis assumes that the design guidance provided by the "Strategy to Mitigate Preclosure Offsite Exposure" (Hastings 1998 [all]) is incorporated into the subsurface emplacement transfer, waste emplacement and ex-container systems. The following paragraphs discuss the impacts of not implementing the strategy. It should be noted that these impacts are based upon the preliminary DBE analysis of CRWMS M&O 1998a and are dependent on the design approach taken to prevent or mitigate the effects of an associated DBE. Further DBE analysis will have an effect on the impacts as discussed. The preclosure safety strategy is described in Sections 5.2 and 6.3.

The preclosure safety strategy makes the following assumptions concerning MGR waste emplacement transportation and waste emplacement systems (Hastings 1998, Attachment 3):

Title: Classification of the MGR Waste Emplacement System Document Identifier: ANL-WES-SE-000001 REV 00

- WP breach as a result of transporter accident in the north emplacement ramp area or main drifts is prevented through transporter and/or locomotive design.
- Lifts or transports above the design basis drop height for a WP will not be performed during the emplacement of the WP in the drift.

The impact of not achieving the strategy objective may include requiring a seismically qualified transporter and rail system and emplacement gantry. The emplacement gantry may be reclassified from QL-2 to QL-1 and the waste emplacement system rail car from CQ to QL-1.
