

NUCLEAR ENERGY INSTITUTE

Douglas J. Walters SR. PROJECT MANAGER, LICENSING NUCLEAR GENERATION

May 1, 2000

Mr. Christopher I. Grimes Chief, License Renewal and Standardization Branch Division of Regulatory Improvement Programs Office of Nuclear Reactor Regulation U.S. Nuclear Regulatory Commission Washington, DC 20555-0001

SUBJECT: Generic Aging Lessons Learned Report Comments

PROJECT NUMBER: 690

Dear Mr. Grimes:

Enclosed are comments on section IIA1 of the Generic Aging Lessons Learned (GALL) Report. The enclosure includes three documents. One document is a mark-up of the existing GALL pages to reflect our comments. Each comment is identified by number. The second document is a table containing our comments, numbered consistent with the marked-up pages. The third document is a clean copy of the GALL pages to reflect how GALL reads with our comments incorporated.

Please note that in previous comments we suggested creating a new Chapter XI in GALL as a repository for the program evaluations. Having such a chapter allows the various GALL sections to merely reference the new chapter when a program is credited. In the enclosed comments we have followed this recommendation. Also in our previous comments we recommended removing Time Limited Aging Analyses (TLAA) from GALL and moving them to the License Renewal Standard Review Plan. As a minimum, we recommend the creation of a new chapter in GALL as a repository for TLAAs. The TLAAs in section IIA1 are identified but have not moved to a new chapter pending a decision by the NRC staff relative to our recommendation.

We look forward to discussing the enclosed comments with the NRC staff. Please contact me to establish a meeting date.

Sincerely,

har [. Walters

Douglas J. Walters

A1. Concrete Containments (Reinforced and Prestressed)

- A1.1 Concrete Elements
- A1.2 Steel Elements
- A1.3 Prestressing System

A1. Concrete Containments (Reinforced and Prestressed)

Systems, Structures, and Components

Review Table II A addresses the elements of PWR containment structures. Reinforced and prestressed concrete containments, steel containments, and common components are discussed separately under subheadings A1, A2, and A3, respectively. This format follows the presentation format in Section 3.3 of the draft Standard Review Plan for License Renewal (SRP-LR). Concrete containments in Review Table II A1 are divided into three elements: concrete, steel, and prestressing system.

System Interfaces

Functional interfaces include the primary containment HVAC system(VII.I), containment isolation system(V.A), containment spray system(V.B), and containment heat removal system(V.C). Physical interfaces exist with any structure, system, or component which either penetrates the containment wall, such as the main steam system(VIII.A) and feedwater systems(VIII.F,VIII.G), or is supported by the containment structure, such as the polar crane(VII.K.7). The containment structure basemat typically provides support to the NSSS components and containment internal structures.

Containment HVAC (VII.F3) Containment Isolation System (V.C) Containment Spray (ViA) Containment Heat Removal Main Steam System (VIII. BI) Feedwater System (VIII.DI) POLAr (rane (VII. B2)

	(Reinforced and Prestressed)	INKE CHAPTER Y.I.	
Existing Aging Management Program		Further	
	Evaluation and Technical Basis • inverted U) for each inspection period. The required minimum number of each tendon type selected for inspection varies from 2 to 4 percent. Regarding the extent, all concrete surfaces receive a visual VT-3C examination. Selected areas, such as those that indicate suspect conditions and areas surrounding tendon anchorages receive a more rigorous VT-1 or VT-1C examination. (5) Monitoring and Trending: With the exception of inaccessible areas, all concrete surfaces are monitored by virtue of the examination requirements on a regular basis as described above. Trending of prestressing force in tendons is required for prestressed containments. In addition to the random sampling used for tendon examination, one tendon of each type is selected from the first year inspection sample and designated as a common tendon. Each common tendon is then examined during each inspection. This provides monitoring and trending information over the life of the plant. 10 CFR 50.55a and IWL also require that prestressing forces in all inspection sample tendons be measured by lift-off tests and compared to acceptance standards based on the predicted force for that type of tendon over its life. (6) Acceptance Criteria: IWL-3000 provides acceptance criteria for concrete containments. For concrete surfaces, the acceptance criteria rely on the determination of the Responsible Engineer whether there is any evidence of damage or degradation sufficient to warrant further evaluation or repair. Although the acceptance criteria are qualitative, guidance is provided in IWL-2510, which references ACI 201. IR-96 for identification of concrete degradation. In addition, IWL- 2320 requires the Responsible Engineer to be a registered professional engineer experienced in evaluating the inservice condition of structural concrete and knowledgeable of the design and construction codes and other criteria used in design and construction codes and other criteria used in design and constructi	Evaluation (92) Cmt 20

MAKE CHANGE 4 MOVE TO DTER CONTAINMENT STRUCTURES TT. **PWR Containments** Α. Concrete Containments (Reinforced and Prestressed) A1. Further Existing Aging Management Program Evaluation **Evaluation and Technical Basis** (AMP) (8) Confirmation Process: When areas of degradation are identified, an evaluation is performed to determine if repair or replacement is necessary. As part of this evaluation, IWL-3300 requires the Engineering Evaluation Report include the extent, nature, and frequency of additional examinations (When significant repairs on modifications are made, additional confirmation is achieved through proceure tests required by IWL and 10 CFR 50, Appendix J. (9) Administrative Controls: An approved site QA Program would be applicable to IWL. IWA-1400 provides requirements for Owner's Responsibility. This includes responsibility for preparation of plans, schedules, and inservice inspection summary reports, and submittal of these plans and reports to the enforcement and regulatory authorities having jurisdiction at the plant site. Owner is also responsible for the preparation of written examination instructions and procedures, verification of qualification level of personnel who perform the examinations, and documentation of a Quality Assurance Program. IWA-6000 specifically covers the requirements for the preparation, submittal, and retention of records and reports. (10) Operating Experience: ASME Section XI, Subsection IWL was specifically developed to identify aging degradation of containment concrete components. Since ASME Section XI, Subsection IWL was only Insert & noted recently adopted by 10CFR50.55a, long term experience in commont# 32 in managing aging of containment concrete components needs to be established. The license renewal applicant should provide plant-specific operating experience related to inservice inspection of containment and occurrences of degradation. (4) Detection of Aging Effects: Examination quirements specified in 10 CFR 50.55e and IWE ensure that aging effects would be detected before they would compromise the design basis requirements because of the frequency and extent of exemination Under IWE, inservice examinations and pressure tests must be performed in accordance with one of two Inspection Programs A or B on a specified schedule. Under Inspection Program A there are four inspection intervals (at 3, 10, 27; and 40 years) for which a 100% of the required examinations must be completed. Within each interval there are various inspection periods for Comment which a certain percentage of the examinations must be performed to reach 100% at the end of that interval. In #65 addition, a general visual examination is performed once each inpection period. After 40 years of operation, any OMMEN future examinations must be performed in accordance 12 with the Inspection Program B. Under Inspection. # 66 Program B there is an initial interval of 10 years and successive intervals of 10 years each, during which 100% of the required examinations must be completed. Regarding the extent of examination, all accessible surfaces receive a visual examination. Selected areas, such as containment surfaces requiring augmented examination (E-C) require volumetric examination. All-6 ressure retaining components (E-P) require system leakage test in accordance with 10 CFR 50, Appendix J. (5) Monitoring and Trending: With the exception of inaccessible areas, all surfaces are monitored by virtue of the examination requirements on a scheduled basis as described above, When component examination results require evaluation of flaws, areas of degradation, er repairs and the component is found to be acceptable GB for continued service, the areas containing such flaws, degradation, or repairs shall be reexamined during the next inspection period, in accordance with Examination

MAKE CHANKES & MOVE TO CHAPTER رم **II. CONTAINMENT STRUCTURES** Α. **PWR Containments** Concrete Containments (Reinforced and Prestressed) **A1** Existing Aging Management Program Further (AMP) Evaluation and Technical Basis Evaluation Category E-C (containment surfaces requiring augmented examination). When these reexaminations reveal that the flaws, areas of degradation, or repairs remain essentially unchanged for three consecutive inspection periods, these areas no longer require augmented examination in accordance with Examination Category E-C. IWE requires that examinations performed during any one inspection that 68 reveal flaws or areas of degradation exceeding the acceptance standards shall be extended to include an Insert two additional number of examinations within the same category approximately equal to the initial number of sontones from examinations. When additional flaws or areas of Commont# 69 degradation that exceed the acceptance standards are revealed, all of the remaining examinations within the same category must be performed for the inspection interval of Acceptance Criteria WB 3000 provide corptance criteria for metal containments and liners of concrete containments, Table IWE-3410-1 presents criteria to evaluate the acceptability of the containment components for service following the preservice examination and each inservice examination. This table specifies the acceptance standard for each Examination visual examinations) Category (E-A, E-B, E-C, etc.). Most of the acceptance standards rely upon an engineering evaluation or require correction by repair or replacement. For some examinations such as Augmented Examinations, numerical values are specified for the acceptance corrective standards. For the containment steel shell or line reduction of up to 10% of the wall thick action acceptable per IWE 3512.5. M Corrective Actions: IWE states that components whose examination results indicate flaws or areas of degradation that do not meet the acceptance standards listed in Table-3410-1 can be considered acceptable if an engineering evaluation indicates that the flaw or area of degradation is Delete and nonstructural in nature or has no effect on the Insert wording in structural integrity of the containment. Components that do not meet the acceptance standards are required to satisfy additional examination requirements and the Comment#70 flaw or area of degradation must be removed by mechanical methods or the component repaired. For repair of components within the scope of IWE, IWE-4000 and IWE-3124 state that repairs and reexaminations shall comply with the requirements of IWA-4000. IWA-4000 provides rules and requirements for the repair of pressure retaining components including metal containments and metallic liners of concrete containments. (8) Confirmation Process: When areas of degradation are identified, an evaluation is required to determine if repair or replacement is necessary. If the evaluation determines that repair or replacement is necessary, IWE requires confirmation to ensure that appropriate corrective actions have been completed and are effective. IWE states that repairs and reexaminations shall comply with the requirements of IWA-4000. Reexaminations are required to be conducted in accordance with the requirements of IWA-2000 and the recorded results must demonstrate that the repair meets the acceptance standards set forth in Table IWE-3410-1.

prog com inclu leak stru itsel agin the of k the of k the com eart pro- lice mon dep Opt intr cass bass bass bass bass bass bass bass	Evaluation and Technical Basis Detection of Aging Difects: A containment LFT ram is effective in detecting degradation which promises the containment pressure boundary, uding seals and gaskets. While the calculation of age rates demonstrates the leak-tightness and cetural integrity of the containment, it does not by if provide information which would indicate that ag' degradation has initiated or that the capacity of containment may have been reduced for other types additional implementation of an acceptable tainment inservice inspection program as described tier. (5) Monitoring and Trending: Since the LRT gram must be repeated throughout the operating nise period, the entire pressure boundary is being nitored over time. The frequency of these tests sends on which option (A or B) is selected. With tion A, testing is performed on a regular fixed time erval as defined in 10 CFR 50, Appendix J. In the te of Option B, the period for testing may be extended sed on acceptable performance of meeting leakage its on prior tests. Additional details for implementing tion B are provided in NRCR.G. 1.163 and NEI 94-, Rev.0. (6) Acceptance Criteria: Acceptance criteria leakage rates are defined in the plant technical ecifications. Acceptance priteria are acceptable if they we the requirements in AO CFR 50, Appendix J and to in accordance with A/SI/ANS-56.8-1994. (77) orrective Actions: When leakage rates do not meet the ceptance criteria, corrective actions are taken in cordance with 10 CFR 50, Appendix J and NEI 94-01.	Evaluation
CommEALT tt	<b>Exercises of Aging Diffects:</b> A containment in 1 ram is effective in detecting degradation which promises the containment pressure boundary, using seals and gaskets. While the calculation of age rates demonstrates the leak-tightness and ectural integrity of the containment, it does not by if provide information which would indicate that ge degradation has initiated or that the capacity of containment may have been reduced for other types bads such as seismic. This would be achieved with additional implementation of an acceptable tainment inservice inspection program as described lier. (5) Monitoring and Trending: Since the LRT gram must be repeated throughout the operating nise period, the entire pressure boundary is being nitored over time. The frequency of these tests ends on which option (A or B) is selected. With tion A, testing is performed on a regular fixed time erval as defined in 10 CFR 50, Appendix J. In the e of Option B, the period for desting may be extended ied on acceptable performance of meeting leakage its on prior tests. Additional details for implementing tion B are provided in NRC/R.G. 1.163 and NEI 94-, Rev.0. (6) Acceptance Criteria: Acceptance criteria leakage rates are defined in the plant technical ecifications. Acceptance criteria are acceptable if they tet the requirements in AO CFR 50, Appendix J and e in accordance with A/ISI/ANS-56.8-1994. (7) prective Actions: When leakage rates do not meet the ceptance criteria, corrective actions are taken in ecificatione with 10 CFR 50, Appendix J and NEI 94-01.	1
CommEALT tt	ram is effective in detecting degradation which promises the containment pressure boundary, using seals and gaskets. While the calculation of age rates demonstrates the leak-tightness and octural integrity of the containment, it does not by if provide information which would indicate that og degradation has initiated or that the capacity of containment may have been reduced for other types bads such as seismic. This would be achieved with additional implementation of an acceptable tainment inservice inspection program as described dier. (5) Monitoring and Trending: Since the LRT gram must be repeated throughout the operating nitored over time. The frequency of these tests ends on which option (A or E) is selected. With tion A, testing is performed on a regular fixed time erval as defined in 10 CFR 50, Appendix J. In the e of Option B, the period for details for implementing tions B are provided in NRC R.G. 1.163 and NEI 94-, Rev.0. (6) Acceptance Criteria: Acceptance criteria leakage rates are defined in the plant technical ecifications. Acceptance criteria are acceptable if they we the requirements in AO CFR 50, Appendix J and e in accordance with A/SI/ANS-56.8-1994. (7) prective Actions: When leakage rates do not meet the ceptance criteria, corrective actions are taken in cordance with 10 CFR 50, Appendix J and NEI 94-01.

.

The Chapter XI As Chapter XI Evoluation of ASME Sis CONTAINMENT STRUCTURES Π. **PWR** Containments Concrete Containments (Reinforced and Prestressed) **A1** Existing Aging Management Program Evaluation Evaluation and Technical Basis (AMP) of 10 CFR 50.55a, IWL is augmented No, Gedes and Standards (100FRE0.55a); Derviewer Provided ASME Section XI, Subsection IWL as follows: Regulatory Guide (5) Monitoring and Trending: 10 CFR 50.55a and IWL do not provide guidance on how 1.35.1 is Note: 10CFR50.55a and IWL do not apply followed. to calculate expected tendon prestressing forces that are to bonded post-tensioning systems. needed to compare against the measured tendon lift-off Otherwise forces. This guidance is provided in NRC Regulatory plant-NUREG-161 Lidentifies both specific Guide 1.35.1. 10CFR50.55a/IWL and TLAA to manage evaluation loss of prestress -> is necessary. To ensure that the structural and functional adequacy of Ves. Tendon Surveillance Program requires the containment are maintained a TLAA for the tendon TLAA Methodoprestressing forces is needed for the extended period of Tendon loss of frestress logy for operation _A TLAA for the containment prestressing TLAA must system which meets 100FR54.21(o)(1)(ii) should have IS A TLAA the following basic attributes: be evaluated. 1. Calculation of the minimum required prestressing force value (MRV) for each tendon group. 2. Calculated predicted lower limit (PLL) prestressing force for each group of tendons (See NRC R.G. 1.35.1). During each inspection, the measured prestressing forces in the sampled tendons are compared against the PLL As discussed in IN 99-10y the trend lines shall be new paragraph developed using a regression analysis considering individual tendon lift-off forces rather than the average lift-off forces for each group of tendons. 3. The PLL developed for the 40 year period of operation appropriate shall be extended to 60 years. The applicant has to demonstrate that the trend of the measured prestressing forces during the extended period remain above the PLLA for each tendon group. If this can not be achieved, then a systematic plan of retensioning selected tendons should be developed which would result in the trend lines remaining above the PLL or a reanalysis of the containment demonstrating design adequacy is needed. If the approach described above is not feasible due to the lack of available tendon lift-off force data needed to develop trend lines, then a TLAA for containment prestressing forces performed in accordance with 10 CFR 54.21(c)(1)(iii) is acceptable. In this case, the TLAA must satisfy the ten (10) criteria for an acceptable aging management program and must specifically include the following: (3)Parameters Monitored: The parameters to be monitored are the prestressing forces in accordance with requirements specified in Subsection IWL of Section XI of the ASME Code as incorporated by reference in 10 CFR 50.55a. (5) Monitoring and Trending: The prestressing forces shall be plotted against time and trending lines developed for the period of extended operation. (6) Acceptance Criteria: The prestressing force mend lines must be shown to be above the cribed lower limit (PLL) lines. -pree MOVE ALL TO NEW TLAA CHAPTER

,

II A1-31

Comment Number	GALL	ITEM NO.	Dama	COMMENT
number	Section		Page	COMINIENT
1	IIA1	IIA1	I1A1-3	The references to interfaces should be revised as noted to match the GALL
	····			Table of Contents
8	IIA1	A1.1	IIA1-4	The environment should only include "Outside Containment" for freeze-thaw. BASIS: Freeze-thaw is only applicable for those components exposed to the external environment.
9	IIA1	A1.1	IIA1-4	Aging Effects should be loss of material and cracking
10	IIA1	A1.1	IIA1-4	In the Reference column delete the reference to Draft Reg. Guide DG-1076. BASIS: Draft Reg Guide DG-1076 is not directly applicable for concrete freeze-thaw considerations
12	IIA1	A1.1	IIA1-4	Delete ACI 349.3 in the References column. BASIS: ACI 349.3 has not been credited with managing aging of concrete and may be more restrictive than IWL requirements. It is not necessary for it to be included in the references since it is discussed under element #6.
13	IIA1	A1.1	IIA1-4	In addition to ASME XI, IWL, licensees should be able to credit the Maintenance Rule 10CFR50.65, Regulatory Guide 1.160 Rev.2., and NUMARC 93-01. BASIS: These programs are particularly effective for structures and supports, which are not currently under the scope of ASME XI-IWL. The structural monitoring programs developed under MR have been mandated since 1996 and therefore provide operating experience and effectiveness demonstration. NEI submitted a paper regarding structural monitoring programs to NRC, with a request to declare the structural monitoring program an effective aging management program for structures on a generic basis. The effectiveness criteria review is part of the NEI submittal to NRC
14	IIA1	A1.1	IIA1-5	Revise sentence to allow credit for later editions of the code. BASIS: Latest Rule now allows use of IWL 1995 Edition with 1996 Addenda. Additionally, several utilities have submitted and received Relief Requests for use of the 1998 Edition with 1998 Addenda.
15	IIA1	A1.1	IIA1-5	Existing Aging Management Program column, the second paragraph should say "NUREG-1611 identifies Subsection IWL Examination Category L-A" Also, this should be moved to the Evaluation and Technical Basis column. BASIS: Provides clarification
16	IIA1	A1.1	IIA1-5	Include reference to structural monitoring program under the maintenance rule. BASIS: The structural monitoring program under the maintenance rule is an aging management program for concrete containments
17	IIA1	A1.1	IIA1-5	Add sentence: Visual examination would identify loss of material and cracking of concrete components BASIS: Parameters monitored or inspected should be directly linked to the aging effect such as loss of material and cracking.
18	IIA1	A1.1	IIA1-5	Add the following sentence: The frequency of inspection is specified in IWL-2400.

Comment	GALL			
Number	Section	ITEM NO.	Page	COMMENT
19	GENERIC			Concrete inspections are performed in accordance with Examination Category L-A, Concrete. BASIS: Ties directly to code. Move discussions and evaluations of the Aging Management Programs to New Gall Chapter XI.
20	IIA1	A1.1	IIA1-5	Editorial. For consistency "attributes" should be used when discussing elements of an aging management program.
22	IIA1	A1.1	IIA1-5	Editorial change – add the word "edition"
23	IIA1	A1.1	IIA1-5	Editorial change – reference should be 50.55a(b)(2)(viii).
24	IIA1	A1.1	IIA1-5	Delete the sentence: "Examination requirements for containment supports are not within the scope of IWL."
25	IIA1	A1.1	ПА1-5	Delete sentence referencing draft Regulatory Guide DG-1076 BASIS: Draft Regulatory Guide DG-1076 (Service Level I, II and III Protective Coatings, proposed revision 1 to R.G 1.54) is not applicable to US power plants and not within the CLB of any plant. Some plants may have implemented portions of R.G. 1.54, however, this applies only to the containment interior, while the evaluated mechanism of freeze/thaw only acts on the exterior. Criteria 2 of the effectiveness evaluation refers to DG-1076 as an effective aging management program for coating maintenance, though no experience or demonstration exists to support this (especially on the exterior containment surfaces subjected to freeze/thaw).
29	IIA1	A1.1	IIA1-7	Recommend changing the ACI reference to ACI 201.1R-92 which is more readily available. BASIS: IWL-2310 (b) does not mandate the use of ACI 201.1R-68, rather suggests its use. The later code is more comprehensive
32	IIA1	A1.1	IIA1-8	Delete the wording in the "environment" column and replace with "Concrete below grade." BASIS: Only concrete exterior surfaces exposed to flowing groundwater are subject to leaching of calcium hydroxide and subsequent attack by aggressive groundwater
33	IIA1	A1.1	IIA1-9	Incorporate the following paragraph: The IWL inspections are comparable to the concrete inspections performed in accordance with 10 CFR 50 Appendix J. NUREG-1540 states that inspections mandated by Appendix J to 10 CFR Part 50, though basically visual, have been reasonably effective in identifying containment problems to date. Therefore, previous Appendix J inspections provide additional verification that a visual inspection of containment concrete is effective. BASIS: The comparable visual examination provides operating experience that can be used for IWL
34	IIA1	A1.1	IIA1-9	Delete the last sentence that deals with Appendix J.

Comment	GALL		n	
Number	Section	ITEM NO.	Page	COMMENT
				BASIS: The Appendix J test is not needed to confirm the adequacy of the concrete
35	IIA1	A1.1	IIA1-9	Only program titles need to be identified in the Existing Aging Management Program
				(AMP) column. Move the detailed information to the Evaluation and Technical Basis
26	TT A 1			column
36	IIA1	A1.1	IIA1-9	Include ASME Section XI, Subsection IWL in the Existing Aging Management Program column
37	IIA1	A1.1	IIA1-5	The "Aging Management Program," "Evaluation," and "Further Evaluation" columns
5,			IIA1-9	imply that there are additional requirements for inservice inspection of inaccessible
				areas when there are no indications of degradation for (adjacent, nearby) accessible
				areas. These implications should be removed.
				BASIS: Implying such requirements is tantamount to additional rulemaking over and
				above 10 CFR 50.55a without adhering to the rulemaking process This same comment applies to other portions of the report related to inservice
				inspection of inaccessible areas.
38	IIA1	A1.1	IIA1-10	Add a reference to EPRI TR-103842.
				BASIS: EPRI TR-103842 emphasizes that oxygen and on-going exposure to an
				aggressive environment are required for corrosion. It states that corrosion is
				potentially significant for intake structures at ocean sites, due to constant exposure to
				seawater. For other structures, it points to the zone of fluctuating groundwater level as the only susceptible region for corrosion. Below this zone, there is insufficient
				oxygen. Above this zone, there is insufficient water.
39	IIA1	A1.1	IIA1-11	Only program titles need to be identified in the Existing Aging Management Program
				(AMP) column. Move the detailed information to the Evaluation and Technical Basis
40	TT 4 1		TT 4 1 1 1	column.
40	IIA1	A1.1	IIA1-11	Include ASME Section XI, Subsection IWL in the Evaluation and Technical Basis column. Add paragraph from III A1-8 on reaction with aggregates.
				BASIS: Provides more complete information.
41	IIA1	A1.1	IIA1-11	Only program titles need to be identified in the Existing Aging Management Program
				(AMP) column. Move the detailed information to the Evaluation and Technical Basis
				column
42	IIA1	A1.1	IIA1-11	Include ASME Section XI, Subsection IWL in the Existing Aging Management
				Program column. BASIS: To be consistent with other sections
43	IIA1	A1.1	IIA1-12	Change the Region of Interest to Dome, Wall, and Basemat.
	*** **			BASIS: To be consistent with other sections
44	IIA1	A1.1	IIA1-13	IWL should be identified as the Existing Aging Management Program.
				BASIS: IWL is implemented to address cracking. Cracking is the effect of settlement.
	TT A 1			Therefore, IWL would address cracking due to settlement.
46	IIA1	A1.1	IIA1-13	Evaluation and Technical Basis: ASME Section XI, Subsection IWL would manage
			· · · · · · · · · ·	cracking, which is the applicable aging effect of settlement on concrete structures. In

Comment Number	GALL Section	ITEM NO,	Page	COMMENT
				addition, for plants with concrete containment structures/basemats founded on soft soil or piles, any plant settlement monitoring program that is an element of the existing licensing basis for the plant should be continued through the license renewal term. ACI 349.3R-96 provides guidance for addressing settlement. Therefore, the Evaluation and Technical Basis column should reference ASME Section XI, Subsection IWL.
47	IIA1	A1.1	IIA1-13	Change further evaluation to NO. BASIS: For settlement, IWL is adequate to manage cracking which is the effect of settlement on structures
48	IIA1	A1.1	ПА1-13	Incorporate the phrase "as referenced in this section" in the Evaluation and Technical Basis column. BASIS: This wording clarifies that it is only the items mentioned in the Region of Interest column that are evaluated
49	IIA1	A1.1	IIA1-14	Clarified the region of interest specific to scope of IWE
50	IIA1	A1.1	IIA1-14	Delete reference to IN 97-10. BASIS: See Comment # 53 below
51	IIA1	A1.1	IIA1-14	See Comment # 10 above
52	IIA1	A1.1	IIA1-15	Move information on NUREG-1611 to the Evaluation and Technical Basis column. BASIS: This column should only identify the program name.
53	IIA1	A1.1	IIA1-15	Delete IN 97-10. BASIS: GALL report states that IN 97-10 identifies specific locations where concrete containments are susceptible to liner plate corrosion. These are areas identified in IWE, Section 1241, as suspect areas requiring augmented examination and are inspected under IWE inspection program, hence no additional inspection required for these areas. In addition IN 97-10 states that concrete containment liner plate inspection in accordance with the 10 CFR 50.55a requirements involves consideration of the potential corrosion areas
54	IIA1	A1.1	IIA1-15	For attribute (3) Parameters Monitored or Inspected, there should be a tie directly to the aging effect (loss of material). The area is to be inspected for evidence of corrosion as specified in IWE-3510. Add the following text to intro: "Table IWE-2500-1 specifies six categories for examination. Table 2500-1 references the applicable section in 3500 which identifies the aging effects which are evaluated."
56	IIA1	A1.1	IIA1-15	Evaluation and Technical Basis column, second paragraph. Delete the information on relief requests. BASIS: Evaluation of relief requests are not required per the rule
57	IIA1	A1.1	IIA1-15	50.55a is the incorrect reference for inaccessible areas. BASIS: Additional requirements for inaccessible areas are identified in 50.55a(b)(2)(ix).

Comment	GALL			
Number	Section	ITEM NO.	Page	COMMENT
58	IIA1	A1.1	IIA1-15	For attribute (1) Scope, delete the last sentence that states that containment supports are not in the scope of IWE. BASIS: Containment supports are not within the list of components identified at the beginning of the section
59	IIA1	A1.1	IIA1-15	Delete the information in attribute (2) Preventive Action that deals with the protective coatings. BASIS: IWE is an acceptable aging management program for loss of material due to corrosion without the coatings program
60	IIA1	A1.1	IIA1-15	Under attribute (3) Parameters Monitored or Inspected, the parts examined for Category E-A should be changed to : E-A Containment surface
61	IIA1	A1.1	IIA1-15	In the Further Evaluation column, delete the information on relief requests. Basis: Evaluation of relief requests are not required per the rule.
62	IIA1	A1.1	IIA1-17	Under attribute (3) Parameters Monitored or Inspected, the parts examined for Category E-B should be changed to E-B Pressure Retaining Welds
63	IIA1	A1.1	IIA1-17	Under attribute (4) Detection of Aging Effects, change the lead in sentence to the following, "The frequency and the scope of examination are sufficient to ensure that aging effects would be detected before they would compromise the design basis requirements." BASIS: Matches lead in for IWL on page II A1-5.
64	IIA1	A1.1	IIA1-17	The reference to $50.55a$ in attribute (3) Parameters Monitored and Inspected, should be changed to $50.55a(b)(2)(ix)(C)$ .
65	IIA1	A1.1	IIA1-17	The four inspection intervals listed in attribute (4) Detection of Aging, should be changed to (at 3, 10, 23, and 40 years) BASIS: Code
66	IIA1	A1.1	IIA1-17	The evaluation and technical basis (Detection of Aging Effects) notes the first inservice inspection interval under Program B to be 10 years for IWE. The industry has taken the position that the first interval is 12 years long for IWE. BASIS: This came about due to the extended first period of five years. The first interval would be divided as follows. First period - five years, second period - 4 years, and third period - 3 years. The last two periods of the interval resume the normal Code duration. The NRC by rulemaking extended the first period of the first interval to five years vice the normal three. Subsequent intervals revert back to ten years. It should be also noted that the Code interval and interval dates for IWE are different than the IWB, IWC, and IWD interval and interval dates for most plants, if not all. The requirement to perform IWE inspections did not exist until September 9, 1996. This was the start of the first IWE period
67	IIA1	A1.1	IIA1-17	Attribute (4) Detection of Aging Effects, delete the information on pressure tests. If left, then need to provide reference to 10 CFR Appendix J for the frequency of the pressure tests. Most licensees are not performing pressure tests to the frequency stated

			Ç	
				in IWE.
				BASIS: Discussing IWE not 10 CFR Appendix J.
68	IIA1	A1.1	IIA1-17	Attribute (5) Monitoring and Trending, delete the last sentence.
				BASIS: There is no requirement in the code to do what the sentence states.
69	IIA1	A1.1	IIA1-19	Under attribute (5) Monitoring and Trending insert the following sentences: Except as permitted by 10 CFR 50.55a(b)(2)(ix)(D), IWE requires that examinations performed during any one inspection that reveal flaws or areas of degradation exceeding the acceptance standards shall be extended to include an additional number of examinations within the same category approximately equal to the initial number of examinations. Also, except as permitted by 10 CFR 50.55a(b)(2)(ix)(D), when additional flaws or areas of degradation that exceed the acceptance standards are revealed, all of the remaining examinations within the same category must be performed for the inspection interval.
				BASIS: Wording reflects the exception permitted by 50.55a(b)(2)(ix)(D).
70	IIA1	A1.1	IIA1-19	Revise wording under attribute (6) to state: For containment steel shell or liner, material loss exceeding 10% of the nominal containment wall thickness, or material loss that is projected to exceed 10% of the nominal containment wall thickness prior to the next examination, shall be documented. Such areas shall be accepted by engineering evaluation or corrected by repair or replacement in accordance with IWE- 3122. BASIS: IWE 3512.3 states: "Containment vessel examinations that reveal material loss exceeding 10% of the nominal containment wall thickness, or material loss that is projected to exceed 10% of the nominal containment wall thickness prior to the next examination, shall be documented. Such areas shall be accepted by engineering evaluation or corrected by repair or replacement in accordance with IWE- 3122.
71	IIA1	A1.1	IIA1 <b>-</b> 19	See Comment # 69
72	IIA1	A1.1	IIA1-19	Attribute (6) Acceptance criteria, delete the first sentence. Start the sentence at "Table IWE-3410-1 presents" BASIS: The existing sentence does not identify everything covered by IWE
73	IIA1	A1.1	IIA1-19	Attribute (6) acceptance Criteria, revise the fourth sentence as follows: "Most of the acceptance standards rely upon visual examinations, an engineering evaluation or require corrective action." BASIS: Most of the acceptance standards rely on visual examinations
74	IIA1	A1.1	IIA1-21	Incorporate the following paragraph: Examinations performed in accordance with Appendix J to 10 CFR Part 50 (which is similar to the visual inspections of IWE) have provided operating experience which supports the reasonableness and effectiveness of IWE. BASIS: Comparable visual program provides operating experience.
75	IIA1	A1.1	IIA1-21	The discussion of Appendix J and Coatings Programs should be deleted.

# GALL REPORT-CIVIL/STRUCTURAL COMMENTS Section IIA1

Comment	GALL			
Number	Section	ITEM NO.	Page	COMMENT
				BASIS: IWE is acceptable as a stand-alone program.
77	IIA1	A1.1	IIA1-24	The references to DG-1076, GL98-04 and ASTM D5163-96 should be deleted, as well as the discussion of the aging management program for protective coatings. The pertinent functions have been adequately addressed by ASME XI-IWE and the Structures Monitoring Program. The referenced program would be a new design basis requirement.
78	IIA1	A1.1	IIA1-25	Delete the information on the coatings program. BASIS: IWE is an acceptable aging management program for containment steel components
80	IIA1	A1.3	IIA1-26	NUREG-1522 is not a mandated program and should be deleted from the Reference column
81	IIA1	A1.2	IIA1-27	Reference only the program. Move the information regarding NUREG-1611 to the Evaluation and Technical Basis column. Delete reference to A1.2 and add "No Program is Required." Also, add "No Program is Required" to the Evaluation and Technical Basis column.
82	IIA1	A1.3	IIA1-27	Reference only the program. Move the information regarding NUREG-1611, NUREG 1522 and IN 99-10 to the Evaluation and Technical Basis column
83	IIA1	A1.3	IIA1-27	Delete the discussion in the Evaluation and Technical Basis column regarding the tendon gallery. BASIS: The environment of the tendon gallery is similar to the external dome environment. Both environments subject the tendon anchorage to moisture, humidity, etc. Therefore, the tendon gallery environment is not unique and should not be singled out. In addition, the tendon anchorage are protected from the moist, humid environment by the tendon caps and grease which is within the cap. The tendon anchorage are evaluated by IWE regardless of where they are located. Tendon anchorage within the tendon gallery would be evaluated by IWE.
84	IIA1	A1.3	IIA1-28	Delete the reference to IN 99-10. Basis: See Comment # 88
85	IIA1	A1.3	IIA1-28	The TLAA evaluation in the Evaluation and Technical Basis column is very prescriptive. Other methods such as ACI-318-95, may be more accurate, appropriate or current.
86	IIA1	A1.3	IIA1-29	Editorial change to reflect that Loss of Prestress is a TLAA.
87	IIA1	A1.3	IIA1-29	Insert the following paragraph: The guidance in reg. Guide 1.35 represents an acceptable method for demonstrating that the loss of prestress in tendons is adequately managed. There are other equivalent methods (such as ACI 318-95) which are acceptale. The guidance in Reg. Guide 1.35 has the following attributes which satisfy the TLAA requirements of 10 CFR 54.21©(1)(ii). The basic attributes are:
88	IIA1	A1.3	IIA1-29	In the discussion for attribute (5) Monitoring and Trending, delete the IN 99-10 information in item 2.

# GALL REPORT-CIVIL/STRUCTURAL COMMENTS Section IIA1

Comment Number	GALL Section	ITEM NO.	Page	COMMENT
				BASIS: Information notices are not requirements. The discussion in item 2 has the tone of the IN being a requirement. Note the word "shall" in the sentence
89	IIA1	A1.3	ША1-29	Item (3) in the evaluation column discusses demonstrating that the trend (regression analysis) of measured prestressing forces remain above the PLL for the extended period, otherwise develop a retensioning plan. The discussion should recognize the alternative of demonstrating that the trend of measured prestressing forces remain above the minimum required prestressing force value (MRV), since there can be a large range of acceptable force values between the PLL and the MRV. For example, consider the realistic case where at year 60, PUL=625k, PLL=575k, Trend=570k, and MRV=525k. Suggested reword: change "PLL" to "PLL or MRV as appropriate" The same comment applies to Items (6) & (7) in the same column.
90	IIA1	A1.3	IIA1-29	Editorial. Two different words have been supplied for the "P" in "PLL" – predicted and prescribed. Whichever is used it should be consistent throughout the document.
91	IIA1	A1.3	IIA1-30	Attribute (7) should be rewritten as follows: "Where tendon forces fall below the acceptance standards, corrective actions may include retensioning, replacement of selected tendons with new tendons, or reanalysis." BASIS: Reg Guide 1.35 and IWL allow the prestressing force of a selected tendon to go below the PLL. If the measured force lies between 95% and 90% of the PLL, additional testing is required.
92	IIA1	A1.3	IIA1-30	Delete reference to IN 99-10 BASIS: Information Notices are not requirements

ŝ

# CHAPTER II A

# PRESSURIZED WATER REACTOR (PWR) CONTAINMENTS

Draft December 6, 1999

#### **Major PWR Containments**

- A1. Concrete Containments (Reinforced and Prestressed)
- A2. Steel Containments
- A3. Common Components

A1.

## Concrete Containments (Reinforced and Prestressed)

- A1.1 Concrete Elements
- A1.2 Steel Elements
- A1.3 Prestressing System

, (

. <

#### A1. Concrete Containments (Reinforced and Prestressed)

#### Systems, Structures, and Components

Review Table II A addresses the elements of PWR containment structures. Reinforced and prestressed concrete containments, steel containments, and common components are discussed separately under subheadings A1, A2, and A3, respectively. This format follows the presentation format in Section 3.3 of the draft Standard Review Plan for License Renewal (SRP-LR). Concrete containments in Review Table II A1 are divided into three elements: concrete, steel, and prestressing system.

#### System Interfaces

Functional interfaces include the primary containment HVAC system (VII.F3), containment isolation system(V.C), containment spray system(V.A), and containment heat removal system(?). Physical interfaces exist with any structure, system, or component which either penetrates the containment wall, such as the main steam system (VIII.B1) and feedwater systems(VIII.B2), or is supported by the containment structure, such as the polar crane(VII.B2). The containment structure basemat typically provides support to the NSSS components and containment internal structures.

10CFR50.55a/ASME Section XI, Subsection IWL	See Chapter XI for an evaluation of 10CFR50.55a/ASME Section XI, Subsection IWL	No
		_ f
No mandated Aging Management Program exists. NUREG-1611 identifies the need for plant-specific evaluation, if the prerequisite conditions exist.	The implementation of 10 CFR 50.55a and IWL would not be able to identify the loss of strength and modulus due to elevated temperature. Thus, for any portions of concrete containment that exceed specified temperature limits, as referenced in this section, further evaluations are warranted. NUREG-1611 specifies the temperature limits, both general ( $150 \circ F$ ) and local ( $200 \circ F$ ), above which a plant-specific evaluation is needed.	Yes. If applicable, the applicant's aging manage- ment program to address this issue must be evaluated.

Existing Aging Management Program (AMP)	Evaluation and Technical Basis	Further Evaluation
10CFR50.55a/ASME Section XI, Subsection IWL	See Chapter XI evaluation of 10CFR50.55a/ASME Section XI, Subsection IWL is augmented as follows:	No, Provided Regulatory Guide
<u>Note:</u> 10CFR50.55a and IWL do not apply to bonded post-tensioning systems. Tendon Loss Of Prestress is a TLAA.	(5) Monitoring and Trending: 10 CFR 50.55a and IWL do not provide guidance on how to calculate expected tendon prestressing forces that are needed to compare against the measured tendon lift-off forces. This guidance is provided in NRC Regulatory Guide 1.35.1.	1.35.1 is followed. Otherwise plant- specific evaluation
	NUREG-1611 identifies both 10CFR50.55a/IWL and TLAA to manage loss of prestress	is necessary.
· · · · · · · · · · · · · · · · · · ·	The guidance provided in Reg. Guide 1.35 represents an acceptable method for demonstrating that the loss of prestress in tendons is adequately managed. There are other equivalent methods (such as ACI 318-95) which are acceptable. The guidancein Reg. Guide 1.35.1 has the following attributes, which satisfy the TLAA requirements of 10CFR54.21(c)(1)(ii). The basic attributes are:	Yes. Methodo- logy for TLAA must be evaluated.
	1. Calculation of the minimum required prestressing force value (MRV) for each tendon group.	
	2. Calculated predicted lower limit (PLL) prestressing force for each group of tendons (See NRC R.G. 1.35.1). During each inspection, the measured prestressing forces in the sampled tendons are compared against the PLL.	
	3. The PLL developed for the 40 year period of operation shall be extended to 60 years. The applicant has to demonstrate that the trend of the measured prestressing forces during the extended period remain above the PLL or MRV as appropriate for each tendon group. If this can not be achieved, then a systematic plan of retensioning selected tendons should be developed which would result in the trend lines remaining above the PLL or a reanalysis of the containment demonstrating design adequacy is needed.	
	If the approach described above is not feasible due to the lack of available tendon lift-off force data needed to develop trend lines, then a TLAA for containment prestressing forces performed in accordance with 10 CFR 54.21(c)(1)(iii) is acceptable. In this case, the TLAA must satisfy the ten (10) criteria for an acceptable aging management program and must specifically include the following:	
	(3)Parameters Monitored: The parameters to be monitored are the prestressing forces in accordance with requirements specified in Subsection IWL of Section XI of the ASME Code as incorporated by reference in 10 CFR 50.55a. (5) Monitoring and Trending: The prestressing forces are monitored and plotted over time. (6) Acceptance Criteria: The prestressing force trend lines must be shown to be above the predicted lower limit (PLL) lines or MRV as appropriate.

# CHAPTER XI

# EXISTING AGING MANAGEMENT PROGRAMS (AMP) AND ACTIVITIES

Draft April 19, 2000

## **Existing Aging Management Programs (AMP) and Activities**

- A.1 Aging Management Program for Electrical Cables and Connections Exposed to an Adverse Localized Environment Caused by Heat or Radiation
- A.2 Aging Management Program for Electrical Cables Used in Instrumentation Circuits that are Sensitive to Reduction in Conductor Insulation Resistance (IR) Exposed to an Adverse Localized Environment Caused by Heat or Radiation
- A.3 Aging Management Program for Inaccessible Medium-Voltage Cables Exposed to an Adverse Localized Environment Caused by Moisture and Voltage Exposure
- A.4 Borated Water Leakage Surveillance Program for Electrical Connectors
- A.5 ASME Section XI, Subsection IWE
- A.6 ASME Section XI, Subsection IWL

# **DESCRIPTION**

10CFR50.55a imposes the examination requirements of ASME B&PV Code Section XI on reinforced and prestressed concrete containments. Examination requirements of ASME Class MC pressure retaining components, metallic shell/liners of Class CC containments, integral attachments, seals and gaskets, pressure retaining bolting, and surface areas including welds are covered in Subsection IWE. Therefore, ASME Code Section XI, Subsection IWE (1992 Edition with 1992 Addenda or later versions including authorized Relief Requests), along with additional requirements specified in 10CFR50.55a(b)(2), constitute an existing mandated program which should be referenced by the applicant's containment inservice inspection program for managing aging of steel containments and liners of concrete containments for license renewal.

# EVALUATION AND TECHNICAL BASIS

Per NUREG-1611, an application for License Renewal should reference ASME Code Section XI, Subsection IWE and associated modifications/additions specified in 10CFR50.55a for managing aging of containment steel elements.

Evaluation of 10CFR50.55a/IWE against the ten (10) attributes for an acceptable aging management program is presented below. An applicant should ensure that its implementation of 10CFR50.55a/IWE for containment steel elements is consistent with this evaluation.

(1) Scope of Program: Subsection IWE-1000 specifies the components within the scope of IWE (1992 edition with 1992 Addenda or later versions) for steel containments and liners of concrete containments. The components within the scope of IWE are Class MC pressure retaining components (steel containments) and their integral attachments; metallic shell and penetration liners of Class CC containments and their integral attachments; containment seals and gaskets; containment pressure retaining bolting; and surface areas, including welds and base metal. The concrete portions of containment are in accordance with IWL. IWE exempts from examination (1) components that are outside the boundaries of the containment as defined in the Design Specifications; (2) embedded or inaccessible portions of containment components that met the requirements of the original Construction Code; (3) components that become embedded or inaccessible as a result of vessel repair or replacement if IWE-1232 and IWE-5220 are met; and (4) piping, pumps, and valves that are part of the containment system, or which penetrate or are attached to the containment vessel (governed by IWB or IWC). (10CFR 50.55a(b)(2)ix) specifies additional requirements, one of which covers inaccessible areas. It states that the licensee shall evaluate the acceptability of inaccessible areas when conditions exist in

accessible areas that could indicate the presence of or result in degradation to such inaccessible areas.

- (2) Preventive Action: No preventive actions are specified; IWE is a monitoring program.
- (3) Parameters Monitored or Inspected: Table IWE-2500-1 specifies six categories for examination. Table 2500-1 references the applicable section in 3500, which identifies the aging effects, which are evaluated.

Category	Parts Examined	Examination Method		
E-A	Containment Surface	General Visual, Visual VT-3		
E-B *	Pressure Retaining Welds	Visual VT-1		
E-C	Containment Surfaces Requiring Augmented Examination	Visual VT-1, Volumetric		
E-D	Seals, Gaskets, and Moisture Barriers	Visual VT-3		
E-F *	Pressure Retaining Dissimilar Metal Welds	Surface		
E-G	Pressure Retaining Bolting	Visual VT-1, Bolt torque or tension test		
E-P	All Pressure Retaining Components (Pressure boundary, penetration bellows, airlocks, seals and gaskets)	10 CFR 50, Appendix J (Containment Leak Rate Testing)		

* These two categories are optional per 10 CFR 50.55a(b)(2)(ix)(C).

** The applicable examination method (where multiple methods are listed) depends on the particular subcategory within each category.

(4) Detection of Aging Effects: The frequency and scope of examinations are sufficient to ensure the aging effects are detected before they compromise the design basis requirements. Under IWE, inservice examinations and pressure tests must be performed in accordance with one of two Inspection Programs A or B on a specified schedule. Under Inspection Program A there are four inspection intervals (at 3, 10, 23, and 40 years) for which a 100% of the required examinations must be completed. Within each interval there are various inspection periods for which a certain percentage of the examinations must be performed to reach 100% at the end of that interval. In addition, a general visual examination is performed once each inspection period. After 40 years of operation, any future examinations must be performed in accordance with the

Inspection Program B. Under Inspection Program B there is an initial interval of 12 years and successive intervals of 10 years each, during which 100% of the required examinations must be completed. Regarding the extent of examination, all accessible surfaces receive a visual examination. Selected areas, such as containment surfaces requiring augmented examination (E-C) require volumetric examination.

- (5) Monitoring and Trending: With the exception of inaccessible areas, all surfaces are monitored by virtue of the examination requirements on a scheduled basis as described above. When component examination results require evaluation of flaws, areas of degradation, or repairs and the component is found to be acceptable for continued service, the areas containing such flaws, degradation or repairs shall be reexamined during the next inspection in accordance with Examination Category E-C (containment surfaces requiring augmented examination). When these reexaminations reveal that the flaws, areas of degradation, or repairs remain essentially unchanged for three consecutive inspection periods, these areas no longer require augmented examination in accordance with Examination Category E-C. Except as permitted by 10 CFR 50.55a(b)(2)(ix)(D), IWE requires that examinations performed during any one inspection that reveal flaws or areas of degradation exceeding the acceptance standards shall be extended to include an additional number of examinations within the same category approximately equal to the initial number of examinations. Also, except as permitted by 10 CFR 50.55a(b)(2)(ix)(D), when additional flaws or areas of degradation that exceed the acceptance standards are revealed, all of the remaining examinations within the same category must be performed to the extent specified in Table IWE 2500-1 for the inspection interval.
- (6) Acceptance Criteria: Table IWE-3410-1 presents criteria to evaluate the acceptability of the containment components for service following the preservice examination and each inservice examination. This table specifies the acceptance standard for each Examination Category (E-A, E-B, E-C, etc.). Most of the acceptance standards rely upon visual examinations, an engineering evaluation or require corrective action . For some examinations such as Augmented Examinations, numerical values are specified for the acceptance standards.. For containment steel shell or liner, material loss exceeding 10% of the nominal containment wall thickness prior to the next examination, shall be documented. Such areas shall be accepted by engineering evaluation or corrected by repair or replacement in accordance with IWE-3122.
- (7) Corrective Actions: IWE states that components whose examination results indicate flaws or areas of degradation that do not meet the acceptance standards listed in Table-3410-1 can be considered acceptable if an engineering evaluation indicates that the flaw or area of degradation is nonstructural in nature or has no effect on the structural integrity of the containment. Components that do not meet the acceptance standards are required to satisfy additional examination

requirements and the flaw or area of degradation must be removed by mechanical methods or the component repaired. For repair of components within the scope of IWE, IWE-4000 and IWE-3124 state that repairs and reexaminations shall comply with the requirements of IWA-4000. IWA-4000 provides rules and requirements for the repair of pressure retaining components including metal containments and metallic liners of concrete containments.

- (8) Confirmation Process: When areas of degradation are identified, an evaluation is required to determine if repair or replacement is necessary. If the evaluation determines that repair or replacement is necessary, IWE requires confirmation to ensure that appropriate corrective actions have been completed and are effective. IWE states that repairs and reexaminations shall comply with the requirements of IWA-4000. Reexaminations are required to be conducted in accordance with the requirements of IWA-2000 and the recorded results must demonstrate that the repair meets the acceptance standards set forth in Table IWE-3410-1. (Additional confirmation of leak tightness is achieved through the pressure tests required by 10 CFR 50, Appendix J.)
- (9) Administrative Controls: An approved site QA Program would be applicable to IWE. IWA-1400 provides requirements for Owner's Responsibility. This includes responsibility for preparation of plans, schedules, and inservice inspection summary reports, and submittal of these plans and reports to the enforcement and regulatory authorities having jurisdiction at the plant site. Owner is also responsible for the preparation of written examination instructions and procedures, verification of qualification level of personnel who perform the examinations, and documentation of a Quality Assurance Program. IWA-6000 specifically covers the requirements for the preparation, submittal, and retention of records and reports.
- (10) Operating Experience: ASME Section XI, Subsection IWE was specifically developed to identify aging degradation of containment steel components. Since ASME Section XI, Subsection IWE was only recently adopted by 10CFR50.55a, long term experience in managing aging of containment components needs to be established. Examinations performed in accordance with Appendix J to 10 CFR Part 50 (which is similar to the visual inspections of IWE) have provided operating experience which supports the reasonableness and effectiveness of IWE. The license renewal applicant should provide plant-specific operating experience related to inservice inspection of containment and occurrences of degradation.

XII. Existing AGING MANAGEMENT PROGRAMS AND ACTIVITIES A.6 ASME Section XI, Subsection IWL

## **DESCRIPTION**

10CFR50.55a imposes the examination requirements of ASME B&PV Code Section XI on reinforced and prestressed concrete containments. Examination requirements of ASME Class CC concrete components are covered in Subsection IWL. Therefore, ASME Code Section XI, Subsection IWL (1992 Edition with 1992 Addenda or later versions), including authorized Relief Requests along with additional requirements specified in 10CFR50.55a(b)(2), constitute an existing mandated program which should be referenced by the applicant's containment inservice inspection program for managing aging of concrete containments for license renewal.

## **EVALUATION AND TECHNICAL BASIS**

Per NUREG-1611, an application for license renewal should reference ASME Code Section XI, Subsection IWL and associated modifications/additions specified in 10CFR50.55a for managing aging of containment concrete elements and prestressing systems.

Evaluation of 10CFR50.55a/IWL against the ten (10) attributes for acceptable aging management program is presented below. An applicant should ensure that its implementation of 10CFR50.55a/IWL for containment concrete elements and prestressing systems is consistent with this evaluation.

- (1) Scope of Program: Subsection IWL-1000 specifies the components within the scope of IWL (1992 edition with 1992 Addenda or later versions]) for concrete containments. The components within the scope of IWL are reinforced concrete and unbonded post-tensioning systems of Class CC containments, as defined by CC-1000. Steel metallic liners are governed by IWE. IWL exempts from examination portions of the concrete containment that are inaccessible (e.g. concrete covered by liner, foundation material, or backfill, or are obstructed by adjacent structures or other components). 10 CFR 50.55a(b)(2)(viii) specifies additional requirements, one of which covers inaccessible areas. It states that the licensee shall evaluate the acceptability of inaccessible areas when conditions exist in accessible areas that could indicate the presence of or result in degradation to such inaccessible areas.
- (2) **Preventive Action**: No preventive actions are specified; IWL is a monitoring program.
- (3) Parameters Monitored or Inspected: Table IWL-2500-1 specifies two categories for examination of concrete surfaces. Category L-A for all concrete surfaces and Category L-B for concrete surfaces surrounding tendon anchorages. Both of these categories rely upon visual examination methods. Visual examination would identify loss of material and cracking of concrete

#### XII. Existing AGING MANAGEMENT PROGRAMS AND ACTIVITIES A.6 ASME Section XI, Subsection IWL

components. Table IWL-2500-1 specifies Category L-B for test and examination requirements for unbonded post tensioning systems.

- (4) Detection of Aging Effects: The frequency and scope of examination are sufficient to ensure that aging effects are detected before the design basis requirements would be compromised. The frequency of inspection is specified in IWL-2400. Concrete inspections are performed in accordance with Examination Category L-A. Under IWL, inservice inspections for concrete and unbonded posttensioning systems are required at 1, 3, and 5 years following the structural integrity test. Thereafter, inspections are performed at 5 year intervals. The required minimum number of each tendon type selected for inspection varies from 2 to 4 percent. Regarding the extent, all concrete surfaces receive a visual VT-3C examination. Selected areas, such as those that indicate suspect conditions and areas surrounding tendon anchorages receive a more rigorous VT-1 or VT-1C examination. In the case of tendons, only a sample of the tendons of each tendon type requires examination at each inspection. The tendons to be examined during an inspection are selected on a random basis. Table IWL-2521-1 specifies the number of tendons to be selected for each type (e.g. hoop, vertical, dome, helical, and inverted U) for each inspection period. Prestressing forces in sample tendons are measured. In addition, one sample tendon of each type is removed for examination and testing.
- (5) Monitoring and Trending: With the exception of inaccessible areas, all concrete surfaces are monitored by virtue of the examination requirements on a regular basis as described above. In addition to the random sampling used for tendon examination, one tendon of each type is selected from the first year inspection sample and designated as a common tendon. Each common tendon is then examined during each inspection. This provides monitoring and trending information over the life of the plant. 10 CFR 50.55a and IWL also require that prestressing forces in all inspection sample tendons be measured by lift-off tests and compared to acceptance standards based on the predicted force for that type of tendon over its life.
- (6) Acceptance Criteria: IWL-3000 provides acceptance criteria for concrete containments. For concrete surfaces, the acceptance criteria rely on the determination of the Responsible Engineer whether there is any evidence of damage or degradation sufficient to warrant further evaluation or repair. Although the acceptance criteria are qualitative, guidance is provided in IWL-2510, which references ACI 201.1R-92 for identification of concrete degradation. In addition, IWL-2320 requires the Responsible Engineer to be a registered professional engineer experienced in evaluating the inservice condition of structural concrete and knowledgeable of the design and construction codes and other criteria used in design and construction of concrete containments. Alternate acceptance criteria based on ACI 349.3R is also acceptable. The acceptance standards for the unbonded post-tensioning system is quantitative in nature. For the post-tensioning system, quantitative acceptance criteria are

#### XII. Existing AGING MANAGEMENT PROGRAMS AND ACTIVITIES A.6 ASME Section XI, Subsection IWL

given for tendon force, tendon wire or strand samples, and corrosion protection medium.

- (7) Corrective Actions: IWL specifies that items with examination results which do not meet the acceptance standards shall be evaluated to IWL-3300 "Evaluation." Items which do not meet the acceptance standards are to be evaluated by the Owner. The Owner is responsible for preparation of an Engineering Evaluation Report. The report should include an evaluation whether the concrete containment is acceptable without repair of the item and if repair is required, the extent, method, and completion date for the repair or replacement. Also included in the report is the cause of the condition and the extent, nature, and frequency of additional examinations. IWL also provides repair procedures to follow in Article IWL-4000. This includes requirements for the concrete repair, repair of reinforcing steel, repair of the post-tensioning system, and examination of the repaired area.
- (8) Confirmation Process: When areas of degradation are identified, an evaluation is performed to determine if repair or replacement is necessary. As part of this evaluation, IWL-3300 requires the Engineering Evaluation Report include the extent, nature, and frequency of additional examinations.
- (9) Administrative Controls: An approved site QA Program would be applicable to IWL. IWA-1400 provides requirements for Owner's Responsibility. This includes responsibility for preparation of plans, schedules, and inservice inspection summary reports, and submittal of these plans and reports to the enforcement and regulatory authorities having jurisdiction at the plant site. Owner is also responsible for the preparation of written examination instructions and procedures, verification of qualification level of personnel who perform the examinations, and documentation of a Quality Assurance Program. IWA-6000 specifically covers the requirements for the preparation, submittal, and retention of records and reports.
- (10) Operating Experience: ASME Section XI, Subsection IWL was specifically developed to manage aging degradation of containment concrete components. Since ASME Section XI, Subsection IWL was only recently adopted by 10CFR50.55a, long term experience w/IWL needs to be established. The license renewal applicant should provide plant-specific operating experience related to inservice inspection of containment and occurrences of degradation. The IWL inspections are comparable to the concrete inspections performed in accordance with 10 CFR 50 Appendix J. NUREG-1540 states that inspections mandated by Appendix J to 10 CFR Part 50, though basically visual, have been reasonably effective in identifying containment problems to date. Therefore, previous Appendix J inspections provide additional verification that a visual inspection of containment concrete is effective.
