Gentleman:

**REPORT OF IMPINGEMENT OF SHORTNOSE STURGEON
SALEM GENERATING STATION UNIT NO. 1
DOCKET NO. 50-272**

In accordance with Section 5.4.2 of Appendix B, Environmental Protection Plan, to the Operating License for the Salem Generating Station, Public Service Electric and Gas Company (PSE&G) hereby transmits notification of a nonroutine event discovery, and documents the occurrence and removal of a shortnose sturgeon from the Salem Generating Station circulating water intake structure.

Enclosed please find two (2) attachments. Attachment 1 gives a narrative description of the event, as requested by the Nuclear Regulatory Commission (NRC). Attachment 2, requested by the National Marine Fisheries Service (NMFS), provides more specific information regarding the observance and retrieval of the sturgeon.

Should you have any questions regarding this transmittal, please feel free to contact us.

Sincerely,

Gabor Salamon
Manager - Licensing

INCIDENTAL TAKE OF SHORTNOSE STURGEON

OCCURRENCE DATE: April 18, 2000

FACILITY: Salem Generating Station, Unit 1
Public Service Electric and Gas Company
Hancocks Bridge, NJ 08038

IDENTIFICATION OF OCCURRENCE:

A shortnose sturgeon (*Acipenser brevirostrum*) was removed from the Circulating Water System (CWS) Intake trash racks at the Salem Generating Station. The sturgeon was recovered on April 18, 2000. Shortnose sturgeon are federally listed as "endangered" species under the Endangered Species Act of 1973, as amended.

CONDITIONS PRIOR TO OCCURRENCE:

April 18, 2000	Unit 1	100 percent power
	Unit 2	100 percent power

DESCRIPTION OF OCCURRENCE:

DATE	TIME	STATUS	INTAKE BAY	FORK LENGTH (CM)	TOTAL LENGTH (CM)	WEIGHT (KG)
4/18/00	1030	DEAD	N/A	76.0	85.0	2.1

During routine cleaning of the trash racks, Site Services personnel recovered the sturgeon dead. Environmental Licensing personnel responded and confirmed the identification of the sturgeon.

The sturgeon was examined, measured, weighed and scanned for Passive Integrated Transponder (PIT) tags. The sturgeon had one vertical wound directly behind the right gill and two large gashes on the top and right side of the body. The wounds appear to have been inflicted prior to removal from the trash racks. The weight of the sturgeon was low compared to previous specimens of the same length. No response was obtained when the sturgeon was scanned for PIT tags. The sturgeon was frozen pending disposition of the carcass in

accordance with the terms and conditions of the current Incidental Take Statement.

The U. S. Nuclear Regulatory Commission (NRC), the National Marine Fisheries Service (NMFS) and the New Jersey Department of Environmental Protection (NJDEP) have been notified regarding this occurrence.

APPARENT CAUSE OF OCCURRENCES

Based on historical and recent records, shortnose sturgeon appear to utilize the entire Delaware estuary-river complex, from the river mouth to New Hope, Pennsylvania (0-238 river kilometer - rkm). Spawning occurs north of Trenton, 128 rkm upstream from the Salem and Hope Creek Generating Stations. It is unlikely that larval or post-larval fish would travel the distance downstream to Artificial Island. Adult shortnose sturgeon may move into the Artificial Island area during fall migration to wintering grounds. Healthy adult and juvenile shortnose sturgeon are strong enough swimmers that they should be able to escape from intake velocities typically encountered at the trash bars. Sturgeon that are in a weakened condition may be subject to impingement.

ANALYSIS OF OCCURRENCE

The CWS intake is monitored for accumulation of debris throughout the year. This accumulated debris is periodically removed. Because of the debris in the Delaware River this winter and spring, cleaning of the trash racks has been occurring typically on a daily basis. The sturgeon was recovered during this cleaning. Between 1978 and 2000, a total of fifteen (15) shortnose sturgeon have been collected at the CWS intake, two in 1978, one in 1981, three in 1991, two in 1992, two in 1994, three in 1998, one in 1999 and this occurrence in 2000.

CORRECTIVE ACTIONS

The trash racks are required to be inspected every two hours from June 1 through October 15. Observations are made specifically for sea turtles and sturgeon during this time. During the remaining months the trash racks are inspected daily for debris load and cleaned as necessary. As the shortnose sturgeon was recovered dead with injuries that appear to have been previously inflicted, it is felt that the measures in place are sufficient and no other actions are warranted at this time.

ATTACHMENT 2

REPORTING REQUIREMENTS
Appendix II to Section 7 Consultation

Photographs should be taken and the information requested below should be collected in association with all protected species (sea turtles and shortnose sturgeon) impingements. This documentation should be sent to the:

National Marine Fisheries Service
Habitat Conservation Branch
One Blackburn Drive
Gloucester, MA 01930-2298

Protected Species Impingements
Salem and Hope Creek Generating Stations

Observers full name: Edward Huesser – PSE&G Site Services

Reporters full name: David Hurka – PSE&G Environmental Licensing

Species identification: Shortnose Sturgeon (*Acipenser brevirostrum*)

Site of impingement: Salem Generating Station – CWS Trash Racks

Date and time impingement was observed: 04/18/00 1030 hrs

Date and time of animal was collected: 04/18/00 1030 hrs

Tidal stage at time of collection: Flood Tide

Date and time of last observation of screen: 04/18/00 1030 hrs

Water temperature at site at time of impingement: 12.2^o (C)

Average percent of power generating capacity achieved per unit over the 48 hours previous to impingement: Unit 1 - 50 percent power
Unit 2 - 85 percent power

Condition of animal: Dead

Shortnose Sturgeon Measurements:

Fork Length: 76 cm

Total Length: 85 cm

Weight: 2.1 kg

Remarks: The sturgeon was found during routine cleaning of the CWS Intake trash racks. It was in a weakened condition with several wounds that appeared to have been previously inflicted prior to impingement.
