**Re: Letter to USNRC and NJDEP re' Final Sampling Results for the Bldg 1-5
Excavated Soil Piles located at Prometcor Site (letter and Tables A-1 and A-2
attached)**

Dear Mr. Shaffer:

We would appreciate your prompt review and approval of the attached sampling results
and letter for the subject soil piles.

Thank you.

Re: Final Radiological Sampling Results for Soil Samples Collected from Building 1-5 Excavated Soils Currently Stored Within the Parking Lot Area at the Prometcor Site (NRC License No. STB-1451)

Dear Mr. Shaffer:

In accordance with your request and on behalf of Prometcor, Inc. (formerly Ronson Metals), McLaren/Hart, Inc (M/H) submits the attached soil sampling results for all composite samples collected from the Bldg. 1-5 excavated soil piles currently stored within the parking area at the Prometcor site. These data include results for the last round of sampling conducted in May 2000 as set forth below.

May 2000 and Combined Sampling

Twenty additional composite soil samples were collected from the subject soil piles in May 2000. Two samples were measured as duplicates. For each composite sample, soil was collected from 3-4 equally spaced sampling locations within each soil pile. At each sampling location, an aggregate soil sample was collected over a depth that either ranged from the surface to the bottom of each pile or from the surface to a depth of four to five feet. The May 2000 results were combined with the December 1999 composite sampling results for the purpose of calculating average concentrations for each radionuclide. The combined data set consists of 30 composite samples. By combining all composite sample results as in accordance with our agreement with the USNRC, each pile is now represented by one composite sample of partial depth and one composite consisting of soil collected over the entire depth (top to bottom). For a given composite, the soil was thoroughly mixed, packaged, and sent to the lab for radionuclide analysis. The purpose of collecting the composite samples over these depths is to closely approximate a three-dimensional concentration signature for each pile. Analytical results (concentration signature) for all composite samples therefore represent a good approximation of the mean concentrations for thorium and radium in each pile.

Mr. Steve Shaffer
June 23, 2000
Page 2

In accordance with the understanding with the USNRC, all samples were analyzed for ^{228}Th and ^{226}Ra . As described in previous data evaluations for the Prometcor site, ^{228}Th is the only thorium isotope of interest at the site. McLaren/Hart used ThermoRetec (Oak Ridge, Tennessee) to analyze the samples for the above radionuclides.

The average concentrations for Ra-226 and Th-228 based on all 30 composite measurements across all soil piles are:

^{226}Ra	37.9 pCi/g
^{228}Th /total thorium	5.5 pCi/g

The average results for all composite samples demonstrate that thorium levels in the soil piles are below the prescribed regulatory limit of 10 pCi/g. Analytical results for these samples are presented in the attached tables (Tables A-1 and A-2). Included in the tables are the individual sample results and the calculated average concentrations for each pile and across all piles.

Accordingly, Prometcor requests that the USNRC review and approve the final sampling results and provide Prometcor with an approval for release of these materials for unrestricted use. The USNRC's prompt action in this regard is necessary to commence disposal activities and permit Prometcor to undertake further site remediation activities that are presently on hold due to the staging of the subject soil piles.

If you have any questions or comments, please feel free to contact me at (216) 272-7799 or you can elect to use my pager at (800) 416-0949. My fax number is (216) 921-3460.

Sincerely,

Jack Buddenbaum, CHP
Supervising Health Scientist
