P R O C E E D I N G S

[8:30 a.m.]

CHAIRMAN APOSTOLAKIS: The meeting will now come to order. This is the first day of the meeting of the ACRS Subcommittee on Reliability and Probabilistic Risk Assessment. I am George Apostolakis, Chairman of the Subcommittee.

ACRS members in attendance are Mario Bonaca, Thomas Kress, William Shack, Jack Sieber and Robert Uhrig.

The purpose of this meeting is to discuss the proposed final ASME standard for probably risk assessment for nuclear power plant applications.

Tomorrow the subcommittee will discuss the status of risk-informed revisions to 10 CFR Part 50, including proposed revision to 10 CFR 50.44 concerning combustible gas control systems, issues in the Nuclear Energy Institute letter dated January 19, 2000, Option 3, and public comments related to the advance notice of proposed rulemaking on 10 CFR 50.69 and Appendix T, Option 2.

The subcommittee will gather information, analyze relevant issues and facts, and formulate proposed positions and actions, as appropriate, for deliberation by the full committee.

Michael T. Markley is the cognizant ACRS staff engineer for this meeting.

1 The rules for participation in today's meeting
2 have been announced as part of the notice of this meeting
3 previously published in the Federal Register on May 16,
4 2000.

5 A transcript of the meeting is being kept and will
6 be made available, as stated in the Federal Register notice.
7 It is requested that speakers first identify themselves and
8 speak with sufficient clarity and volume so that they can be
9 readily heard.

10 We have received no written comments or requests
11 for time to make oral statements from members of the public
12 regarding today's meeting. However, Mr. Robert Christie of
13 Performance Technology, Incorporated, has requested time to
14 make a presentation during tomorrow's session concerning
15 proposed revision to 10 CFR 50.44.

16 We will now proceed with the meeting and I call
17 upon Mr. Gerry Eisenberg of ASME to begin.

18 MR. EISENBERG: Thank you. I am Gerry Eisenberg,
19 Director of Nuclear Codes and Standards at ASME, and I want
20 to thank the subcommittee for this opportunity to brief the
21 committee as well as to receive direct and early feedback on
22 our proposed ASME PRA standard. I think this feedback is a
23 very important part of our process.

24 With me at the table here, all the way to my
25 right, is Karl Fleming, a member of our Project Team and

1 Standards Committee; Sidney Bernsen, who is the Chairman of
2 our Standards Committee; and Ron Simard, who is Chairman of
3 our Project Team. Also, supporting Project Team members
4 Rick Hill, Barry Sloane, Ray Schneider and Ian Wall.

5 With that, I would like to turn it over to Dr.
6 Bernsen.

7 MR. BERNSEN: Good morning. My name is Sid
8 Bernsen. As Gerry said, I am Chair of the Committee on
9 Nuclear Risk Management, the Standards Committee that is
10 responsible for approving the standard and maintaining it.

11 We have a few visuals and they are also in a
12 handout. It was prepared for both the workshop that we held
13 yesterday and for this meeting today. I don't intend to
14 cover in detail all of the slides, but they are for your
15 information.

16 The first, just to review where we have been and
17 we are finally -- we are happy we are finally back here
18 again to talk to you. We are using the ASME redesign
19 process which involves using a project team of experts to
20 develop the document, publish it for early public and
21 comment, and then it will be approved by our committee,
22 which is a balanced committee without any dominance in any
23 sector, and the work is overseen by the Board of Codes &
24 Standards. And we intend for the standard to be recognized
25 as an American National Standard, we are going to submit it

Washington, D.C. 20036
(202) 842-0034

1 to ANSI for approval.

2 The current status, historically, as you know, we
3 issued draft 10 for comment in the spring of '99. We
4 received 49 responses and well over 2,000 general and
5 specific comments and suggestions. This project team has
6 worked intensively to address the comments. I am not aware
7 of any effort in standards that involved as much as time
8 investment on the part of the people. The NRC, the industry
9 have all participated heavily in this thing. Project team
10 members have worked extremely hard to address the comments.

11 Our draft 12, which is the one in your handouts,
12 was issued for comment June 14th, and with it is included a
13 white paper that summarizes where we have been and where we
14 have come to.

15 Just briefly again, the scope and purpose of the
16 standard, it covers a Level I PRA analysis of internal
17 events at power, excluding fire, and a limited Level II,
18 sufficient for LERF evaluation. It is developed to support
19 risk-informed applications, including, of course, those
20 within the ASME Codes & Standards framework, the inservice
21 inspection, inservice testing, and others underway. And it
22 is developed to support the use of existing PRAs, which, as
23 we get into our discussion, is something to keep in mind.

24 It provides a process for determining the ability
25 of a PRA to support an application and it provides options

1 for augmenting the PRA either by adding to it or by
2 supplementary analysis to handle those cases where the PRA
3 has weaknesses and deficiencies.

4 Projected schedule, perhaps a bit optimistic, but
5 we are going to work toward it. August 14th, the comment
6 period ends. The project team will work to disposition the
7 comments and we hope by early October it will go to the
8 committee for approval, and that particular package will
9 include responses to the substantive comments. We will
10 probably go for a parallel public review at that time, the
11 formal public review.

12 Then the votes from the committee are due back in
13 a month. The team will work to resolve the comments. And
14 if we are successful, the whole package can go to ASME Board
15 of Codes & Standards for their concurrence before the end of
16 the year. And the ANSI process may take a month or so more.

17 The purpose of this review, and, as you know, we
18 held a workshop yesterday where we introduced this to a
19 number of members of the industry and public, is primarily
20 we want to make sure that we have resolved your specific
21 comments, your meaning in the case, obviously, ACRS sent a
22 lot of comments through the staff. And we have tried to
23 address them, but we really need the feedback from you on
24 how well we have done, the acceptability of other changes we
25 have made in response to other comments.

1 Recommendations for the future. This is a living
2 document. We are probably going to have to defer a number
3 of the comments and recommendations for future
4 consideration, so long as we come up with a standard now
5 that is adequately comprehensive and usable. And we hope
6 that the comments will be supported with a basis,
7 justification and proposed wording.

8 The only other thing I would like to mention is we
9 do have a number of representatives of the project team here
10 today. They are participating as individual experts. Their
11 comments don't necessarily represent the position of the
12 committee or ASME. Obviously, we haven't formally approved
13 the standard, and, therefore, we don't have an ASME position
14 on the standard, but I think you will hear from people who
15 are quite knowledgeable and, in a few cases, we may even
16 expose some still areas that need resolution, where there
17 are some differences of opinion and approach.

18 And we certainly welcome your interest, which we
19 know has been continuing, and the input that you have
20 provided to us. So, with that, I am going to turn the
21 meeting over to Ron Simard, who will discuss in more detail
22 the comments and what we have come to. Thank you.

23 MR. SIMARD: Good morning. I am Ron Simard. I
24 would like to acknowledge two more Project Team members who
25 have joined us since Sid made his introduction, Frank Rahn

ANN RILEY & ASSOCIATES, LTD.
Court Reporters

Washington, D.C. 20036
(202) 842-0034

1 and Mary Drouin.

2 Gerry, I would like to skip right to the slide
3 that summarizes the comments that we got on Rev. 10, because
4 what I would like to do is set the stage for Karl Fleming's
5 presentation and the more detailed discussion that I expect
6 we will get into about the approach we have taken in Rev.
7 12.

8 But let me try to help you understand what was
9 behind our rationale for the approach in Rev. 12. As Sid
10 said, we got a substantial number of written comments at the
11 end of the comment period on Rev. 12, and I am holding this
12 up. This is a two-sided copy. And in addition to the
13 comments that you see here that were submitted in writing,
14 we had discussions at a public workshop held shortly after
15 Rev. 10 was released, and at a number of key industry
16 meetings throughout the year. And what you see on this
17 viewgraph is my attempt to summarize what were the very
18 strong and clear messages that came through in all these
19 various discussions.

20 There was a very strong sense that Rev. 10, was it
21 was written, was too prescriptive, and it didn't allow the
22 flexibility needed to apply it to a variety of risk-informed
23 applications. One thing that we heard throughout the year
24 was that somebody had counted the number of "shall"
25 statements that were in the standard, and I am not going to

1 propagate that number by repeating it here, but there was
2 perceived to be a large number of "shalls."

3 Now, there were a number of concerns with that,
4 and I think one concern that really bothered us the most is
5 that they said the large number of shalls made it very
6 difficult to use with the process that we had laid out in
7 this standard for our risk-informed application. And the
8 related remark in the second bullet here is that we needed
9 to do more to allow users to distinguish among the grades of
10 application, given that there is, you know, a pretty broad
11 spectrum of applications that require different levels of
12 PRA capability. And again, another related comment in the
13 third bullet is that the applications that we are trying to
14 support today are applications that involve the wide mix of
15 PRAs. I think you all are familiar with the variety of PRAs
16 that are out there today.

17 And finally, there is a considerable amount of
18 work that has gone on in parallel with us developing this
19 standard to assess the quality of PRAs, and that is through
20 the industry certification process, which I understand you
21 are going to talk about tomorrow. But as we were working to
22 develop our standard, the guidelines for that process were
23 being developed, and visits were being carried out. I am
24 not quite sure where we stand today, but I have heard that
25 by the time -- well, certainly, by the time this standard is

1 out, most of the plants today will have had one of these
2 visits.

3 So, again, a very strong comment came through in
4 the written comments, in the workshop, in the discussions
5 throughout the year, that these visits were providing a lot
6 of good insights. And they also represented a significant
7 commitment of resources, and we needed, where possible, to
8 acknowledge that and allow a user to make use of any
9 insights from a previous peer review in the way that we
10 structured the peer review requirements in our standard.

11 And finally, although it is not on there, there
12 were also a number of comments that were favorable with
13 respect to Rev. 10. A number of commenters felt that,
14 despite the various comments that I just said about the lack
15 of flexibility and difficulty in applying the requirements
16 in Rev. 10 to the process, that, in fact, there was some
17 good stuff in there. There were some very -- some
18 characterizations of a PRA that really made sense and were
19 worth maintaining.

20 So, this is what we have tried to do in our
21 approach to Rev. 12. I won't get into too much detail in
22 the interest of time, knowing that Karl is going to cover
23 the approach that we have taken to recognizing different
24 categories of application and restructuring.

25 But I would like to point out a couple of other

1 differences that you will notice between Rev. 12 and Rev.
2 10. There is a fair amount of restructuring. For example,
3 we had what we would proposed as a mandatory appendix to
4 Rev. 10 of the standard, that had a database to be used for
5 generic data. And it was decided by the Committee on
6 Nuclear Risk Management that the standard is not the right
7 vehicle for that, but they have taken that on for
8 consideration in the future, whether or not it would be
9 appropriate for them to issue a separate standard on that.

10 Another thing that we have tried to do is we have
11 tried to emphasize that, really, the heart of this standard
12 is the process we have laid out for using the standard in a
13 risk-informed application. So, cosmetically, we have moved
14 that process from the bank of the standard now to the very
15 first thing that you see once you have read the definitions.
16 And second, we have tried to make that standard more usable.

17 The other thing that we have tried to do, again,
18 responding to those comments that we talked about earlier,
19 is we have tried to link the requirements for the various
20 aspects of a PRA in our standard to corresponding criteria
21 in that industry certification process where we could make
22 the linkage. So, where we could see that one of the
23 requirements in our standard was equivalent to a criterion
24 that was being used in the cert process, we explicitly
25 recognized that.

1 When Karl -- if Karl goes into the viewgraphs he
2 has got, for example, of one of the tables of requirements
3 in Rev. 12, you will see in the leftmost column, there is a
4 unique identifier for each requirement. And where we can
5 identify a corresponding criterion in the cert process,
6 there is also -- that number is there.

7 The other thing that you will notice is that where
8 we have retained a Rev. 10 requirement, we have also put in
9 the number of the subsection where that requirement appeared
10 in Rev. 10. Only for this review and only to assist you as
11 you compare what you are looking at today with what was in
12 Rev. 10. Those numbers will come out when it is published.

13 The only thing that I might do -- Gerry, would you
14 put up the last viewgraph, the flow chart, please?

15 This is something that Karl is not going into in
16 detail, and that we wouldn't expect to be -- I want to make
17 sure that we hit it now before we get into the way we have
18 structured the requirements. I want to emphasize the
19 importance of the process again.

20 This slide summarizes some of the main points of
21 the process as we have laid it out in Rev. 12. We
22 emphasize, for example, that the process is -- that the
23 requirements in the standard, for example, apply only to a
24 PRA that is going to be used in this process. So, the
25 requirements in Section 4 apply only to a PRA that is going

1 to be used in Section 3. They are not meant to describe a
2 PRA that is going to be used outside that context.

3 MR. EISENBERG: You might point out that it is the
4 last one. They are looking for it.

5 MR. SIMARD: In case you are having the trouble
6 finding the slide that is up there now, it should be the
7 last slide that is in the handout with my name on the front.
8 You got it?

9 The other thing is that in the second bullet, we
10 have added a statement to say that we -- the process
11 intended to be used with a PRA, that has had a peer review,
12 that meets the requirements of Section 6 of the standard.

13 A third point that I think came up again
14 yesterday, we had some useful feedback yesterday, I think
15 maybe we need to emphasize this a little bit more, is that
16 in the process we go through the various aspects of the PRA
17 requirement by requirement, as opposed to saying the entire
18 PRA has this level of capability. In certification
19 language, we don't say this is a Grade 2 PRA or a Grade 3
20 PRA.

21 And finally, it is only those aspects of a PRA
22 that you need for the application that you are considering
23 that would have to meet the capability level that we lay out
24 in our standard.

25 DR. BONACA: I would like to just make a comment

1 for the record, because we discussed this yesterday at the
2 workshop. I still have an issue or a concern with the
3 presumption that there is in Box A, that one can say this is
4 my problem and this, all I need to do is to develop this
5 primitive model and that is good enough, because, as I
6 mentioned yesterday, I have seen it hundreds of times and
7 that we use PRAs for so many years.

8 The PRAs always surprised us with findings about
9 dependencies that we did not understand when we were trying
10 to address a problem. PRAs always surprised the
11 specialists, they surprised the electrical engineers or the
12 mechanical engineers about things that they had not
13 imagined, and most of them were in the description of the
14 support systems.

15 And I am saying that I don't think it is a major
16 issue, however, I feel that the standard right now, it
17 doesn't provide any warning to this kind of issue, at least
18 in the forward where the distinction is being made in the
19 process. There have to be some forewarning that says that
20 changes proposed to be addressed with a Category I type of
21 capability should be very limited. I mean there is a
22 message somewhere here, but it is not very well
23 communicated. And this point of the importance of the
24 dependencies that cannot be intuitively understood up front
25 has to be presented. That is a judgment I have. And I

1 present yesterday, Karl. And, you know, anybody who has
2 used extensively PRA always gets these kind of findings and
3 surprises.

4 CHAIRMAN APOSTOLAKIS: So, how would you change
5 Box A?

6 DR. BONACA: I would not, maybe not change Box A,
7 but in the text where you have a description, in fact, of
8 how the steps are being done, there has to be a very clear
9 warning that there is always a risk in limiting your
10 projection of a model that you may miss something there.

11 MR. SIMARD: Thank you. That is useful comment.

12 DR. BONACA: And I can verbalize it and put it
13 down in writing and send it to you as a comment, I think.

14 CHAIRMAN APOSTOLAKIS: Yes. I think I would
15 appreciate it.

16 DR. KRESS: Would it be useful, Mario, to say --
17 say, you have identified your issue as a Category 1 type PRA
18 need, to use that Category I PRA in an iterative fashion to
19 verify that, sure enough, it was a Category I? Or is that
20 lifting yourself up by your bootstraps too much?

21 DR. BONACA: Well, I guess what I am trying to say
22 here is that if I had the Category I that I tailored to
23 address my issue, and then I did the same evaluation with a
24 Category III, for some changes, Category III will tell me
25 something different than Category I.

1 DR. KRESS: Tell you something too much different
2 than Category I.

3 CHAIRMAN APOSTOLAKIS: It is really Box C that you
4 comment is addressed --

5 DR. KRESS: Yes, determining.

6 CHAIRMAN APOSTOLAKIS: It determines the category.
7 That is where the warning should be.

8 DR. BONACA: It maybe ought to go there. Yeah.

9 CHAIRMAN APOSTOLAKIS: Determine the category of
10 application.

11 DR. BONACA: Okay.

12 CHAIRMAN APOSTOLAKIS: That is I, II, or III,
13 Roman I, II or III.

14 DR. BONACA: Okay.

15 CHAIRMAN APOSTOLAKIS: Mario is questioning
16 whether Category I is always sufficient, even when you think
17 it is.

18 DR. BONACA: Or that if you upfront can make a
19 decision.

20 DR. SHACK: I think it is really Box A he is
21 talking about, it is always Box 2, that you have somehow
22 identified the problem and you have limited it already
23 upfront.

24 CHAIRMAN APOSTOLAKIS: Then how about Box 5? That
25 is where you determine the category. 2 and 5 are related, I

1 suppose.

2 DR. BONACA: No, this is in the choice of the
3 specific requirements, the set of requirements they are
4 going through. The first assessment up there is how large
5 -- how well is my model supposed to be in order to address
6 this specific question.

7 CHAIRMAN APOSTOLAKIS: I think we are going to
8 have a discussion of the categories when Karl gets up there,
9 the appropriate slides. So let's say that we note the
10 comment.

11 I think Mr. Bernsen wanted to say something.

12 MR. BERNSEN: I was just going to say that perhaps
13 we do have something, I think it is in the quantification
14 area, where we say, when you are all done, you have got to
15 review this for reasonableness. And it may be that it would
16 be better to consider as an option, when you get done doing
17 the application, look back and see that you have had a
18 reasonable --

19 DR. BONACA: But if you look at the
20 quantification, I mean you have statements like, you know,
21 for Category I, you may want to check that the truncation
22 total does not exceed the CDF from the rest. I mean you may
23 want to do that.

24 MR. BERNSEN: That type of thing, right.

25 DR. BONACA: This is so loose that, you know,

1 there is not really a verification that you are making. You
2 know, if I go through those requirements on the
3 quantification, they don't give you any --

4 MR. BERNSEN: What I am saying, a similar thing at
5 the end of the application, when you have done it and you
6 have your results, then you need to sit back and look at it
7 and say, what have I done, is it reasonable?

8 DR. BONACA: I just, the last testimony, my main
9 concern is that if there is a presumption in this, and
10 people in good faith may think, and probably they are
11 thinking today, that they have very limited model and they
12 can do the world with it, because there is sufficient
13 description. But the fact is I can tell -- I mean anybody
14 who uses the PRA, how many times the PRA provides surprises
15 to the deterministic people, because it provides
16 dependencies that they don't understand upfront, so.

17 MR. SIMARD: Well, I think at this point what I
18 will do is, I think at this point I will end and let Karl
19 start walking us through the way the requirements are
20 structured in more detail. And then that will help to give
21 us specific examples before us that we can talk about.

22 CHAIRMAN APOSTOLAKIS: Good idea.

23 MR. SIMARD: I will just note one thing, if we
24 have any comments in particular about the Level II LERF
25 analysis, all the sections, the nine elements of the PRA

1 that we describe in our standard were assigned to various
2 members of the team with one team member as the lead. In
3 the case of the Level II LERF analysis, the team lead was
4 Ray Schneider, who, unfortunately, has a conflict and will
5 have to leave here around 10:00. So, if we have additional
6 comments beyond that, I think other team members can help,
7 but it might be good, if there is anything really
8 substantive, to try to involve Ray if we can.

9 CHAIRMAN APOSTOLAKIS: Perhaps after Mr. Fleming
10 gives us an overall view of the methodology, we can jump
11 into LERF and make sure that the comments are covered. Now,
12 who is this Mr. Fleming?

13 MR. FLEMING: My name is Karl Fleming and I am --

14 CHAIRMAN APOSTOLAKIS: The committee is not
15 familiar with you.

16 MR. FLEMING: I am a member of the Project Team
17 working on the standard.

18 CHAIRMAN APOSTOLAKIS: Okay.

19 MR. FLEMING: I would like to begin my
20 presentation with a few comments on Mario's concern, because
21 I think it is a valid concern. But there are a couple of
22 comments I want to make that could perhaps mitigate the
23 impact of your comment.

24 On one, I think one part of your comment
25 indicates, and I agree with this wholeheartedly, there is a

1 critical mass for a PRA, that before we can even put the PRA
2 label on something called a PRA, it has to meet some minimum
3 qualifications. And it is certainly our intention that the
4 Category I requirements capture that, and if there are some
5 specific problems or limitations with our requirements that
6 don't get us to that critical mass, we certainly are anxious
7 to get that feedback.

8 But another reflection I want to make is Ron
9 indicated there has been, you know, more than half of the
10 plant PSAs have been subjected to this industry
11 certification peer review process. I have participated on
12 about 10 of them myself. And I don't think there is a
13 Category I -- I mean I doubt, I haven't seen all of them,
14 but, based on my evidence, I would doubt if there is a full
15 Category I PRA out there.

16 I think every PRA out there has many elements that
17 would classify as Category II and some Category III. And I
18 think the concept of the block diagram that we have shown
19 earlier is to try to clarify that a given PRA may have an
20 outstanding accident sequence model for transients and
21 LOCAs, but may be very weak for ATWS or very weak for
22 station blackout. So, there may be specific areas of the
23 PSA that are Category I or maybe not even Category I, but
24 other aspects of their PRA and systems and data treatment
25 that may be very good.

1 So the block diagram is meant to clarify that, for
2 some applications, what -- the current PSA, with its
3 weakness and strengths, could be adequate for a given
4 application, and to advance the concept that perhaps one can
5 use the PSA today and incrementally, you know, build on its
6 capabilities without having to invest huge resources to
7 bring the whole PRA up to some level before they can begin
8 to apply it.

9 CHAIRMAN APOSTOLAKIS: Speaking of resources,
10 Karl, you are very experienced with these things, given that
11 most units have an IPE now, what do you think the cost would
12 be, roughly, for the utilities to upgrade those to a good
13 Level II PRA and then a good Level III PRA? What are these
14 huge resources we are talking about all the time?

15 Is it \$10 million or half a million dollars?

16 MR. FLEMING: I would say that if there is an
17 example of a PSA that went to the minimum, might be
18 requirements and not much further, and did not update it and
19 so forth and needed to do risk-informed applications, I
20 would say that the typical cost upgrade, if they just sort
21 of purchased the services from a consultant company, may be
22 one million dollars to update the Level I PSA, and perhaps
23 half a million for the Level II.

24 CHAIRMAN APOSTOLAKIS: So with a million and a
25 half, they would have a very good LEVEL II PRA?

1 MR. FLEMING: Right.

2 CHAIRMAN APOSTOLAKIS: And the would not need to
3 agonize over Category I, II, III, and all these things?

4 MR. FLEMING: Right.

5 CHAIRMAN APOSTOLAKIS: So I'm a little puzzled
6 here. Where are these limitations in resources and so on?
7 It seems to me a million and a half, considering the
8 benefits that the utilities will have from the PRAs, is
9 nothing.

10 And yet we hear all the time that there are
11 limited resources, that we have to develop standards that
12 recognize that you don't need a good PRA for all
13 applications, and debate it.

14 You know, we spend a million and a half debating
15 when you need a PRA, instead of spending it doing a good
16 one.

17 Now, Mr. Sieber, I think, has something to say.

18 MR. SIEBER: Well, my comment is that in the
19 context of budgeting for a nuclear power plant, a million
20 dollars is something. And it takes at least two people,
21 full-time, to keep the PRA up, and that adds to your
22 employment list.

23 And so it's not inconsequential.

24 CHAIRMAN APOSTOLAKIS: It is no inconsequential,
25 but I think we're spending that much money arguing about

1 quality and arguing about -- instead of just doing it. Of
2 course, this has nothing to do with the ASME standard which
3 is facing reality, of course.

4 But I was just wondering why we have all these
5 things. But anyway, you answered my question.

6 MR. FLEMING: I think that whatever the resources
7 are and whoever wants to decide to allocate those resources,
8 it's also a legitimate consideration to optimally allocate
9 those resources so that you're adding the resources in the
10 parts of the PSA that you need to apply today, so don't
11 necessarily have to go out and put a bit chunk of resources
12 in at once.

13 CHAIRMAN APOSTOLAKIS: It seems to me that the
14 Revised Oversight Process has sent a clear message that this
15 Agency is serious about risk-informing the regulations.

16 MR. FLEMING: Right.

17 CHAIRMAN APOSTOLAKIS: So whether the utilities
18 want to spend a million dollars now, or drag their feet and
19 spend it three years from now, I think it's coming.

20 MR. FLEMING: Right.

21 CHAIRMAN APOSTOLAKIS: And the Staff was
22 authorized recently to request risk information from the
23 licensees, even if they choose not to submit risk
24 information. So now you tell me what those signs are.

25 MR. SIEBER: Right.

1 DR. BONACA: I would like to add just one more
2 thing, Mr. Chairman, which is --

3 CHAIRMAN APOSTOLAKIS: George, for you.

4 DR. BONACA: I totally agree with your statement
5 that I don't know of any PRA out there that is just a
6 Category I. But also, I would like to remake the statement
7 that I made yesterday that if there was one Category I PRA,
8 it would be a dog. I mean, I would be really something that
9 you would not want to use for anything.

10 And then we have a standard, however, that would
11 allow for a PRA to be that poor, because it doesn't say here
12 that only some aspects should be Category I, and others
13 shouldn't be.

14 CHAIRMAN APOSTOLAKIS: If you remember yesterday,
15 we discussed something that I believe the gentleman from
16 ASME agreed that if you think in terms of Regulatory Guide
17 1.174, and you remember the almost white lower left-hand
18 side corner, then as you move towards the boundary, it
19 becomes darker and darker.

20 Category II, I believe we said, really would apply
21 to the nearly-white area. As you moved to the darker areas,
22 then you enter Category III, which I think is a very good
23 description of the categories. I mean, that really
24 cleared it up for me.

25 And the other important thing, Mario, which is

1 relevant to your question, is that there is no room for
2 Category I there. In the context of 1.174, I don't see a
3 Category I playing a role.

4 DR. BONACA: You're right. I'm not saying that.
5 I'm only saying that when I look at the standard, I have
6 always had an expectation that standards are the standards,
7 which is, you know, I have something I can look up to, and I
8 know I can do something with that standard.

9 And so, I'm a little bit troubled by -- and I
10 recognize, totally, the point that you are making, about
11 only looking at certain attributes.

12 But, taken in a vacuum, you could think about, you
13 know, these are Category I and what could I do with that?
14 And the issue -- and the answer is, you can do much with it,
15 which is a very poor --

16 CHAIRMAN APOSTOLAKIS: Karl, you remember many
17 years ago, in order to streamline the PRA, there was a Phase
18 I where people used rough point estimates, looking at other
19 similar PRAs, PRAs for similar plants.

20 And they came up with a list of dominant sequences
21 before they started doing a more detailed analysis.

22 Now, as I recall, that list was pretty good. I
23 mean, a detailed analysis did not really upset the order
24 that you got.

25 Would you say that that kind of a crude ranking

1 would be a Category I application?

2 MR. FLEMING: Well, I think that it would. I
3 think the main difference might be some of the documentation
4 requirements.

5 Those limited-scope, Phase I PRAs that you're
6 talking about, their primary purpose was to optimize the
7 resources for the full PRA.

8 CHAIRMAN APOSTOLAKIS: Right.

9 MR. FLEMING: And I don't recall many important
10 decisions being made.

11 CHAIRMAN APOSTOLAKIS: No, no.

12 MR. FLEMING: On the basis of that.

13 CHAIRMAN APOSTOLAKIS: I agree.

14 MR. FLEMING: It was a way to risk-inform the PRA
15 itself.

16 CHAIRMAN APOSTOLAKIS: But the results, though,
17 were fairly robust.

18 MR. FLEMING: Yes, if experienced people are doing
19 the PRA, they are capable of coming up with dominant
20 sequences very quickly, with maybe ten percent of the
21 resources of the PRA.

22 DR. KRESS: George, with respect to your
23 categorization, linked to the white to dark, the problem I
24 have with that is that white-to-dark space has -- is in a
25 plane at which you have to have the absolute value of the

1 CDF already, and the absolute value of the LERF.

2 That means you have to have a Category III to
3 determine those numbers, before you even enter into that
4 space.

5 CHAIRMAN APOSTOLAKIS: If you want to be a purist,
6 that's correct.

7 DR. KRESS: Yes, well, I am a purist.

8 CHAIRMAN APOSTOLAKIS: There are situations, I
9 think, where you have an idea that you are really way down
10 there.

11 Some of the newer plants are highly redundant,
12 they produce numbers like ten to the minus six. Now, you
13 might say that if you don't have a complete PRA, that number
14 could be as high as ten to the minus five.

15 But you're still --

16 DR. KRESS: You still could estimate.

17 CHAIRMAN APOSTOLAKIS: -- in that region, so I
18 mean, at least trying to tie it to the decisionmaking
19 process, helps, I think. But, again, you can never draw a
20 line and say Category II to the left and III to the right.

21 We have a request?

22 MR. SCHNEIDER: Yes, Ray Schneider, Westinghouse.

23 One of the issues with the Category I is that if
24 you view that some PSAs will have Category I elements where
25 they were intended to be conservative in the modeling, tried

1 to give a higher estimate of CDF, which tried to give a
2 higher estimate of LERF, and in those cases, you can make
3 decisions within certain regions, as long as you're making
4 the decision based on a well-focused assessment, and you
5 understand what the limitations of the PSA is, and that you
6 understand the uncertainty bounds are with respect to the
7 uncertainties.

8 And so if you are on the high end, you can make
9 reasonable assumptions, so that while we're not -- the
10 standard isn't purporting to say you should have -- anyone
11 should have a Category I PSA, but Category I PSAs could have
12 Category I elements within them that -- where certain
13 assessments can be made, and made quite effectively and
14 quite robustly.

15 DR. BONACA: I understand.

16 MR. RAHN: Mr. Chairman?

17 CHAIRMAN APOSTOLAKIS: Yes.

18 MR. RAHN: Frank Rahn, a member of the Project
19 Team.

20 I know it's hard to believe, but there are
21 potentially some ramifications that are non-regulatory in
22 nature, where we don't even need to, for instance, consider
23 a Category II, but where a Category I may be well sufficient
24 to make a decision.

25 Again, the purpose of a PRA is a guide to your

1 thinking, and there are applications, as example, making
2 insurance decisions, which are based on some insights in PRA
3 where we've used this, things like trip meters which may be
4 economic decisions.

5 So the ASME is not only serving, if you will, the
6 regulatory applications, but a whole spectrum of other
7 applications where a Category I application may be
8 sufficient.

9 MR. SIMARD: Karl, are you done?

10 CHAIRMAN APOSTOLAKIS: No, we are discussing
11 Categories without -- I suggest going directly to the
12 categories.

13 MR. EISENBERG: Show me which one.

14 MR. FLEMING: The next one, actually.

15 CHAIRMAN APOSTOLAKIS: Either the second or the
16 third.

17 MR. FLEMING: In the effort that we went through
18 to prepare this draft, we were attempting to meet several
19 objectives, one of which was to retain the technical
20 resources that had been set forth in Draft 10, and also to
21 try to match up the requirements to the certification
22 process.

23 We spent quite a bit of time in the last six
24 months, working on the definition of the application
25 categories, because the detailed supporting requirements are

1 all specified in terms of three different application
2 categories.

3 We came up with three categories that match the
4 top three categories of the industry's peer review and
5 certification process.

6 We go in there, recognizing that a given PRA will
7 have to be examined for their capabilities with respect to
8 the details of the PRA. Individual elements and individual
9 parts of the PRA within an element may fall into different
10 categories, and with that recognition, we'd like to be able
11 to provide a set of tools for the utility to use, so that
12 they can find the appropriate applications to support the
13 requirements.

14 We might move to the next slide, please. A little
15 bit on the definition: I think George's descriptions were
16 provided some good insights.

17 The Category I applications, we define in terms of
18 decisions that are normally made based on deterministic
19 analyses. And if you had a PRA, you could supplement those
20 deterministic insights with PRA insights.

21 But these are applications that refer to actions
22 that the utility has to do anyway, with or without a PRA,
23 and with the availability of the PRA resources, can provide
24 additional insights.

25 Category II was intended to line up with risk-

1 informed applications, the minimum applications that might
2 be required to support a risk-informed application in which
3 you need a balanced set of PRA insights and deterministic
4 analyses.

5 Category III applications get up into the area
6 where in Reg 1.174, you need to increase management
7 attention, where the decision more heavily hinges on the
8 validity and absolute values of the PSA.

9 DR. KRESS: Let me ask another question: I like
10 to think in terms of uncertainty. And it seems to me like
11 you could link each category to the degree to which you need
12 to know the uncertainty.

13 For example, Category I looks to me like you need
14 to know the uncertainty, because the application is of such
15 a nature that you cover it otherwise with the deterministic
16 analysis.

17 Category II, you probably need to know something
18 about the uncertainty, but you can probably do it with a
19 sensitivity-type analysis.

20 MR. FLEMING: Right.

21 DR. KRESS: Category III looks to me like it needs
22 a full uncertainty analysis. Is that a good way to look at
23 these?

24 MR. FLEMING: Yes. There are several different
25 attributes of the PRA that we have looked at across these

1 application categories.

2 And uncertainty is one of those. In fact, we'll
3 go on to Slide Number 4 where we identified the
4 differentiation across these categories with respect to the
5 expectations for uncertainties.

6 In Category I, there certainly is a need to
7 appreciate the sources of uncertainty and the general
8 concepts of uncertainty that are behind the PSA results.

9 In the Category II, there is an expectation that
10 you can understand uncertainties well enough to be able to
11 identify your CDF and LERF estimates with mean values.

12 That means you have to think adequately through
13 your uncertainties to be able to say that the point
14 estimates you're calculating are reasonable estimates of the
15 mean value.

16 And then finally, in Category III, a full
17 quantification of the epistemic and alliatory uncertainties
18 is expected, which is consistent with Reg Guide 1.174
19 expectations.

20 DR. KRESS: I should have looked ahead to see your
21 slide.

22 MR. FLEMING: Yes. So that is one of the
23 dimensions. Another dimension is the extent to which the
24 decisions may impact the licensing basis with respect to
25 safety-related systems, structures, and components.

1 And as Frank Rahn mentioned, there may be
2 applications in which the utility might want to make some
3 changes to the balance of plant to reduce the -- to improve
4 the reliability of the plant, in which case, it does not
5 have to apply to the NRC for these types of decisions, and
6 may have somewhat less requirements to document the PSA so
7 that a regulatory body can participate in the peer review
8 process.

9 CHAIRMAN APOSTOLAKIS: Now, again, this is
10 something that came up yesterday. When we discuss these
11 things, I think it's important to always bear in mind what
12 the purpose of this is in the standard.

13 In other words, I don't think anyone will come to
14 the NRC and say, well, this is a Category II issue, and
15 that's why I did it this way; don't ask me any questions.

16 The staff will say, well, excuse me, but here are
17 100 questions. So that's not the intended use.

18 The intended use is before they come here, to
19 think about the issues. What would be required? So there
20 is a contribution to the general, I would say, elevation of
21 the state of the art to a certain level.

22 So the licensee will know in advance, what kinds
23 of things are really expected of the PRA. So when they come
24 here, they will be prepared.

25 So in that sense, I'm fairly comfortable with

1 this, because it recognizes, you know, reality.

2 I mean, we can argue about the words and put in
3 1.174 references and so on, but I -- but if the intent was,
4 I mean, to have somebody come and say, gee, the standard
5 says Category II, and you are asking questions about
6 Category III, well, excuse me, then I'm against it.

7 But the Staff will always be free to ask the
8 questions that they feel are appropriate to ask.

9 So, that's fine with me. If the licensee wants to
10 think that it's Category I and come here and be surprised,
11 well, that's one more surprise for Mario here.

12 PRAs surprise people in a lot of ways. So, I'm
13 happy with the -- I mean, not the details, but the whole
14 idea.

15 DR. BONACA: I didn't not express an opposition to
16 the way that the standard is being -- I believe, however,
17 that there is need for -- I think, in the text, you know,
18 the presentation, I think, is clearer than the text.

19 There is a need to translate some of this into the
20 text, so there is a clearer understanding of the limitations
21 of PRA Category I, and, therefore, you don't stray from this
22 approach.

23 CHAIRMAN APOSTOLAKIS: In the context of what I
24 just said, of helping the licensee understand what is
25 happening here, so that he won't be surprised before the

1 Staff, that would be a very valuable thing to do.

2 DR. BONACA: Yes.

3 MR. FLEMING: The other thing that came out in our
4 presentation yesterday, and I think we got some feedback
5 that we could improve our presentation of this in the text.

6 And that is that there is also an expectation that
7 in terms of the scope of coverage of these requirements, in
8 terms of the dominant and risk-significant accident
9 sequences.

10 And in this slide we bring out the expectation
11 that for Category I applications, we have a set of
12 requirements, and we expect those requirements would capture
13 the critical mass issues before we could put the label of
14 PRA on the product.

15 But we impose the requirements on the treatment of
16 the dominant sequences. And so, for example, there may be
17 some requirements that have to be applied to the dominant
18 sequences that are not important for the non-dominant parts
19 of the accident sequences.

20 When we go into Categories II and III, we have to
21 extend the application of these supporting requirements to
22 all the risk-significant sequences. And if we go up into
23 this area of increased management scrutiny, we may have to
24 go beyond the risk-significant sequences to some of the even
25 less important sequences, to the extent that that may impact

1 the decision.

2 So, that's another characteristic of these
3 requirements, and one of the feedback discussions we had
4 yesterday is that we probably need to work on a definition
5 of what we're talking about when we use these terms,
6 dominant, and risk-significance.

7 We did not include those in the actual definitions
8 section, and I think we got some feedback that we would be
9 well advised to add that.

10 If we can skip the next slide, so, working sort of
11 from a top-down fashion, we, of course, then have the
12 elements, the nine elements of the PSA, and these are the
13 same nine elements that we used in Draft 10.

14 And they are very typical of what you would see in
15 the breakdown: Initiating Events, Sequence Development,
16 Systems Analysis, Data Analysis, and so forth.

17 There are nine of these that cover the scope for
18 internal events, including internal flooding, but not
19 including internal fires.

20 If you look at these attributes, the attributes
21 call out the concepts of dominant versus risk-significant
22 accident sequences, and the other concept that's clearly
23 differentiated across these three columns is that
24 conservatism is tolerated, if you will, more completely --
25 more freely in the Category I applications, whereas it's not

1 really tolerated in the risk-significant arena for the
2 Category II and III applications.

3 And anytime that we permit or provide the
4 opportunity to meet requirements with conservative
5 assumptions, we have the caveat that the conservatisms do
6 not distort the ability to make risk screening applications
7 that you would need in a Category I.

8 The basic Category I type of applications are
9 applications in which you just want to make course screening
10 of elements of your PSA into very course risk categories, so
11 that conservatism would be permitted, only to the extent
12 that it does not distort that kind of application.

13 So that's -- these attributes provide the logic
14 for how we tried to come up with a differentiation, when
15 appropriate, for the supporting requirements for each of the
16 categories.

17 CHAIRMAN APOSTOLAKIS: Under Data Analysis, it
18 says realistic quantification of mean values.

19 MR. FLEMING: Right.

20 CHAIRMAN APOSTOLAKIS: Many PRA type analysis -- a
21 lot of people take a point estimate, and they say, well,
22 this is a mean value.

23 That's not what you mean here. You have to alert
24 people to the fact that the mean is not the same as
25 somebody's best estimate.

1 MR. FLEMING: That's right. The concept for data
2 and quantification is that point estimates, which could be
3 conservative estimates, as long as they don't distort the
4 risk profile, are accepted for Category I.

5 Mean point estimates are expected for Category II,
6 and that means that you have to carry through your
7 uncertainty analysis to a sufficient extent to be able to
8 show, demonstrate that you have mean values.

9 CHAIRMAN APOSTOLAKIS: That's stated somewhere?
10 It should be clarified.

11 MR. FLEMING: We certainly intended it to be.

12 CHAIRMAN APOSTOLAKIS: Yes. I don't remember
13 seeing that.

14 DR. KRESS: That's the mean value of only the
15 alliatory uncertainty?

16 MR. FLEMING: Alliatory and --

17 CHAIRMAN APOSTOLAKIS: Epistemic uncertainties, as
18 well. I think it is really epistemic.

19 DR. KRESS: Yes. That's only the --

20 CHAIRMAN APOSTOLAKIS: The failure rate is
21 epistemic.

22 DR. KRESS: Yes.

23 MR. FLEMING: Whatever epistemic uncertainties
24 that are included in the model.

25 CHAIRMAN APOSTOLAKIS: Yes, the human error rates.

1 MR. FLEMING: Yes, the human error rates, and --

2 CHAIRMAN APOSTOLAKIS: So that's a key point, and
3 I think that maybe we can look for a place to make sure --

4 DR. KRESS: Both of those things need
5 clarification.

6 MR. FLEMING: For example, that would require some
7 kind of uncertainty analysis be done at the data level, but
8 not necessarily propagated all the way through to CDF and
9 LERF.

10 CHAIRMAN APOSTOLAKIS: But when you propagate mean
11 values, in some instances, as you know, the variance plays a
12 role.

13 MR. FLEMING: Right.

14 CHAIRMAN APOSTOLAKIS: I think people will find it
15 easier to just do a Monte Carlo simulation. That is at
16 least numerical, you know. Just do it.

17 MR. FLEMING: And that may be, in fact, the case.

18 CHAIRMAN APOSTOLAKIS: I wonder whether we can,
19 before Karl moves on to discussing requirements, maybe we
20 can start with the LERF, the very last one, Level II
21 analysis, and make sure we cover it before the expert
22 leaves? How about that? Is that okay?

23 MR. FLEMING: Sure.

24 CHAIRMAN APOSTOLAKIS: Unless there is something -
25 -

1 MR. FLEMING: Sure.

2 CHAIRMAN APOSTOLAKIS: Do you have any viewgraphs
3 on this subject?

4 MR. SCHNEIDER: No. I was just basically going to
5 take questions from the Committee, but I would want to put
6 something in overview in terms of what was done with the
7 LERF section.

8 The intent was not to be a full Level II PSA, but
9 to look at the LERF surrogate that the NRC's been using for
10 regulatory review. And the three categories in --

11 The words probably don't specifically state the
12 way it was structured, but the three categories, Category I,
13 was generally intended to be the conservative estimate of
14 LERF, using bounding assumptions, where bounding assumptions
15 would be -- would provide acceptable results in sufficient
16 margin.

17 As you move it to the Categories, you will get
18 increased resolution and increased precision. You include
19 more information, more phenomena, and more information on
20 the -- more details on the quantification.

21 So as you go from Category I, II, and III, what
22 you should be getting is a more refined prediction of LERF,
23 generally moving down.

24 The expectation is that Category I estimates
25 should not under-predict LERF.

ANN RILEY & ASSOCIATES, LTD.
Court Reporters
1025 Connecticut Avenue, NW, Suite 1014
Washington, D.C. 20036
(202) 842-0034

1 Okay, I guess with that as an overview, I'll take
2 questions.

3 DR. KRESS: Well, I had a couple of questions,
4 mostly -- I thought that was a fairly good section of the
5 standards, but I had some questions that I think are mostly
6 just of a clarification nature.

7 On page 126 of my version of the document, in the
8 Category III applications, you say in the bottom box there,
9 you say you include a requirement that the effects of in-
10 vessel melt retention ought to be included.

11 And I wonder why you felt it necessary to actually
12 spell that out. Is that at all applicable to any operating
13 plants we have?

14 MR. SCHNEIDER: There are several C-plants that
15 have the ability to be bottom-flooded, and some of them have
16 credited a certain proportion in their detail Level IIs,
17 more or less a certain proportion of the events wouldn't
18 necessarily go to failure, because they could flood all the
19 way up to the nozzles.

20 So, there's a -- we have integral lower heads, so,
21 as a result of the design differences, at least for the
22 plants that I'm familiar with, it is a consideration that
23 has shown up in PSAs, and could result in certain events
24 that would have gone into failure/not going to failure.

25 DR. KRESS: My understanding is that they all go

1 to failure if you include the uncertainties, and the size of
2 the vessels and the power levels are such that none of them
3 really can take much credit for in-vessel retention.

4 I would rethink whether or not I wanted to have
5 that called out, specifically, there. But maybe I'm wrong
6 there.

7 MR. SCHNEIDER: I believe that most of them can,
8 and the analyses depend on -- there is, I guess, the
9 probabilistic assessment that a certain fraction of them,
10 under -- I guess there were two issues.

11 One was a delayed injection into the RCS, coupled
12 with a flooding of the external would give you a high
13 probability of recovery.

14 And that wouldn't be recovery in another high-
15 pressure event or another event that progressed slightly
16 differently. That's why it says level of precision that's
17 moving.

18 What's happening is that you're reducing your LERF
19 probability.

20 DR. KRESS: My feelings are that the uncertainties
21 are so large in that that it probably is not useful.

22 MR. SCHNEIDER: Understood.

23 DR. KRESS: Likewise, on page 128, in defining a
24 large early release it says that the analyst may consider
25 mitigating factors, such as played out and deposition of

1 fission products released from the fuel and the release
2 pathway characteristics.

3 I certainly again with that but unfortunately
4 nowhere in the standards do you mention any standards for
5 fission product release modeling that I can see at all
6 because you are dealing mostly with LERF, which doesn't
7 really involve the modelling of fission product release, but
8 if you are going to take credit for mitigating issues, then
9 you have to know something about the timing of the release.
10 You have to know something about the species. You have to
11 know something about the aerosol characteristics which
12 depend on those things, so when you say they may take credit
13 for it, you don't go the next step and say but if you do you
14 will have to meet certain standards in your fission product
15 release model, so this is more just a comment than a
16 question.

17 MR. SCHNEIDER: Good point.

18 DR. KRESS: And I guess I had one other. This is
19 a clarification question.

20 On Table 4.49 on the dominant contributors to be
21 considered in LERF, I was a little bit interested in why
22 under hydrogen combustion for example you included Mark 1s
23 and Mark 2s, which I thought were inerted and why you didn't
24 include large dries because in combination with other loads
25 hydrogen combustion could be the straw that puts you over

1 the brink so I was just wondering why the check marks, how
2 the check marks came about in that table?

3 MR. SCHNEIDER: For the large dries, the Level II
4 analyses and the experiments that have been followed up,
5 that have been used to support this is that the DCH and
6 hydrogen combustion really aren't concurrent. They do occur
7 displaced in time and while if you add the two together
8 would put you above the brink, they probability that they
9 will be there as a dominant contributor hasn't shown out to
10 be in practice, in experiments.

11 I think that is why we didn't put the check box
12 there for that and why we kept it but we did keep it for the
13 DCH induced failure with a certain probability, but when you
14 start adding the DCD in hydrogen the probability would be a
15 lot lower.

16 Also, a lot of the analyses that are actually
17 being done often when they do the DCH add to it, consider
18 the hydrogen combustion in conjunction with the DCH as well,
19 so this is really for the hydrogen combustion independent of
20 the high pressure melt ejection.

21 DR. KRESS: Okay, and they detect the Mark 1s and
22 Mark 2?

23 MR. SCHNEIDER: I'll turn that over to Rick Hill.

24 MR. HILL: This is Rick Hill, GE, and a member of
25 the project team.

1 Hydrogen combustion is listed for Mark 1, Mark 2
2 even though they are inerted plants. They are oxygen
3 controlled plants and there are scenarios where you could
4 de-inert or have oxygen in the containment and we feel that
5 that is a question of Level II modeling that should take
6 place even though obviously the risks are very low.

7 DR. KRESS: Okay, it wasn't screened out on low
8 probability?

9 MR. HILL: Right.

10 DR. KRESS: Okay. A similar question on this
11 table. Why did you feel like you could exclude steam
12 explosions from consideration in large dries and ice
13 condensers?

14 MR. SCHNEIDER: It goes pretty much back to what
15 the existing Level IIs tend to show is that the steam
16 explosion phenomenon is, once officially uncertain and low
17 probability, that for a LERF assessment it just was over-
18 dominated by all the other processes.

19 The main issues in terms of releases to the public
20 pragmatically are where you have the loss of containment
21 isolations above ground typically and it would be loss of
22 containment isolation, the IS LOCA and the steam generator
23 tube rupture.

24 To a much lower extent you have the probabilistic
25 potential that you can fail containment due to the high

1 pressure.

2 The steam explosions typically occur in the lower
3 portions of the cavity. You would have to fail the
4 containment in a way that would affect the above-ground
5 releases and it was just felt to be a much lower probability
6 event that would be more than covered by the others as long
7 as you are not doing a detailed Level II.

8 DR. KRESS: So you are relying on the risk
9 insights --

10 MR. SCHNEIDER: From the Level IIs that were
11 done --

12 DR. KRESS: -- from the Level IIs that were done
13 by the IPes.

14 I suspect that that might be a risky thing to rely
15 on for this. I am not sure I would want to exclude steam
16 explosions, at least I don't think the explosion itself is
17 going to damage the containment.

18 We are dealing with containment here --

19 MR. SCHNEIDER: Right.

20 DR. KRESS: -- but I think there is a high
21 probability it can add pressure to an already pressurized
22 containment and might ought to be considered for looking at.

23 MR. SCHNEIDER: Well, we have looked at that issue
24 and that is not the driver.

25 You can vaporize a lot of the water but the

1 robustness of the containments are such that you are not
2 going to, pragmatically you are not going to have enough
3 water in the containment to take that to a containment
4 failure condition, but we could look at that and reconsider
5 and check the numbers out.

6 DR. KRESS: Okay. Well, that is the extent of the
7 questions I had. Do you have some?

8 CHAIRMAN APOSTOLAKIS: I have one or two, but
9 maybe it is because of my ignorance of the subject.

10 I have always been mystified by the definition of
11 large early release, so I was looking for a definition.

12 So on page 8 it says that large early release is
13 the rapid, unscrubbed release of airborne fission products
14 from the containment to the environment occurring before the
15 effective implementation of offsite emergency response and
16 protective actions.

17 Then on page 128 it says you define LERF
18 consistent with the definition given on page 8, Section 2,
19 but then it goes on and elaborates a little bit on early --
20 which means, early refers to a timeframe -- prior to
21 effective evacuation of the inhabitants of the exclusionary
22 area boundary.

23 My question is why are we avoiding giving a time,
24 a rough time? I have heard in the past before three hours,
25 but I don't know. Is it before any effective implementation

1 of offsite emergency response? I wonder if that is a
2 scientific definition -- early.

3 What if the emergency response measures fail and
4 they are delayed? Well, then early release is anything that
5 is released before that? There has to be some time --

6 MR. SCHNEIDER: For most of the transients if you
7 look at what contributes to LERF, it mostly isn't an issue.
8 It comes because like if you have loss of containment
9 isolation it is core damage events that occur and have an
10 early core damage failure.

11 CHAIRMAN APOSTOLAKIS: Early?

12 MR. SCHNEIDER: Yes, and so you are generally
13 talking the first several hours, so when you initially get
14 to this, you are dealing with 4 to 8 and then that depends
15 on how quickly they can get the information out to the
16 public, how much population they have around the site.

17 For example, in Arizona, it's not going to be that
18 bad. They know everyone's phone number, but in other areas
19 it may take longer for evacuation so to but a rule on the
20 time was -- we didn't feel comfortable doing an exact,
21 precise time, but the issues that you have to consider are
22 about how rapidly is the staff going to be able to recognize
23 they are undergoing a core damage state, how quickly can the
24 information get out, and when do they expect the releases to
25 be felt given the event? For example, steam generator

1 ruptures may occur very late in time.

2 What this does is gives them the flexibility to
3 say not all steam generator tube ruptures have to be
4 considered large early if you can keep the core covered for
5 12 to 15 to 18 hours, but if you have a steam generator tube
6 rupture that rapidly progresses to failure with an open
7 MSSV, then that would be an early release, so --

8 CHAIRMAN APOSTOLAKIS: I guess my question is why
9 is the condition of early or late, why does it depend on the
10 evacuation and not on some physical characteristics of the
11 accident?

12 MR. SCHNEIDER: The QHO was the original --

13 CHAIRMAN APOSTOLAKIS: The unscrubbed --

14 MR. SCHNEIDER: Because you go back to the
15 original definition of what was trying to be accomplished
16 maybe five to eight years ago when you had the Qualitative
17 Health Objective, and that was basically to limit the number
18 of fatalities, to put it into a certain level -- to make it
19 consistent with the rest of the industry, and what they did
20 is they made a surrogate and the surrogate was LERF.

21 So you have taken away now a lot of the features
22 that went into what the QHO was but the QHO included
23 evacuation, sheltering and all of those features so the LERF
24 retained some of that flexibility without the clear
25 definition of how it affects the population and so you need

1 to define something and if you put a defining time for
2 certain plants that may not be an appropriate timeframe, so
3 we're allowing them the flexibility to adjudge their
4 emergency planning procedures that match up against the
5 various events and then determine whether they would class a
6 specific steam generator tube rupture as a large, early or a
7 delayed.

8 Otherwise you may end up in situations where you
9 have later releases that because of some issue associated
10 with the transient that may have prevented them from
11 alerting the public might really be classified as a large
12 but if we put -- an early, but if we put a short timeframe
13 involved that would just automatically throw it out and if
14 by the same token if you put a long timeframe you probably
15 are including too many events, especially for the plants
16 with low population area.

17 So we did allow some flexibility. It mainly will
18 affect issues like steam generator tube rupture and some of
19 the high pressure melt events. They have to justify how
20 they are binning it.

21 DR. KRESS: I think when NRC, and I may be
22 interpreting them incorrectly, but when they went to the
23 LERF what their intention was to do was to more or less
24 separate outside issues from design issues and do it in such
25 a way that the LERF would cover essentially most of the

1 sites.

2 CHAIRMAN APOSTOLAKIS: Right.

3 DR. KRESS: And now we seem to be going away from
4 that and going back and saying now we have to -- if you are
5 going to do a LERF that is site specific, you have got to
6 have Level III PRA, which we are not dealing with in here at
7 all. We have no standards for Level III. We don't
8 discussion fission product standards and I think it is a
9 mistake to in this particular standard to go wavy from NRC's
10 intended use where the LERF that we have is related to plant
11 accident issues, like George says.

12 I think you do need some sort of tighter
13 definition of large and early release that relates to
14 actually the timing of the accident that would be site-
15 independent, frankly, and that is a problem I had with it
16 too.

17 CHAIRMAN APOSTOLAKIS: The definition seems to
18 depend on site characteristics in emergency --

19 DR. KRESS: Yes, but those fall into Level III
20 categories and you have no standards for Level III, so I
21 think you have a bit of a problem with that.

22 CHAIRMAN APOSTOLAKIS: Please.

23 MR. FLEMING: There was also some industry
24 perspective on the definition of LERF that we put into the
25 EPRI PSA Applications Guide, and we offered a definition in

ANN RILEY & ASSOCIATES, LTD.
Court Reporters
1025 Connecticut Avenue, NW, Suite 1014
Washington, D.C. 20036
(202) 842-0034

1 the PSA Applications Guide which is consistent with this
2 definition but it was a little bit different.

3 The philosophy from the industry perspective was
4 to expand the range of risk informed applications to be able
5 to consider some of the containment systems that might be
6 involved in the applications, and we came up with a
7 definition of LERF in the EPRI PSA Applications Guide which
8 was based on the philosophy of capturing all the risk of
9 early health effects and we used the definition that was
10 based on the assumption that Seabrook, the Seabrook Level
11 III PSA, which had a vast inventory of Level III analyses,
12 and also the Staff had pretty much concluded that Seabrook
13 had one of the more limiting sites with respect to the
14 emergency plan, we came up with a definition in the
15 Applications Guide, which I believe was earlier was
16 something like within four hours of vessel breach, which for
17 Seabrook was the time it took to clear out the EPZ based on
18 their site specific emergency plan, and that was part of the
19 definition for quite awhile.

20 We dropped the hour definition in recognition of
21 the fact that some plants may be able to clear out their EPZ
22 in two hours or one hour and if they have site-specific
23 analyses to be able to tighten up their definition of LERF
24 and not use the conservative definition for Seabrook they
25 would have that option.

1 But the philosophy was to provide a surrogate for
2 a Level III PRA that would expand the range of applications
3 beyond what CDF could look at without dragging in all the
4 issues that we have difficulty -- rebed cooling and basemat
5 melt-through -- and just take a subset of the Level II
6 issues into the risk-informed arena.

7 CHAIRMAN APOSTOLAKIS: I appreciate the effort but
8 the problem I see with that is that somebody may declare
9 their plant as capable of evacuating within 2 hours
10 without -- and then that is buried somewhere there and that
11 may be significantly uncertain.

12 DR. KRESS: You say how do you know that, whether
13 you did Level III, how good is your Level III.

14 CHAIRMAN APOSTOLAKIS: And to base a quantity that
15 plays such an important role in decisionmaking on these
16 kinds of assumptions makes me a little uneasy.

17 I would rather have a definition that depends on
18 the design, as Tom said, and the accident characteristics,
19 at least to have some bounds and give maybe some flexibility
20 because perhaps Karl's point is an important one that you
21 can't really ignore the fact that they may have very good
22 evacuation plans, but limit the impact of that. Perhaps
23 that would be a better way of doing it, because what if
24 someone says we can do it in an hour, and that is a sentence
25 there somewhere there in a three volume PRA and, you know,

1 the whole calculation of LERF depends on that --

2 DR. KRESS: Depends on that --

3 CHAIRMAN APOSTOLAKIS: -- and it would be very
4 hard to touch it.

5 I would feel better if there were some
6 recognition, some acknowledgement that these issues are
7 important because I fully appreciate the arguments you made.

8 Now there is also a page 128 user definition of
9 LERF that captures the contributions to the risk of early
10 health effects, but it seems to me that that has been stated
11 several times. It is just a matter of editorial cleaning
12 up, I think.

13 I think a lot of the discussion in 128 on the
14 right-hand column is very repetitive. That's your business.

15 MR. SCHNEIDER: Okay. I will take that into
16 consideration.

17 CHAIRMAN APOSTOLAKIS: Maybe we should start using
18 fuzzy sets, you know -- so dead set against them, but now I
19 see those definitions.

20 [Laughter.]

21 CHAIRMAN APOSTOLAKIS: Are you guys willing to
22 develop a standard for fuzzy PRA? Say no.

23 Okay. Are we done with LERF? Well, back to Mr.
24 Fleming.

25 MR. FLEMING: Thank you.

1 CHAIRMAN APOSTOLAKIS: I really hate to work for
2 an hour and a half without a break.

3 DR. KRESS: Yes, me too.

4 CHAIRMAN APOSTOLAKIS: Is our Federal employee
5 objecting to taking a break now? Okay. We will take a
6 break now for -- oh, well. How do we define a break without
7 using a clock? What about 15 minutes.

8 [Recess.]

9 CHAIRMAN APOSTOLAKIS: Okay. Back to session.
10 Karl?

11 MR. FLEMING: Karl Fleming from the project team.
12 Before I return to Section 4, I wanted to make a
13 comment. The cost estimates I provided earlier were for
14 time and materials and not a fixed price contract.

15 [Laughter.]

16 MR. FLEMING: Getting back to Section 4, one of
17 the comments that we wrestled with from Draft 10 was that
18 somebody counted up 900 and some odd requirements that had
19 the work "shall" and we were trying to avoid a frankly silly
20 exercise where we sit down and negotiate how many "shalls"
21 could be sent to "shoulds" or "mays" or whatever and it
22 didn't seem to be a very useful exercise, so what we decided
23 to do as part of our effort for Rev. 12 was to back up to,
24 say, 20,000 feet and from the point of view of people who
25 are competent to perform peer reviews and people who have

1 lots of experience in PSAs is to boil down these
2 requirements into a set of irreducible high level
3 requirements that point to basic attributes of a PRA that we
4 are all aware of.

5 These would be attributes such as the completeness
6 of the PRA, treatment of dependencies, the degree of realism
7 in the assumptions and the success criteria, the degree of
8 fidelity with the plant and the PRA model, and how well it
9 reflects the as-built, as-operated, and design change plant
10 and so forth and go across each of the nine elements of the
11 PRA and come up with high level requirements phrased in
12 "shall" language that everybody would agree have to be
13 present and form the critical mass of what is needed for the
14 product that we are going to put the PRA label on, whether
15 it is Category I, II or III.

16 One of the tasks that we laid out here, and I will
17 walk through some examples of those in a few minutes for
18 accident sequences, is to capture the essence of the
19 requirements in these high level requirements that typically
20 are a number in the range of maybe four or six high level
21 requirements for each of the nine elements, and we used this
22 as a starting point for organizing and defining the detailed
23 supporting requirements.

24 Many of these high level requirements are actually
25 in Draft 10 but they may be difficult to find because it was

1 presented in sort of a textual format and we wanted to bring
2 them out and make them very clear and explicit in this
3 version.

4 The concept is that each of these high level
5 requirements would apply to all three application
6 categories, but the extent and the context in which you
7 would apply them would be different depending on the
8 characteristics that I mentioned in the earlier
9 presentation.

10 With this kind of a concept what I would like to
11 do is actually walk through some of the high level
12 requirements for accident sequences.x

13 DR. BONACA: So you are in Chapter 4?

14 MR. FLEMING: Yes, we are in Chapter 4.

15 CHAIRMAN APOSTOLAKIS: I was wondering whether the
16 members had any comments on the definitions and the risk
17 assessment application process that are Chapters 2 and 3.

18 DR. BONACA: The Definitions section, you mean?

19 CHAIRMAN APOSTOLAKIS: Yes. I just got a comment
20 from Mr. Barton, who could not be here today. On page 10,
21 unavailability is defined as follows -- the fraction of time
22 that a test or maintenance activity disables a system or
23 component, also the average unreliability of a system or
24 component over a defined period of time.

25 His comment is the word "unreliability" is not

1 defined, so there should be a definition of unreliability as
2 well.

3 That brings me to another comments, which is a
4 favorite of mine. This definition I recognize is one that
5 the industry has been using for a long time, the fraction of
6 time that a test or maintenance activity disables a system.

7 It is not consistent with the definition in
8 reliability theory, which is that the component or system is
9 unavailable due to any reason at Time T, and this has been
10 an issue before in other contexts.

11 What was the last time we had an appendix with a
12 definition and I didn't like it there either? The
13 maintenance rule.

14 It seems to me that if one decides to go with this
15 definition of unavailability then one would have to have in
16 the expressions for the probability of the thing not
17 responding --

18 MR. BUDNITZ: [By Telephone] This is Bob
19 Budnitz --

20 CHAIRMAN APOSTOLAKIS: Okay. We know who you are.

21 MR. BUDNITZ: Oh. I know who you are too.

22 CHAIRMAN APOSTOLAKIS: Can you see us?

23 MR. BUDNITZ: I cannot see you. I am only on a
24 phone. Are you more gorgeous than usual?

25 DR. KRESS: Yes. The answer is yes.

ANN RILEY & ASSOCIATES, LTD.
Court Reporters
1025 Connecticut Avenue, NW, Suite 1014
Washington, D.C. 20036
(202) 842-0034

1 CHAIRMAN APOSTOLAKIS: Okay, we can hear you very
2 well, Bob.

3 MR. BUDNITZ: Look, I have to be out of here at a
4 quarter after, which is just over an hour from now.

5 CHAIRMAN APOSTOLAKIS: Okay, don't worry. We will
6 be done by then.

7 DR. KRESS: Do you have some comments you want to
8 make, Bob?

9 MR. BUDNITZ: You mean upfront?

10 DR. KRESS: Yes.

11 MR. BUDNITZ: Where are you in the agenda?

12 CHAIRMAN APOSTOLAKIS: We are talking about
13 definitions. We finished LERF.

14 I will give you a few minutes to catch up, okay?

15 MR. BUDNITZ: Yes. I thought I was on because
16 when you come to expert judgment I am the one.

17 CHAIRMAN APOSTOLAKIS: We will make sure we do
18 this before you have to go.

19 MR. BUDNITZ: Okay.

20 MR. SIMARD: Expert judgment as well as any
21 questions about initiating events -- Bob and Steve in that
22 area.

23 CHAIRMAN APOSTOLAKIS: Initiating events is coming
24 up.

25 So as I was saying, if we adopt this definition,

1 which the industry seems to be comfortable with, then there
2 has to be an extra term, probably of failure on demand.

3 I am not sure that we have that in the
4 expressions.

5 Now if you go to standard mathematical books on
6 reliability, unavailability includes that so I don't know
7 what the resolution should be.

8 At some point we have to make sure we have one
9 definition.

10 I think the industry refers to the latter, the
11 probability of failure on demand is unreliability, which
12 again conflicts with the mathematical definition which says
13 it is the probability of not performing in a period of time,
14 so I don't know.

15 Do the members have any suggestions? Should we
16 try to change the way the industry uses these terms?

17 DR. BONACA: Well, for me, not including other
18 reasons why a system or component is unavailable, it just
19 doesn't make any sense.

20 CHAIRMAN APOSTOLAKIS: They may include it in the
21 calculations. I don't know.

22 DR. BONACA: I understand that.

23 CHAIRMAN APOSTOLAKIS: The definitions should
24 include it, in my view --

25 DR. BONACA: -- should include it.

1 CHAIRMAN APOSTOLAKIS: Okay, so we will probably
2 make a comment to that effect and the committee will have to
3 decide.

4 Now speaking of definitions, I also have a
5 question, but maybe we can wait until -- the human error.
6 The definition of latent human error, do you want to do it
7 now or when we talk about human errors?

8 MR. FLEMING: As you wish.

9 CHAIRMAN APOSTOLAKIS: Well, it says here on page
10 8 a human error typically by mispositioning or
11 miscalibrating a component that if not detected or corrected
12 predisposes the affected component to failure when demanded.

13 This is a very limited definition of the latent
14 error, and I would recommend that you use Jim Reason's
15 definition of latent conditions and latent, which is any
16 human action before the actual active error takes place and
17 not just mispositioning or miscalibrating.

18 Any other comments from the members on the
19 definitions?

20 DR. BONACA: I would like to provide one.

21 On page 5 on the definition of accident class
22 there is a use of the word "severe" accidents, and I believe
23 that is a little bit of a narrow connotation there, somewhat
24 confusing. I would certainly prefer to see a grouping of
25 accidents that by severe accidents we indicate very specific

1 ones but you include the category of transients that are not
2 necessarily ending up in a severe accident.

3 Now on the issue of accident consequences, here is
4 it more of a -- you know, in regulatory space is meant only
5 doses. I mean is meant only radiological release, and I am
6 not sure that you may not want to look at that definition
7 there if it creates an unintended conflict, a confusion.

8 This I am just raising as a question and would let
9 the ASME decide what is the proper approach.

10 At the bottom of page 5, "available time"
11 specifically talks about time from which an indication is
12 given that human action is needed to where the action was
13 performed to "avert" -- first of all, the word "avert" --
14 but core damage I think again is a very narrow definition
15 there.

16 I don't think it is intended only that sense of
17 available time. I think there are actions that prevent
18 other events, not only core damage and again it is very
19 narrow to focus on core damage -- maybe to where the action
20 was to be performed to achieve success, whatever that means.
21 You could let it be in the analysis.

22 The definition on page 6 on containment analysis
23 needs work. There is some editorial problem there -- no,
24 that's okay -- definition of extended events on page 6,
25 again there is always this pointing may lead to core damage

1 or larger releases, but really you are looking at extended
2 events in a broader sense -- and again that reference to
3 core damage early release I don't think that is necessary in
4 the context of the definition.

5 CHAIRMAN APOSTOLAKIS: Well, for extended events
6 though that is really what you worry about. Isn't it? I
7 mean if you have an earthquake or --

8 DR. BONACA: Yes. I am talking about there
9 extended events is initiating event originating outside -- I
10 mean you may conclude in the analysis they will lead you to
11 that. You are still defining certain external events.

12 For example, I could have conceivably a typical
13 external event for a PRA that you always analyze that in
14 that particular plant will not lead to CDF or LERF.

15 It would still be --

16 CHAIRMAN APOSTOLAKIS: But the concern is that it
17 might. That is why you analyze it.

18 DR. BONACA: Yes, but if you look at the
19 definition -- may lead.

20 CHAIRMAN APOSTOLAKIS: May lead to the part of
21 external events?

22 MR. FLEMING: Internal events. It's in the scope.

23 DR. BONACA: Page 7 on the harsh environment,
24 there is a reference to appropriate for design basis or
25 beyond design basis accidents.

1 I would rather a definition that does not include
2 -- not narrow that much. Again, a environment -- as a
3 result of the postulated accident condition.

4 I mean, there are some others one, and I don't
5 want to spend any more time. I will provide them.

6 CHAIRMAN APOSTOLAKIS: Sure. We'll have an
7 appendix.

8 DR. BONACA: Again, the word, unavailability on
9 page 10, mirrors the comments we had.

10 MR. BERNSEN: Let me just ask one question. We
11 would like, wherever possible, to use existing definitions,
12 definitions that have been published, if they're at all
13 consistent with our intent. So that if you have some
14 alternative definitions that have been published, if you
15 could cite the reference or whatever for them, that would be
16 very helpful.

17 CHAIRMAN APOSTOLAKIS: Sure. We will probably
18 have appendix to our letter with the detailed comments,
19 maybe line-by-line. I don't know.

20 One last comment on the definitions which may
21 involve Bob Budnitz. On page 6, there is a definition of
22 expert solicitation.

23 First of all, I would suggest that you change it
24 to expert opinion elicitation. It's not the elicitation
25 that's expert; it's the opinion.

1 And second, it says a formal highly structured and
2 documented process. Now, if you go to the actual section on
3 expert opinion, there is allowance for less than highly
4 structured processes.

5 So, it seems to me that it's overly restrictive to
6 define it as a highly-structured process. Above, when you
7 use the technical integrator, the technical integrator, then
8 the process is not necessarily highly structured.

9 It's highly structured when you go to the full
10 treatment that the technical facilitator, integrator,
11 demands.

12 And I think that in Section 6, you make -- I'm
13 sorry, 4.6, you make that point well. So it seems to me
14 this definition here should delete -- maybe you can say a
15 structured formal approach, rather than highly structured.

16 MR. BUDNITZ: Which definition are you looking at?

17 CHAIRMAN APOSTOLAKIS: Expert elicitation on page
18 6. Okay?

19 MR. BUDNITZ: Yes, you can just take the "highly"
20 out of there. I understand that point. It's a good point.

21 CHAIRMAN APOSTOLAKIS: Or maybe completely highly
22 structured and say a formal and documented process, and you
23 differentiate in 4.6, regarding the various levels.

24 MR. BUDNITZ: It's got to be structured, George.

25 CHAIRMAN APOSTOLAKIS: Okay. Can you have a

1 formal process that's not structured?

2 DR. KRESS: Yes.

3 CHAIRMAN APOSTOLAKIS: Okay. My expert in English
4 tells me yes. I will not question it. I have questioned it
5 in the past and have regretted it.

6 MR. BERNSEN: I would observe that this is a
7 formal process.

8 CHAIRMAN APOSTOLAKIS: But it's not structured.

9 [Laughter.]

10 CHAIRMAN APOSTOLAKIS: Thank you very much, Mr.
11 Bernsen.

12 DR. KRESS: I had a couple of items on the
13 definitions.

14 CHAIRMAN APOSTOLAKIS: Sure.

15 DR. KRESS: Most of mine were covered by Mario,
16 but on page 6, the definition of core damage frequency, I
17 wonder why the shied away from the usual connotation that's
18 per year instead of per unit time, although, you could
19 define it anyway you want to, but it's usually in the use of
20 CDF and LERF, it's always per year, per reactor year.

21 CHAIRMAN APOSTOLAKIS: Actually, in the text
22 somewhere they say that it's not per reactor year; that's
23 it's per calendar year. That was a question I wanted to
24 ask, why-- because you're considering all modes of
25 operation, so even if the reactor --

1 But if the reactor is in cold shutdown, do you
2 really care? I mean, the definition is somewhere, and let
3 me see if I can find it.

4 [Pause.]

5 You're saying it in the text, but --

6 DR. KRESS: If Dana were here, he's say, yes, I
7 care.

8 CHAIRMAN APOSTOLAKIS: Yes, I what?

9 DR. KRESS: If Dana were here, he's say, yes, I
10 care, to your question.

11 CHAIRMAN APOSTOLAKIS: I think there is an
12 inconsistency between the definition and the text. Karl?

13 MR. FLEMING: Yes, with respect to the -- I
14 believe that in the technical requirements for quantifying
15 initiating event frequencies, for example, you'll see the
16 need for expressing units in terms of calendar year.

17 That's just to clarify that the alternative might
18 be to calculate it per reactor operating year, and then
19 you're going to be coming up with units that may be
20 inconsistent with the criteria, you know, all the safety
21 goals and core damage objectives, and so forth, really are
22 calendar year.

23 There has actually been some confusion out there
24 in the industry about what calculations should be performed.

25 DR. KRESS: Okay, the other question I had was on

1 common-cause failure. I thought that defining it in terms
2 of a short period is a good idea, but it leave me wanting a
3 little bit more in terms of what is meant by short.

4 It has something to do with whether the two
5 failures are close enough in time that they actually impact
6 the sequence somehow.

7 And so somebody needs to add a little more of a
8 definition of "short" in there that I thought it could be
9 expanded on.

10 DR. BONACA: I think it's a very good comment.
11 For example, you may have oftentimes a -- mode failure is
12 caused by a replacement, say, of a component with a
13 different material that will lead to the failure later on.

14 Many of them are latent, and then may develop
15 themselves in a long time.

16 DR. KRESS: You to have a certain probability
17 that's going to impact the sequence.

18 DR. BONACA: That's right. So that's a good
19 requirement to clarify that.

20 CHAIRMAN APOSTOLAKIS: Karl, do you plan to spend
21 any time on initiating events? I would like to finish
22 initiating events and expert judgments, so that Bob can be
23 off the line.

24 MR. FLEMING: Fine. If you have questions, I did
25 not prepare.

1 CHAIRMAN APOSTOLAKIS: Okay, let's finish first.

2 DR. BONACA: I just have one more comment,
3 unfortunately, on -- a question, actually. That's why I'm
4 raising it, on the definition on page 9, under PRA Upgrade.

5 It says the incorporation into the PRA models of a
6 new methodology that has not been previously peer-reviewed.
7 I assume that if I incorporate it into my model, a new
8 methodology, whether or not it was peer-reviewed, it would
9 be an upgrade of my PRA.

10 MR. FLEMING: Yes.

11 DR. BONACA: Unless I misunderstand what you
12 meant.

13 DR. KRESS: It doesn't matter whether it's peer-
14 reviewed or not.

15 DR. BONACA: That's right.

16 DR. KRESS: It's still an upgrade.

17 DR. BONACA: May I'm missing something.

18 MR. BERNSEN: We could let Rick answer that, but I
19 think the intent here is that this is a definition that's
20 unique to the standard, and, in particular, to the peer
21 review section where we're talking about what changes in the
22 PRA need to have a peer review.

23 So it's kind of -- it's unique to the standard,
24 and that's why the differentiation. Is that right, Rick?

25 MR. HILL: Well, actually, I don't think I'd have

1 a problem with taking out the, "that has not been previously
2 peer-reviewed."

3 Yes, it is unique to the standard, but the context
4 of what an upgrade is, is a change in methodology, rather
5 than just a change in time phasing like data or something
6 like that.

7 I also think that this has not previously been
8 peer-reviewed, might skew the definition to somebody
9 thinking, well, this particular methodology has been
10 reviewed someplace else, so, therefore, it's acceptable
11 here, without thinking about the application of that
12 methodology.

13 MR. WALL: Mr. Bonaca, I'd like to draw your
14 attention -- sorry, this is E.M. Wall, a team member.

15 Mr. Bonaca, I'd like to draw your attention to
16 page 136, configuration control, Section 5, and Subsection
17 5.4.

18 We used these two definitions to distinguish an
19 upgrade from maintenance. For a maintenance, we kind of
20 even have kind of an internal review. It's for very minor
21 things.

22 An upgrade is a major thing which will require
23 some incremental peer review, pursuant to Section 6.

24 DR. BONACA: I understand, but still, I mean, I
25 may decide to upgrade by adding seismic or fire, okay? And

1 I'm going to use a PRA methodology which has been previously
2 reviewed. I'm asking somebody to put it in.

3 That's a major upgrade of the PRA. And so I would
4 call it an upgrade, irrespective of whether or not that
5 methodology has been peer-reviewed.

6 MR. SIMARD: We'll look at that. It sounds like
7 we ought to delete that phrase and just end the sentence
8 after new methodology.

9 DR. BONACA: I don't want to belabor it, I'm just
10 pointing out that it is something to look at. Thank you.

11 MR. SIMARD: Okay.

12 CHAIRMAN APOSTOLAKIS: Are we ready to move on to
13 initiating events? Since Carl Doesn't have any -- maybe you
14 can put up the viewgraph you have which is the -- no, it's
15 on page 21, where it talks about --

16 MR. BUDNITZ: George?

17 CHAIRMAN APOSTOLAKIS: Yes?

18 MR. BUDNITZ: In the sequence of the text expert
19 opinion. comes first.

20 CHAIRMAN APOSTOLAKIS: Really?

21 MR. EISENBERG: No, it doesn't.

22 MR. BUDNITZ: Doesn't it?

23 CHAIRMAN APOSTOLAKIS: It's on --

24 MR. BUDNITZ: It's 4.6. I apologize.

25 CHAIRMAN APOSTOLAKIS: It's page 135.

1 MR. BUDNITZ: Of course.

2 CHAIRMAN APOSTOLAKIS: Are there any comments on
3 initiating events from the members?

4 [No response.]

5 MR. BUDNITZ: Well, that was easy.

6 DR. SHACK: My one comment is sort of really just
7 that it does apply that there is an awful lot of detail that
8 was in the Draft 10 that disappeared from the Draft 12. I
9 mean, that's common to the whole thing, and it's this
10 philosophy, perhaps --

11 I mean, typical ASME standards are fairly
12 prescriptive, and they provide a lot of detail. You know,
13 I've heard references here that the philosophy here is to
14 provide sort of a high level guidance to the peer review
15 panel who are assumed to be knowledgeable.

16 And you've omitted a great deal of detail that is
17 in other guidance documents like NUREG 1602, which was
18 another attempt to sort of set up guidance for PRA, or the
19 Draft 10 version.

20 And haven't you really lost something here in
21 omitting these details?

22 MR. BUDNITZ: Well, about initiating events --
23 this is Bob Budnitz from 3,000 miles away -- about
24 initiating events -- and I believe that this was something
25 that was true all the way through --

1 Remember -- and it's very important for you to
2 understand that the whole standard is telling the analyst or
3 the analyst team what to do and not how to do it. What to
4 do, and not how to do it.

5 Now, in the course of reviewing Rev 10, there was
6 some stuff in there that told them how to do it, and I, like
7 the others, took that out. Actually, I didn't have to take
8 a lot of it out; it was taken out in the intermediate thing
9 you never saw called Rev 11.

10 When a subset of our group took Rev 10, they made
11 the major, major changes of going to three columns of
12 requirements, and integrating the NRC certification
13 requirements with what had been there before to make a
14 larger list and straightening things out, a whole lot of
15 detail was taken out that was of the character of how to do
16 that.

17 And that was true here, too, however, I don't
18 think that, unless you find one -- and I'd be, of course,
19 eager to know -- I don't think there was any what-to-do's
20 that we lost in the course of taking out a lot of that how-
21 to-do.

22 So although it comes up here in initiating events,
23 it's really a question of philosophy for the whole thing.
24 It just happens to come up here, first, I suppose.

25 CHAIRMAN APOSTOLAKIS: Karl?

1 MR. FLEMING: Yes, to amplify on what Bob just
2 said, if you go back to Rev 10, on the Section 3, I guess it
3 was, that had the detailed requirements, the entire content
4 of all the requirements for initiating events was on page.

5 All the other material that you found in Rev 10 on
6 initiating events and other issues like that, was back in
7 the Appendix, which was in the form of guidance and things
8 like that.

9 So, actually, if you look at the detailed
10 requirements we have in initiating events in Rev 12, there
11 is actually more here. There is more because we have
12 integrated in additional requirements that were in the
13 certification process that were not in Draft 10.

14 MR. BUDNITZ: But either that one -- it was really
15 one that had pages, Karl, you're right.

16 Even there, there was some stuff that was how to
17 do it, that I then went through and took out, in the spirit
18 of what we were trying to do with the whole thing.

19 You see, if there are five different ways to
20 accomplish a certain thing, we made a decision up front that
21 it was erroneous for us to prescribe one of them.

22 Now, by the way, if they're all equipment -- and
23 no one had ever done a PRA in this area -- it might be
24 useful to prescribe and have everybody do it the same way.

25 But, in fact, we've got 100-odd PRAs out there,

1 that all did it different ways. And you don't want anyone
2 of them to say, gee, you did it incorrectly, because you
3 didn't do it the way we told them how to do it.

4 So, if you're reacting to that, I believe your
5 observation is completely correct, and we did it on purpose.

6 CHAIRMAN APOSTOLAKIS: There is some
7 inconsistency. I agree with you, Bob, that this is a
8 broader issue than just initiating events.

9 MR. BUDNITZ: Oh, of course.

10 CHAIRMAN APOSTOLAKIS: And I was planning to bring
11 it up when we discuss human reliability analysis, and expert
12 judgement.

13 In other words, in some instances, you give more
14 detailed guidance in the form of references, and in others,
15 you don't.

16 MR. BUDNITZ: Well, I --

17 CHAIRMAN APOSTOLAKIS: It's a matter of being
18 consistent.

19 MR. BUDNITZ: Well, without arguing the case, it
20 is -- if you can point out places where we can give
21 references that provide a good example of how one goes about
22 it, why, those are very valuable.

23 CHAIRMAN APOSTOLAKIS: I mean, I realize that this
24 particular standard is not really a procedures guide. It
25 doesn't really give you methods.

1 MR. BUDNITZ: Quite the opposite.

2 CHAIRMAN APOSTOLAKIS: You stayed away from it,
3 and, in fact, one of the criticisms, as you told us earlier,
4 was that you were too prescriptive in Rev 10.

5 So, the least we can do then is, when we discuss
6 HRA, and expert judgment, is to make sure that there we
7 eliminate the more specific advice that is given, which is
8 inconsistent with the other chapters.

9 Anything else in initiators?

10 DR. KRESS: I had one, George.

11 CHAIRMAN APOSTOLAKIS: Sure.

12 DR. KRESS: On page 33, Table 4.4-1(d), under Item
13 1(e)-D14, we talk about that the frequencies need to be
14 weighted by the fraction of time the plant is at power. I
15 think that needs to be made a little more clear that the
16 weighting goes in the denominator instead of the numerator.
17 It may be clear to everybody else.

18 MR. BUDNITZ: By the way, this is exactly the
19 place where the adjustment is made to the difference between
20 a reactor year and a calendar year.

21 DR. KRESS: That's right.

22 MR. BUDNITZ: That's exactly the point that we
23 spoke about this about five minutes ago?

24 DR. KRESS: That's it.

25 MR. BUDNITZ: This is the only place it's done.

1 This is the only place where frequency comes in, in quite
2 this way, right?

3 DR. KRESS: That's right, and that's why I thought
4 it need to be made a little clearer as to what you're doing
5 here.

6 MR. BUDNITZ: Well, explain -- no sweat. What
7 wording would you --

8 DR. KRESS: Well --

9 MR. BUDNITZ: You're going to tell them to do the
10 arithmetic right, or something?

11 DR. KRESS: Well, that's basically that's it.

12 CHAIRMAN APOSTOLAKIS: We do that in the
13 introduction.

14 DR. KRESS: If it's clear to everybody, okay.

15 MR. BUDNITZ: If it isn't clear --

16 DR. KRESS: It was clear enough to me, but I
17 wasn't sure it would be clear to everybody.

18 I have another sort of comment on page 25 where
19 we're introduced to key safety functions, which I thought
20 was --

21 MR. BUDNITZ: Which requirement?

22 DR. KRESS: This is high level requirements for
23 initiating event analyses on page 25 of my version. At the
24 footnote, we're introduced to key safety functions.

25 I like that. I liked the list that they have

1 there, but the problem I have with it is, I hated to see
2 that relegated only to a footnote. I wish there was a
3 section in there talking about key safety functions and the
4 role they play here.

5 In fact, you see this footnote showing up with
6 multiple tables, all along through here. I thought that if
7 you could take care of it up front, and not have to repeat
8 it every time, it might help the readability a little bit.

9 But somehow I thought this was too-important a
10 concept just to relegate to a footnote, and that was the
11 only comment there.

12 CHAIRMAN APOSTOLAKIS: Can you give me an example
13 of a safety function that is not a key safety function? If
14 I look the way you define them, it seems to me that you
15 covered everything, reactivity control, core heat removal,
16 reactor coolant inventory control, reactor coolant heat
17 removal and containment bypass integrity.

18 MR. BUDNITZ: Oh, I suppose you'll find -- I
19 imagine that if I told you that the Center for Disease
20 Control in Atlanta concentrated on key diseases, I could
21 probably come up with some minor diseases they don't
22 concentrate on. I bet there are some.

23 CHAIRMAN APOSTOLAKIS: No, I'm not sure.

24 MR. BUDNITZ: Maybe not. Control --

25 CHAIRMAN APOSTOLAKIS: What you have listed here -

1 -

2 MR. BUDNITZ: Inventory, that's pretty much the
3 whole thing.

4 CHAIRMAN APOSTOLAKIS: It is pretty high level,
5 and it sounds like it's all-inclusive, so they are really
6 safety functions, so there isn't such a thing as a key
7 safety function.

8 I mean, the moment you talk about core heat
9 removal, reactor coolant inventory control and reactor
10 coolant heat removal --

11 DR. KRESS: Where would you put flooding the
12 cavity in that?

13 CHAIRMAN APOSTOLAKIS: Is that a safety function?

14 DR. KRESS: I consider it one. Where would you
15 put operation of the sprays?

16 CHAIRMAN APOSTOLAKIS: I would say if you deleted
17 the word, bypass, and you said containment integrity, then
18 all these things are included there.

19 DR. KRESS: But they didn't. They had containment
20 bypass integrity.

21 CHAIRMAN APOSTOLAKIS: Just because of the word,
22 bypass, we define a new class of safety function?

23 MR. BUDNITZ: No, no, these aren't those. These
24 are functional initiating event categories or categories
25 that affect these things.

1 DR. KRESS: Oh, you're talking about initiating
2 events.

3 CHAIRMAN APOSTOLAKIS: I think the word, key, is
4 redundant here. I mean, you really have to try very hard to
5 find something that doesn't belong there.

6 MR. BUDNITZ: Well, going once, going twice, it's
7 out. It also has the phrase, are the minimum set -- well,
8 these include, at a minimum, X, Y, and Z, so you're right,
9 there is the freedom to throw something else in there; do
10 you see it?

11 DR. KRESS: You're right.

12 CHAIRMAN APOSTOLAKIS: Anyway, we don't want to
13 make a big deal out of it.

14 MR. BUDNITZ: Are you taking notes about these
15 things, because I'm not.

16 MR. SIMARD: Yes, we're taking notes and we're
17 also going to get a copy of the transcript.

18 CHAIRMAN APOSTOLAKIS: There is a transcript.

19 MR. BUDNITZ: Enough said; it's done, okay?

20 CHAIRMAN APOSTOLAKIS: Anything else on
21 initiators?

22 [No response.]

23 CHAIRMAN APOSTOLAKIS: From the members?

24 [No response.]

25 CHAIRMAN APOSTOLAKIS: One quick question on page

1 26 under Transients in the bottom box: And this is now a
2 requirement that applies to all three categories.

3 MR. BUDNITZ: Which requirement are you in?

4 CHAIRMAN APOSTOLAKIS: This is Table 4.4-1(a),
5 page 26, 331, 331-B, transients, loss of offsite power and
6 manual shutdowns. Are these the only transients we're
7 looking at?

8 MR. SIMARD: Well, we do say that the following
9 list is not intended to be all-inclusive.

10 CHAIRMAN APOSTOLAKIS: I mean, automatic shutdowns
11 for some reason are not a transient?

12 DR. KRESS: They generally are categorized as
13 transients.

14 CHAIRMAN APOSTOLAKIS: Why do we distinguish? Why
15 the word, manual? Should it be just shutdowns?

16 MR. SIMARD: Absolutely.

17 CHAIRMAN APOSTOLAKIS: Bob?

18 MR. BUDNITZ: I can't remember why that's there.

19 CHAIRMAN APOSTOLAKIS: Well, maybe you guys can
20 think about it.

21 DR. SHACK: That's really one of the things that
22 really got stripped down compared to Version 10. There was
23 a much longer list and much more detailed thing in 10 than
24 there is in 12.

25 MR. BUDNITZ: Yes. It should say manual and

1 automatic, just to flesh it out.

2 CHAIRMAN APOSTOLAKIS: Yes.

3 MR. BUDNITZ: I don't argue that for a moment.

4 CHAIRMAN APOSTOLAKIS: Especially since these
5 things are now part of the performance indicators, right?

6 MR. BUDNITZ: That isn't relevant to us. We're
7 doing a PRA.

8 CHAIRMAN APOSTOLAKIS: To support risk-informed
9 oversight.

10 MR. BUDNITZ: In part.

11 CHAIRMAN APOSTOLAKIS: Why am I arguing with you,
12 Bob. Maybe now we can go back to Mr. Fleming. You plan to
13 talk about accident sequence analysis?

14 MR. FLEMING: Yes.

15 CHAIRMAN APOSTOLAKIS: Good. I don't know, but
16 how do we handle this expert judgment? Should we do it now
17 so that Bob can --

18 MR. FLEMING: It's your call.

19 CHAIRMAN APOSTOLAKIS: Okay, let's do expert
20 judgment. That is on page 155, as I recall. One of the
21 comments of the Committee was time -- was too detailed and
22 focused on one approach.

23 MR. BUDNITZ: Well, it's fair to say that the
24 original version 18 months ago was ten times as long.

25 CHAIRMAN APOSTOLAKIS: Yes. The first comment,

1 Bob, is --

2 MR. BUDNITZ: With a whole lot of detail that's
3 just gone, including a long appendix that's gone.

4 CHAIRMAN APOSTOLAKIS: Yes. Unlike other chapters
5 -- we're coming back to the earlier comment about
6 consistency and so on.

7 You are giving two references here. Other
8 chapters, or most of them stay away from providing
9 references.

10 MR. BUDNITZ: But you notice that they're
11 permissive, may be used to meet the requirements in the --

12 CHAIRMAN APOSTOLAKIS: But you know, the moment
13 you say "may be" in a standard, I mean, that's --

14 MR. BUDNITZ: No, "may" is a crucial word that is
15 used in standards to indicate a permissive that is not
16 required.

17 CHAIRMAN APOSTOLAKIS: Right, but then --

18 MR. BUDNITZ: Other approaches may also be used.

19 CHAIRMAN APOSTOLAKIS: But then the question is
20 why these two? For example, the second one would seem to me
21 to apply to high level waste repositories. It's from the
22 NMSS Branch of the NRC, and it says in the title, in the
23 high level radioactive waste program.

24 Why does this belong in a reactor standards?

25 MR. BUDNITZ: Because it's a method.

1 CHAIRMAN APOSTOLAKIS: It's a method? I thought
2 they just reviewed existing methods?

3 MR. BUDNITZ: Well --

4 CHAIRMAN APOSTOLAKIS: The first reference is a
5 method, but the second one really was a review to state the
6 Branch position and I'm not sure that this helps anybody
7 here.

8 And then the big question you're going to get is,
9 why are you ignoring NUREG 1150? If you are going to put a
10 Branch technical position on high level radioactive waste
11 repositories, you are -- you are not citing the major study
12 that involved expert judgments sponsored by the Nuclear
13 Regulatory Commission.

14 MR. BUDNITZ: George, you might know the answer to
15 that.

16 CHAIRMAN APOSTOLAKIS: I know.

17 MR. BUDNITZ: That was written by Apostolakis and
18 Budnitz and a bunch of other people. If you don't know
19 that, George and I were the authors of 6372.

20 The answer, George, is that in 6372, after a lot
21 of thinking, we rejected some of the methodology used in
22 1150.

23 CHAIRMAN APOSTOLAKIS: But we never really look at
24 what the staff did in NMSS, and I'm pretty sure if we
25 reviewed that, we would have some comments as well.

1 My point is that the moment you start putting
2 references, you get these questions. You know, why didn't
3 you include this guide? Why didn't you include that guide?
4 Why do you have this fellow?

5 I would say it would be probably best to not have
6 any references at all. Now, that severely limits the
7 ability of the user to really do something, but it would be
8 consistent with the rest --

9 Or, just take out the second reference, which I
10 think is irrelevant here, and put two or three more. I'm
11 sure you're going to get this comment about NUREG 1150.

12 I mean, they went through a major exercise there.
13 They spent a lot of the Agency's money, and now we are not
14 even citing them.

15 MR. BUDNITZ: On 1150, I'm prepared to write a
16 rebuttal if anybody says that, and I assume that you will
17 review and tell me I was right about it.

18 You remember what they didn't do that was right.

19 CHAIRMAN APOSTOLAKIS: But since you are allowing,
20 Bob, a graded approach to the use of expert judgment --

21 MR. BUDNITZ: Sure.

22 CHAIRMAN APOSTOLAKIS: Surely there is a role for
23 1150 somewhere there? I mean, in Category II issue, for
24 example, I mean, we're even allowing the technical
25 integrator to do it internally to the company, you know,

1 without even going to outside experts.

2 In that sense, there must be a role for 1150
3 somewhere. I mean, I am on your side when you say that in
4 the full treatment, the first reference we have here goes
5 beyond 1150. And now it just occurred to me, can we comment
6 on things that we have co-authored?

7 MR. BUDNITZ: Well, I am on the phone with you so
8 we can do what we want. You just stated on the record that
9 you and I co-authored that, so everybody understands.

10 CHAIRMAN APOSTOLAKIS: There is Mr. Markley here
11 who has some views.

12 MR. MARKLEY: Well, George, to the extent that you
13 can, you should avoid discussing your own work.

14 CHAIRMAN APOSTOLAKIS: What I am doing here, Mike,
15 is I am staying away from the technical content.

16 MR. MARKLEY: You can state the facts.

17 CHAIRMAN APOSTOLAKIS: I am just stating that
18 there are other references that I think belong.

19 DR. KRESS: Right.

20 MR. MARKLEY: There is nothing wrong with that.

21 DR. KRESS: You can provide clarifications, and to
22 the extent that you are not supporting the reference, you
23 can actually add to the discussion.

24 CHAIRMAN APOSTOLAKIS: Sure. And I think it is
25 evidence from our exchange with Bob that we are not really

1 getting into the details. My point is that since you
2 decided to cite the reference, and I think that is
3 appropriate here, because it is not easy to find these
4 things, it seems to me you have to cite a few more for
5 completeness. And especially since your write-up, the text,
6 does allow for different approaches that involve different
7 levels of sophistication, if you will. That is all the
8 comment I have to make here.

9 DR. KRESS: But when you start adding more
10 references you always have the completeness problem.

11 CHAIRMAN APOSTOLAKIS: Well, yeah, but I mean
12 there are two or three major, like 1150, I mean, for
13 heaven's sake, it introduced the formal use of expert
14 judgment to the nuclear safety business. There were lots of
15 little papers here and there, some of them mine, but 1150
16 really pulled the whole thing together.

17 DR. KRESS: But there is a whole science out there
18 on expert elicitation.

19 CHAIRMAN APOSTOLAKIS: Sure.

20 DR. KRESS: With books and texts, and where do you
21 stop?

22 CHAIRMAN APOSTOLAKIS: But what I am saying is we
23 should limit ourselves to things that have been used in the
24 nuclear business, especially the ones -- I don't know that
25 the industry has supported any major studies in this area,

1 but the NRC certainly has. There was another one later on
2 Level III.

3 DR. KRESS: Level III.

4 CHAIRMAN APOSTOLAKIS: Which was in collaboration
5 with the European Union.

6 MR. BERNSEN: George, we will certainly consider the
7 comment.

8 One of the other observations I would make is that
9 we have talked to Bob about the fact that there was a lot of
10 valuable material in the earlier drafts that shouldn't be
11 lost. And I believe he is committed to write a paper which
12 might be suitable for reference in this issue or some
13 subsequent issue of our standard. We felt that a technical
14 paper would be more useful for that type of information
15 perhaps than a standard.

16 CHAIRMAN APOSTOLAKIS: That's fine. But, again,
17 looking at the standard alone, since there are no references
18 in other places.

19 MR. BERNSEN: Understood. And we will certainly
20 consider that.

21 CHAIRMAN APOSTOLAKIS: Jack?

22 MR. SIEBER: I was just thinking that that is a
23 good idea to write a supplementary paper, because I think
24 that then becomes the tutorial for the application of the
25 standard, and without it, I think there is something

1 missing.

2 MR. BUDNITZ: Well, on the other end, I said I
3 would do that, but it hasn't been done yet, and it certainly
4 isn't going to get into this edition of the standard, you
5 know, because, obviously, you know how long these things
6 take.

7 George, by the way, so here is George -- George is
8 talking about this, and without about arguing about
9 conflicts, George, offline, let's have a conversation about
10 what other references might be appropriate here, and I will
11 give it some thought.

12 CHAIRMAN APOSTOLAKIS: Sure.

13 MR. BUDNITZ: And, by the way, just to broaden
14 this, I can call up and have discussions with two or three
15 other members of our team, there were seven authors there,
16 like Peter Morris and so on, and see if I can pull together
17 an improved little list.

18 CHAIRMAN APOSTOLAKIS: Yeah, I am not talking
19 about, you know, 35 references. I am talking about --

20 MR. BUDNITZ: Certainly. You are talking about
21 two or three more.

22 CHAIRMAN APOSTOLAKIS: Two or three key, major
23 references, you know, that included nuclear related issues.

24 One or two more comments. I think, Bob, you
25 undertook a very difficult task here trying to give guidance

1 as to when to use, you know, the facilitator approach or the
2 technical integrator, and there is a series of four bullets
3 on page 135. I would suggest, I mean I understood what you
4 meant here, but, you know, I have spent three years with you
5 working on this, earlier on the standard says that examples
6 will be used to clarify things. In fact, in Section 4.4 on
7 requirements, there is a series of examples. I would
8 suggest that on this Section 4.6, you give a few examples of
9 what you mean by certain things.

10 For example, are there any Level I issues that
11 would require a TFI treatment, or would the technical
12 integrator treatment would be good enough? The one that
13 comes to mind from 1150 is the coolant pump seal LOCA, where
14 there is model uncertainty. Would that be a good example?
15 And maybe that one can be handled by the utility itself,
16 since you allow them to do that, by a technical integrator.
17 Then, as you move on to Level II, I suspect for some of
18 these issues, one would have to do a more rigorous expert
19 judgment elicitation process, you know, so people will get a
20 better idea.

21 I am afraid that this is not clear now, unless you
22 really have read some of the citations. And especially when
23 you say, on page 135, 4.6.3, "The PRA analysis team may
24 elect to resolve a technical issue using their own expert
25 judgment or the judgment of others within their

1 organization." Now, if I were a utility person, I would say
2 this is great, we can resolve all the issues internally.
3 Maybe we will call up one or two consultants to make sure we
4 are not doing anything really bad, and then I would not read
5 the rest.

6 Why should I worry about uncertainties are large
7 and significant judgments of outside technical experts are
8 useful? I mean since you allow me to resolve technical
9 issues within my organization, I would probably do that.

10 MR. BUDNITZ: Yes, but read the next sentence. I
11 will read the sentence you read, "The PRA analysis team may
12 elect to resolve a technical issue using their own expert
13 judgment or --" Right. But the next sentence, "The PRA
14 analysis team shall use outside experts when the needed
15 expertise on the commission is not available inside."

16 CHAIRMAN APOSTOLAKIS: Well, I understand that,
17 and that again --

18 MR. BUDNITZ: And then there is a "should" which
19 is sort of in between. It says maybe you have the experts,
20 there is a "should" which is in between. You got it, but
21 there are other reasons why you want to go outside.

22 CHAIRMAN APOSTOLAKIS: But, again, I mean then it
23 comes down to deciding whether I have the expertise or not,
24 which, of course, --

25 MR. BUDNITZ: Yes, but that is always discussion

1 that is left up to the analyst team. Nobody but the analyst
2 team could ever make that call. I think that is intrinsic
3 to this game.

4 CHAIRMAN APOSTOLAKIS: But all I am saying is --

5 MR. BUDNITZ: Do you agree with that?

6 CHAIRMAN APOSTOLAKIS: A few -- no, I agree. But
7 a few examples, I mean not 10, but two or three.

8 MR. BUDNITZ: I can cite some examples.

9 CHAIRMAN APOSTOLAKIS: Of issues.

10 MR. BUDNITZ: The way I can cite it is I can cite
11 two or three reports which cover issues.

12 CHAIRMAN APOSTOLAKIS: Yeah.

13 MR. BUDNITZ: In other words, the analyst who is
14 trying to figure out what the hell is what, could go to that
15 coolant pump seal example, or they could go to, for example,
16 full elicitation at Yucca Mountain for seismic hazard or
17 something, to see the whole big, gory thing.

18 CHAIRMAN APOSTOLAKIS: Well, this is actually a
19 good example, or 1150. I mean in Level II analysis, there
20 are all sorts of issues that require expert judgment, right.

21 MR. BUDNITZ: Right.

22 CHAIRMAN APOSTOLAKIS: Although I don't know if
23 you would limit yourself to LERF, or whether there is the
24 same number of issues. But, certainly, if you do the
25 traditional Level II, with the release of --

1 DR. KRESS: There are a lot less issues if you do
2 it to LERF.

3 CHAIRMAN APOSTOLAKIS: A lot less. But the
4 question that would come to my mind would be, if I were a
5 utility executive, why can't I go to NUREG-1150? They did
6 all this analysis, maybe I can take their results, use my
7 expertise in my facility, maybe hire a consultant, and maybe
8 adopt those results to my plant. So I don't have to go
9 through this expert elicitation process and all that. I
10 mean do you allow that reality here, which I suspect a lot
11 of people would find very attractive?

12 MR. BUDNITZ: Well, of course.

13 CHAIRMAN APOSTOLAKIS: Because the idea of going
14 through a NUREG-1150, it is just out of the question for a
15 private company to do. I mean it is okay for a federal
16 agency that wants to gain insight and so on.

17 MR. BUDNITZ: By the way, of course, it is not
18 only allowed, it is explicitly -- it is expected, I suppose.
19 But they do have to get by their peer reviewers.

20 CHAIRMAN APOSTOLAKIS: That's right. And all I am
21 saying is by giving two or three specific examples, like I
22 just did, I think you will make this section much easier for
23 people to understand and implement.

24 Also, you don't emphasize enough this community
25 perspective, which, for a private company, may not be

1 relevant. Remember when we were doing this other thing, a
2 very important concern for a federal agency that is looking
3 at broader issues is what is the community of experts' view
4 or a spectrum of views on a particular issue? Because this
5 is a federal agency, they have to regulate 103 units. But
6 if I am one utility with one or two plants, I probably don't
7 care about the community of experts, do I? I mean I really
8 worry about what applies to my facility. Although, of
9 course, there I can have the community's views. So, I would
10 suggest that this become clearer.

11 MR. BUDNITZ: Well, it is right there, the last
12 paragraph of 4.6.4, probably this whole thing is only, you
13 know, half, two-thirds of a page. Read it.

14 "The utility shall be responsible for aggregating
15 the judgments so as to develop the composite distribution of
16 the informed technical community."

17 CHAIRMAN APOSTOLAKIS: Yeah, but what I am saying
18 is that this is not sufficient to bring up the issue of the
19 community view. Maybe you can emphasize it a little more.
20 I mean every word here, every sentence is loaded with
21 meaning.

22 MR. BUDNITZ: You and I know that this was 100
23 pages turned into three-quarters of a page.

24 CHAIRMAN APOSTOLAKIS: I know. I know. So, maybe
25 by using a few examples, you can make it a little clearer

1 and that is all I have. And maybe thinking again about the
2 issue of references, either eliminate all of them or add two
3 or three more.

4 MR. BUDNITZ: I see your point.

5 CHAIRMAN APOSTOLAKIS: Yeah. Are there any -- I
6 guess the issue of expert opinion elicitation does not arise
7 when you do a Category I. I mean it really has to be
8 Category III, right

9 MR. BUDNITZ: Well, I mean if you are just having
10 a couple of experts in, which is not only allowed, it is
11 probably the most common thing.

12 CHAIRMAN APOSTOLAKIS: A Category II perhaps. But
13 Category I, which is --

14 MR. BUDNITZ: I mean, you know, you have a couple
15 of experts in, you still have got to follow this, you just
16 do it in a certain way. Right?

17 CHAIRMAN APOSTOLAKIS: That's right. I think it
18 is so short that it probably will not be of great use to
19 people, but I don't expect individual utilities to really
20 resort to expert judgment elicitation to a large degree
21 anyway. I mean this is more like a federal kind of
22 activity.

23 Any other members have any comments on this
24 particular issue?

25 [No response.]

1 CHAIRMAN APOSTOLAKIS: Well, I guess we are done
2 with Bob. Bob, do you have any comments?

3 MR. BUDNITZ: Yes. I am not sure, and my
4 colleagues are sitting around the table there, how much more
5 here -- well, you know, we cut this way down on purpose
6 because there didn't seem any middle ground between
7 something that was real short and the whole big banana,
8 which didn't make sense, it was out of context. That thing
9 that was in the first thing was out of context, it was as
10 long as the rest of the standard practically.

11 CHAIRMAN APOSTOLAKIS: Yeah.

12 MR. BUDNITZ: I suppose, you know, 25 percent more
13 doesn't place it too much out of -- you know, doesn't screw
14 up the balance

15 CHAIRMAN APOSTOLAKIS: Yeah.

16 MR. BUDNITZ: And I will see what I can do. Maybe
17 it is only just a sentence here and there.

18 CHAIRMAN APOSTOLAKIS: Okay. Have you thought
19 about eliminating the whole section, or is that out of the
20 question?

21 MR. BUDNITZ: Of course we did. I didn't think
22 eliminating it made sense because without some guidance, you
23 leave it wide open.

24 CHAIRMAN APOSTOLAKIS: Okay.

25 MR. BUDNITZ: I mean you do want to say things

1 like look at the last one. You do want to tell them who is
2 responsible. You do want to tell them that they have go to
3 identify the issue and that they shall go outside. You do
4 want to tell them they shall go outside when they don't have
5 the needed expertise, I think, don't you?

6 CHAIRMAN APOSTOLAKIS: Yeah. Mario.

7 DR. BONACA: Just I want to make sure before Bob
8 goes, I want to pick up again on something we talked about
9 before.

10 CHAIRMAN APOSTOLAKIS: Okay. Are we done with
11 expert judgment? I think we are done.

12 MR. BERNSEN: Just let me make an observation with
13 regard to this. I mean our primary purpose here is we are
14 responding to comments received.

15 MR. BUDNITZ: Yes.

16 MR. BERNSEN: And in that context, I don't recall
17 any comment that said, take it out. I do think we had
18 comments that said it seemed to be over-weighted in terms of
19 the total approach in the standard. And yet, obviously, you
20 want to recognize that this is a part of the process and
21 must be considered. The user is obligated to address, and
22 the peer review team has the opportunity to evaluate. So, I
23 don't think we should take it out.

24 And, obviously, your comments on the examples and
25 detail and references are quite appropriate. But we did not

1 get any suggestion that said delete it

2 CHAIRMAN APOSTOLAKIS: And you are not getting one
3 now either. I am not suggesting that.

4 MR. BERNSEN: Right.

5 CHAIRMAN APOSTOLAKIS: I just asked a question
6 whether you have considered it.

7 I think this kind of exercise is really foreign to
8 most utility practitioners. I don't think they will go
9 through this thing, unless somebody is about to shut down
10 their facility and there is a major seismic issue, and then
11 it is a different story. But in their routine application
12 of PRA, I doubt it very much. But I agree with you, there
13 should be some guidance.

14 So let's go on to the other issue that Dr. Bonaca
15 has.

16 DR. BONACA: Yeah, I just had -- I wanted to pick
17 up on the issue, Bob, of what you described before, that is,
18 from Rev. 10 to Rev. 12, you really took out how to do it.

19 MR. BUDNITZ: Well, that is not fair. And the
20 others in the room can elaborate. Sprinkled throughout all
21 of this text are how to do it, you know, at different
22 levels. Because sometimes you couldn't describe what to do
23 without telling them how. You know, there has to be a
24 flavor of that or it can be sterile in some places.

25 But where there were five ways to do something for

1 sure, it was erroneous to tell them how to do one of those,
2 you see.

3 DR. BONACA: Yeah. And I don't disagree with the
4 approach you have taken.

5 MR. BUDNITZ: Do people around the table agree
6 with me, my team members there?

7 DR. BONACA: Well, let me finish my question.

8 MR. BUDNITZ: Yeah.

9 DR. BONACA: At least I don't disagree that you
10 should do that. I am only considering some cases not always
11 to do one thing are equal, I mean some of them leave behind
12 some problems. And, you know, I have heard time and time
13 again from PRA practitioners, you know, a discussion about
14 the method, because if you follow a certain method, then you
15 have to do something else later on to back up some possible
16 shortcoming in the approach. And I think the original
17 version we reviewed, Rev. 10 had some of those elements
18 inside that

19 Now, I am not saying Rev. 12 doesn't have it,
20 because I haven't performed that kind of evaluation. I only
21 see that, you know, I am just concerned that -- it seems to
22 me, okay that a lot of the burden now has been placed on the
23 back of the peer review process, that is supposed to make
24 sure that all this possible, you know, pitfalls in the kind
25 of approach you use are being dealt with. Am I correct or

1 not? I don't know. That is a question.

2 MR. BUDNITZ: Does anybody else want to try to
3 answer that, too? I don't know where the burden is. The
4 burden is always on the analyst to do it right, and for the
5 peer reviewers to check, isn't it?

6 DR. BONACA: Well, I mean --

7 MR. BUDNITZ: It is just like a running a reactor,
8 the burden is on the reactor operator to run the reactor.
9 The NRC can't.

10 DR. BONACA: Let me explain to you why I have got
11 a problem, okay.

12 MR. BUDNITZ: No, I understand.

13 DR. BONACA: No, no, no. No, let me just finish.
14 I have got a problem because you keep saying that this
15 standard applies to -- as a standard is going to be used by
16 the power plants and there is a full process here that, in
17 fact, describes, you know, the utility use of this. And, in
18 fact, the peer review process is also very focused on
19 utility use. Most of these utility people did not perform
20 the PRAs. PRAs were performed by, in a lot of cases, by
21 specialists who were not participated in the peer review
22 process, who are not parties to this. And so those kind of
23 capabilities are not being applied in this review process.
24 That is why I am raising it. That is the only reason.

25 I would have no problem if all this is going to be

1 administered by, you know, top, experienced industry
2 practitioners. This is going to be applied individual
3 utilities, typically, with one or two PRA people, that is
4 the whole staff they got, plus a lot of other people in
5 their expert panel, and that is why I am raising these
6 questions.

7 And there may be an excellent answer. I just said
8 it seems to me that there has been a significant shift, and
9 maybe it is not significant, but some shift of
10 responsibility to the peer review process.

11 CHAIRMAN APOSTOLAKIS: Well, I think the issue you
12 are raising, Mario, is really much bigger, and it comes back
13 to the earlier discussion we had on whether this is a
14 procedures guide or a high level guidance document. It
15 seems to me it is inevitable that this will happen, what you
16 just described, because they have to stay away from actually
17 prescribing methods. In fact, even the previous version,
18 Rev. 10, that we saw was criticized as being overly
19 prescriptive.

20 And I have a comment, for example, on the common
21 cause failure part here that lists five methods, and without
22 any qualification, and I think one of them should not really
23 be there at all. So, you know, unless you are an expert in
24 that field, unless you are Karl Fleming, you will not really
25 know which method to use.

1 DR. BONACA: And I want to point out, --

2 CHAIRMAN APOSTOLAKIS: I would rather eliminate
3 all five.

4 DR. BONACA: -- George, in fact, I didn't disagree
5 that this could be done. And I am not not supportive of
6 this. I am only making a statement that, in my judgment, I
7 see some shifting of the role to the review process, or the
8 peer process, which, in fact, you have. And maybe we will
9 talk about the peer process, review process later.

10 CHAIRMAN APOSTOLAKIS: We will. But I think you
11 see that in many, many applications like Option 2 and so on.
12 And it is inevitable. When you really don't trust the
13 numbers or the models to guide you to a decision, you have
14 to rely on the judgment of people. And this is what is
15 happening here, too. It may be in a different context, but
16 it is the same thing.

17 DR. BONACA: Yes.

18 MR. BUDNITZ: Mario, let me talk about how this
19 standard differs from most standards that ASME puts out.
20 And I will tell you that I just had this exact same comment.
21 I am chairing the group that is writing, under the American
22 Nuclear Society, the seismic external hazards piece. And we
23 had a meeting of our oversight committee just last week and
24 it came up, the exact same question.

25 One of our committee members objected strongly to

1 what we had written because it wasn't prescriptive enough.
2 And I will just read you an example, but I am going to read
3 it from initiating events. If you have initiating events,
4 the first high level requirement says, I will read it to
5 you, "The initiating event analysis shall provide a
6 reasonably complete and appropriately group treatment of
7 initiating event categories." Okay.

8 Now, let's focus on the word "reasonably." Shall
9 provide a reasonably complete treatment of the stuff.

10 Right. Now, and the same thing came up in the seismic PRA,
11 but it is generic throughout here. The person said, what do
12 you mean by reasonably complete? I mean, you know, when you
13 are telling people how to design, how to do a calculation of
14 the stress on a piece of metal, you don't talk about
15 reasonably complete, you give them a method.

16 And we had this discussion, and, of course,
17 everybody understands in PRA that if we ever said the word
18 "all" or "complete," it is death. There is no "all" and
19 there is no "complete" in PRA, because you have to screen
20 things out that are unimportant compared to other things.
21 So, you have to use the word "reasonably." And then you
22 come -- what is reasonably complete? Well, the analyst has
23 to make that call, and the peer reviewers have to agree with
24 it. You are stuck with that, there is no way around that,
25 Mario and the rest of you, in my view. And I hope everybody

1 in the room will nod at what I am saying.

2 It is that sort of judgment that in the end --
3 that is why this standard, this whole area is different than
4 most ASME standards or ANS standards that one writes in
5 other areas.

6 DR. BONACA: And, Bob, I totally agree with you, I
7 understand it. I am only --

8 MR. BUDNITZ: So it is dilemma that we are in from
9 the start.

10 DR. BONACA: Yeah. But this sets certain parts in
11 my mind about the peer review.

12 MR. BUDNITZ: Of course.

13 DR. BONACA: I know that when I was still -- and I
14 knew we had the peer reviews of a number of PRAs, and I am
15 going back in my memory to see what the qualification of the
16 people were. Just because -- and probably they were
17 adequate. I am only saying that I didn't even think about
18 the peer review when I was reviewing Rev. 10, and maybe that
19 was my problem, but now I am thinking about it more
20 thoroughly.

21 CHAIRMAN APOSTOLAKIS: Okay. Any other comments?
22 I'm sorry.

23 MR. BERNSEN: Just one. I did look at the changes
24 from 10 to 12 fairly thoroughly in the initiating event
25 area. And substantially, most of 10 is there. A lot of the

1 narrative stuff may have been deleted, but the what
2 requirements by and large remain. In the initiating event
3 area, there wasn't that much change.

4 MR. BUDNITZ: Wait, wait, wait. There was no
5 requirement in Rev. 10 that isn't here.

6 MR. BERNSEN: What I mean is, and Bob did the same
7 thing independently, so --

8 MR. BUDNITZ: There is absolutely no requirement
9 that is missing.

10 MR. BERNSEN: Right. Okay. I guess I stand
11 corrected. That is true. And so, I don't think there is a
12 major change, in fact, from -- going from 10 to 12 for this
13 particular element.

14 DR. BONACA: No, I am only mentioning that in some
15 cases there were examples. Remember, you can use this
16 approach or you can use that approach. And if you use this,
17 you should be doing also this and this and that. There was
18 that part.

19 MR. BERNSEN: That was kind of -- it was in 10 as
20 well.

21 DR. SHACK: It sort of comes back to George's
22 question. You know, if you look at (a)(4) in 12 versus the
23 list in 3.3.1.1 of 10, there really is a great deal of
24 difference in the list. You know, you get the transients
25 and the LOCAs in (a)(4) and you have a much more descriptive

1 sort of thing in 3.3.1.1. And the question is why just
2 these, you know? You know, should you have dropped them
3 all, or, you know, included them all. And it is, you know,
4 it is another one of those things. Where do you stop? And
5 it is just curious, I guess is the answer.

6 MR. BUDNITZ: Well, that is a hard call. If you
7 are looking 1(e)(a)(4), which is 3.3.1.

8 DR. SHACK: Yeah.

9 MR. BUDNITZ: Well, it says at the bottom this is
10 not intended to be all inclusive. So, you know, it was a
11 shot, okay.

12 DR. SHACK: Well, the other list wasn't all
13 inclusive either.

14 MR. BUDNITZ: Right. Right.

15 DR. SHACK: You know, there is no all inclusive
16 list.

17 MR. BUDNITZ: Right. That is what I said three
18 minutes ago.

19 DR. SHACK: Right. And, you know, the question
20 is, where do you stop when you give the example list? The
21 one in (a)(4) seems awfully abbreviated, I guess is sort of
22 my just general gut reaction. And why give such an
23 abbreviated list, you know, versus what was in the 8, the
24 10?

25 MR. BERNSEN: It is distributed to other elements.

1 In other words, if you go back to 1(e)(b)(3), so on and so
2 on, it is distributed. It is still there, but it has been
3 redistributed.

4 MR. FLEMING: I think it is a valid comment, but
5 the discussion that resulted in the solution that we adopted
6 in Rev. 12 was the following, that as you go from a general
7 list or a larger list to the appropriate list for a
8 particular plant, one ends up with the unavoidable
9 conclusion that the appropriate set of initiating events is
10 plant-specific. So, we worked on the requirements, the
11 supporting requirements, put a lot of emphasis on needing to
12 resolve the dependencies, the plant-specific details and so
13 forth, to come up with the appropriate list before you are
14 done.

15 The more we worked with more detailed lists, the
16 more we got arguments about, well, this is more of a PWR
17 list and not a BWR list, and it doesn't belong in my plant,
18 and so forth, so I think we all agree that one needs a
19 detailed list of initiating events to support the PRA but
20 putting a -- we did not want to promote the concept of using
21 a standard list of initiating events.

22 That is why we did it the way we did it.

23 MR. BUDNITZ: Yes, Karl. We could, for example,
24 have taken the, what? -- 12 or so things on this list, we
25 could have made this 62, but then you might convey the

1 flavor to the initiated that if you do all those 62 you are
2 done, and that is exactly the wrong flavor.

3 CHAIRMAN APOSTOLAKIS: I think we have exhausted
4 the subject and it is a broader comment and --

5 DR. BONACA: Yes, we have.

6 CHAIRMAN APOSTOLAKIS: Anything else?

7 [No response.]

8 CHAIRMAN APOSTOLAKIS: Okay, Bob. Thank you very
9 much.

10 MR. BUDNITZ: Okay. I'll ring off.

11 CHAIRMAN APOSTOLAKIS: Okay, bye bye.

12 MR. BUDNITZ: Thank you.

13 CHAIRMAN APOSTOLAKIS: And maybe we can also take
14 a short break until maybe just before -- until 11:18.

15 [Recess.]

16 CHAIRMAN APOSTOLAKIS: Back in session. I don't
17 have a quorum.

18 MR. MARKLEY: Your quorum -- 13 --

19 CHAIRMAN APOSTOLAKIS: All right. Okay, back to
20 Mr. Fleming.

21 MR. FLEMING: What I wanted to do at this point if
22 it is convenient for the committee is to go through some of
23 the details of the accident sequence element to bring out
24 some additional aspects of the structuring of Rev. 12 of the
25 standard and make some key points that we haven't really

1 stressed up to now.

2 In addition to the three column, three category
3 approach, which is of course where the detailed supporting
4 requirements are listed, the other feature of this draft of
5 the standard was the derivation of high level requirements
6 for each of the elements.

7 These high level requirements I believe are very
8 important, a very important enhancement to the standard from
9 the following perspectives that I will get into.

10 The process we used to develop them was to start
11 with the basic attributes of a PSA -- completeness,
12 dependencies, fidelity -- those types of issues and look at
13 those in the context of the particular objectives for each
14 element, which are also listed for each of the elements in
15 the standard and come up with an irreducible set, minimum
16 set of requirements for a PRA, for any category of
17 application that would have to be met.

18 This for example, the slide I have up here right
19 now, is on page 38, which is the high level requirements for
20 accident sequence analysis.

21 MR. EISENBERG: Page 39.

22 MR. FLEMING: Okay, it may be on page 39 in your
23 copy.

24 Table 4.4.2 -- this is the style in which we
25 presented all of the requirements for each of the nine

1 elements in the standard.

2 What we have done is developed from a high level
3 perspective really the fundamental requirements that have to
4 be met.

5 On these requirements we worked very hard, and I
6 think the degree of consensus that the project team and the
7 other industry groups that peer reviewed and provided input
8 to this process, the degree of consensus that was reached at
9 this level is much stronger than actually was a reality at
10 the functional requirement level.

11 I, for one, my own personal opinion is that if a
12 peer review team consisted of appropriately experienced and
13 competent practitioners in PRA they could take these high
14 level requirements and go in and perform a very good, sound
15 peer review process to determine the quality of the PRA.

16 We wrote these down for several reasons, one of
17 which is to show the context and logic for all the
18 supporting requirements.

19 To the extent that people have optional approaches
20 to do common cause, data, whatever, and to the extent that
21 someone may not have exactly followed some of the supporting
22 requirement tables that we have, the judgment, the yardstick
23 on which you should judge the adequacy of an alternative
24 approach would be with respect to these high level
25 requirements.

1 I wanted to mention these, because this is a very
2 key addition to what we had in Draft 10. While many of
3 these concepts were in Draft 10, they were kind of buried in
4 the textual presentation and we brought them out as very,
5 very explicit requirements.

6 The detailed requirements are then organized by
7 each of these high level requirements.

8 I might just pick a page of these for accident
9 sequence definition. As you go into the specific supporting
10 requirements for accident sequence, and this happens to be
11 several pages in, for Requirement B, which shows you the
12 style in which we have presented all these supporting
13 requirements, we have carried down into these detailed
14 requirements -- at the top of the table a reminder of what
15 functional requirement we are supporting.

16 This particular page happens to be Functional
17 Requirement B on plant-specific CDF and LERF quantification;
18 the accident sequence analysis shall provide a sequence
19 definition structure that is capable of supporting a plant-
20 specific quantification of CDF and LERF by the Level I-II
21 interface.

22 That is the functional requirement that all of
23 these particular detailed requirements refer to.

24 The second thing that we remind people of is that
25 as we apply the high level requirement and the supporting

1 requirements we are applying them against the attributes
2 that are the column headings in these tables, where we
3 repeat the particular attributes for this element, which
4 provides the scope of applicability of each of the detailed
5 requirements.

6 As you read these particular -- these are the same
7 ones I showed in a previous table -- a common theme here is
8 that Category 1 is focused on the dominant sequences and
9 contributors to core damage frequency and large early
10 release, whereas Categories 2 and 3 have to be extended to
11 the risk significant accident sequences and contributors.

12 In recognition of the fact that some Category 3
13 applications may have to go beyond risk significant accident
14 sequence contributors we dropped that caveat with -- you
15 know, it is sort of an implicit way of saying something more
16 than the risk significant and accident sequences.

17 Then as you go down into the specific
18 requirements -- now we are into the very, very details of
19 the supporting guidelines, one thing that you will see here
20 is that for some elements like initiating events and
21 accident sequence definition, for example, these elements
22 are so fundamental to the overall structure of a PRA that
23 you won't see a great deal of delineation of specific
24 requirements coming across the columns.

25 The example that I threw up here, in most cases

1 what you will see in this differentiation is a permission of
2 the application of conservative models in Category 1 and a
3 lack of tolerance of conservative models in Categories 2 and
4 3.

5 Then based on the judgment of the project team,
6 there is in some cases a softening of the language, the
7 action statements that we are using that are specifying the
8 detailed supporting requirements.

9 The choice of the verbs was considered very
10 carefully but using the judgment of the project team as to
11 whether something ought to be included in the model or
12 whether it should just be considered in the model, and that
13 is another example of differentiation.

14 When you get into other elements like data
15 analysis and quantification and HRA you will see quite a bit
16 more differentiation of detailed requirements across the
17 three columns, and the classic example is what we were
18 talking about earlier is that we go from point estimates,
19 mean values, to full uncertainty quantification, as one
20 particular type of example.

21 But then finally we end up for all of the
22 elements, and if I am right -- I'll get the particular
23 pages -- the particular requirements for documentation.

24 In general you will find, and this just happens to
25 be the table on page 51, which may be 52 in your package,

1 you will generally find the documentation requirements to be
2 common across all three elements.

3 The practical reason for this is that in order for
4 a peer review team to even determine what category of
5 application the PRA can support it is necessary to have that
6 document so we can measure what is in there, so you tend to
7 see particular aspects of that.

8 The other thing that we tried to avoid and we
9 debated at length in the preparation of this draft of the
10 standard, we tried to avoid having let me say "buzzwords"
11 like "shall" or "should" or "may" trigger some kind of an
12 automatic documentation requirement, so what we tried to do
13 is for each element to have very specific documentation
14 requirements for that element that is in the judgment of the
15 project team is necessary and sufficient for a peer review
16 team to come in, read that documentation, determine the
17 category of application that that element is capable of
18 supporting, and whether it meets the intent of the
19 requirements.

20 You will see a very, very specific long list here.
21 In fact, I think if you look at these documentation
22 requirements you will see that by and large they include the
23 documentation requirements that were in Rev. 10 as well as
24 additional documentation requirements we had in the
25 standard.

1 So that is -- you know, the purpose of this part
2 of the presentation was to just walk you through a little
3 bit more of the structure to point out the role of the high
4 level requirements and the way in which we'd carried down
5 the high level requirements and the attributes for each of
6 the three categories, so that each time one is reading a
7 specific requirement in the tables, they can provide the
8 context, they can grasp the context of that requirement and
9 what it was intended to achieve in interpreting how far to
10 implement it.

11 Those represent some of the structural changes and
12 enhancements that we tried to put into this draft of the
13 standard, again exclusively motivated by the comments that
14 we received on Draft 10 to make the standard easier to use
15 for a range of applications.

16 That pretty much concludes what I planned to
17 formally present as far as the standard, so if you have any
18 other comments --

19 CHAIRMAN APOSTOLAKIS: It appears to me that
20 Category 1 is really separate from the other two and the
21 distinction between Categories 2 and 3 is really a very fine
22 one.

23 If you look at the various requirements you are
24 imposing, usually you ally both of them to Categories 2 and
25 3, with some exceptions.

1 Perhaps -- I think this is a very important issue.
2 Maybe the subcommittee can debate it a little bit. The
3 categories are discussed on pages 3 and 4 of the standard in
4 terms of examples.

5 In Category 2, give examples, typical
6 applications, risk informed prioritization of GL96-05,
7 periodic valve verification testing requirements, risk
8 informed inservice testing, risk monitoring applications,
9 quality assurance, and tech spec modifications, it appears
10 that most of these, if not all, really rely on importance
11 measures to rank SSCs, don't they?

12 Then if you go to Category 3, you also have PRA
13 products are used to prioritize and rank SSCs with respect
14 to safety significance. Well, if that is the case, then why
15 when I do a GQA I have to prioritize, rank SSCs, so which
16 category does that belong to?

17 On the one hand, you are telling us this is
18 Category 2 but then in Category 3 you say that when I rank
19 SSCs I have to do a Category 3 analysis.

20 This issue came up yesterday in the other meeting.
21 I guess there is an implicit assumption here that the
22 importance measures are fairly insensitive to a full
23 Category 3 treatment, that you can get a reasonable ranking
24 without going to the details of Category 3, which is an
25 untested assumption, and perhaps somebody ought to test

1 that.

2 Maybe for RAW that is valid because you make such
3 drastic assumptions, although the remaining is still, you
4 know, sensitive. I mean you set a component down but the
5 rest of the stuff is at their nominal values.

6 I don't know that what you have here on pages 3
7 and 4 is the best description of what the categories are and
8 whether -- I mean there is no statement here regarding the
9 degree of confidence that one has to have in the PRA results
10 and how that degree of confidence really dictates how
11 sophisticated your analysis should be, but isn't that really
12 what it comes down to?

13 MR. FLEMING: Yes, that is very important --

14 CHAIRMAN APOSTOLAKIS: And that is related of
15 course to approaching the forbidden region in the diagrams
16 of 1.174, increased management attention, that the Staff
17 uses.

18 I wonder whether these kinds of thoughts can be
19 reflected on these, that what really matters is the degree
20 of confidence that is required in the calculations to
21 support the application and then you go on to the examples
22 and so on.

23 DR. SHACK: The one that struck me as funny here
24 was the A4 Category 1, where --

25 CHAIRMAN APOSTOLAKIS: Yews.

1 DR. SHACK: -- in A4 you are looking in
2 combinations that may be rather unusual and different, and
3 yet it is often in the category where you think you are
4 almost looking at the generic PRA and that just struck me as
5 a kind of an unusual way for that.

6 I would have characterized the A4 applications as
7 somewhat different, where you are really looking for some
8 unexpected, surprising interactions.

9 CHAIRMAN APOSTOLAKIS: Which comes back to Mario's
10 surprise. Karl?

11 MR. FLEMING: Yes. I think the particular --
12 sorry, I lost my fuzzy there -- back to fuzzy sets.

13 I think that is a good comment. I think the reason
14 why something like A4 was placed in Category 1 in this
15 document is based on the fact that A4 is a rule that was
16 imposed on utilities and of course the utilities were
17 expected to use their existing PSAs, whatever their existing
18 PSAs, they had to implement that rule, but there was really
19 no requirement at least from a regulatory perspective that
20 they employ the kind of elevation of a PRA, which would be
21 expected, like, say, a Reg Guide 1.74 application, so I
22 think that is sort of the motivation for putting it down
23 there.

24 It was a rule that they had to fulfill anyway and
25 there was not a formal requirement by the NRC that you have

ANN RILEY & ASSOCIATES, LTD.
Court Reporters
1025 Connecticut Avenue, NW, Suite 1014
Washington, D.C. 20036
(202) 842-0034

1 to do a quality -- you have to upgrade to a certain level of
2 quality of PRA before you can implement the rule, so I think
3 from a technical standpoint your point is well-taken.

4 MR. SIMARD: We have had a number of
5 comments these are not good examples and we need to revisit
6 them.

7 One example though that seemed to resonate at the
8 workshop yesterday, Karl, maybe you could summarize the
9 discussion about how given that you have a Generic Letter
10 88-10 MOV testing program, the distinction between
11 Categories 1 and 2?

12 MR. FLEMING: Right. Yes, we had a very good
13 discussion on this and I think it did provide us with some
14 good insights on how we can improve the discussion on these
15 pages in response to George's earlier comment.

16 For example, Generic Letter 89-10, we would take
17 the position that use of the PRA to apply risk ranking
18 quantifications to your MOV list just for the purpose of
19 deciding which ones you are going to test first in
20 fulfilling the 89-10 requirements without impacting the
21 scope of the valves in 89-10 would be a Category 1
22 application, but if you wanted to say that, hey, we only
23 wanted -- we are going to exclude certain requirements from
24 scope and now we are actually bending or modifying or
25 proposing a relaxation of the rule on a plant-specific

1 basis, now we are talking more of a risk-informed
2 application a la 89-10 in which we would actually have to
3 quantify the risk impact of the part of the rule that we
4 weren't planning to fulfill.

5 While the risk ranking might have been a useful
6 prioritization, we would have had to elevate this to a risk-
7 significant determination to show that the delta risk
8 associated with modifying how we are going to apply the rule
9 is justified, so that would be how we would make those
10 particular distinctions.

11 DR. BONACA: I would like at some point to go back
12 to the Category 1 --

13 CHAIRMAN APOSTOLAKIS: Well, this is the point.
14 This is the time.

15 Go ahead.

16 DR. BONACA: Well, it seems to me that one
17 fundamental requirement I believe is that the PRA must be
18 commensurate with the change that it supports. That is a
19 fundamental element of the whole standard here.

20 It seems to me that there is a prejudging by
21 saying that Category 1 specifically addresses SSC risk
22 significant determination for the maintenance rule and A4.
23 There is a prejudgment here.

24 Will it be true that the utility still has a
25 responsibility to assess his own PRA, determining in fact

1 for example that the component is described and all that
2 kind of stuff, and look at the dependencies and if, in fact,
3 dependencies are not, then maybe he has to upgrade the whole
4 system.

5 Now the concept is within the standard. I
6 understand that, okay? -- but by reading this under Category
7 1 it seems there is almost a prejudgment that anything that
8 meets Category 1 it will be adequate for doing this support
9 of the maintenance rule.

10 Do you feel that it is supportable this way,
11 particularly for the issue of dependencies, which were
12 shallow at times, as we discussed before, because in the
13 application of the maintenance rule that is exactly what is
14 happening out there.

15 There are very at times innocuous pieces of
16 equipment which are removed from service. They appear to be
17 innocuous. They may be in the air system. They may be, you
18 know, systems which are not safety grade typically.

19 MR. FLEMING: Right. There is one aspect of your
20 comment, Dr. Bonaca, that was not intended by the project
21 team, and that is the treatment of dependencies.

22 I believe that, and we will have to go back and
23 check this, but I believe that in the phrasing of the
24 requirements for treatment of dependencies which would show
25 up in a number of places including initiating event,

1 sequence definitions, systems analysis, probably
2 quantification and LERF, but as you go through and look at
3 the detailed requirements I don't believe that we let the
4 PRA staff off the hook, so to speak, in treatment of
5 dependencies with the exception that we may permit a
6 conservative treatment of dependencies for some of the
7 Category 1 applications.

8 I don't think that we really intend to avoid the
9 need to find all the system interaction and functional
10 dependencies and common cause dependencies and so forth even
11 for a Category 1 application.

12 I think in our upgrade of these pages for the
13 final draft that we would consider in light of these
14 comments, I don't think that we intend to make these
15 assignments of applications on an exclusive basis in the way
16 in which it is arranged in the standard right here and right
17 now.

18 There may indeed be an A4 -- applications of A4
19 that in the way in which they are implemented at a
20 particular plant really call for a Category 2 or 3 of PRA.

21 DR. BONACA: I guess what makes me uncomfortable
22 is singling out the maintenance rule and A4 as a specific
23 application in Category 1, when I do believe that the
24 configurations you may end up with by pulling out equipment
25 out of service at power, it would be more challenging than

1 other changes more formal that you are making, in part also
2 because for more formal changes you do have a more thorough
3 process. They have more time --

4 MR. FLEMING: Right.

5 DR. BONACA: -- and other things, so I think you
6 have to be -- I don't know, this just seems to single out
7 maintenance rule and A4 as a less challenging situation and
8 I don't think it is.

9 MR. FLEMING: There is one other important caveat
10 that perhaps we haven't been too clear on, and that is that
11 it makes A4 a particularly interesting example to discuss
12 because this standard and these requirements are really only
13 covering the annual average CDF, LERF part of the PRA.

14 All of these new issues that come into play for
15 the time-dependent risk monitoring applications that
16 differentiate above those different -- this standard does
17 not really go into that. It is really outside the scope of
18 our standard, and I think for that reason maybe A4 would not
19 be a very good example.

20 CHAIRMAN APOSTOLAKIS: But you have an example
21 under Category 2, risk monitoring application. That is not
22 part of the standard?

23 MR. FLEMING: I am saying that when you look at
24 the technical requirements for initiating events and
25 accident sequence and so forth, we really do not go into the

1 additional requirements that you would have to have in there
2 to do risk monitoring applications.

3 For example, time dependent initiating events --
4 the details of what is in the standard right now don't go
5 into the additional technical issues that come into play
6 when you do time dependent risk monitoring in applications.

7 MR. SIMARD: Well, I think it was a good idea to
8 put these examples in because it has brought out some really
9 good discussion here, but I think what I am hearing is that
10 we need to go back and reconsider whether we have any
11 examples at all, because of Dr. Bonaca's point about
12 prejudging the outcome.

13 The other thing I am hearing from the past day and
14 a half is that we need to go back and make even clearer our
15 expectations here that, first of all, experience with the
16 certification process shows that as you look at the various
17 subelements of a PRA you will find for every PRA -- I think
18 every PRA that has been looked at some of the subelements
19 are grades 2, some are grades 3, some are even grades 4, so
20 we have found the spread among existing PRAs that would
21 roughly correspond to the three categories.

22 Second, we need to make clear that what we are
23 talking about now does not describe the PRA, it describes
24 the attributes of an application. And for a specific
25 application, our intent is to go through the PRA subelement-

1 by-subelement, and for a particular subelement determine
2 what level of capability that application calls for.

3 So, I think we need to do a better job of
4 reinforcing the point that this does not describe the PRA.
5 We are not giving an overall grade, for example, to the PRA.

6 DR. BONACA: I wanted to just point out, first of
7 all, I really want to be reasonable. But let me give you an
8 example of what my concern would be. My concern would be I
9 have a very simple PRA and I am going to take out of service
10 two safety systems. Okay. And my PRA recognizes them, pull
11 out one and two. Then I have some component in a support
12 system is not safety related. Nobody recognizes the safety
13 role to it, so, therefore, we take it out of service because
14 it doesn't fall into the maintenance rule listing or
15 anything like that. And we know that there are dependencies
16 out there.

17 Okay. Now, typically, the operations people are
18 pretty smart. At times, they don't see it. We are all
19 human. And so that is the scenario under which, you know,
20 the maintenance rule still has a lot of experience to -- you
21 know, as far as online maintenance to be developed, and so
22 it is not such an easy application. So, anyway, it is just
23 a comment.

24 CHAIRMAN APOSTOLAKIS: I would like to come back
25 to what Mr. Simard just said. You said that you look at

1 what PRAs are out there and they roughly correspond to one
2 of the three categories. It seems to me that this should
3 not be a criterion for defining the categories, because you
4 should go one step beyond that and ask yourself, has the NRC
5 staff, or have these PRAs of the various categories been
6 actually used in some of these applications successfully?

7 Because it is true perhaps -- no, I am sure it is,
8 that there are Category I PRAs out there, but have they
9 actually been used in risk significance determination for
10 the maintenance rule? And has the NRC staff said this is
11 good enough? That should be the criterion, because the fact
12 that the PRAs exist out there independently of their use in
13 the decision-making process really doesn't tell us very
14 much. So, I wonder whether that is the case, whether
15 anybody came here with an IPE that was what we call now
16 Category I, they submitted an application and the staff
17 said, this is good enough.

18 MR. FLEMING: In the effort that went into the
19 original development of the industry peer review
20 certification process that was originally sponsored by the
21 Boiling Water Reactors Owners Group, now all the Owners
22 Groups have picked up on a variation of this process, the
23 information that existed at that time with respect to
24 different plants' successes and failures with risk-informed
25 applications was taken into account in the definition of

1 these. These categories were originally defined in the
2 certification process.

3 And as a matter of fact, the great success that
4 the South Texas project had provided many of the examples
5 for the checklist that were developed to differentiate, at
6 least with respect to some elements, the category -- what is
7 now the Category III applications, for example. So that,
8 the information that did exist with respect to the track
9 record of PRAs using the decision-making process, went into
10 the original definition of these categories.

11 CHAIRMAN APOSTOLAKIS: The question is whether the
12 staff now accepted these applications. And South Texas
13 perhaps is not the best example because they have a very
14 good PRA. Level III, right?

15 MR. FLEMING: Right.

16 CHAIRMAN APOSTOLAKIS: A Category III. So they
17 can support the arguments that they may want to make using a
18 very good PRA. But I think that should be really a good
19 test, because just because there are PRAs out there that are
20 of the three categories doesn't really mean very much unless
21 they have been tested in a real risk-informed decision-
22 making environment, which means the NRC staff has reviewed
23 them and said, yeah, for this application, this is good
24 enough. And I don't know of any case where the staff did
25 not actually go to Category III and raise questions.

1 Now, that may be temporary because we are all
2 learning, but --

3 MR. FLEMING: But, again, at the time these
4 categories were initially defined, there was quite a large
5 database of experiences at South Texas and other plants with
6 risk-informed applications that had a track record of
7 success that provided an information base on which to define
8 these categories.

9 CHAIRMAN APOSTOLAKIS: In other words, has anyone
10 used the Category I IPE to satisfy the (a)(4) requirements?

11 MR. FLEMING: Well, the definition of that
12 category was defined to capture those activities which the
13 industry was, in general, using, but was not subjected to an
14 additional special peer review process of their PRA to
15 verify the application.

16 CHAIRMAN APOSTOLAKIS: The reason why I think this
17 is very important is because it is my understanding that
18 there is a Presidential directive that all federal agencies
19 should use national standards to the maximum degree
20 possible, correct?

21 MR. MARKLEY: OMB Circular A-119.

22 CHAIRMAN APOSTOLAKIS: There you are. So, one
23 possible misuse of this might be that, you know, if it
24 becomes a national standard, a licensee may come to the
25 staff and say, you know, you are not following the OMB

1 directive because you have to follow the standard, and the
2 standard says that for (a)(4), I can use a Category I
3 analysis. So, now we are really changing the process.
4 Instead of establishing the categories based on a mutual
5 interaction between the staff and the industry, now we are
6 trying to impose on the staff certain limitations as to what
7 they can ask and what they can expect.

8 So, I think this is a very critical point here
9 when it comes to the categories.

10 DR. BONACA: Because I think it is important to
11 note, also, regarding the online maintenance, utilities who
12 are making -- who were doing online maintenance before, at
13 times they were performing evaluation with their IPEs or
14 PRAs, many of them. So there has been a backfitting and
15 they have been using whatever they had. And so, I don't
16 think we want to, you know, make the standard endorse this
17 necessarily, force this on the NRC, an acceptance of a
18 process.

19 CHAIRMAN APOSTOLAKIS: Yeah, I mean it should not
20 impose limitations on what the NRC staff may want to do.

21 MR. SIMARD: Can you help me understand your
22 concern? Because if we eliminate any pre-judgment, if we
23 eliminate the statement that this particular application
24 fits Category I and so forth, all we are doing is -- and,
25 again, we are not talking about Category I PRAs. This part

1 of the standard we are talking about describes the
2 application, not the PRA. So, all we are doing is
3 recognizing that given applications may require PRA
4 subelements of varying capability, that for a particular
5 application, you may need a fairly robust treatment, in one
6 area of your PRA, and the way you have treated other
7 elements of your PRA may not be as important.

8 So, all we are doing is setting in place a
9 framework without committing the NRC staff to any judgments
10 with respect to a given application. All we are doing, if
11 we eliminate the examples here, is saying, for applications
12 that have the following categories, here is an appropriate
13 level of PRA.

14 Now, it is our intent that it is up to the NRC
15 staff to make the judgment of particular applications.

16 DR. BONACA: If you are leaving out the examples,
17 I thought I would agree with you. I have no problem at all.
18 The only issue here, in my eyes, was, by de facto, you had
19 established that the capabilities necessary to support
20 (a)(4) maintenance rule are less than the capability to
21 rank, you know, risk prioritizing and less than others.

22 MR. SIMARD: Yeah, no.

23 DR. BONACA: That is really a prevarication of the
24 process. The process --

25 CHAIRMAN APOSTOLAKIS: As long as the NRC staff

1 doesn't get its hands tied because of the OMB directive --

2 DR. KRESS: They are already standard.

3 CHAIRMAN APOSTOLAKIS: I'm sorry?

4 DR. KRESS: Go ahead.

5 CHAIRMAN APOSTOLAKIS: And they actually judge and
6 say, well, gee, that is what this says, but we really
7 believe you ought to do this and this and that to satisfy
8 (a)(4), then I don't have a problem. Yes?

9 MR. BERNSEN: George, I think this discussion was
10 very useful. We need to take it back and consider it,
11 because there is no way that this standard is going to put
12 out the concept that we are making decisions on where you
13 apply it in regulatory space. These were intended to be
14 examples of typical current usage. And apparently it is not
15 clear. And I think as the discussion proceeded, it isn't
16 clear. We need to reconsider that.

17 Now, what Karl presented yesterday in the workshop
18 describing the attributes of the different categories was
19 very useful. And, you know, it pointed out that, you know,
20 for the Category I, we are talking about cases where you are
21 using the PRA to support deterministic and you are not
22 changing licensing bases and things of this sort, and so on.

23 We need to go back and focus on that, and take
24 another look at this. And if these are not good examples of
25 current usage, we need to take them out. And we make it

1 clear that this is -- we are not prescribing them. The
2 standard does not prescribe them, that is done by the
3 regulator. We are sensitive to that, so that is a good
4 discussion.

5 CHAIRMAN APOSTOLAKIS: I think Section 1.5, pages
6 3 and 4, should be revisited with that point of view.

7 MR. BERNSEN: Right.

8 CHAIRMAN APOSTOLAKIS: You know, this is a very
9 sensitive issue. Maybe in the paragraph, the second
10 paragraph that talks about the boundaries between the
11 categories and so on, bring up the issue of degree of
12 confidence and so on.

13 MR. BERNSEN: Right.

14 CHAIRMAN APOSTOLAKIS: But the introductory
15 paragraph perhaps should make it clear as to what these
16 typical applications are intended to -- the message they are
17 intended to convey, and that in no way are binding somebody.
18 I don't know if you can say.

19 MR. SIMARD: Exactly.

20 CHAIRMAN APOSTOLAKIS: Because I think this
21 particular section, you know, is very critical in how the
22 categories will be viewed later on, because you don't want,
23 again, to have people say, gee, it was Category II, and the
24 OMB says you have follow it, and all of a sudden the NRC
25 staff is on the defensive why they are violating an OMB

1 directive and they don't follow a national standard, you
2 know.

3 DR. BONACA: The other interesting thing is that
4 one could contend that in order to evaluate two or three
5 different components simultaneously, you need quite an
6 advanced degree sophistication, you know, and so you want to
7 look at it, too. Okay. I just added that.

8 CHAIRMAN APOSTOLAKIS: Okay. Any other comments
9 and categories? Yes.

10 MR. FLEMING: I wanted to clarify one thing that
11 one of my colleagues on the project team wanted me to point
12 out, and there is a lot of confusion, I think, or
13 opportunities for confusion when one compares these three
14 categories in our standard to the categories that were
15 originally defined in the industry certification process.

16 These categories here refer to the industry
17 Categories II, III and IV, and whereas I in the industry
18 certification process was the IPE level. So, I just wanted
19 to make a clarification here, is that this Category I is
20 already raising the bar, I think to a significant extent
21 above what was expected for the IPEs. So, I just wanted to
22 clarify that point. Category II is further up the bar.

23 MR. BERNSEN: I don't know, we may revisit this
24 again, but it is appropriate to bring it up at this stage.
25 We felt that it was useful to have the three categories in

1 our standard because it does reflect current usage, and it
2 does recognize that there different grades for the various
3 elements and supporting requirements. And we are looking
4 for feedback on that, what your reaction is to that, because
5 it is an important concept of the standard.

6 CHAIRMAN APOSTOLAKIS: On this particular subject,
7 any comments from the NRC staff?

8 [No response.]

9 CHAIRMAN APOSTOLAKIS: Public?

10 [No response.]

11 CHAIRMAN APOSTOLAKIS: I guess -- Karl, do you
12 have any more viewgraphs?

13 MR. FLEMING: No, that is all.

14 CHAIRMAN APOSTOLAKIS: I have comments on the HRA
15 and data analysis. I don't know, Jack, do you have anything
16 on the accident quantification?

17 DR. BONACA: On the quantification, yeah.

18 CHAIRMAN APOSTOLAKIS: You do.

19 DR. BONACA: Yeah.

20 CHAIRMAN APOSTOLAKIS: So, I guess we can break
21 for lunch now and then pick up the specifics after that. We
22 have comments on specific sections. I don't think it will
23 take more than an hour or so.

24 DR. BONACA: No, I don't have extensive comments.

25 CHAIRMAN APOSTOLAKIS: Gerry.

1 MR. EISENBERG: I just wondered, the question Dr.
2 Bernsen raised is a more generic question.

3 CHAIRMAN APOSTOLAKIS: Yes.

4 MR. EISENBERG: Are we going to revisit that after
5 lunch?

6 CHAIRMAN APOSTOLAKIS: I thought we were done, but
7 at the end there will be -- we will go around the table so
8 that the members --

9 MR. BERNSEN: I guess my question is, is the
10 discussion clear on this? Have we had a reaction from you,
11 or are we still waiting? With regard to --

12 CHAIRMAN APOSTOLAKIS: Our reaction to the
13 categories?

14 MR. BERNSEN: Your consideration of the
15 acceptability of retaining the three categories and the
16 utility of it.

17 CHAIRMAN APOSTOLAKIS: Well, why don't we think
18 about it and maybe come back to it. But at the end I plan
19 to go around the table and maybe this is a question to which
20 we will have to.

21 MR. BERNSEN: Fine.

22 DR. BONACA: I think there is a lot of questions,
23 of course. And, you know, I want to say that still I can
24 see the strength of the high level requirement approach,
25 that is a real strength over the previous, because it is

1 structured, the top process, how you get into that.

2 CHAIRMAN APOSTOLAKIS: Well, the thing is the NRC
3 staff itself, in Reg. Guide 1.174, recognized that the
4 degree of sophistication of a PRA varies with the
5 application. That is why we have the shades of gray and
6 there is a discussion about sensitivities and model
7 uncertainties and so on, as you approach the boundaries.

8 So, people do recognize that not all PRAs have to
9 be, you know, the perfect PRAs for all applications.

10 What you are doing here is you are going one step
11 beyond that and you are actually trying to formalize that by
12 defining categories. And, you know, the implications and
13 consequences of this kind of thing is something that we are
14 all thinking about. And, again, my concern, as I expressed
15 earlier, is how are certain licensees going to use this in
16 light of the OMB directive. And if it is used to impose
17 certain constraints on the staff, then I think that would be
18 an unfortunate use of the standard.

19 So, let's come back to this at the end, around
20 2:00 or so, after we finish with the specific questions.
21 But this is certainly something that is extremely important.

22 Okay. So, we will come back at 1:00.

23 [Whereupon, at 12:05 p.m., the meeting was
24 recessed, to reconvene at 1:00 p.m., this same day.]
25

A F T E R N O O N S E S S I O N

[1:06 P.M.]

CHAIRMAN APOSTOLAKIS: Back in session. So, we will discuss first, some of the items under Risk Assessment Technical Requirements, and some of the specific questions, and then perhaps go back to a general discussion of the standards, and let's plan on finishing maybe like 2:15 or 2:30.

Okay, we've discussed already initiating events, accident sequence analysis, success criteria. Any comments?

[No response.]

CHAIRMAN APOSTOLAKIS: System analysis. Success criteria, I think Bill Shack may have some comments. Do we know where he is?

MR. MARKLEY: Have you seen Dr. Shack?

MR. SIEBER: He had an appointment over lunch.

CHAIRMAN APOSTOLAKIS: He did? Well, that brings us to Human Reliability Analysis, which is me.

And that takes us to page 76. Yes, that's where it starts, right, 76.

[Pause.]

On page 78, under C, for pre-initiator HRA, it says that the evaluation of errors in pre-initiator human action shall be performed using a well defined process that recognizes plant-specific nature of the human failure

1 events.

2 Are you referring to the Swain Guttman various
3 adjustment factors there?

4 MR. MROWCA: Bruce Mrowca, I'm a Project Team
5 Member and also from Baltimore Gas and Electric. I didn't
6 get to the section you were talking about.

7 CHAIRMAN APOSTOLAKIS: Page 78.

8 MR. MROWCA: 78.

9 CHAIRMAN APOSTOLAKIS: There's a table there on
10 high level requirements for human reliability analysis.
11 Under C, Quantification --

12 MR. MROWCA: Okay.

13 CHAIRMAN APOSTOLAKIS: Plant-specific nature, the
14 plant-specific nature of the human failure events, I was
15 wondering what that meant.

16 MR. MROWCA: This is for pre-initiating actions?

17 CHAIRMAN APOSTOLAKIS: Yes.

18 MR. MROWCA: My page numbers are different than
19 yours. That's what I'm struggling with.

20 MR. BERNSEN: Our page 76.

21 MR. WALL: Dr. Apostolakis, if I might offer a
22 small suggestion, if you use the index number on the
23 righthand column, it avoids the confusion about the page.

24 CHAIRMAN APOSTOLAKIS: Righthand column. How
25 about if I give you a table number, 4.4-5.

1 MR. WALL: The index number gives you the right -

2 -

3 MR. BERNSEN: But he's talking about the high
4 level requirements, Table 4.4-5, page 78 of mine. Is that
5 the same page for you?

6 MR. MROWCA: It's 76 for us.

7 CHAIRMAN APOSTOLAKIS: You dropped two pages, but
8 you're not going to tell us which ones. Quantification.

9 MR. MROWCA: That's the quantification of pre-
10 initiators?

11 CHAIRMAN APOSTOLAKIS: Yes.

12 MR. MROWCA: The intent was to reflect the plant
13 unique features of test calibration and maintenance, and
14 have a process that will identify those tests, maintenance,
15 and calibration activities that, one, need to be identified;
16 and, then whether they're proceduralized, and some method to
17 address the degree of proceduralization and the degree of
18 independent degree and checking that's going on in the
19 development of those actions.

20 It actually is not meant to endorse, again, a
21 particular methodology.

22 CHAIRMAN APOSTOLAKIS: The only methodology really
23 that is out there and people are using is the NRC Human
24 Reliability Handbook when it comes to pre-initiators. I
25 don't know of any other.

1 So, in this particular case, it doesn't really
2 matter. It's the post-initiator that is subject to.

3 MR. MROWCA: I've seen many ways to employ a
4 single methodology.

5 CHAIRMAN APOSTOLAKIS: Yes, because it has a lot
6 of discussion on performance factors, so I was wondering
7 whether you were referring to that.

8 MR. MROWCA: Well, the key thing I think we're
9 trying to say is that the two attributes that you need to
10 consider were proceduralization and independence, and having
11 a technique to reflect those attributes.

12 CHAIRMAN APOSTOLAKIS: Okay. On page 80, which is
13 78 for you, I suppose, supporting requirements, Table
14 4.4.5(b), under both Category II and III applications, you
15 have a parenthesis that says, i.e., latent.

16 Now, first of all, we said earlier this morning -
17 - and I don't know if you were here -- that the definition
18 earlier was not quite accurate.

19 But this is not something that people do
20 routinely, I don't think. Wouldn't it be worthwhile to
21 explain what you mean by latent conditions and latent errors
22 somewhere?

23 I was pleasantly surprised to see it here, but I
24 don't know that most people will understand what you mean by
25 latent, unless they have worked in the field.

1 MR. MROWCA: Are you making a distinction between
2 post-initiators and latent errors?

3 CHAIRMAN APOSTOLAKIS: No, no; this applies to
4 both.

5 MR. MROWCA: Excuse me, pre-initiators and latent
6 errors, is what I meant to say. They are the same thing,
7 right, the way you read it.

8 CHAIRMAN APOSTOLAKIS: Oh, I see.

9 MR. MROWCA: Essentially, I think they're being
10 used interchangeably in the standard, for pre-initiators
11 being any action prior to the initiating event.

12 CHAIRMAN APOSTOLAKIS: Right, and you refer to
13 miscalibration, for example.

14 MR. MROWCA: Miscalibration, maintenance,
15 alignments.

16 CHAIRMAN APOSTOLAKIS: What I am saying is that in
17 his book, Jim Reason and others defined latent conditions in
18 a broader sense, so my mind went to that. I didn't go to a
19 specific human action that disables something before the
20 initiator.

21 For example, latent conditions may include things
22 like prioritizing something or giving it a low priority, so
23 even though the Agency is aware of second actions that must
24 be taken, they will take them sometime in the future, and
25 then something happens before the corrective action is

1 taken.

2 And a recent review by Idaho for the Staff here
3 identified many of those. They did a number of root cause
4 analyses and confirmed that.

5 So, the word, latent, means now something very
6 specific in the HRA community. And I think you should make
7 that clear that you are not referring only to the specific
8 action of miscalibration.

9 MR. SIMARD: Would you suggest a change then to
10 our definition of latent human error?

11 CHAIRMAN APOSTOLAKIS: There is a definition which
12 is very specific.

13 MR. SIMARD: Right.

14 CHAIRMAN APOSTOLAKIS: I suggested earlier this
15 morning to broaden it.

16 MR. SIMARD: Thank you.

17 CHAIRMAN APOSTOLAKIS: But I'm not sure that just
18 listing a definition will do it. Maybe some elaboration
19 somewhere here as to what latent conditions are would help.
20 I'm sure the Staff will be happy to give you the INEL study,
21 or at least the viewgraphs that were presented to us, and
22 that will give you an idea of where people are coming from.

23 MR. SIMARD: All right, thank you.

24 CHAIRMAN APOSTOLAKIS: One other comment on this
25 table: Oh, on page 82, again I was pleasantly surprised to

1 see under HR-C-4, assess the dependency of pre-initiator
2 human actions among multiple systems and trains, including
3 whether the work process itself introduces a mechanism for
4 dependency.

5 Well, I don't know of anyone besides me who
6 worries about work processes, so this was really very
7 pleasant to me. Is that something that you are doing and I
8 don't know about it?

9 MR. MROWCA: Well, I think maybe it's maybe the
10 interpretation of what work processes --

11 CHAIRMAN APOSTOLAKIS: The way the term is used at
12 the plants?

13 MR. MROWCA: We assess whether there are different
14 crews that look at redundant channels, for example, and
15 whether there are a couple of mechanisms that's possible
16 between those redundant channels. That's what we do at
17 Calvert Cliffs.

18 When we look at pre-initiators, we're trying to
19 actually identify mainly those things that do take out
20 redundant channels, because those were the ones of most
21 interest to us.

22 CHAIRMAN APOSTOLAKIS: So you are focusing on the
23 number of crews, perhaps?

24 MR. MROWCA: Well, not only the crews, but whether
25 the indications of the test will provide indication that it

1 was mis-done. For example, if there is adequate feedback to
2 the checker, that he will know that; whether the checker is
3 actually embedded into the proceduralized process or
4 performing the test or calibration or maintenance activity.

5 CHAIRMAN APOSTOLAKIS: In a maintenance work
6 process, for example, you will have maintenance request.
7 There is some prioritization, again, because there are too
8 many of those, and there is a scheduling step.

9 There are all those things which are before the
10 actual execution. What you are saying, I think you are
11 focusing on the execution itself and how many people are
12 involved and whether there is feedback.

13 MR. MROWCA: Well, maybe I misunderstand your
14 point, but most of the latent failures that I have been
15 concerned with are the ones that have occurred as a result
16 of maintenance being performed, not as a result of waiting
17 for maintenance to be performed.

18 And those are typically captured in the
19 unavailability conditions that you have in the plant, and
20 the length of time that they're in that condition. And so
21 you would see that information in the unavailability data or
22 failure data, more than you would see it in developing human
23 error probabilities.

24 CHAIRMAN APOSTOLAKIS: I think both the INEL work
25 and work at MIT have seen the prioritization process --

1 MR. MROWCA: As important.

2 CHAIRMAN APOSTOLAKIS: As important, yes. But
3 since the words, work process, really means something again
4 to many people, maybe you need to define it and explain in
5 what context you're bringing it up here.

6 MR. MROWCA: Okay.

7 CHAIRMAN APOSTOLAKIS: And I would encourage you
8 to do that. Page 88, I have something on 88.

9 Oh, well, yes. The issue of model uncertainty is
10 really not raised anywhere in this guide, not just the HRA.
11 And it seems to me if one does a Category III PRA, and if
12 one goes back again to 1.174, you realize that the issue of
13 model uncertainty in some instances may be important.

14 And the Staff now explains very clearly in the
15 Guide, that those cases where we're near the boundary,
16 increased management attention means that we're going to
17 look at sensitivity studies and so on, because the Staff
18 also recognizes that there is no accepted method for dealing
19 with model uncertainty, although expert judgment elicitation
20 techniques come into that.

21 And in the post-initiator -- I think we are there,
22 pre- and post-, so it applies to both -- in the post-
23 initiator HRA, the issue of model uncertainty, of course, is
24 very important, simply because there are many different
25 groups around the world that have developed their own

1 models, and we have SLIM MOD; we have ATHENA from here,
2 although ATHENA hasn't quantified anything yet.

3 And we have ACEP from 1150 and so on. So it seems
4 to me that if there is one place perhaps Level II PRA where
5 model uncertainty is really important, it's the post-
6 initiator HRA.

7 And yet the standard is silent, and what's --
8 there is also inconsistency between what you're doing here
9 and the level of detail and what you do later for common
10 cause failures and expert judgment, but especially common
11 cause failures where you actually list five methods for
12 handling common cause failures.

13 And yet in this chapter, you are completely silent
14 as to what methods exist out there. So that's a broader
15 comment for you that, again, we have this inconsistency that
16 we discussed also in the context of Bob Budnitz's --

17 MR. MROWCA: In those cases, do you have a
18 recommendation that you would prefer to see listed?

19 CHAIRMAN APOSTOLAKIS: I would stay away from
20 recommending methods, and I will recommend later in the
21 context of common cause failures, that --

22 MR. MROWCA: To remove them?

23 CHAIRMAN APOSTOLAKIS: -- they delete the five
24 models. But that's my personal view, and I'm not going to
25 defend it in depth.

1 MR. MROWCA: Okay.

2 CHAIRMAN APOSTOLAKIS: The reason is that, as you
3 know very well, these methods -- I mean, there is no single
4 method that is acceptable by the group of people, but we
5 have to recognize, it seems to me, the fact that there are
6 different models out there, and perhaps you are aware of
7 some benchmark exercises that were run by the ISPRA
8 laboratory of the European Union a number of years back.

9 And Mr. Fleming, in fact, participated in at least
10 two of those, I believe. One was a common cause failure.

11 MR. FLEMING: That's right.

12 CHAIRMAN APOSTOLAKIS: And they have nice tables.
13 I mean, the table on HRA is just mind-boggling. The same
14 team using different models get orders of magnitude
15 different results, and different teams, of course, using the
16 same model also get that.

17 So, it's all over. And that's not your problem,
18 but you have to recognize here, it seems to me, that there
19 is such significant model uncertainty, and that if the issue
20 of recovery actions, for example, is important, important
21 enough to attract increased management attention, some
22 handling, some sort of sensitivity analysis here, you know,
23 using perhaps two or three of these models or arguing that
24 the model we're going to use under these assumptions is
25 really the bounding one, we need some guidance on this, it

1 seems to me.

2 And I'm not saying it's an easy task, and I'm not
3 saying it was obvious and we missed it, but it strikes me
4 that's something that is unique to this particular subject,
5 and I think the fact that even this Agency in this era of
6 limited resources is spending considerable resources in
7 developing ATHENA, shows you that this is an area where
8 there is really a lot of activity.

9 So I would recommend that you do that, but I would
10 also recommend the higher-ups that they put something on
11 model uncertainty somewhere.

12 Yes?

13 MR. FLEMING: I don't think this will end up being
14 an impressive list, but there are a limited number of
15 examples of modeling uncertainty that's addressed in the
16 standard to some extent, and a couple that come to mind are
17 the seal LOCA.

18 CHAIRMAN APOSTOLAKIS: Exactly.

19 MR. FLEMING: The reactor coolant pump seal LOCA,
20 which is a modeling uncertainty issue, and the other one is
21 the modeling of the electric power recovery process.

22 CHAIRMAN APOSTOLAKIS: Right. This morning, I
23 don't know if you remember, but I suggested to Bob that he
24 list a few examples in the expert judgment section of Level
25 I issues that would require experts.

1 Now, again, why do they require experts? Because
2 of model uncertainty. So the whole thing ties in very
3 nicely, but I think somebody who can influence the whole
4 thing, can make -- must make sure that these things are
5 coordinated.

6 You wouldn't go to expert judgment in Level II
7 unless you had model uncertainty, right? If it's a
8 parameter issue, it's not a big deal.

9 Well, we can move on. So, my personal view is not
10 to list any models. You know how people -- at least some
11 people are. They might say, well, one of these is
12 acceptable and we'll do that.

13 If, on the other hand, in the context of model
14 uncertainty, you say, well, there is a number of models out
15 there, e.g., such and such, and then immediately you say one
16 would need to do something with those, then it's okay.

17 MR. FLEMING: Okay.

18 CHAIRMAN APOSTOLAKIS: Yes?

19 MR. FLEMING: Sid just reminded me of something
20 else to point out for the record, and that is when we get
21 down to quantification, there are specific requirements to
22 include modeling uncertainty.

23 CHAIRMAN APOSTOLAKIS: Wonderful.

24 MR. FLEMING: That's in a general sense, not a
25 specific sense.

1 CHAIRMAN APOSTOLAKIS: Yes, but this is an area
2 where guidance is needed, because, you know, I don't think
3 we disagree.

4 I have just a minor comment on 87, Table 4.4-
5 5(f), the third row, HR-F3, Category 3, include best
6 estimate time-dependent HEPs for initiation control, and the
7 previous one says best estimate, best estimate.

8 It is a crusade of mine to eliminate that
9 terminology from reactor safety. I realize it will be an
10 uphill battle when it comes to thermal hydraulics, fighting
11 an entrenched establishment.

12 But I have yet to find a book on probability and
13 statistics that tells me what a best estimate is, and I
14 think that is a pretty powerful argument. And I would
15 suggest that you, especially in Category III, avoid the
16 words, best estimate, and, in fact, there may be uncertainty
17 in that time.

18 I remember seeing a paper way back in the early
19 80s where people said, the author said that -- well, and I
20 think they are right -- that what really matters is not the
21 available time. It's what the operators perceive as the
22 available time.

23 They're not going to do thermal hydraulic
24 calculations there in 20 minutes, so that's what they
25 perceive as the available time.

1 Then, of course, the authors went out and asked
2 operators what the available time would be under a given
3 condition, expert judgment elicitation, and the available
4 time was overestimated systematically by a factor of three
5 or more.

6 This confirms another finding from the
7 psychologists that people tend to be optimistic when it
8 comes to their profession and their ability of handling
9 those situations.

10 So my suggestion is to eliminate, at least under
11 Category III, the words, best estimate, and maybe state
12 something to the effect that the time itself may be
13 uncertain.

14 MR. MROWCA: Okay.

15 CHAIRMAN APOSTOLAKIS: And then on page 90, this
16 is data. We're moving on to data. But overall, I thought
17 it was a pretty good high level description of the
18 requirements.

19 MR. MROWCA: There was a strong attempt to try to
20 stay away from methodologies and just stick to
21 characteristics that were important.

22 CHAIRMAN APOSTOLAKIS: Which is the theme of the
23 standard, right? Now, I don't know how some of these things
24 will affect the quantification, but that's a universal
25 problem.

1 I mean, I don't know whether we can really argue
2 that the quality of the written procedures is so high that I
3 should use rates lower than what another fellow is using,
4 but at least it makes people think about it.

5 Any other comments on HRA from the audience,
6 perhaps?

7 [No response.]

8 CHAIRMAN APOSTOLAKIS: No? Data analysis is the
9 next chapter, 4.4.6. On page 90 of mine, where it talks
10 about parameter estimation -- and this is repeated later. I
11 guess, Karl, you are the man here?

12 MR. SIMARD: That would be Ian Wall.

13 CHAIRMAN APOSTOLAKIS: Ian, I'm sorry. Okay, Ian
14 Wall.

15 Under Requirement C, Parameter Estimation, it says
16 uncertainty intervals should address key parameters. Why
17 intervals and not distribution? That's my page 90, Table
18 4.4-6.

19 MR. WALL: Which index number.

20 MR. BERNSEN: It's high level C.

21 CHAIRMAN APOSTOLAKIS: High level requirements for
22 data analysis, Table 4.4-6, or maybe the numbering of the
23 tables has changed.

24 MR. WALL: Let me say up front, Dr. Apostolakis,
25 that as penance for a lifetime of sins, I was assigned this

1 section, even though I lack expertise.

2 CHAIRMAN APOSTOLAKIS: Your's is not to blame,
3 it's just to come up with a better product.

4 MR. WALL: I was fortunate in having some
5 excellent help as facilitator, including Karl Fleming and
6 Stanley Levinson, and other consultants, Shobba Roa, who I
7 think you may know for PLG. So if I cannot answer your
8 questions, I will be happy to take notes of them and get an
9 answer later on.

10 CHAIRMAN APOSTOLAKIS: So, the question is really
11 why -- first of all, are we on the same page?

12 MR. WALL: We're on the same page.

13 CHAIRMAN APOSTOLAKIS: Uncertainty intervals shall
14 be addressed for key parameters. My question is, why not
15 distributions, because what are you going to do with the
16 intervals?

17 MR. FLEMING: I think I have an insight here.
18 This is a high level requirement which is phrased so that it
19 applies to all three categories. If you go down to the
20 detailed categories, you will see that we're insisting on
21 uncertainty quantification -- full uncertainty
22 quantification for Category III, but less -- you know, more
23 of a qualitative examination of uncertainties in Categories
24 I and II.

25 So the phraseology up at this level --

1 CHAIRMAN APOSTOLAKIS: For Category I, Karl, you
2 really don't ask for any uncertainty, so why would they come
3 up with an uncertainty?

4 MR. FLEMING: There are still requirements to
5 understand uncertainty from a qualitative perspective, even
6 in Category I, so the choice of words up at this level was
7 selected to be broad enough. It says considered.

8 It says uncertainty intervals shall be considered.
9 Down in Category III, you will see uncertainty distributions
10 have to be quantified.

11 CHAIRMAN APOSTOLAKIS: Why didn't you note that?
12 You confused me, and if you guys want to take action --

13 MR. FLEMING: I think the word, intervals, was the
14 problem.

15 CHAIRMAN APOSTOLAKIS: The word, intervals,
16 bothers me.

17 Then on page 94, alpha factor, multiple Greek
18 letter, basic parameter binomial. Why? This is the only
19 place where you do this.

20 Table 4.4-6(e), third row. Use one of the
21 following models for estimating CCF parameters, and it gives
22 a reference, which I bet is NUREG. And I don't know why all
23 of a sudden you decided to be so specific here and list
24 models.

25 I mean, I would rather do what the HRA folks did,

1 and say use a model from out there, but be careful and do
2 all these things that we're telling you.

3 As you know, I don't know that the binomial
4 failure rate model is one of the following models, at the
5 same level as a multiple Greek letter model. I would rather
6 go with multiple Greek letter model than the binomial
7 failure rate model.

8 And also, you know, now it begs the question, the
9 alpha factor model was developed to correct certain
10 statistical things in the multiple Greek letter model, and
11 yet we say you can go back and use the multiple Greek letter
12 model. I would take them out.

13 It would be consistent with the other chapters,
14 and you wouldn't get questions like this, the ones I'm
15 giving you now. Now you're endorsing models.

16 MR. FLEMING: If I might respond to that, I think
17 that, yes, I think it is true that there are some
18 inconsistencies across the elements in the position they
19 took with respect to methods.

20 There were a few example like an accident sequence
21 definition where we throw out some concepts like event
22 sequence diagrams, dependency matrices, and so forth, to
23 provide specific examples of a systematic method for a
24 certain task in the PRA.

25 But in each case, we made judgments. There is an

1 important distinction we need to make between when we
2 compare HRA to Common Cause, and that is that, in fact, one
3 of the conclusions of the ISPRA benchmark exercises on these
4 different elements was that the selection of the method, the
5 modeling method itself, was not fundamental to the nature of
6 the result.

7 It was more in how the model was applied and how
8 the data was screened and so forth. So the variability
9 across methodologies among all the ones that are mentioned
10 here, are not nearly as strong as they are in the HRA field.

11 But we have a tradeoff here. We can list methods
12 that we know are acceptable, and say justify alternatives,
13 or we can take this out and then replace it with the
14 recreation of these NUREGs that describe all the acceptable
15 characteristics that you have to have.

16 CHAIRMAN APOSTOLAKIS: If you took out the
17 binomial failure rate model, it wouldn't bother me.

18 MR. BERNSEN: George, that's a carryover from
19 Draft 10. It's a direct statement, quote, out of Draft 10,
20 but it's still a valid comment on your part. I'm not --

21 CHAIRMAN APOSTOLAKIS: Yes, I think you would have
22 to think about the issue of consistency from chapter to
23 chapter, but coming to the specific thing here, I mean,
24 sure, Karl has a point, people have spent a lot of effort
25 and resources on developing these. But the binomial failure

1 rate model, I'm not sure belongs in the same category as the
2 others.

3 As a matter of fact, we were told that in a
4 different context. But the San Onofre risk monitor uses a
5 multiple Greek letter model. So you really don't want to
6 say just use the alpha factor.

7 I agree with you, Karl, that some statistical
8 corrections really never made a big difference, which brings
9 me to the other point which I may have missed. But as you
10 know, a lot of the emphasis of the NRC work on this subject
11 over the last several years has been on building up a good
12 database, and then urging the user to screen all these
13 events.

14 I think, in fact, that goes back to you, Karl, in
15 the early days when you started this project.

16 To screen these past events as to their
17 applicability to the particular facility for which the PRA
18 is done. Is that emphasized anywhere here or have I missed
19 it? In any table here it says go to the data and actually
20 screen and be careful when you screen. I mean all it says
21 is usually a list of common cause probabilities. But the
22 probabilities come after a long investigation.

23 MR. FLEMING: For example, if you look at DA-B8.

24 CHAIRMAN APOSTOLAKIS: B8?

25 MR. EISENBERG: DA-B8.

1 MR. FLEMING: DA-B8, which is at the top of one of
2 the pages of Table 4.4-6B. It is probably page 94 in your
3 IEEE. The very top requirement in that.

4 MR. SIMARD: It is the one right before the
5 requirement:

6 MR. FLEMING: It is suggesting that for Category
7 III applications you have to do this plant-specific
8 screening as indicated in the NUREG. So, yes, it is
9 mentioned for Category III applications.

10 CHAIRMAN APOSTOLAKIS: Yes, supported by plant-
11 specific screening and mapping. All right. If that is good
12 enough, that is good enough. And, again, we have a
13 particular reference here.

14 MR. WALL: I would like to note, Dr. Apostolakis,
15 that the supporting requirement DA-B8, to which Karl has
16 referred, is actually responding to an ACRS comment on the
17 previous draft, your comment in one of your attachments.
18 So, we did listen last time and we will listen again.

19 CHAIRMAN APOSTOLAKIS: So, our promises are coming
20 back to haunt us, is that what you are saying Dr. Wall?

21 MR. FLEMING: In fact, we refer to this as the
22 Apostolakis requirement.

23 CHAIRMAN APOSTOLAKIS: Okay. Well, so I don't
24 know, is your inclination right now -- I know that you
25 cannot really commit the committee, but to eliminate all

1 four or keep the first three and delete the binomial failure
2 rate model?

3 MR. FLEMING: I think those are good comments that
4 we will certainly take very seriously.

5 CHAIRMAN APOSTOLAKIS: I would like to see a
6 little more emphasis on the screening. Just saying plant-
7 specific screening, maybe that is good enough, I don't know.

8 Well, I think I am done with the common cause
9 failures, unless -- no, there is more. There is more. I'm
10 sorry. There is data analysis. Yeah, that is part of data
11 analysis. I have more comments. Page 96, Table 4.4-6C.
12 Again, the caption talks about intervals but we have
13 discussed this.

14 On the righthand side there are four bullets. Are
15 we on the same table? I like this one, verify that the
16 Bayesian updating does not produce a posterior distribution
17 with a single bin histogram. That way you don't -- in fact,
18 I like it so much I think you should elaborate a little bit
19 more, because the original data specialization paper did
20 not, unfortunately, emphasize this enough, and people take
21 test data, for example, and you don't need very many of
22 those. If you have done a few Bayesian calculations, you
23 know that very quickly, the posterior distribution becomes
24 very narrow, and if the idea was to keep a tail for the
25 accidents, for the accident conditions, and the data come

1 only from tests, then you have a problem.

2 MR. FLEMING: That's right.

3 CHAIRMAN APOSTOLAKIS: And I think that was the
4 intent here, but I think perhaps only a few of us understand
5 this if you just read it. So --

6 MR. FLEMING: True.

7 CHAIRMAN APOSTOLAKIS: And then the fourth bullet
8 says, verify the reasonableness of the posterior
9 distribution mean value. I would say, verify the
10 reasonableness of the posterior distribution. Why just the
11 mean? I mean since you have done the work, you might as
12 well look at it, which is related to the previous comment.

13 MR. FLEMING: Good comment.

14 CHAIRMAN APOSTOLAKIS: And I think now I am done
15 with the data.

16 MR. WALL: Before you leave the data, Dr.
17 Apostolakis, I would like to just mention that you may react
18 to the fact how much smaller this section is than Rev. 10,
19 and I would like to provide some assurance to you that we
20 systematically went through Rev. 10 and took each of the
21 "shall's" from Rev. 10 and made sure it was handled in this
22 section as an action statement. And this section, I tried
23 also, in the square brackets on the lefthand side, to show
24 the paragraph in Rev. 10 from which that statement came.

25 CHAIRMAN APOSTOLAKIS: Good. Thank you. Well,

1 this is an area that is fairly mature now. The data has
2 subsided. So, unless someone else has a comment on data?

3 MR. FLEMING: George.

4 CHAIRMAN APOSTOLAKIS: Yes.

5 MR. FLEMING: I just wanted to -- Ian brought up a
6 very good point, it is something that I just wanted to bring
7 to your attention, the committee's attention, is that one of
8 the characteristics of Rev. 10 that we tried to address in
9 this rev. was that if you go back to Rev. 10 and develop a
10 frequency distribution of the number of pages of
11 requirements against the elements, there was a strong
12 feeling by many of us that it was out of balance. That Rev.
13 10 tended to write the most about the things that we have
14 the least concern about in PRA, system analysis, data
15 analysis. There were lots and lots of requirements in here,
16 and fewer and fewer requirements in there that are really
17 tough.

18 So, we tried to balance, come up with a better
19 distribution of the level of detail of the requirements to
20 reflect the importance of the PRA element, and that was part
21 of what Ian was trying to accomplish this.

22 CHAIRMAN APOSTOLAKIS: One last thing, the user
23 will, if they go the literature, which I am sure they will,
24 or the PRAs, will find terms such as state of knowledge
25 distribution, more recently, epistemic, alliatory.

1 Shouldn't these be in the glossary definitions?

2 MR. FLEMING: If we use them.

3 CHAIRMAN APOSTOLAKIS: And perhaps in the data
4 section, say a few words about the terminology. Because I
5 can see someone getting completely lost. Right now it says,
6 you know, develop a probability. In the definitions, I
7 didn't see it. But I think there is complete silence on
8 these things, and I think people will find it useful.

9 MR. FLEMING: In the quantification section, QUD2,
10 the ones we were referring to earlier, we do, in fact, use
11 alliatory and epistemic.

12 CHAIRMAN APOSTOLAKIS: Yeah, but in the data
13 section.

14 MR. FLEMING: Therefore, we should have a
15 definition.

16 CHAIRMAN APOSTOLAKIS: So, there are two places,
17 one is the definitions and the other in the data section.
18 But when we talk about uncertainty intervals for parameters
19 like failure rates, maybe you put a parenthesis and say, you
20 know, this is epistemic.

21 Dr. Shack, we skipped the success criteria
22 section. Do you have any comments?

23 DR. SHACK: No.

24 CHAIRMAN APOSTOLAKIS: It's okay?

25 DR. SHACK: It's okay.

1 CHAIRMAN APOSTOLAKIS: Fine.

2 DR. KRESS: I had one question on success
3 criteria, I guess. It is sort of the same question I had on
4 the fission products. They call for use of remediation
5 things in fission product, but this requires you have a
6 model for fission product release and transport, but there
7 is no standards, or no requirements related to what that is.

8 I had sort of the same question on success
9 criteria. It calls for using realistic thermal-hydraulic
10 analysis or whatever to determine the success criteria. But
11 that is about as far as it went. And I was a little bit
12 concerned, well, I can do an awful lot in perturbing the
13 results of a PRA by screwing around with success criteria.
14 But it seemed like we didn't talk much about how one
15 determines those success criteria and what are the standards
16 of the deterministic calculations or the other kind of
17 calculations that are used for those. And it was just a
18 comment. It just seemed --

19 CHAIRMAN APOSTOLAKIS: That is actually related
20 also to the available time.

21 DR. KRESS: And available time, yeah. Yeah.

22 CHAIRMAN APOSTOLAKIS: It all comes together.

23 DR. KRESS: Same -- available time is the same
24 sort of issue there. So, I thought it needed a little more
25 discussion or something about that in there.

1 CHAIRMAN APOSTOLAKIS: In fact, different success
2 criteria do have an impact, right?

3 MR. FLEMING: Absolutely.

4 CHAIRMAN APOSTOLAKIS: It is not like failure
5 rates and common cause failure.

6 I think Dr. Kress makes an important point. I
7 think you can tie that to the available time for HRA
8 purposes and all that, and maybe say a few words about the
9 uncertainties in the so-called deterministic analysis.
10 Right?

11 MR. FLEMING: Right. Good comment.

12 CHAIRMAN APOSTOLAKIS: Okay. Mario.

13 DR. BONACA: In many cases it makes enormous
14 difference.

15 DR. KRESS: Yeah, you can really, you can make
16 enormous differences with it.

17 DR. BONACA: Train auxiliary feedwater, the
18 reality, the best estimate, a cantilever, a three redundant.
19 Really, if you have a three redundant train, rather than two
20 redundant. So that just is an example, you can derive very
21 big differences just by the fact that you can prove that you
22 have three redundant system rather than two.

23 CHAIRMAN APOSTOLAKIS: Sure.

24 DR. BONACA: I had some comments on the
25 quantification here. One of them is I believe mostly

1 editorial, I brought it up yesterday, it is on page 109. I
2 am not sure it is only editorial. If you look at the high
3 level requirements, they are listed as B and C and they are
4 the same. But if you go into the supporting requirements,
5 page 113 and 115, they are different. So, I think probably,
6 C was meant to be something else.

7 MR. SIMARD: Oops, a mistake there.

8 CHAIRMAN APOSTOLAKIS: They are identical, yeah.

9 MR. SIMARD: The official answer to that is
10 "oops."

11 DR. BONACA: But the supporting requirements are
12 different in their meaning, so maybe you want a different
13 heading here under C.

14 MR. FLEMING: I believe that one of them was
15 intended to be Completeness and Scope, and the other one
16 supposed to be Completeness and Detail, but we will confirm
17 that. But it is obviously a failure of our document.

18 MR. SIMARD: Yeah. Obviously a failure of the
19 computer.

20 MR. FLEMING: Yes.

21 DR. BONACA: At the beginning I scratched it, and
22 then when I went back, and I said, oh, I can't scratch the
23 supporting requirement there.

24 MR. FLEMING: That is where I hit "do what I mean"
25 button and nothing happened.

1 DR. KRESS: I wish I had one of those buttons.

2 DR. BONACA: On page 110, under index, a couple of
3 the tables you have, under Category I, applications, two
4 applications and three, the only difference is one is
5 understanding, two is a sound understanding, and three is
6 sound understanding and quantification, which is fine. But
7 when you get down to the first supporting requirements, and
8 often after that, you use the word "estimate CDF and LERF,"
9 rather than calculate. Any reason here? I mean estimate
10 seems to me like such a more vague word that has a lot of
11 latitude to it, estimate things.

12 MR. FLEMING: I don't believe we had any profound
13 reasoning in the use of that term and it is probably
14 superfluous. It probably could be --

15 DR. BONACA: Well, I just, you know -- since you
16 are using it also for a Category III, I thought it may have
17 been something else at the beginning. Anyway, look at it,
18 for whatever that.

19 On page 111, the top of the page, now if you look
20 at Category I, again, it says it should have an
21 understanding of the impact of key uncertainties. And so I
22 don't know why the next supporting requirement, QUA9, you
23 know, the truncation requirement, would that apply also to
24 Category I? I mean you still want to truncate at a
25 sufficiently low enough value that the importance

1 calculations are understood. Even if you don't have the
2 same level of scrutiny or precision, you would want to have
3 that.

4 And I had the same comment somewhat on QUA11 here.
5 You are talking about, this is something that I have seen
6 analysts do always. I mean at some point they estimate what
7 they have lost in the truncation. It is a simple check, I
8 mean it is not that this is a major undertaking. My sense
9 is that they will be beneficial by just using the word
10 "consider," to me says that if you don't consider, you may
11 lose the understanding of the impact of key uncertainties.

12 So, my suggestion here is just that you review the
13 high level requirement against the supporting requirements
14 to see that there isn't a logical inconsistency. And that
15 goes down also to QUA12. I don't know, the screening value
16 seems to be pretty large.

17 CHAIRMAN APOSTOLAKIS: I have a minor editorial
18 comment off of there.

19 DR. BONACA: So that is -- I'm sorry.

20 CHAIRMAN APOSTOLAKIS: Understanding and
21 quantification of the impact of uncertainties, I would say
22 quantification of the uncertainties, to avoid. And that is
23 everywhere.

24 MR. FLEMING: Yes.

25 CHAIRMAN APOSTOLAKIS: Yes. I also got the

1 comment from Mr. Barton, he is also wondering whether people
2 will really understand the distinction between a realistic
3 quantification and straightforward quantification. He asks,
4 what is meant by realistic basis? And I think that is
5 related to what Dr. Bonaca just raised. He actually -- we
6 make a distinction here between an understanding and a sound
7 understanding.

8 These are very fine lines to walk --

9 DR. BONACA: That's why at the beginning I didn't
10 critique it.

11 I just went down into the supporting to see if
12 that, by that clarification --

13 CHAIRMAN APOSTOLAKIS: I really don't know what
14 you guys can do about it but I am just telling you what the
15 reaction of people who have not lived with this for the time
16 that you have lived with it is when they see that a
17 distinction between one category and the other is that here
18 you are modeling something but here you are doing a
19 realistic model. Here you understand something but here you
20 have a sound understanding.

21 If you can do something to make it clearer, I
22 don't know what you can do but this is a reaction, okay?

23 MR. FLEMING: Just a comment on that. I think
24 that you see to some extent a work in process along the way
25 from a point in time when we were trying to figure out the

1 logic for, an appropriate logic for differentiating
2 requirements across the three categories.

3 At one time it was oversimplified to say that in
4 Category 3 you shall do something, should, and may, so we
5 converted the actions statements --

6 CHAIRMAN APOSTOLAKIS: Right.

7 MR. FLEMING: -- and we don't mean unsound
8 understanding if you don't say sound, so I think this is
9 good feedback.

10 We need to go back and tighten that up.

11 CHAIRMAN APOSTOLAKIS: And that is why I will come
12 back to my comment yesterday and this morning that if you
13 tie these categories to the decisionmaking process and the
14 decisionmaking process is 1.174, and refer to the decision
15 criteria of 1.174, at least for me that makes it much
16 clearer as to what you mean by Category 3 and Category 2.

17 MR. FLEMING: Right.

18 CHAIRMAN APOSTOLAKIS: The Staff is on the record
19 saying that as you approach the boundaries things become
20 darker, increased management attention, but when you attract
21 increased management attention you better have a Category 3
22 analysis.

23 MR. FLEMING: That's right.

24 CHAIRMAN APOSTOLAKIS: That makes it clearer to
25 me.

1 MR. FLEMING: That's right.

2 CHAIRMAN APOSTOLAKIS: Otherwise, sound versus
3 unsound, realistic versus unrealistic -- it's a little
4 difficult.

5 It may be in the same context -- I mean I can see
6 the distinction between Category 2 and 3 in the context of
7 1.174. Category 1, I can't place it, so that is something I
8 am sure we will discuss again.

9 DR. KRESS: 50.59?

10 [Laughter.]

11 CHAIRMAN APOSTOLAKIS: 50.59 is always the answer.

12 DR. BONACA: I had one more comment here.

13 CHAIRMAN APOSTOLAKIS: One more comment, yes.

14 DR. BONACA: Which is general. That's all I've
15 got -- which is more of the use of the word "may" rather
16 than use like -- let me give you an example -- QUA-14 on
17 page 111.

18 Under Category 3 you are making it a requirement
19 to use the same truncation limit for solving each system in
20 the overall sequence CDF, because it is the proper approach.

21 When you come down to the other two categories you
22 are using the word "may" -- now if I had seen the word
23 "should" I would have said that's fine. It's a
24 recommendation. People don't have to follow it, but "may"
25 seems to be a little bit -- almost too loose.

1 CHAIRMAN APOSTOLAKIS: Too weak.

2 DR. BONACA: Too weak. I mean "may" -- yeah, I
3 may also take a walk.

4 [Laughter.]

5 CHAIRMAN APOSTOLAKIS: But should you though?

6 [Laughter.]

7 DR. BONACA: Just a suggestion though -- it seems
8 a little bit, you know, especially for Category 2 --

9 CHAIRMAN APOSTOLAKIS: Too wimpy.

10 DR. BONACA: Category 2 I would see that,
11 certainly I would want to see there a "should" and then if I
12 go to Category 1, I would almost I will put the word "may do
13 without using" by saying, you know, well, okay, but "may" I
14 couldn't understand what it meant.

15 I can understand the trouble you are going through
16 and I wouldn't want to be in your shoes, actually, going
17 from where you are going before you had all those "shall" --
18 but still I think it would help.

19 MR. FLEMING: Just to comment on that, it was our
20 intention but although not completely successful, in
21 preparation of this draft to use the word "may" only as a
22 permissive. You had several options. You could say you
23 could do it (a), (b), or (c), but there are some remnants
24 and this was one of them of leaving a "may" to be a somewhat
25 less than "should" -- which we don't intend to leave in

1 there.

2 MR. BERNSEN: We also don't want to use
3 "should" -- we have had too much trouble with that so we
4 will come up with something else.

5 DR. BONACA: Okay.

6 MR. WALL: It may be appropriate to point out that
7 in the process of going to action statements we translated
8 the "shalls" to a plain declarative verb, "shoulds" to a
9 consider -- so it would be use this -- the "shoulds" to
10 consider using something, and we left the "mays" as "mays"
11 so that was the general thing, the way we presented this.

12 Now in the process of other hands doing things,
13 some of those "consider usings" may have turned into "mays."

14 MR. FLEMING: That's right.

15 MR. BERNSEN: We'll fix it.

16 CHAIRMAN APOSTOLAKIS: Level II we have covered.

17 Process check is one little paragraph. Anybody
18 has a comment on the little paragraph?

19 DR. BONACA: I just want to ask would this process
20 check be different from a review that you normally have for
21 a standard calculation? What I mean is that there are very
22 specific requirements in QA whereby after performing a
23 calculation you have an independent reviewer who reviews it
24 and he also takes the responsibility to make a statement
25 that says I sign it, I have reviewed it for approach and

1 content and I agree or disagree on the following issues.

2 Would you see it differently? It doesn't sound
3 like -- it is kind of loose, a little bit here?

4 MR. BERNSEN: This is a bit of a special problem.
5 We have been discussing whether to incorporate things like
6 specific QA requirements and some other requirements like
7 that as by reference in the standard and decided not to do
8 that because it is really up to the user at this stage.

9 The general feeling of the project team was that
10 even though one might not apply an Appendix B process to
11 this, although I am not sure where it would be done,
12 parentheses, there was a need to do some level of
13 independent review but perhaps not as sophisticated as a
14 number of licensees have developed in their design control
15 program.

16 It is certainly permissible under Appendix B to do
17 any kind of independent review for design verification.
18 This is not intended to be something else other than that,
19 but it was trying to clarify that we wanted some level of
20 checking yet we didn't want to impose the formality, because
21 it is really up to the user in their program.

22 DR. BONACA: Once the user applies this tool for,
23 say, 1.174 application, doesn't it take a role, a regulatory
24 role, where there are certain requirements in quality
25 assurance, et cetera?

1 MR. BERNSEN: Probably, but that is another venue
2 right now.

3 DR. BONACA: I think we should note, however, that
4 it is not included.

5 MR. BERNSEN: Yes. We have done both things in
6 ASME standards. In some cases we have explicitly called for
7 some kind of QA and in other cases we have allowed for
8 different incorporation of QA requirements.

9 In some cases we have not been explicit.

10 We are finding our way. We are primarily
11 interested in the PRA here, and not configuration control,
12 not QA, not things of this nature.

13 Management systems -- we are not trying to address
14 those. We are talking about the techniques that need to be
15 applied to the PRA, so this is an attempt to recognize
16 something needs to be done, but it is still worth your
17 questions.

18 I think if it is not clear, we need to clarify it
19 some more.

20 DR. BONACA: When you go to Section 5, on PRA
21 configuration control and you say certain things that place
22 a burden on processes --

23 CHAIRMAN APOSTOLAKIS: Bob, do you have any
24 comments?

25 DR. UHRIG: This standard is different than any

1 other that I have had occasion to deal with in the sense
2 that a boiler code basically specifies that you have got
3 confidence that this is not going to blow up.

4 You use an ASME standard in the specification of
5 materials, in a system, you know what you are getting, and
6 if you don't get it you can sue.

7 [Laughter.]

8 DR. UHRIG: This is totally different and I have
9 had a little trouble grasping it. I think I have got a
10 pretty good feel.

11 I accept the categories you have got here and they
12 make sense and I have read through what you have tried to do
13 but I am bothered by George's comment about people using the
14 same system and getting totally different results.

15 Am I misquoting you?

16 CHAIRMAN APOSTOLAKIS: In some instances, no, you
17 are not. In some instances, comma, no, you are not.

18 DR. UHRIG: We are going to have a chaos out here
19 in the regulatory area if Utility A gets different results
20 from Utility B and they both have got essentially the same
21 plants and the -- I don't know how we are going to resolve
22 that.

23 CHAIRMAN APOSTOLAKIS: Well, it is not their job
24 to resolve it. Their job is to make sure that the Applicant
25 recognizes it and does something about it, but I don't think

1 the standard really should resolve issues of model
2 uncertainty that exist out there, so my comment was in the
3 spirit of make sure that the Licensee realizes that here
4 there is a real problem and if they have to do a Category 3
5 PRA they should expect comments from the NRC Staff.

6 DR. UHRIG: You have got the same problem
7 eliciting expert opinions. Two different sets of experts
8 will give you two different views.

9 CHAIRMAN APOSTOLAKIS: Yes.

10 DR. UHRIG: So it is probably inherent in the
11 process.

12 CHAIRMAN APOSTOLAKIS: Mario? I'm sorry. Karl,
13 you had a response?

14 MR. FLEMING: Yes. I think it is an excellent
15 observation. I think it reflects the state-of-the-art to
16 some extent, but I think the other examples that you
17 mentioned, buying materials, building a pressure vessel, and
18 so forth, it could be simplified in the sense that you could
19 talk about the state variables of something you could
20 measure in an objective sense, and the problem that we have
21 is that we are trying to do something that is a function of
22 not the state variables but our state of knowledge about the
23 state variables and the variability, the variability stems
24 from the fact that our states of knowledge are different.

25 CHAIRMAN APOSTOLAKIS: Not only that but let's not

1 forget that PRAs are extremely ambitious. They are supposed
2 to have everything that can go wrong at the plant. This is
3 really a huge task which necessarily leads to this
4 situation, so it is not a specific issue we are dealing with
5 and we don't have the parameters to measure it and so on.

6 I mean ideally it should be the model for the
7 plant and it is people and everybody. Necessarily then you
8 are led to this situation.

9 I think, Jack, have you been trying to say
10 something?

11 MR. SIEBER: Yes. I would just like to comment on
12 Dr. Uhrig's comment, and this is something that you and I
13 have talked about too.

14 When I reviewed the standard I reviewed it, I
15 thought it was good, and I understood what it was you were
16 doing, but I kept in mind some things that were said at a
17 meeting we had on January 27th where you were a presenter,
18 Mr. Fleming -- Perry.,

19 CHAIRMAN APOSTOLAKIS: That was the ACRS retreat
20 in Florida, where Mr. Fleming and Dr. Perry were invited
21 experts.

22 MR. SIEBER: Right, and a couple of the statements
23 that were made was typical industry PRA is too simple and
24 often incomplete and sometimes has low probabilities for
25 initiating events.

1 Another one was typical industry PRAs have
2 differing engineering assumptions related to equipment
3 performance and phenomenological analysis.

4 There were some conclusions out of that with CDF
5 and LERF, et cetera, are relative terms and the absolute
6 value compares from plant to plant is significantly
7 influenced by the engineering assumptions and when used to
8 evaluate a change in risk PRAs of varying quality may still
9 give valuable risk insights related to plant changes.

10 Then Mr. Perry said the current quality of typical
11 PRAs is not sufficient to move from risk-informed regulation
12 to risk-based regulation.

13 I think that everybody can at least intuitively
14 say all these factors are correct.

15 When I reviewed the standard I tried to review it
16 with the thought in mind is will the varying qualify from
17 plant to plant of PRAs and the different answers the
18 different practitioners would get analyzing the same plant
19 with the same initiating events as far as the absolute
20 value, will that be helped by this standard?

21 I came to the conclusion that with the exception
22 of the question of completeness, which is the only thing I
23 could pull out of here that was more or less addressed, that
24 that problem of inconsistency from one practitioner to
25 another would probably remain.

1 I don't know whether that is good or bad. From
2 the delta risk standpoint it makes no difference in my view.
3 On an absolute value, which is your Category 3 it does make
4 a difference, and I am not criticizing or suggesting that
5 you change anything but I would like to hear your comments
6 on my way of thinking about it.

7 MR. BERNSEN: Yes. My reaction is that the
8 introduction of this standard and application of it is going
9 to lead in time to more convergence.

10 MR. SIEBER: Okay.

11 MR. BERNSEN: I don't think that all by itself it
12 will get you there, but there is a lot of cross-pollination
13 built into this, if you will, through the peer review
14 process, through the questions and responses that we will
15 have to answer over the years, through the additional things
16 that we are going to have to generate to supplement the
17 standard.

18 This is just the beginning. I mean if you recall,
19 we were talking about it before, the original nuclear boiler
20 code was a vessel design code for the reactor vessel,
21 nothing more. Look how far this has evolved to respond to
22 the need.

23 I think that we are going to see this as the top
24 level that generates over a period of time a lot more
25 formalized and informalized guidance and examples and

1 probably training and cross-communication that is going to
2 bring things closer together in time.

3 It is not going to happen overnight but if we
4 don't begin to move in that direction, and starting with a
5 basis that people can use based on the kinds of standards,
6 kinds of PRAs they have, so we encourage them to begin to
7 use it in a logical way, control fashion, we are never going
8 to get there, so this is I think a major step in that
9 direction, but we have got a long way to go.

10 MR. SIEBER: Well, I see it as just one element.
11 There is the standard and you can publish the standard and
12 the Commission can endorse it, but equally important are two
13 other elements that are the peer review and certification
14 process to me is the one that will have the greatest
15 influence on standardizing methodology and in self-criticism
16 and criticism of bad or inadequate phenomenological
17 analysis.

18 The other element to that is the sourcebook or
19 paper that really combines what was contained in Version 10,
20 okay, as a way to say here are the standard methods that are
21 being used. These are the "how-tos" and make the real
22 standard, the obligatory part, and the other one just a
23 tutorial, so to speak, and so I see this as really a three-
24 pronged effort which one of those is the standard itself.
25 The second one is peer review and certification. The third

1 is publishing the "how-to" portion of it, and that at least
2 is the way I see it.

3 CHAIRMAN APOSTOLAKIS: But I do agree with you,
4 Jack, that if there is one contribution I am sure there is
5 more than one of this standard is in the area of
6 completeness, because it raises all the issues that the
7 practitioner has to think about.

8 MR. SIEBER: Once they are in the standard you
9 can't ignore them.

10 CHAIRMAN APOSTOLAKIS: That's right.

11 MR. SIEBER: Obviously you aren't complying and so
12 you have to give due consideration to all the factors that
13 are in the standard. From that standpoint it is a good
14 thing.

15 CHAIRMAN APOSTOLAKIS: In fact, given the state-
16 of-the-art, I would oppose a standard that went beyond that
17 and actually recommended methods because I don't think
18 that --

19 MR. SIEBER: And I agree.

20 CHAIRMAN APOSTOLAKIS: In many areas we are not
21 ready.

22 MR. SIEBER: Well, that is my global comment.

23 CHAIRMAN APOSTOLAKIS: Well, it seems to me that
24 Mr. Sieber has broadened the discussion, so maybe we can go
25 around the table and see what the members have to say in

1 terms of general comments, if members so desire, or we can
2 open up the discussion in terms of specific issues and have
3 an unstructured formal discussion --

4 [Laughter.]

5 CHAIRMAN APOSTOLAKIS: -- of the issue by issue.

6 We certainly have to revisit the issue of
7 categories because ASME is obviously very much interested in
8 knowing the subcommittee's views.

9 I don't hear any suggestions, so I will pick one
10 method. Why don't we go around the table. I think Jack
11 just --

12 MR. SIEBER: I already gave mine.

13 CHAIRMAN APOSTOLAKIS: -- did his piece. Tom?

14 DR. KRESS: Certainly. Thank you.

15 Well, a general comment. I was just a little
16 disappointed that the standard chose to limit itself to the
17 current definition of CDF and LERF. The reason I say that
18 is I think having limited itself to those it did a pretty
19 good job. I mean I really have no complaints, but I think
20 that NRC when they go in to risk inform the regulations they
21 are really going to be in the business of looking at fission
22 products and the frequency of their releases and controls on
23 those and the standard comes up short on discussing fission
24 products.

25 I think more will be needed later by NRC or

1 somewhere on the standards associated with that, so that is
2 just a statement saying as far as it went I think you did a
3 good job. I think it left out an important part.

4 You always have to limit what you do, especially
5 if you have got limited time and resources so I think it is
6 appropriate to limit it but I was a little disappointed in
7 that.

8 I do think the main issue with the limited set is
9 going to be the categories and not so much that it is
10 appropriate to have different categories for different
11 applications. I think it is. I think you almost have to
12 buy off on that presumption.

13 The problem is going to be how to be sure you are
14 fitting the right application in the right category and I
15 think the guidance on how to do that might be a little too
16 loose, that I can fit things into categories one way or the
17 other by some small assumptions.

18 I think there might be some thoughts about saying
19 if you are unclear about what category to use, use the more
20 stringent one. I really don't see that admonition in there.

21 I also share George's view that the categories
22 might be tied to some extent to how well you need to know
23 the answer and that is either in terms of a predetermined
24 confidence level you need in the CDF and LERF, which may or
25 may not be something a standard ought to deal with. That is

1 something that NRC has to come up with, but then if they
2 came up with the confidence level they need, how do they go
3 to these categories and say this category will give me this
4 confidence level?

5 That connection is not made explicitly and I think
6 George's suggestion that looking at it in terms of the 1.174
7 may be a way to make that link and I did kind of like that
8 suggestion, George.

9 I thought the definition of LERF that allowed site
10 specific flexibility probably goes against the intention of
11 the definition of LERF in the first place in that it ought
12 to be made independent of the site.

13 I am not quite sure of that one yet. I have to
14 think about it awhile but that was my first reaction to
15 that.

16 I thought the requirement to have a full
17 uncertainty analysis for Category 3 needed a little bit more
18 expansion, and the reason is -- I share George's views -- I
19 can't see any plant-specific PRA doing a full uncertainty of
20 the NUREG-1150 type. What they will do is do the Monte Carlo
21 propagation which is easily done, but I think there's some
22 guidance needed on how you deal with the knowledge
23 uncertainty. What do you call it, George? Is that the
24 epistemic? I didn't see real good guidance on how you deal
25 with that in here, because I don't think it is going to come

1 out of a routine uncertainty analysis, so I thought that was
2 a missing element on how to deal with it first, particularly
3 for Category 3.

4 That is basically all the general comments I have
5 right now, besides the specific ones I had before.

6 CHAIRMAN APOSTOLAKIS: Mike, do you want to say
7 anything?

8 MR. MARKLEY: Yes, I have just got one slightly
9 technical and the other two just a formality.

10 I guess I am a little bit uncomfortable when I am
11 told that something is intended for a general purpose and
12 not really for regulatory purposes and then something like
13 the maintenance rule A4 is partitioned into Category 1. I
14 know you are going to go look at all that stuff.

15 The other two things were just that the member
16 comments, I just wanted to reinforce that. They are just
17 their own views. They do not represent the subcommittee's
18 or the full committee's, and I wanted to mentioned the
19 schedule for the full committee, and that is from 1:15 to
20 3:15 p.m. on Wednesday, July 12th.

21 CHAIRMAN APOSTOLAKIS: In fact, we should talk
22 about it before adjourn today as to maybe recommendations
23 that the members might have, what you should address,
24 because it is only an hour and a half, right?

25 MR. MARKLEY: It's two hours.

1 CHAIRMAN APOSTOLAKIS: Two hours, and points to
2 focus on -- let's not forget we should do that before we --
3 we usually do it with the Staff, because we don't want to
4 repeat everything verbatim that was done today.

5 Maybe you will have a chance to think about some
6 of our comments today and respond to the extent possible.
7 Dr. Bonaca?

8 DR. BONACA: I gave all the comments before, but
9 just to summarize what I view as important in addition to
10 the points already made by the members.

11 One is again we talked about the view,
12 characterization of Category 1 for maintenance rule and I
13 meant to say this morning the fact that some part of the
14 guidance and presentation as been pointed out in Category 1
15 is primarily decisions based on deterministic analysis
16 supplemented with basic insights.

17 I am not sure that the maintenance rule right now
18 says that as far as the role of risk information to make
19 decisions so that adds another thing, saying that this point
20 really has to be resolved.

21 There is an inconsistency.

22 Somewhere else also there is some inference that
23 the PRA -- for example under Category 1, page 3, it says PRA
24 applications are not expected to impact safety-related SSCs,
25 but you are pulling them out of service. There is an issue

1 there.

2 The second is the point I made this morning and I
3 still believe it is important. The chart which you are
4 presenting there, which is important, because visually it
5 helps to understand, has the fundamental presumption that
6 one can build a model to fit a need, and that is simplistic
7 in PRA.

8 A complete PRA at a plant is a massive model that
9 contains all kinds of information and my suggestion would be
10 simply that in the text somewhere you can explain that. The
11 reason or the intent of doing that is only, the intent is to
12 say that if the application is limited enough and clear
13 enough then it can be used for the purpose, but there is
14 some warning there that says don't -- and this is really
15 with good intent.

16 You may have a very low capability that begins to
17 do some, for example, subtle electrical changes, in some
18 support systems which are nonquality related, and yet they
19 cascade into dependencies which are important.

20 The third point I would like to make is I
21 recognize that the probably there isn't any PRA out there
22 that meets strictly the minimum requirements of Category 1
23 but the standard allows it. I don't know how we go
24 around --

25 CHAIRMAN APOSTOLAKIS: Say that again. There is no

1 PRA that what?

2 DR. BONACA: That meets only the minimum
3 requirements of Category 1.

4 CHAIRMAN APOSTOLAKIS: I thought that Karl said
5 that Category 1 in fact is higher level than the IPEs.
6 Isn't that inconsistent with this?

7 DR. SHACK: It's the intention.

8 MR. FLEMING: Again I think the distinction needs
9 to be broken down at the subelement level, and so we are
10 looking at the individual elements and subelements of the
11 PRA. There are some out there that are Category 0, 1, 2, 3
12 4, so --

13 CHAIRMAN APOSTOLAKIS: I see.

14 MR. FLEMING: -- so no full PRA is only Category
15 1. It is a mixed bag.

16 DR. BONACA: The message here is only -- I don't
17 want to interfere in the process. I only want to make sure
18 that as a committee you can review that and look at Category
19 1 and ask yourself does it provide you a very low standard
20 and do you want to support it, yes or maybe no.

21 It may be that you feel comfortable with that and
22 I trust that the committee can do that. I just say that if
23 I were in your shoes I would do that, just a simple
24 verification.

25 The last thing I would like to add is only that we

1 did not discuss the issue of peer review.

2 CHAIRMAN APOSTOLAKIS: Yes. Today we didn't.

3 DR. BONACA: Yes. But, you know, when I look at
4 some of the qualifications for example of the PRA I don't
5 understand exactly what kind of latitude you are allowing
6 the PRA peer review team qualification, because here it says
7 somebody who is knowledgeable in the requirements in the
8 standard for the area of review, which means we are all
9 knowledgeable enough right now with the standard.

10 Have the most experience performing PRA
11 activities relevant to the area -- it doesn't say he has
12 performed PRA. It says somebody who is doing some, you
13 know, evaluations, and have collective knowledge of the
14 plant design, containment design and plant operation.

15 Now these general characteristics, I don't believe
16 that they are capable -- how capable the members will be of
17 performing a true independent and thorough evaluation.

18 CHAIRMAN APOSTOLAKIS: It will come down to what
19 the Staff has. The Staff sees two or three of those that
20 are shallow the whole process will die.

21 A comment from somewhere?

22 MR. HILL: Just a little bit of a response to your
23 concern. Our original -- as you probably saw on Rev. 10 --
24 we used timing requirements, so many years experience, et
25 cetera, in various areas, but the point was made that you

1 could have that many years' experience and still not know
2 what you are doing, so that doesn't necessarily qualify
3 somebody.

4 CHAIRMAN APOSTOLAKIS: That's right.

5 MR. HILL: And it is difficult to tap into the
6 brain of the reviewer and say how much do you really know.
7 We chose these kinds of statements to be able to say that
8 they need to be able to cover all the ground of the NSSS,
9 the containment type, the operations, et cetera, and leaving
10 it somewhat on the judgment of the team leader.

11 That person has to make sure that they have the
12 right set of skills and talents available to perform their
13 review.

14 So, yes, it is somewhat vague and somewhat
15 general, but I am not sure how you can nail it down because
16 every time you try to nail it down with some specific
17 somebody can say, well, that specific doesn't prove
18 capability.

19 DR. BONACA: The reason why I am raising this
20 issue is because this is a unique area where the work done
21 for most PRA in the country have been done by a few
22 specialists and then put in the hands of the utilities.
23 From my experience many of these do not have the expertise
24 internally. They have expertise to tinker with some change
25 inside, but they don't understand oftentimes some of the

1 real subtle issues that were addressed by the professionals
2 who built the PRA. That is the only reason why I raised the
3 question.

4 MR. HILL: And you had another comment about why
5 doesn't it say performing requirements of having performed
6 PRA.

7 We did have those kinds of words in there but we
8 came to the rapid conclusion that we don't have people
9 performing PRAs anymore. We have people updating PRAs
10 because the PRAs already exist and there probably won't be
11 any more performed.

12 If we limit it to that, five years from now with
13 the career paths we won't have anybody available.

14 DR. BONACA: And I think, I was talking to some
15 utility guys last week and they were talking about how to
16 build a PRA capability at their facilities, and every single
17 one of them wanted an experienced systems engineer who would
18 be willing to learn PRA methods, and today we are talking
19 about experienced people doing this, experienced people -- I
20 don't think college graduates will find a job in the nuclear
21 business anymore, because all the jobs are for experienced
22 people.

23 [Laughter.]

24 DR. KRESS: Of course.

25 CHAIRMAN APOSTOLAKIS: I don't know what they have

1 to do to enter the field.

2 DR. BONACA: Still this is a unique issue because
3 I mean --

4 CHAIRMAN APOSTOLAKIS: It is. It is, but it
5 ultimately comes to the guys behind us. If they start
6 rejecting the quality of PRAs that have undergone the PRA
7 review, then there is a problem, because I am sure that they
8 will at the beginning at least review, themselves, the
9 products.

10 DR. BONACA: They are not rejecting thermal
11 hydraulic codes.

12 CHAIRMAN APOSTOLAKIS: What?

13 DR. BONACA: But that is a different issue.

14 [Laughter.]

15 CHAIRMAN APOSTOLAKIS: Thermal hydraulics isn't
16 different. Thermal hydraulics came from the fountain.

17 DR. KRESS: It was handed down from on high.

18 George, I think a good graduate student that
19 specializes in PRA at the right institution with the right
20 teacher could probably qualify as being experienced.

21 CHAIRMAN APOSTOLAKIS: I don't think so, Tom, but
22 very kind of you. Dr. Uhrig?

23 DR. UHRIG: The only thing I have to add is
24 related to a comment you made, concern about this OMB
25 regulation.

1 CHAIRMAN APOSTOLAKIS: Yes.

2 DR. UHRIG: I don't think that is a real problem.
3 I think if NRC -- I think it has the right to reject or
4 modify specific parts of any of the codes and having been on
5 the other side of the fence a time or two, if NRC wants to
6 do something they usually get it done.

7 CHAIRMAN APOSTOLAKIS: Still, though --

8 DR. UHRIG: Philosophically it is a concern but --

9 DR. KRESS: Well, they have gotten themselves in
10 that trap with the backfit rule.

11 DR. UHRIG: What?

12 DR. KRESS: They are certainly gotten themselves
13 in that trap with the backfit rule.

14 DR. UHRIG: Yes, they have. What I alluded to was
15 before the backfit rule came into effect. That's it.

16 CHAIRMAN APOSTOLAKIS: Okay, thank you. Bill?

17 DR. SHACK: I think it is a very interesting
18 attempt -- I think there is a lot of good, useful
19 information on the categorization in your viewgraphs and in
20 1-5 I think you beat up enough on that already today, but I
21 think you really do have the material to make a useful
22 approach to the categorization in the viewgraphs.

23 CHAIRMAN APOSTOLAKIS: Don't worry about
24 limitations of space when it comes to 1.5, okay? Take as
25 much as you want.

1 [Laughter.]

2 MR. BERNSEN: Well, I am going to go around our
3 side too. One of the points that was made I guess by Tom or
4 somebody with regard to the completeness of this standard,
5 as we mentioned before, this is the first effort.

6 You are probably aware of the fact that ANS is
7 writing some parts to the overall PRA and the low power
8 shutdown, external events.

9 We have had on our plate, work assignment, to look
10 at what is needed in the future, and in fact Karl graciously
11 agreed I still think to lead our little task group to define
12 what we should be doing in the future, so this is not the
13 end of the line in the process by any means. It is the
14 first step.

15 We recognize -- I think all of us -- that you need
16 to go further in terms of detail, in terms of guidance, in
17 terms of expansion of scope and things of this sort and that
18 will be done and we will work in a coordinated fashion with
19 ANS in doing that.

20 DR. KRESS: Will this be like other ASME standards
21 that may get updated?

22 MR. BERNSEN: Yes. It's intended -- this is a
23 living document.

24 DR. KRESS: Living document?

25 MR. BERNSEN: That we have done with our O&M, with

1 our code sections, with our QA and with all the other
2 standards. They are living documents. They are maintained.

3 I was going to say, Bob, you know, think of this
4 standard more in terms of a QA program standard, which
5 really didn't give prescriptive requirements on how you do
6 things either.

7 This is not the first step. It is somewhere in
8 the middle between them but we have had to deal with
9 different approaches for standards, but as I say, the main
10 thing to keep in mind is this is the first step. It is
11 going to be maintained. It is going to be interpreted.

12 I am sensitive to the concern whether or not --
13 the Staff certainly can accept or reject pieces and parts of
14 the standard. It makes it more difficult for them to do
15 that if we have something in the standard that says this is
16 the way we intended it to be used, so we have got to be
17 careful that we don't necessarily lead the pack when we
18 should be following. We will think about that.

19 DR. KRESS: Okay.

20 MR. FLEMING: I just wanted to make one final
21 comment about the categories that I don't think we had a
22 chance to bring up is that there is I think a quantum leap
23 in improvement when we went from one line in the sand to the
24 idea of multiple categories, because what we were trying to
25 avoid is by having one line in the sand is the unfortunate

1 consequence of having everybody expected to get to that line
2 and stop, so the idea of having, recognizing the three
3 categories, especially Category 3, also points a direction
4 for future enhancement of the technology.

5 We wanted to try to avoid just this idea of
6 meeting the requirement -- what do I have to do to meet the
7 requirement, as opposed to what we need to do to advance
8 this technology so we can make better decisions.

9 To echo something Sid said in response to Jack's
10 comments earlier, I do believe that already the
11 certification process is already helping this problem of
12 variability in the PSA results and I also agree with what
13 you say. It can't be done with any one leg of the stool.

14 MR. SIEBER: Right.

15 MR. FLEMING: It is all three of these -- the
16 certification process, the standard and the methodology
17 enhancements have to be working together.

18 CHAIRMAN APOSTOLAKIS: Gerry?

19 MR. EISENBERG: I am going to hand off to Ron
20 first.

21 CHAIRMAN APOSTOLAKIS: Sure. You are not
22 obligated to speak.

23 MR. SIMARD: All the good comments have been
24 taken.

25 I would just like to thank you on behalf of the

1 project team for some good discussions, some constructive
2 suggestions over the past day and a half.

3 I think I have heard that we have struck a
4 reasonable approach by trying to approximate the spectrum of
5 possible applications with these three categories, have
6 certainly gotten the signal that we need to do a better job
7 of characterizing the attributes of these categories, and
8 appreciate the fact that you gave us specific suggestions
9 that we can work on, so I just want to thank you.

10 CHAIRMAN APOSTOLAKIS: You are welcome. Ian,
11 would you like to say anything? No?

12 Before we adjourn though, I think there are two
13 points to be brought up.

14 As a prelude, I always find that sometimes being a
15 reviewer gives you a certain perspective that is not always
16 right, so I always learn when I have to defend my research
17 contracts at MIT before other people who are reviewing me.
18 I get upset a little bit at the beginning when they dare ask
19 questions, but then after awhile I realize that this is the
20 name of the game, so imagine I sitting over there and I act
21 accordingly.

22 Now why is that relevant to this?

23 Well, there was a suggestion made yesterday at the
24 workshop which I thought was very good. The suggestion was
25 that the NRC Staff apply this standard to its own work, and

1 what came to mind was the SPAR models.

2 This committee recommended in the recent past to
3 the EDO that the SPAR models be subjected to peer review.
4 The response from the EDO was no, we have had enough peer
5 review and they have been used by some Sandia folks -- that
6 is good enough.

7 It seems to me that we should come back to this
8 and if the committee agrees, of course, we should come back
9 to it and I think it will be a healthy exercise for the NRC
10 Staff to use this approach and maybe try to categorize SPAR
11 models and what they can do -- well, I think that will be a
12 very healthy exercise.

13 DR. BONACA: We will have to develop that.

14 CHAIRMAN APOSTOLAKIS: If we can demand perfection
15 from others --

16 DR. BONACA: We have to develop a new category
17 then because --

18 CHAIRMAN APOSTOLAKIS: What?

19 DR. BONACA: I will not mention it.

20 [Laughter.]

21 CHAIRMAN APOSTOLAKIS: But I mean the SPAR models
22 eventually will be, unless I am mistaken, will be the plant-
23 specific PRAs that the Staff will be using not to make
24 decisions but as a major input to their decisionmaking
25 process.

1 DR. KRESS: That's right.

2 CHAIRMAN APOSTOLAKIS: And I don't see why the
3 SPAR models cannot be subjected to this particular process.

4 Yes? We get a smile from the Staff. Are we
5 getting anything more? Oh, there you are.

6 MR. CHEOK: By default I'm it. This is Mike Cheok
7 from the Staff.

8 I guess the SPAR models will be used as an initial
9 stepping stone into whether something is risk significant or
10 not. All it is is to tell us if something needs to be
11 looked at some more, and if something needs to be looked at
12 some more, we will look at the licensees for more specific
13 information.

14 CHAIRMAN APOSTOLAKIS: Well, I guess you just told
15 us that the SPAR cannot be Category 3.

16 [Laughter.]

17 CHAIRMAN APOSTOLAKIS: Now the question is are
18 they Category 1 or Category 2?

19 MR. CHEOK: In my opinion, probably not Category
20 1.

21 CHAIRMAN APOSTOLAKIS: 1.5 perhaps.

22 MR. CHEOK: It is probably below a Category 1.

23 DR. KRESS: Category 1.9.

24 CHAIRMAN APOSTOLAKIS: Below Category 1?

25 MR. CHEOK: Yes.

1 CHAIRMAN APOSTOLAKIS: Well, they just did it.
2 But we may find other examples.

3 MR. CHECK: That's right.

4 CHAIRMAN APOSTOLAKIS: Thank you very much,
5 anyway, for the comment. That is your expert opinion. Give
6 it to Budnitz. He will give it to us.

7 The other one is do the members have any
8 suggestions regarding the July meeting? Should, for
9 example, Mr. Bernsen and Mr. Fleming and Mr. Simard come
10 here with the same presentations or should they modify them
11 a little bit?

12 MR. SIEBER: Condense them.

13 CHAIRMAN APOSTOLAKIS: I mean we can't tell you
14 what to do. I'm sorry. I am using the word "should" -- you
15 are not Staff.

16 MR. BERNSEN: "Should" is a recommendation.

17 CHAIRMAN APOSTOLAKIS: Recommendation, okay, or
18 "shall" they -- they should consider. They should consider.

19 DR. KRESS: I think they ought to consider the
20 same stuff, only condensed a bit and maybe focus a little
21 bit on the categorization process.

22 CHAIRMAN APOSTOLAKIS: I would agree with that.

23 I mean if you could -- I don't know how much time
24 you have until then, but maybe take the major comments that
25 were made today and give us some preliminary reaction?

1 DR. KRESS: Yes.

2 CHAIRMAN APOSTOLAKIS: That will bring the
3 committee up to speed. I don't know if you realize this is
4 not a paying job, for some of you anyway, so it may not be
5 enough time, but if you could address some of these comments
6 or what you thought was something --

7 MR. BERNSEN: We can do that. Of course we will
8 not have had all the comments. We won't have a project team
9 meeting, so again, just as I said in this meeting where we
10 are representing ourselves as knowledgeable --

11 CHAIRMAN APOSTOLAKIS: Sure.

12 MR. BERNSEN: -- committee members and project
13 team members, we certainly will be able to I think identify
14 some of the issues you have raised and the fact that we are
15 going to take them under advisement in some possible ways to
16 the extent we can.

17 CHAIRMAN APOSTOLAKIS: For example, I mean when,
18 Karl, you presented the categories, you might modify your
19 viewgraphs a little perhaps to reflect some of the things
20 that you accept and say this is what eventually the document
21 will say I think that will promote better understanding.

22 Again, you don't have to do this. These are
23 individual comments.

24 MR. MARKLEY: And because we had four members who
25 didn't attend I think it is unavoidable to have the

1 overview.

2 CHAIRMAN APOSTOLAKIS: We will have the overview.

3 MR. MARKLEY: Short and brief and concise as you
4 can, but the issues are really the important points.

5 CHAIRMAN APOSTOLAKIS: And judging from the
6 experience of yesterday and today, the question of how do
7 you really define the categories is there, so if they feel
8 they have gotten any useful comments today, then maybe they
9 should do it.

10 MR. EISENBERG: You mentioned there is a two-hour
11 window for that. How much of that window is the
12 subcommittee presentation?

13 DR. KRESS: Normally --

14 MR. EISENBERG: Go ahead.

15 MR. MARKLEY: I'm sorry, Tom. Normally it is
16 about five to ten minutes, just introductory to introduce
17 you and then you have the majority of the rest of the --

18 CHAIRMAN APOSTOLAKIS: Well, I can go over the
19 major points.

20 DR. KRESS: Normally though, when you have two
21 hours you ought to count on about an hour of that is yours.
22 The rest of it is interruptions from us.

23 MR. EISENBERG: I understand -- just to know what
24 the ratio was.

25 DR. BONACA: I think they have a very good summary

1 presentation. If you went through that and if you just
2 simply acknowledged some of the questions you got, to
3 anticipate those --

4 CHAIRMAN APOSTOLAKIS: I will try to sketch some
5 of the major points in my introduction, okay.

6 DR. BONACA: -- so that we avoid having to jump in
7 again and again on the same issues, and otherwise I think
8 the summary presentation was good.

9 CHAIRMAN APOSTOLAKIS: And the nature of that
10 meeting is not to go into details and say on line this you
11 said that and so on, but we will write a letter, right,
12 addressed to the EDO?

13 Does anyone have any comments or questions from
14 the people around the table or others?

15 Hearing none --

16 DR. BONACA: I want to say we had a lot of
17 comments, a lot of criticism, et cetera. Again, you know,
18 at least personally -- I don't want to leave a perspective
19 that I don't think that there hasn't been progress since
20 last year. I think there has been progress and that is just
21 my personal view and that you people should be more than
22 encouraged for what you are going through.

23 I mean you are sifting through not only our
24 comments but so many others and so that is what I wanted to
25 say.

1 DR. KRESS: Yes. I second that. I think you are
2 on the right track with this as the kind of standard we need
3 to come up with. I certainly want to thank you guys.

4 MR. EISENBERG: Thank you very much.

5 CHAIRMAN APOSTOLAKIS: It's a very difficult job
6 trying to draw the line between various applications and so
7 on, and a lot of it is subjective, as we discussed, so we do
8 realize that you have a difficult job on your hands.

9 The comments are offered, you know, in a
10 constructive spirit and hopefully they will improve the
11 product, because there is a need out there, even
12 internationally. I am being asked by a lot of people when I
13 travel, especially people who are not in the business, and
14 they are surprised that there is no standard for doing this
15 new thing, so I appreciate your coming here and being
16 patient with us and thank you very much.

17 I think it was a very good meeting. We all
18 learned something, and on that note this meeting is
19 adjourned.

20 [Whereupon, at 2:44 p.m., the meeting was
21 concluded.]
22

REPORTER'S CERTIFICATE

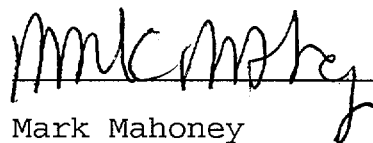

This is to certify that the attached proceedings
before the United States Nuclear Regulatory Commission in
the matter of:

NAME OF PROCEEDING: RELIABILITY AND PROBABLISTIC
RISK ASSESSMENT

CASE NO:

PLACE OF PROCEEDING: Rockville, MD

were held as herein appears, and that this is the original
transcript thereof for the file of the United States Nuclear
Regulatory Commission taken by me and thereafter reduced to
typewriting by me or under the direction of the court
reporting company, and that the transcript is a true and
accurate record of the foregoing proceedings.

REVISED 6/26/00

**ADVISORY COMMITTEE ON REACTOR SAFEGUARDS
MEETING OF THE SUBCOMMITTEE ON PROBABILISTIC RISK ASSESSMENT
ROOM T-2B3, 11545 ROCKVILLE PIKE, ROCKVILLE, MD
JUNE 28-29, 2000**

ACRS Contact: Michael T. Markley (301) 415-6885

- PROPOSED SCHEDULE -

June 28, 2000

<u>TOPIC</u>	<u>PRESENTER</u>	<u>TIME</u>
1) Introduction		8:30-8:35 am
• Review goals and objectives for this meeting	G. Apostolakis, ACRS	
• Review points raised in ACRS report dated March 25, 1999; ACRS member assignments for reviewing the proposed Standard	G. Apostolakis, ACRS	
2) ASME Presentation		8:35-10:00 am
• Introductory remarks	G. Eisenberg, ASME	
• Discussion of revised ASME document entitled, "Standard for Probabilistic Risk Assessment for Nuclear Power Plant Applications," including proposed use of industry certification programs.	S. Bernsen, Chairman ASME CNRM R. Simard, ASME Project Team Leader Others, TBD	
• Reconciliation of comments (ACRS, NRC, industry, and public) on draft #10		
• Public comments from the June 27, 2000 public workshop on the revised Standard.		
** BREAK **		10:00-10:15 am
3) ASME Presentation - continued		10:15-12:00 noon
• Discussion of technical issues associated with the proposed Standard and its use, including the use of expert opinion, peer review, quantitative and qualitative aspects, methods and models.	ASME, TBD	

**** LUNCH ****

12:00-1:00 pm

4) General Discussion and Recess

1:00-2:30 pm

- General discussion and comments by Members of the Subcommittee; items for July 12-14, 2000 ACRS meeting
- G. Apostolakis, ACRS

June 29, 2000

<u>TOPIC</u>	<u>PRESENTER</u>	<u>TIME</u>
5) Introduction		8:30-8:35 am
<ul style="list-style-type: none">• Review goals and objectives for this meeting	G. Apostolakis, ACRS	
<ul style="list-style-type: none">• Review points raised during March 2000 ACRS meeting and issues noted in ACRS report dated October 12, 1999	G. Apostolakis, ACRS	
6) NRC Staff Presentation		8:35-10:15 am
<ul style="list-style-type: none">• Discussion of public comments on proposed 10 CFR 50.69 and associated Appendix T (Option 2)	C. Carpenter, NRR T. Bergman, NRR T. Reed, NRR

<ul style="list-style-type: none">• Discussion of proposed revision to 10 CFR Part 50 (Option 3) and 10 CFR 50.44 concerning combustible gas control	T. King, RES M. Cunningham, RES M. Drouin, RES	

systems

- Status of 10 CFR 50.44 rulemaking petition C. Carpenter, NRR

**** BREAK ****

2:00-2:15 pm

9) Industry Presentation

2:15-2:45 pm

- Industry perspective on proposed revision to 10 CFR 50.69 and Appendix T S. Floyd, NEI
A. Heymer, NEI
- Issues and priorities noted in the NEI letter dated January 19, 2000
- Status of industry guidance development

10) General Discussion and Adjournment

2:45-3:00 pm

- General discussion and comments by Members of the Subcommittee; items for July 12-14, 2000 ACRS meeting G. Apostolakis, ACRS

Note: Presentation time should not exceed 50% of the total time allocated for a specific item. Number of copies of presentation materials to be provided to the ACRS - 35.

INTRODUCTORY STATEMENT BY THE CHAIRMAN OF THE
SUBCOMMITTEE ON RELIABILITY AND PRA
11545 ROCKVILLE PIKE, ROOM T-2B3
ROCKVILLE, MARYLAND
JUNE 28-29, 2000

The meeting will now come to order. This is the first day of the meeting of the ACRS Subcommittee on Reliability and Probabilistic Risk Assessment. I am George Apostolakis Chairman of the Subcommittee.

ACRS Members in attendance are: Mario Bonaca, Thomas Kress, William Shack, Jack Sieber and Robert Uhrig.

The purpose of this meeting is to discuss the proposed final ASME standard for probabilistic risk assessment for nuclear power plant applications. Tomorrow, the Subcommittee will discuss the status of risk-informed revisions to 10 CFR Part 50, including proposed revision to 10 CFR 50.44 concerning combustible gas control systems, issues in the Nuclear Energy Institute letter dated January 19, 2000 (Option 3), and public comments related to the Advance Notice of Proposed Rulemaking on 10 CFR 50.69 and Appendix T (Option 2). The Subcommittee will gather information, analyze relevant issues and facts, and formulate proposed positions and actions, as appropriate, for deliberation by the full Committee. Michael T. Markley is the Cognizant ACRS Staff Engineer for this meeting.

The rules for participation in today's meeting have been announced as part of the notice of this meeting previously published in the *Federal Register* on May 16, 2000.

A transcript of the meeting is being kept and will be made available as stated in the Federal Register Notice. It is requested that speakers first identify themselves and speak with sufficient clarity and volume so that they can be readily heard.

We have received no written comments or requests for time to make oral statements from members of the public regarding today's meeting. However, Mr. Bob Christie of Performance Technology, Inc. has requested time to make a presentation during tomorrow's session concerning proposed revision to 10 CFR 50.44.

(Chairman's Comments-if any)

We will now proceed with the meeting and I call upon Mr. Gerry Eisenberg of ASME to begin.

Workshop and ACRS subcommittee
meeting on Rev 12 of the ASME standard
June 27-28, 2000

**Major changes from the previous
draft in response to public
comments**

**Ron Simard
Chair, ASME Project Team**

Rev 10 approach

- Specify a single set of requirements for Elements of a PRA that provides a realistic estimate of CDF
- Specify requirements for documentation, configuration control, peer review
- Describe a process for
 - **determining the extent to which the PRA Elements are necessary and sufficient to support a particular application**
 - **comparing the plant PRA to the Standard PRA**
 - **evaluating the significance to that specific application of any differences between the plant and Standard PRAs**

Rev 10 comments

- Prescriptiveness and perceived difficulty in applying the process
- need to distinguish among grades of application with a commensurate level of PRA capability
- need to recognize primary use of standard will be with existing PRAs
- need for closer alignment with the industry peer review and certification process

Rev 12 approach

- **Significant restructuring, e.g.,**
 - process moved from back to front to emphasize intended use of the standard
 - mandatory appendix with generic data base removed
- **Range of possible risk informed applications approximated by three Categories**
- **Corresponding PRA capabilities presented in tables with three columns**
 - action statements whose scope of applicability varies across the three columns

Rev 12 approach (cont.)

- PRA Element requirements linked to industry certification process criteria, where possible
- peer review requirements reference the industry certification process methodology
- retention of Rev 10 requirements, where appropriate
- modification of the application process to make it easier to use

The application process

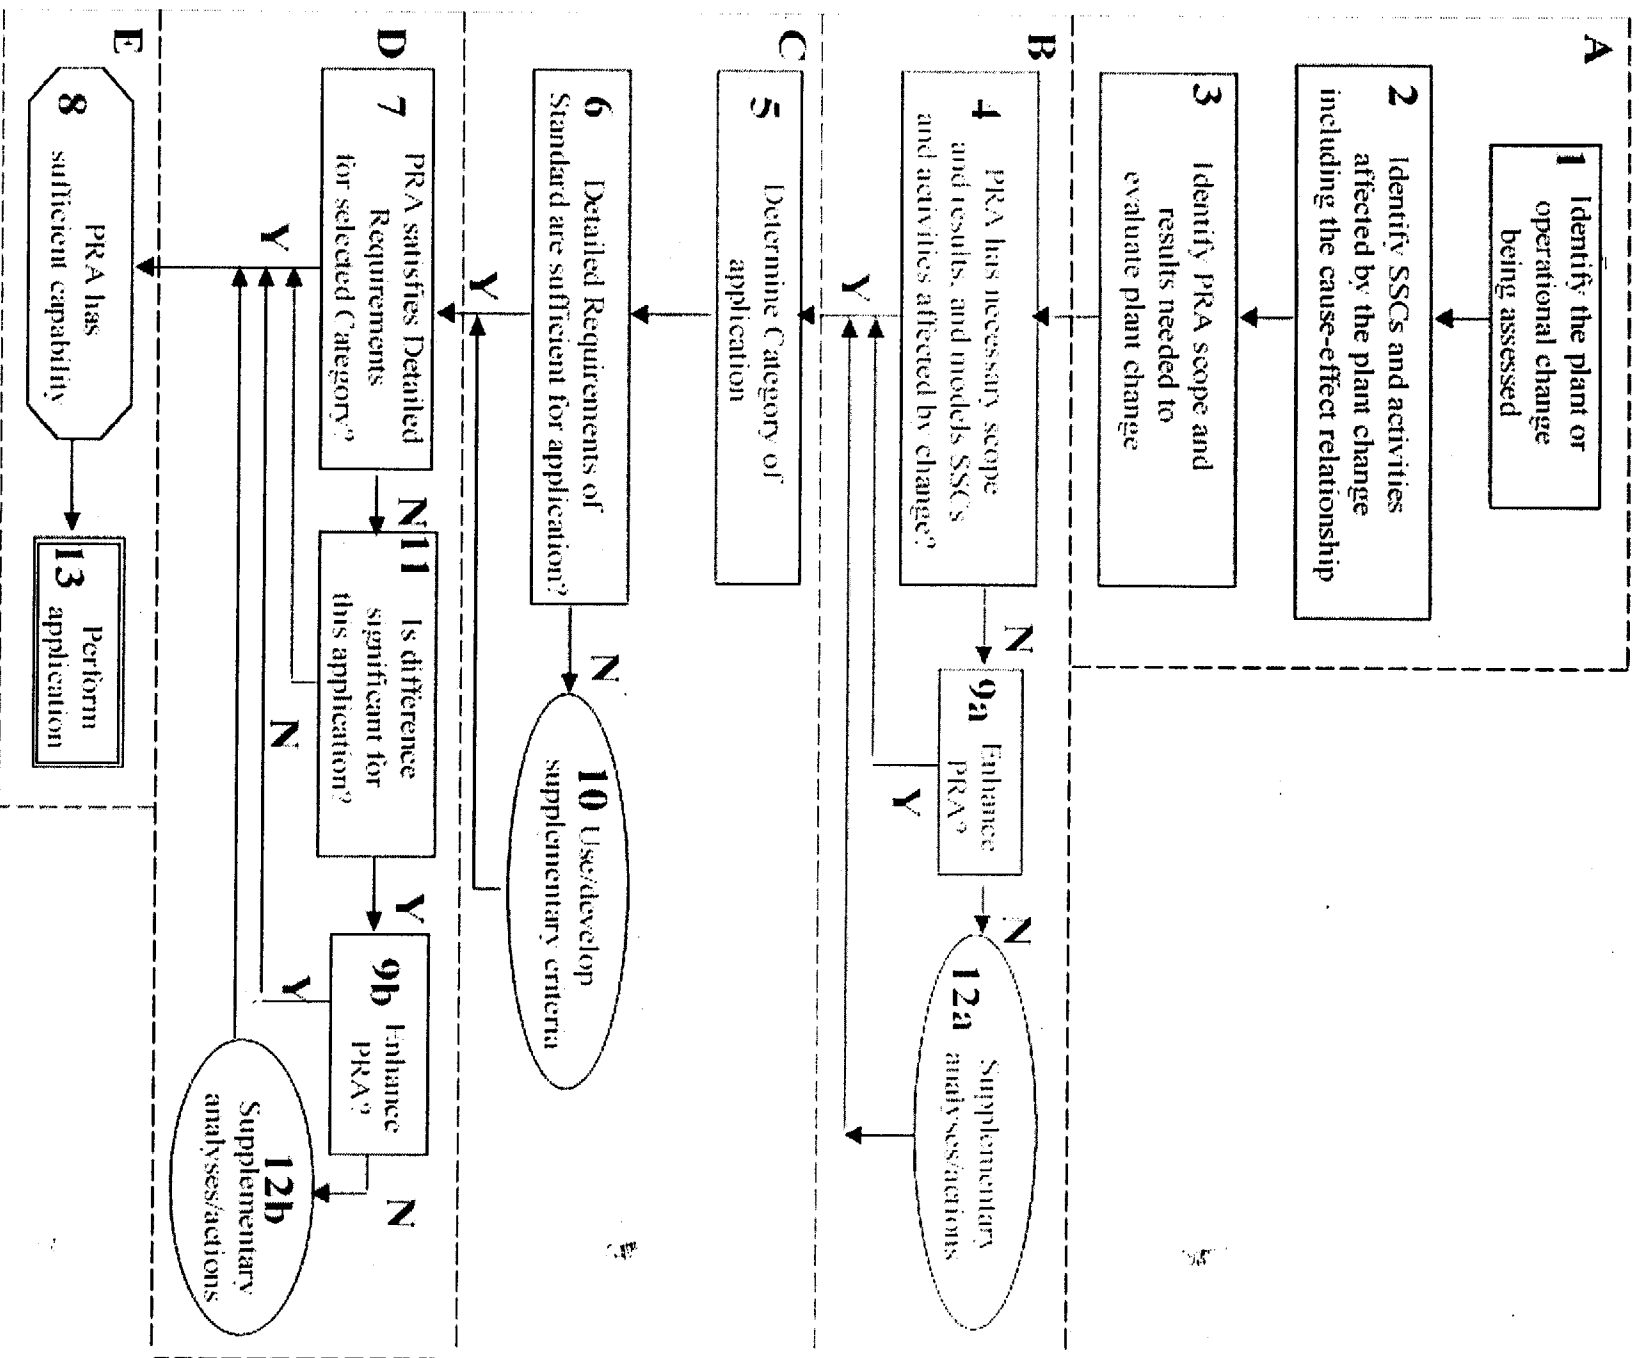

- **Requirements in Section 4 of the standard apply only to a PRA to be used with this process**
- **The process is intended to be used with PRAs that have had a peer review that meets the requirements of Section 6 of the standard**
- **PRA capabilities are evaluated for each Supporting Requirement in Section 4, *vice* specifying a capability level for the entire PRA**
- **Only those aspects of a PRA Element required to support the application in question need the capability level appropriate for that application**

The application process (cont.)

- Define the application in terms of SSCs affected by the proposed change
- Determine if the scope and level of detail of the plant PRA is sufficient for the application (if not, enhance or supplement PRA)
- Determine the Category of the application and whether the level of detail in the standard is sufficient for the application (if not, use supplementary criteria)
- Compare the PRA to the appropriate requirements in the standard to determine whether the PRA has adequate capability to support the application
- If difference is significant, enhance or supplement PRA

Workshop and ACRS subcommittee
meeting on Rev 12 of the ASME standard
June 27-28, 2000

INTRODUCTION

Sid Bernsen
Chair, ASME Committee on Nuclear Risk Management

MEMBERSHIP

DEVELOPMENT PROCESS

- Use ASME redesign process
- Project Team for development
- early opportunity for review & comment
- approval by balanced committee of stakeholders - CNRM
- oversight by ASME Board on Nuclear Codes & Standards
- recognition by ANSI

CURRENT STATUS

- draft 10 issued spring 99
- more than 2000 general and specific comments received
- project team worked *intensively* to address comments
- draft 12 issued for comment June 14 2000
 - includes a white paper

SCOPE AND PURPOSE

- Level 1 PRA analysis of internal events
 - at power - excluding fires
- Limited Level 2 - Sufficient for LERF evaluation
- Developed to support
 - risk informed applications
 - use of existing PRAs
- Process for determining PRA ability to support an application and provides options for augmentation

PROJECTED SCHEDULE

- August 14, 2000 comment period ends
 - Project Team dispositions comments
 - Early October 2000 to CNRM committee for approval
 - includes responses to substantive comments
 - November, 2000 receive votes and comments
 - Project team resolves comments
 - changes to committee for review and reconsideration
 - initiate formal public review
 - End of Year BNCS final review and approval
-

PURPOSE OF CURRENT REVIEW

- resolution of your specific comments on Draft 10.
- acceptability of other changes
- recommendations for future consideration
- comments should be supported with basis/justification
- include proposed word changes, additions or deletions

FORMAT AND AGENDA

- Rev 10 approach and comments received
- major changes from rev 10 to rev 12
- risk assessment application process
- approach used to develop PRA technical requirements
- peer review
- general discussion
- closing remarks

ROLE OF PARTICIPANTS

- individual experts
- comments do not necessarily represent position of CNRM or ASME
- seeking feedback and recommendations
- position still on several issues still needs definition
- **We welcome your interest and input**

**Workshop and ACRS subcommittee
meeting on Rev 12 of the ASME standard
June 27-28, 2000**

**Matching PRA Element capabilities
and application characteristics**

**Karl Fleming
Member, ASME Project Team**

Application Categories

- The standard is intended to be used in a wide range of applications
- Three broad Categories were used to develop and present the requirements of Section 4
- The plant PRA capabilities will not fall all into one Category *applications*
- For some ~~requirements in Section 4~~, the plant PRA may not have to meet any of the three Categories *for a given set of elements*

The Category of a given application depends on ...

1. Extent of the reliance of the risk informed decision on the PRA

Decisions are based ...

- Category I: primarily on deterministic analysis supplemented with risk insights
- Category II: ... on a balanced set of PRA insights and  Rev. 10 deterministic analyses
- Category III: ... primarily on PRA insights supplemented with little deterministic analyses

The Category of a given application depends on ...

2. Required level of resolution of the PRA results needed by applications

- Category I: PRA products are used to differentiate among broad categories of safety significance using order of magnitude CDF and LERF estimates
- Category II: PRA products are used to prioritize/risk rank SSCs and to resolve risk contributors for risk significance determinations
- Category III: PRA products are used to prioritize/risk rank SSCs; to resolve risk contributions for risk significance determinations; and to achieve confidence in results when decision/risk acceptance criteria are approached

The Category of a given application depends on ...

3. Degree of accuracy required of the PRA results

- Category I: Order of magnitude estimates of the PRA results for dominant sequences and contributors
- Category II: Realistic estimates of PRA results for all risk significant sequences and contributors
- Category III: Realistic (better than order of magnitude) estimates of PRA results for sequences and contributors

The Category of a given application depends on ...

4. Degree of confidence in the PRA results

- Category I: Only a general understanding of the sources and magnitudes of uncertainties and their impacts
- Category II: Detailed understanding of the sources and magnitudes of the uncertainties and their impact on all risk significant sequences and risk contributors
- Category III: Same as Category II with uncertainty quantification for CDF and LERF

Scope of Coverage of High Level and Detailed Requirements

- Category I
 - Dominant accident sequences and contributors
 - Definition of dominant is to capture a major fraction that is sufficient to support intended applications
- Category II
 - Risk Significant accident sequences and contributors
 - Definition of risk significant is to capture sufficient fraction to support risk significant determinations in which PRA results are used supported by deterministic considerations
- Category III
 - Risk Significant accident sequences and contributors as well as non-risk significant sequences and contributors that are relevant to a Category III application
 - Definition of coverage of sequences and contributors is to capture sufficient fraction to support applications whose decisions are primarily based on PRA results are supported by deterministic considerations

The Category of a given application depends on ...

5. Safety significance of the application

- Category I: Typically do not impact safety related SSCs
- Category II: Expected to impact safety related SSCs
- Category III: Expected to impact safety related SSCs

4.3 PRA Elements and Attributes

Table 4.3-1 describes the attributes of PRA Elements appropriate to the three categories of applications described in Subsection 1.5.

TABLE 4.3-1 PRA ATTRIBUTES

ELEMENT		CATEGORY I	CATEGORY II	CATEGORY III
Initiating Events Analysis	IE	Identification and quantification of dominant accident initiating events	Identification and realistic quantification of risk significant accident initiating events	Identification and realistic quantification of initiating events
Accident Sequence Analysis	AS	Modeling of dominant core damage and large early release accident sequences	Modeling of risk significant core damage and large early release accident sequences	Modeling of core damage and large early release accident sequences
Success Criteria	SC	Bases and supporting analyses for establishing success or failure in dominant accident sequences	Realistic bases and supporting analyses for establishing success or failure in risk significant accident sequences	Realistic bases and supporting analyses for establishing success or failure for modeled accident sequences
Systems Analysis	SY	Modeling of key components and failure modes contributing to the function of systems expected to operate in dominant accident sequences	Realistic modeling of major components and failure modes contributing to the reliability and availability of systems expected to operate in risk significant sequences	Realistic modeling of components and failure modes contributing to the reliability and availability of systems expected to operate in modeled sequences
Human Reliability Analysis	HR	Modeling of major human actions (i.e., latent, response and recovery) with screening Human Error Probabilities (HEPs)	Realistic modeling of human actions (i.e., latent, response and recovery) with plant-specific HEPs in risk significant sequences	Realistic modeling of human actions (i.e., latent, response and recovery) with plant-specific HEPs
Data Analysis	DA	Quantification of point estimates for basic events, and associated parameters with generic data for dominant accident sequences	Realistic quantification of mean values for basic events, and associated parameters in a manner that accounts for relevant plant specific and generic data for risk significant sequences	Realistic quantification of risk significant basic events in a manner that quantifies impacts of uncertainties
Internal Flooding	IF	Modeling of dominant flood sequences	Realistic modeling of risk significant flood contributors	Realistic and thorough modeling of flooding contributors
Quantification	QU	Quantification of CDF and key contributors	Realistic quantification of CDF and key contributors supported by	Realistic quantification of CDF and risk significant contributors supported by a sound understanding and quantification of the impact of uncertainties

full quantification of CDF

ELEMENT		CATEGORY I	CATEGORY II	CATEGORY III
		supported by an understanding of the impact of key uncertainties	a sound understanding of the impact of uncertainties	
Level 2 Analysis	L2	Quantification of LERF with an understanding of the impact of key uncertainties for the dominant LERF contributors	Realistic quantification of LERF with a sound understanding of the impact of uncertainties for risk significant accident sequences.	Realistic quantification of LERF supported by a sound understanding and quantification of the impact of uncertainties

Section 4 requirements

- High Level Requirements (HLRs) attempt to capture the important technical issues identified while drafting this standard
- HLRs apply to PRAs used with this standard for any application
- Supporting Requirements (SRs) are phrased as action statements that support the HLRs
- When an action statement extends to more than one Category, its scope of applicability varies as appropriate for applications in that Category

Table 4.4.2 HIGH LEVEL REQUIREMENTS FOR ACCIDENT SEQUENCE ANALYSIS (HLR-AS)

- A Functional Sequence Categories** The *Accident Sequence Analysis* shall provide a reasonably complete set of scenarios that can lead to core damage following each initiating event or initiating event category defined in *Initiating Events Analysis*. These scenarios shall cover system responses and operator actions, including recovery actions, that support the key safety functions⁽²⁾ necessary to prevent core damage, and shall be defined in a manner that supports the Level 1/Level 2 interface. (HLR-AS-A)
- B Plant Specific CDF and LERF Quantification** The *Accident Sequence Analysis* shall provide a sequence definition structure that is capable of supporting plant specific quantification of the CDF, and LERF via the Level 1/Level 2 interface. (HLR-AS-B)
- C Interface with Success Criteria** *Accident Sequence Analysis* shall provide an interface with the success criteria, mission times, and time windows needed to support each key safety function⁽²⁾ represented in the modeled scenarios. (HLR-AS-C)
- D Treatment Of Dependencies** Dependencies due to initiating events, human interface, functional dependencies, environmental and spatial impacts, and common cause failures shall be addressed. (HLR-AS-D)
- E Documentation** The *Accident Sequence Analysis* shall be documented in a manner that facilitates PRA applications, updates, and peer review by describing the processes that were followed, with assumptions and bases stated. (HLR-AS-E)

⁽²⁾ Key safety functions are the minimum set of safety functions that must be maintained to prevent core damage and large early release. These include, at a minimum, reactivity control, core heat removal, reactor coolant inventory control, reactor coolant heat removal, and containment bypass integrity in appropriate combinations to prevent core damage and large early release.

TABLE 4.4-2a SUPPORTING REQUIREMENTS FOR ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT A
FUNCTIONAL SEQUENCE CATEGORIES: The *Accident Sequence Analysis* shall provide a reasonably complete set of scenarios that can lead to core damage following each initiating event or initiating event category defined in *Initiating Events Analysis*. These scenarios shall cover system responses and operator actions, including recovery actions, that support the key safety functions⁽²⁾ necessary to prevent core damage, and shall be defined in a manner that supports the Level1/Level 2 interface. (HLR-AS-A)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-A1 [AS-6] [3.3.2.2]	CHOOSE a method for <i>Accident Sequence Analysis</i> that explicitly models the appropriate combinations of system responses and operator actions that affect the key plant safety functions for each modeled initiating event. DEFINE and INCLUDE the critical safety functions that are assumed to be necessary to reach a safe stable state in the model.		
AS-A2 [AS-4] [3.3.2.2]	USE a method for <i>Accident Sequence Analysis</i> that : a) includes a reasonably complete set of event sequences involving core damage that could result from each modeled initiating event. b) considers the different plant responses and containment challenges that could result from each modeled initiating event; and c) provides a framework to support sequence quantification. d) reflects the initiating event categories defined in the <i>Initiating Events Analysis</i>	USE a method for <i>Accident Sequence Analysis</i> that : a) includes a reasonably complete set of event sequences involving core damage that could result from each modeled initiating event. b) models the different plant responses and addresses the containment challenges that could result from each modeled initiating event; and c) provides a framework to support sequence quantification. d) is explicitly traceable to the initiating event categories defined in the <i>Initiating Events Analysis</i>	
AS-A3 [AS-4]	DEFINE separate accident sequences as needed to address differences in timing, system success criteria, and operator actions.		
AS-A4 [AS-8]	ADDRESS a level of discrimination in the event tree structure that represents the key procedurally directed operator actions and delineates the differences in success criteria reflected in challenges to the critical safety functions.	DEVELOP a level of discrimination in the event tree structure that represents the key procedurally directed operator actions and delineates the differences in success criteria reflected in challenges to the critical safety functions.	
AS-A5 [AS-4] [3.3.2.2]	USE event trees or their equivalent to represent the accident sequence logic. JUSTIFY the use of alternatives to event trees (e.g., single top fault tree).		

(2) Key safety functions are the minimum set of safety functions that must be maintained to prevent core damage and large early release. These include, at a minimum, reactivity control, core heat removal, reactor coolant inventory control, reactor coolant heat removal, and containment bypass integrity in appropriate combinations to prevent core damage and large early release.

TABLE 4.4-2a SUPPORTING REQUIREMENTS FOR ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT A
FUNCTIONAL SEQUENCE CATEGORIES: The *Accident Sequence Analysis* shall provide a reasonably complete set of scenarios that can lead to core damage following each initiating event or initiating event category defined in *Initiating Events Analysis*. These scenarios shall cover system responses and operator actions, including recovery actions, that support the key safety functions⁽²⁾ necessary to prevent core damage, and shall be defined in a manner that supports the Level1/Level 2 interface. (HLR-AS-A)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-A6 [AS-4] [3.3.2.2]	USE an acceptable event tree/fault tree method for interfacing the Accident Sequence Analysis with the Systems Analysis tasks. Acceptable approaches for event tree/fault tree modeling include. event trees with conditional split fractions(also referred to as event tree linking), and fault tree linking, both described in (Reference [4.4.2-1]). JUSTIFY the use of alternative approaches for this function.		
AS-A7 [3.3.2.4.1]	DEVELOP the event trees in sufficient detail to: a) determine which safety systems, functions, and operator actions have been challenged for each accident sequence b) determine whether core damage has occurred or core damage may be assumed initially in the PRA development c) identify the conditions needed to define the appropriate operator recovery actions and the necessary conditions for each sequence.		
AS-A8 [AS-4]	INCLUDE each necessary critical safety function in the quantitative model. JUSTIFY exceptions to the critical safety functions that are omitted from the model.		
AS-A9 [AS-7]	INCLUDE those relevant systems that support each critical safety function in the event sequence model in support of sequence quantification.		
AS-A10 [AS-8]	Transfers between event trees MAY be used to reduce the size and complexity of individual event trees. DEFINE any transfers that are used and the method that is used to implement them in the qualitative definition of accident sequences and in their quantification. USE a method for implementing an event tree transfer that preserves the dependencies that are part of the transferred sequence. These include functional, system, initiating event, operator, and spatial or environmental dependencies.		
AS-A11 [AS-8]	When event tree branching and event tree transfers are employed, DEVELOP the structure in a manner that maintains and unambiguously resolves the definition of success and failure paths.		
AS-A12 [3.3.2.4]	CONSIDER USING one or more accepted methods for developing and documenting the event sequence modeling process. Accepted methods include: a) functional and systemic event trees or both (as explained in Reference [4.4.2-1]) b) event sequence diagrams c) system dependency matrices	USE one or more accepted methods for developing and documenting the event sequence modeling process. Accepted methods include: a) functional and systemic event trees or both (as explained in Reference [4.4.2-1]) b) event sequence diagrams c) system dependency matrices	
AS-A13 [3.3.2.4]	INCLUDE a traceable interface between the event tree development process and the method or methods chosen from above or JUSTIFY use of alternative methods	INCLUDE a traceable interface between the event tree development process and the method or methods chosen from above.	

TABLE 4.4-2b SUPPORTING REQUIREMENTS ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT B
PLANT SPECIFIC CDF AND LERF QUANTIFICATION: The accident sequence analysis shall provide a sequence definition structure that is capable of supporting plant specific quantification of the CDF and LERF via the Level 1/Level 2 interface. (HLR-AS-B)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-B1 [AS-5]	INCLUDE models and analyses for <i>Accident Sequence Analysis</i> that are consistent with the as-built and as-operated plant. PERFORM realistic modeling of the as-built plant as supported by available information. Conservative modeling of the as-built plant MAY be performed to the extent that Category I applications are not distorted..	INCLUDE models and analysis for <i>Accident Sequence Analysis</i> that are consistent with the as-built and as-operated plant. PERFORM realistic modeling of the as-built plant as supported by available information.	
AS-B2 [AS-9]	DEFINE the success paths in the <i>Accident Sequence Analysis</i> that are logically consistent with the plant specific definition of core damage. Conservative treatment of success paths MAY be implemented only to the extent that Category I applications are not distorted by such conservative assumptions.	DEFINE the success paths in the <i>Accident Sequence Analysis</i> that are logically consistent with the definition of core damage and in a manner that supports a realistic and plant specific quantification of CDF.	
AS-B3 [AS-16]	INCLUDE models for repair and recovery that are based on data or accepted models applicable to the plant and that account for accident sequence dependencies such as time available, adverse environment, and lack of access, lighting, or room cooling. Conservative evaluations of repair and recovery MAY be incorporated only to extent that the relative risk significance of modeled SSCs is not distorted.	INCLUDE models for repair and recovery that are based on data or accepted models applicable to the plant and that account for accident sequence dependencies such as time available, adverse environment, and lack of access, lighting, or room cooling.	
AS-B4 [AS-19]	PROVIDE functions and structure of the event trees in a manner that is consistent with the plant specific EOPs and abnormal procedures.		

TABLE 4.4-2b SUPPORTING REQUIREMENTS ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT B
PLANT SPECIFIC CDF AND LERF QUANTIFICATION: The accident sequence analysis shall provide a sequence definition structure that is capable of supporting plant specific quantification of the CDF and LERF via the Level 1/Level 2 interface. (HLR-AS-B)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-B5 [AS-19]	ACCOUNT FOR procedurally directed operator actions (both positive and negative impacts) that substantially influence the accident sequence progression or its probability in the accident sequence structure or the supporting fault tree analysis. INCORPORATE into the <i>Accident Sequence Analysis</i> the expected responses to an initiator as reflected in the plant emergency and abnormal operating procedures, training simulator exercises, and existing plant transient analysis. CHARACTERIZE the operator responses in a manner that is consistent with operator training and results of applicable simulator exercises. INCLUDE operator training input in the interpretation of proceduralized steps. INCLUDE operator actions that influence accident progression in the accident sequence model. Exceptions to this requirement MAY be taken only to the extent that Category I applications are not distorted.	ACCOUNT FOR procedurally directed operator actions (both positive and negative impacts) that substantially influence the accident sequence progression or its probability in the accident sequence structure or the supporting fault tree analysis. INCORPORATE into the <i>Accident Sequence Analysis</i> the expected responses to an initiator as reflected in the plant emergency and abnormal operating procedures, training simulator exercises, and existing plant transient analysis. CHARACTERIZE the operator responses in a manner that is consistent with operator training and results of applicable simulator exercises. INCLUDE operator training input in the interpretation of proceduralized steps. INCLUDE operator actions that influence accident progression in the accident sequence model.	
AS-B6 [AS-20, AS-22]	Clearly DEFINE the Level 1 end states as core damage or a safe stable state. USE a definition of core damage that is consistent with the requirements for <i>Success Criteria</i>		
AS-B7 [AS-20, AS-22]	RESOLVE other end states such as “core vulnerable” into core damage or safe stable states. ADDRESS the treatment of the impact of containment failure or vent on continued RPV makeup capability and basis for assumptions regarding ultimate end-state when such resolutions are made.		
AS-B8 [AS-20, AS-22]	Conservative definitions of core damage MAY be used only to the extent that Category I applications are not impacted.	DO NOT USE conservative definitions of core damage	

TABLE 4.4-2b SUPPORTING REQUIREMENTS ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT B
PLANT SPECIFIC CDF AND LERF QUANTIFICATION: The accident sequence analysis shall provide a sequence definition structure that is capable of supporting plant specific quantification of the CDF and LERF via the Level 1/Level 2 interface. (HLR-AS-B)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-B9 [AS-21]	USE a method for <i>Accident Sequence Analysis</i> that supports the development of an interface between Level 1 and Level 2 LERF analysis. To accomplish this, core damage sequences MAY be further developed by using accident sequence knowledge or information or consequence questions to unambiguously assign the modeled sequence to an appropriate plant damage state (PDS).		
AS-B10	USE Level 1 plant damage states that provide adequate information to support Level 2 analysis with minimal loss of information. If individual sequence cut sets are assigned to Plant Damage States (PDS), PROVIDE sufficient information to be able to remove ambiguities in mapping the basic event cutsets to unique PDS. Exceptions to this requirement MAY be made only to the extent that Category I applications are not distorted.	USE Level 1 plant damage states that provide adequate information to support Level 2 analysis with minimal loss of information. If individual sequence cut sets are assigned to Plant Damage States (PDS), PROVIDE sufficient information to be able to remove ambiguities in mapping the basic event cutsets to unique PDS.	
AS-B11 [AS-14]	Grouping of sequences into broader plant damage state categories MAY be performed only to the extent that Category I applications are not distorted. DO NOT GROUP sequences or plant damage states in a non-conservative manner (subsuming of sequences into broader categories not bounded by the worst case accident).	Grouping of sequences into broader plant damage state categories MAY be performed only to the extent that such grouping does not distort realistic CDF and LERF estimation. DO NOT GROUP sequences or plant damage states in a non-conservative manner (subsuming of sequences into broader categories not bounded by the worst case accident).	
AS-B12 [AS-15]	The Accident Sequence Analysis may be modeled using a single top event linked fault tree model. When this option is selected, DEVELOP such models in manner that meets all the technical requirements of this section. PROVIDE justification for any requirements that are not met or do not apply.		

TABLE 4.4-2c SUPPORTING REQUIREMENTS FOR ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT C
INTERFACE WITH SUCCESS CRITERIA: *Accident Sequence Analysis* shall provide an interface with the success criteria, mission times, and time windows needed to support each key safety function ⁽²⁾represented in the modeled scenarios. (HLR-AS-C)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-C1 [AS-17]	Based on the functional success criteria developed in <i>Success Criteria</i> , INCLUDE a reasonably accurate treatment of the functional requirements associated with the plant-specific safety functions, system capabilities and system interactions, procedural guidance to operators, and the timing of events within the <i>Accident Sequence Analysis</i> for each modeled initiating event category.		
AS-C2 [AS-18]	IDENTIFY the information sources used as the basis for the <i>Accident Sequence Analysis</i> including: (a) system analysis and system dependencies (b) success criteria, plant thermal hydraulics, and plant transient response (c) plant operating procedures and practices.		
AS-C3 [AS-18]	PROVIDE a sequence definition that is based on realistic thermal hydraulic analyses to support the success criteria used in the <i>Accident Sequence Analysis</i> . Conservative analyses MAY be used only to the extent that Category I applications are not distorted.	PROVIDE a sequence definition that is based on realistic thermal hydraulic analyses to support the success criteria used in the <i>Accident Sequence Analysis</i> . Conservative analyses MAY be used only to the extent that realistic estimates of CDF and LERF are not distorted.	
AS-C4	DEVELOP and SPECIFY the success criteria in a manner that shows an interface with the definition of core damage and PDS, definition of plant safety functions needed to prevent core damage or PDS, and the boundary conditions for the systems analysis. INCLUDE a definition of the success criteria and mission time for each event tree top event. If multiple success criteria and mission times are needed for the same event tree top event, PROVIDE this information for each case.		
AS-C5 [AS-23]	INCLUDE in the definition of success criteria for sequences terminating with no core damage, a mission of at least 24 hours with stable plant conditions or an appropriate representation for accident sequences with unstable conditions that is consistent with the sequence end-state. JUSTIFY and PROVIDE any mission times less than 24 hours for stable sequences and all assumed mission times for all unstable sequences.		

(2) Key safety functions are the minimum set of safety functions that must be maintained to prevent core damage and large early release. These include, at a minimum, reactivity control, core heat removal, reactor coolant inventory control, reactor coolant heat removal, and containment bypass integrity in appropriate combinations to prevent core damage and large early release.

TABLE 4.4-2d SUPPORTING REQUIREMENTS FOR ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT D
TREATMENT OF DEPENDENCIES: Dependencies due to initiating events, human interface, functional dependencies, environmental and spatial impacts, and common cause failures shall be addressed. (HLR-AS-D)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-D1 [AS-5] [3.3.2.4.1]	PROVIDE a sequence model development with a clear interface with the system analysis and dependency evaluation tasks of the PRA.		
AS-D2 [AS-10] [3.3.2.4.1]	INCLUDE a visible and a reasonably accurate treatment of dependencies and interfaces among the plant safety functions, system responses, and operator actions needed for accident mitigation in the <i>Accident Sequence Analysis</i> . These dependencies include functional, phenomenological, and operational dependencies and interfaces. IDENTIFY dependencies among all modeled event tree top events and INCLUDE these quantitatively in the model.		
AS-D3 [AS-11] [3.3.2.3]	PROVIDE a systematic evaluation of dependencies, such as that provided by dependency matrices. When using dependency matrices for this purpose INCLUDE a matrix or set of matrices that accounts for: <ul style="list-style-type: none"> a) initiating event to system dependencies b) dependencies among support systems c) dependencies between support and front line systems; d) dependencies among front line systems that support key safety functions ⁽²⁾ PROVIDE an event sequence model that realistically treats, and consistently applies, to capture the dependencies among event tree top events.		

(2) Key safety functions are the minimum set of safety functions that must be maintained to prevent core damage and large early release. These include, at a minimum, reactivity control, core heat removal, reactor coolant inventory control, reactor coolant heat removal, and containment bypass integrity in appropriate combinations to prevent core damage and large early release.

TABLE 4.4-2d SUPPORTING REQUIREMENTS FOR ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT D
TREATMENT OF DEPENDENCIES: Dependencies due to initiating events, human interface, functional dependencies, environmental and spatial impacts, and common cause failures shall be addressed. (HLR-AS-D)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-D4 [AS-10]	<p>INCLUDE the following types of accident sequence dependencies:</p> <p><u>Functional</u>: Functional failures, e.g.:</p> <ul style="list-style-type: none"> a) LOCA initiator causes debris clogging of ECCS Suction b) turbine driven system dependency on SORV, depressurization, and containment heat removal (suppression pool cooling). c) low pressure system injection success dependent on need for RPV depressurization. <p><u>Intra and Intersystem</u>: Common cause failures and functional dependencies between systems. IDENTIFY system dependencies, dependency matrices, and/or linked fault trees.</p> <p><u>Human</u>: Adverse environment or sequence timing influences on operator actions.</p> <p><u>Spatial/Environmental/Phenomenological</u>: Spatial/Environmental dependencies that may result from initiating events and subsequent sequences. Example of Phenomenological dependencies: These dependencies manifest themselves when the environmental conditions generated during an accident sequence influence the operability of equipment or the capability of the operators to implement procedures and recovery actions. Examples of phenomenological impacts include generation of harsh environments that actuate protective trip circuits, loss of pump net positive suction head (NPSH), clogging of flow paths, and consequential effects of other failures.</p>		
AS-D5 [AS-10]	<p>INCLUDE dependencies between the initiating event and mitigating systems as well as dependencies between and among the mitigating systems and operator actions. ACCOUNT for dependencies between the initiating event and mitigating systems, including immediate (e.g. loss of electric power) and delayed responses (e.g., loss of room cooling) in the accident sequence model or reflected in the system logic models. Dependencies among mitigating systems and operator actions MAY also be modeled in the accident sequence model or the system logic models.</p>		
AS-D6 [3.3.2.4.1]	<p>When developing the event sequence structure, ORDER the event tree top events representing the response of systems and post initiator operator actions sequentially according to the timing of the events along the sequence to ensure proper treatment of time dependencies.</p>		
AS-D7 [3.3.2.4.1]	<p>When the event trees with conditional split fraction method is used, if the probability of Event B is dependent on the occurrence or non-occurrence of Event A, PLACE Event A to the left of Event B in the ordering of event tops.</p>		

TABLE 4.4-2d SUPPORTING REQUIREMENTS FOR ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT D
TREATMENT OF DEPENDENCIES: Dependencies due to initiating events, human interface, functional dependencies, environmental and spatial impacts, and common cause failures shall be addressed. (HLR-AS-D)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-D8 [3.3.2.4.1]	For the event trees with conditional split fraction method, DEVELOP the event trees to a level of detail sufficient to identify intersystem dependencies and train level interfaces. For the fault tree linking method, DEVELOP fault trees and apply flag settings and mutually exclusive files or comparable method to resolve these same dependencies. If plant configurations and maintenance practices create dependencies among various system alignments, DEFINE and MODEL these configurations and alignments in a manner that reflects these dependencies. PROVIDE one event sequence model or set of event trees that accounts for each initiating event or initiating event category defined in the <i>Initiating Event Analysis</i> element so that initiating event dependencies can be properly modeled.		
AS-D9 [AS-12]	PROVIDE an explicit model of the Pump seal LOCA in the <i>Accident Sequence Analysis</i> when applicable. PROVIDE the basis for the model.		
AS-D10 [AS-13]	INCLUDE in the <i>Accident Sequence Analysis</i> and quantified model an explicit and realistic treatment of dependencies introduced by the time phasing of the event progression. A conservative treatment of time phasing MAY be used to the extent that Category I applications are not distorted.	INCLUDE in the <i>Accident Sequence Analysis</i> and quantified model an explicit and realistic treatment of dependencies introduced by the time phasing of the event progression. A conservative treatment of time phasing MAY be used to the extent that realistic estimates of CDF and LERF are not distorted.

AS-D12 [AS-13]	As part of the time dependence assessment, ADDRESS the following: <ul style="list-style-type: none"> • Mission time of diesel generators • Mission time of RPT, ARI, scram system • Time to core uncover 		
AS-D13 [AS-15] [3.3.2.4.1]	To model the changing nature of certain sequences, ACCOUNT for operational dependencies. ACCOUNT for interfaces when sequences are modeled in multiple event trees with transfers. <u>Example of event progression:</u> In developing sequences for a transient initiating event in which the reactor coolant boundary is initially intact, event progression may lead to sequences in which reactor coolant system safety or relief valves open such that a transient induced LOCA condition is created.		
AS-D14 [AS-15]	When transfers are being employed, INCLUDE Transfers among event trees explicitly in the quantification except for cases that are noted in the documented descriptions of the sequences to address dependencies properly. PRESERVE the appropriate dependencies, both hardware and human related, from the original event sequence model across the transfer interfaces.		

TABLE 4.4-2e SUPPORTING REQUIREMENTS FOR ACCIDENT SEQUENCE ANALYSIS HIGH LEVEL REQUIREMENT E
DOCUMENTATION: The accident sequence analysis shall be documented in a manner that facilitates PRA applications, updates, and peer review by describing the processes that were followed, with assumptions and bases stated. (HLR-AS-E)

Index No. AS	CATEGORY I APPLICATIONS Modeling of dominant core damage and large early release accident sequences	CATEGORY II APPLICATIONS Modeling of risk significant core damage and large early release accident sequences	CATEGORY III APPLICATIONS Modeling of core damage and large early release accident sequences
AS-E1 [AS-25]	DOCUMENT the results of the Accident Sequence Analysis consistent with the process that was used for its development. PROVIDE the basis for the accident sequence process.		
AS-E2 [AS-26]	DOCUMENT the results of independent reviews of the <i>Accident Sequence Analysis</i> and the qualifications of the reviewers.		
AS-E3 [AS-26]	DOCUMENT the treatment of each initiator and event tree to support reviews and applications.		
AS-E4	DOCUMENT interfaces between <i>Accident Sequence Analysis</i> and other PRA tasks. INCLUDE the following interfaces in the documentation: <ul style="list-style-type: none"> • a link between the definition of initiating event category in the Initiating Event Analysis Task and the event sequence model • the definition of core damage and associated success criteria that is consistent with that documented in the Success Criteria Task • key definitions of operator actions and sequence specific timing and dependencies reflected in the event trees that is traceable to the HRA for these actions • the basis for the sequence and cutset quantification in the Level 1 Quantification And Interpretation of Results Task • a framework for an integrated treatment of dependencies in the initiating events analysis, systems analysis, data analysis, human reliability analysis, Level 1 quantification, and Level 2 LERF quantification PRA elements.
