YMP-007-R2 10/28/91	YUCCA MOUNTAIN	SITE CHARACTERIZATI RIM CHANGE NOTICE	ON PROJE	ECT		
Procedure No.:	BTP-SMF-008	Rev. No.:	ICN No.:		 	

FIELD LOGGING, HANDLING, AND DOCUMENTING	2	1	Page 2	of 31
BOREHOLE SAMPLES				

1.0 PURPOSE AND SCOPE

This procedure defines the Yucca Mountain Site Characterization Project Office (YMPO) requirements and responsibilities for documentation, handling, lithologic and structural logging, core photography, and packaging of Yucca Mountain Site Characterization Project (YMP) borehole samples and specimens at surface-based borehole sites.

2.0 APPLICABILITY

This procedure applies to Field Operations (FO) staff of the Field Test Control Department (FTCD) documenting, handling, field logging, photographing, and packaging cores and cuttings acquired at YMP surface-based drill sites, exclusive of any samples and specimens requiring alternative handling as directed by the Sample Overview Committee (SOC) as indicated on form YMP-055 in AP-6.4Q.

3.0 DEFINITIONS

NOTE: Terms in this procedure are used as defined in the Project Glossary. The following additional definitions are adopted for the purpose of this procedure.

3.1 CORE

Core consists of a cylindrical section of rock, taken as a sample of the interval penetrated by a core bit and brought to the surface for examination and/or analysis.

3.2 CORE RUN

A core run is an attempt to drill and recover a length of core; also, the core recovered from the core barrel after the core run.

3.3 CUTTINGS

Cuttings are chips of rock produced during drilling that are removed from the borehole by circulation of drilling fluids.

3.4 DAILY ACTIVITIES LOG

The Daily Activities Log (DAL) is a daily, chronological record of activities (using a 24-hour timeclock [0000-2400 hrs]) that occur during drill site operations. It is kept in a paginated, hardbound notebook.

YMP-053-R0 YUCCA MOUNTAIN SITE CHARACTERIZATION PROJECT 7/12/91 PROCEDURE

Procedure No.: BTP-SMF-008		Revision:	
FIELD LOGGING, HANDLING AND	DOCUMENTING BOREHOLE	2	Page 3 of 31
SAMPLES			

3.5 DISCREPANCY

A discrepancy exists when incorrect documentation or notation is discovered after completion of the immediate activity or form.

3.6 RUBBLE

Rubble consists of fragments of core from a single interval, the individual diameters of which average less than one half the diameter of the whole core. They are broken in such a manner that reconstruction between individual pieces is impossible.

3.7 SAMPLE

A sample is part of a population whose properties are studied to gain information about the whole or group. Examples of samples include core, cuttings, and fluids collected at YMP borehole sites.

3.8 SAMPLE OVERVIEW COMMITTEE

The SOC is comprised of representatives from Las Alamos National Laboratory, Lawrence Livermore National Laboratory, Sandia National Laboratories, U.S. Geological Survey, Technical and Management Support Services, YMPO, FTCD, and Quality Assurance (QA). It was formed to ensure a balance between YMP sample needs, acquisition, and use, and the need to curate samples for a long period of time.

3.9 SPECIMEN

A specimen is a subsection or portion which has been removed from a sample or remnant and tracked individually.

3.10 UNIQUE IDENTIFIER

. . .

A unique identifier (ID) is a designation that sets a documentable object or event apart from similar entities. It may consist of an assigned number, a name, an alpha-numeric designation, or a set of data items that collectively serve to specify the entity. Examples of unique IDs used in this procedure include borehole ID, container ID, sample ID, or specimen ID.

4.0 RESPONSIBLE PARTIES

NOTE: The following YMP individuals or organizations are responsible for activities identified in Section 5.0 of this procedure:

YMP-053-R0 YUCCA MOUNTAIN SITE CHARACTERIZATION PROJECT 7/12/91 PROCEDURE

Procedure No.: BTP-SMF-008 FIELD LOGGING, HANDLING AND DOCUMENTING BOREHOLE	Revision: 2	Page 4 of 31
SAMPLES		

1. FO Manager

2. FO Shift Supervisor (SS)

3. FO Geologist

4. FO Geotechnician

5. FO Administrative Assistant

.

NOTE: FO Staff may consist of the FO Manager, FO SS, FO Geologist, and/or FO Geotechnician.

5.0 PROCEDURE

NOTE: A flowchart of the following processes described in this procedure is attached as Figure 1.

NOTE: All forms in this procedure shall be filled out as the information becomes available.

NOTE: Activities performed during this procedure will be performed in accordance with YMP Administrative Procedure (AP)-6.2Q, Management and Operations of Sample Handling Activities at Borehole Sites.

RESPONSIBLE PARTY

STEPS PROCEDURE

INITIAL SAMPLE HANDLING

FO Staff

- Maintain controlled access to logging trailer by maintaining visual contact, locking, or other means, as necessary. Maintain Field Facility Access Log (Attachment 1), according to instructions on back of log.
- 2. Determine sample type.
 - a. If cuttings, go to Step 33.
 - b. If core, continue.
- 3. Take custody of inner barrel and core on drill rig floor. Mark barrel to ensure

 FO Staff
 that core will not be switched

end-for-end during transport to logging trailer. Obtain run number and interval from driller or designee. If core is in a solid inner barrel, extrude inner sleeve and mark sleeve, as above.

4. Carry barrel or sleeve to logging trailer. Open barrel or sleeve to expose core. Fill out polystyrene foam (foam) Run Marker with run number and interval, and place it at top of core run. Fill out foam Information Markers and place them appropriately in sleeve, as necessary.

INITIAL VIDEOTAPING OF CORE

- 5. Place scale marked in 0.1-foot intervals and annotated with the borehole ID beside the core. Ensure that:
 - a. Proper cassette is identified and in video camera.
 - b. Markers are legible and visible.
 - c. Camera is securely affixed to camera rack assuring consistent distance to core, and is focused.
 - d. Core is well lighted.
 - e. Camera is set on Record mode.
 - f. Track speed is set correctly.
- Videotape core run with high-resolution video camera. Complete Field Photographic Log (Attachment 2), according to instructions on back of log.

ENCLOSURE 9

Procedure No.: BTP-SMF-010	Revision:			
GAMMA-RAY LOGGING OF YUCCA MOUNTAIN	0	Page 2	of	9
PROJECT CORE				

1.0 PURPOSE AND SCOPE

The purpose of this procedure is to produce a gamma-ray log of the core stored at the Yucca Mountain Site Characterization Project (Project) Sample Management Facility (SMF), which can be compared to the gamma-ray logs run in the borehole.

2.0 APPLICABILITY

This procedure applies to existing Project core that was drilled prior to the implementation of the Yucca Mountain Site Characterization Project Office (Project Office) Quality Assurance (QA) Program Plan (YMP/88-9) and any core drilled subsequent to implementation of YMP/88-9 has subsequently been replaced by Office of Civilian Radioactive Waste Management (OCRWM) Quality Assurance Program Description Document. This procedure applies exclusively to those Sample Management (SM) staff assisting in the implementation of this procedure as directed by the SMF Curator.

3.0 DEFINITIONS

NOTE: Terms in this procedure are used as defined in the Project Glossary. The following additional definitions are adopted for the purposes of this procedure.

3.1 SAMPLE MANAGEMENT

SM of the Technical and Management Support Services (T&MSS) contractor is the organization responsible for reprocessing activities. SM staff consists of management and operations personnel who ensure that SM operations and documentation satisfy applicable regulatory requirements. Reynolds Electrical and Engineering Co., Inc., shall assist the SMF staff in a craft support role as needed.

3.2 SAMPLE MANAGEMENT FACILITY

The SMF consists of a physical facility and equipment designed to effectively process and preserve geologic and other samples. The SMF is operated by T&MSS contractor personnel for the Project. The SMF Curator administers daily operations and activities at the SMF, and the SMF Geologist directs and performs daily processing activities, with support from the SMF Geotechnician. Core will be gamma scanned in a restricted area of the SMF.

3.3 EXISTING (UNQUALIFIED) SAMPLES

Existing (unqualified) samples are those cores that were collected for the Project prior to implementation of the YMP/88-9 and applicable, approved implementing procedures. Samples will be considered unqualified until they

Procedure No.: BTP-SMF-010	Revision:				
GAMMA-RAY LOGGING OF YUCCA MOUNTAIN	0	Page	3	of	9
PROJECT CORE					

have been qualified by the process described in Project Administrative Procedure (AP)-5.9Q. Data from qualified samples may be used as primary data in reports supporting licensing documents.

3.4 LOST CORE BLOCK

A lost core block indicates an interval of core that was not recovered.

3.5 CORE INFORMATION PACKAGE

A core information package is prepared by SMF staff during reprocessing. These packages may include, but are not limited to, lithologic logs, geophysical logs, oriented and wax core logs, geolograph records, Participant sample collection and disposition records, and core gamma scanner logs. Also included are the QA records generated by this procedure.

3.6 CORE GAMMA-RAY SCANNER

A core gamma-ray scanner is a machine that detects and records the total gamma-rays emitted by the minerals in the core.

3.7 CORE GAMMA-RAY LOG

The gamma-ray log is a plot of the total gamma counts versus the depth of the core.

3.8 DISCREPANCY

A discrepancy exists when there is incorrect information that significantly affects documentation or notation and that is beyond the scope of the immediate activity or form being completed.

3.9 NONCONFORMANCE

A nonconformance exists when there is a deficiency in characteristics, documentation, or procedures that renders the quality of an item or activity unacceptable or indeterminate. The intent of nonconformance reporting is to ensure the resolution of the conditions not meeting the requirements or to ensure that undefined conditions are defined.

4.0 RESPONSIBLE PARTIES

The SMF staff is responsible for the implementation of this procedure as defined and outlined in Section 5.0. The support staff to the SMF Curator includes the following individuals:

Procedure No.: BTP-SMF-010	Revision:			
GAMMA-RAY LOGGING OF YUCCA MOUNTAIN	0	Page 4	0	19
PROJECT CORE		L		

- 1. Chief, Site Investigation Branch (SIB)
- 2. SMF Geologist
- 3. SMF Geotechnician
- 4. SMF Technical Staff Assistant
- 5. SMF Administrative Assistant

5.0 PROCEDURE

NOTE: A flowchart of the following processes described in this procedure is attached as Figure 1.

RESPONSIBLE PARTY	<u>STEPS</u>	PROCEDURE
Chief, SIB	1.	Notify the SMF Curator of request to scan an interval of core.
SMF Curator	2.	Notify the SMF staff which cores will be gamma-scanned.
SMF Staff	. 3.	Place the core into the polyvinyl chloride (PVC) half-tube, ensuring that fit is maintained.
	NOTE:	The half-tube should be marked at one end to indicate top depth.
	NOTE :	In the event of core loss intervals, specimens, or other intervals of removed or missing core, measure the correct amount of space to the beginning of the next piece of core.
		a. Mark the location of the end of the box and each row.
		b. Repeat Step 3 as required until desired interval of core has been scanned.
	4.	Standardize the gamma scanner at the beginning and end of each day or when boreholes are changed.

Y-AD-001 8/90

YUCCA MOUNTAIN PROJECT Y-AD- PROCEDURE 8/90			
Procedure No.: BTP-SMF-010 GAMMA-RAY LOGGING OF YUCCA PROJECT CORE	MOUNTAIN	Revision: 0 Page 5	of 9
RESPONSIBLE PARTY	STEPS	PROCEDURE	
SMF Staff		a. Start the gamma scanner and run wind nothing in the detector for five t ten minutes. This is the backgrou count.	th o ind
		b. Place a rock specimen into the gam scanner using the bracket to hold the rock stationary over the detector and record for five to te minutes. The rock used should produce a total count approximatel two times greater than background.	ma en ey
	5.	Perform gamma scan of core using operating instructions by the manufacturer.	
	NOTE :	The system is menu driven. However, a hard copy of the operating instruction is kept with the gamma scanner. The equipment used to gamma scan the core may include, but is not limited to, a Harbert Engineering single channel Con Gamma-Ray Scanner.	i is re
	6.	Return core to box as it exits the games and scanner.	ma
	7.	Return core to storage location and continue processing core until intervais is complete.	1
	8.	Submit a floppy disk with gamma scanne files and a hard copy of the informat: (including log printout and data file) to the Administrative Assistant when a borehole or requested interval is complete.	er ion the
	NOTE :	SMF staff completing scan should init and date hard copy of the log and the data file.	ial
	9.	Identify a discrepancy that results f the actions of the SMF staff using th procedure.	rom is

YUCCA MOUNTAIN PROJECT PROCEDURE			Y-AD-001 8/90
Procedure No.: BTP-SMF-010 GAMMA-RAY LOGGING OF YUCCA PROJECT CORE	MOUNTAIN	Revision: 0 Page 6	of 9
RESPONSIBLE PARTY	STEPS	PROCEDURE	
	10.	Is the discrepancy discovered after an activity or form has been completed?	
SMF Staff		a. If yes, handle according to BTP-SMF-001.	
		b. If no, go to next step.	
	11.	Cross through the error, correct the original document, and initial and date the correction.	
	NOTE :	If additional explanation is required, assign a number to the correction and attach a sheet to the original record describing the correction performed.	
	12.	Identify any nonconformance to this procedure, process in accordance with QMP-15-01.	
	NOTE :	This is applicable for nonconformances noted during or after activities associated with this procedure.	
Administrative Assistant	13.	Submit records to Local Records Center (LRC) according to QMP-17-01.	
	14.	Submit copy of records to the Chief, SIB.
