Mr. Richard A Meserve
Chairman of the Commission

Dear Mr. Meserve,
Please do not allow the reactors to extend their life 20 years by the use of license renewal or any other means. Millions of people live far too close to take any form of risk with such dangerous plants nearby. We now have proof that the amount of strontium 90 per gram of bone mass is unacceptably high, as high as it was during the Nevada above ground testing. Near the reactors it's even higher. The government was given a report that stated that infant mortality rate declined by 30% after reactors are closed (this is true in every single case). A new study shows that cancer rates in 2 year old and younger go down by 50% when reactors close. If you extend the given life span (thus raising the odds of truly serious accidents), you will be killing children and that's with out any accidents, just ALLOWABLE emissions.
If you have not seen the health studies I have included a web site where you can research this for yourself
www.radiation.org

Sincerely,

Pamela Slater
