

November 3, 2000

Mr. Stephen A. Byrne
Vice President, Nuclear Operations
South Carolina Electric & Gas Company
Virgil C. Summer Nuclear Station
Post Office Box 88
Jenkinsville, South Carolina 29065

SUBJECT: VIRGIL C. SUMMER NUCLEAR STATION - CRACK IN WELD AREA OF
REACTOR COOLANT SYSTEM (TAC NO. MB025)

Dear Mr. Byrne:

On October 24, 2000, the NRC Resident Inspector informally presented you with the following expectations and information needs listed below. The purpose of this letter is to publicly document this request for information.

1. The licensee should assess the ability of nondestructive examination at the Virgil C. Summer Nuclear Station (Summer) to detect, characterize, and size the crack in the hot leg. The licensee should either provide sufficient information to resolve this issue prior to restart or provide a plan for resolving the issue.
2. The licensee should re-evaluate the 1993 Inservice Inspection (ISI) data in light of the assessment performed above. What is the impact of the assessment in Item 1 on the integrity of the other reactor coolant system hot legs and the cold legs?
3. The staff expects that the licensee will perform sufficient inspections and repairs to ensure all American Society of Mechanical Engineers Code rejectable defects in all hot legs and cold legs are removed prior to plant restart such that the facility is brought back in conformance with the facility Code of record.

GENERIC INDUSTRY ISSUES - FOR APPROPRIATE INDUSTRY RESPONSE GROUP

1. Are techniques other than ultrasonic testing (UT) appropriate for assessing the integrity of the nozzle to pipe weld? How should these techniques be qualified?
2. What qualified UT techniques (i.e., inner diameter or outer diameter inspection, transducers, beam angle, type of wave, etc.) are used by industry (each UT vendor) to perform ISI of these types of welds? Describe how these techniques are capable of assessing the type of flaw found at Summer.

S. Byrne
