Subject: reused soils

reused soils mixed with other soils that are not contaminated makes more soil contaminated.

This reminds me of a story I heard about in Russia. A smoke stack with emitting contaminates was being blamed for environmental problemsso they built a bigger smoke stack so the pollution would be spread out further and locals would not see as much contamination in their local environment.

think locally act globally or was that act locally think globally?

there are ways to remediate soil in a contained area. It is a huge liability to move the in question soil. it called "risk Assesment"
