?s draft publication ?Human Interaction with Reused Soil:

A Literature Search.? We strongly suggest that the literature search should examine potential soil reuse and dose exposure in urban areas. In addition, the possible reuse of soil in building materials and ground fill needs examination. Table I Soil Reuse Scenario Framework should be expanded to include residential front and back yards, garden plots, neighborhood parks in addition to tot lots, children 5 years and under who are most likely to use residential yards for recreation, and exposure due to dust from wind. Human contact with radioactive materials in reused soil in metropolitan areas would be a primary concern to this agency and could be a major environmental factor affecting health.
