PRA Evaluation for Heavy Loads Drop

- 1. Use the NUREG-0612 methodology (fault tree)
- Based on NUREG-0612 range of incidents is 10<sup>-4</sup> to 10<sup>-5</sup> per movement 2.

NEI provided data for cask loading data indicates, at 50% confidence level, 1.6x10<sup>-4</sup> per movement for LWRs  $6.2 \times 10^{-5}$  for LWRs + GCR

3. Use new (1996 to 1999) Navy data and 100 lift per year to revisit NUREG-0612 evaluation for a singlefailure proof crane and Phase I of NUREG-0612

> 3.1x10<sup>-5</sup> per year Mean crane failure leading to dropper load: (NUREG-0612 mean value 5.0x10<sup>-5</sup> per vear)

Use new Navy data and WIPP "Trudock" crane report to estimate rigging failure leading to a dropped load 4 (for 100 lifts)

> Mean rigging failure leading to a dropped load: 5.8x10<sup>-6</sup> per year (NUREG-0612 mean value 1.5x10<sup>-5</sup> per vear)

Assume only 10% of path is critical such that a drop may result in significant damage to the pool floor 5.

Mean loss-of-inventory from a dropped load: 4.0x10<sup>-6</sup> per year.

- 6. Reduce incident rate by a factor of 10 to add additional credit for single-failure proof crane and procedures. training, maintenance, etc.
  - (3) Mean crane failure leading to dropper load: 4.8x10<sup>-6</sup> per year 5.8x10<sup>-6</sup> per year
    - (4) Mean rigging failure leading to a dropped load:

242

(5) Mean loss-of-inventory from a dropped load: 1.1x10<sup>-6</sup> per vear.
