Subject: Re: Fwd: Seismic Response

For Humboldt Bay (the message from S. Richards was about the Pacific northwest) the peak ground acceleration from a magnitude 7+ under the site concurrent with a magnitude 9+ on the subduction zone is postulated by PG&E to be over 1 g.

George,

We are under the impression that we are looking at EP for beyond design bases earthquakes because of a recent Commission decision. If this is not true, we certainly would like to know that and argue that for the g-levels involved, we think EP will not be very useful.

Glenn
