Re: Final memo on SFP consequence calculations

Please take a look at the attached draft memo on SFP consequence calculations, to ensure it includes the results you need.

>>> Robert Palla 10/23 11:49 AM >>>

Your draft memo on SFP consequences at various times after shutdown (30 days to 10 years) did not include results for "individual risk of early fatality at 1 mile" and "individual risk of latent cancer fatality". You provided that info in a separate e-mail on 9/19/2000 (attached). We are relying on the tabulated results of the aforementioned parameters for our comparisons to the safety goals. Thus, we request that you incorporate these consequence results in the final version of the memo, which will be Appendix 4B of the report. The plots of these results need not be included in the memo.

MEMORANDUM TO: Gary M. Holahan, Director

Division of Systems Safety and Analysis Office of Nuclear Reactor Regulation

FROM:

Farouk Eltawila, Acting Director

Division of Systems Analysis and Regulatory Effectiveness

Office of Nuclear Regulatory Research

SUBJECT:

RADIOLOGICAL CONSEQUENCES OF SPENT FUEL POOL

ACCIDENTS OCCURRING UP TO 10 YEARS AFTER FINAL REACTOR

SHUTDOWN

As part of its effort to develop generic, risk-informed requirements for decommissioning, NRR requested (Reference 1) that RES evaluate the offsite radiological consequences of beyond-design-basis spent fuel pool accidents. In response to that user need, RES completed an in-house analysis (References 2 and 3) using the MACCS code (Reference 4). The focus of that work was estimation of consequences of accidents occurring between 30 days and 1 year after final reactor shutdown. Recently, NRR requested (References 5 and 6) that RES extend the consequence evaluation to accidents occurring up to 10 years after final shutdown.

RES performed the requested calculations using the release fractions in Table 1 and the fission product inventories at 30 and 90 days and 1, 2, 5, and 10 years after final shutdown. The release fractions in the first row of Table 1 are the sum of the in-vessel and ex-vessel release fractions in NUREG-1465, *Accident Source Terms for Light-Water Nuclear Power Plants*, February 1995 (Reference 7). NUREG-1465 has received significant peer review and is representative of a low pressure core-melt accident. The release fractions in the second row of Table 1, other than those for ruthenium and fuel fines, also are from NUREG-1465. In this case, the ruthenium release fraction is that for a volatile fission product, and the fuel fines release fraction is that from the Chernobyl accident (Reference 8). Results of the RES calculations for distances of 1, 10, 50, and 100 miles (consistent with the distance used in earlier RES analysis for NRR on spent fuel pool accidents) are given in Tables 2 and 3.

Table 1 Fission Product Release Fractions

Source Term	Release Fractions								
Course roiiii	Xe,Kr	l l	Cs	Те	Sr	Ba	Ru	La	Ce
NUREG-1465	1	.75	.75	.31	.12	.12	.005	.0052	.0055
NUREG-1465	1	.75	.75	.31	.12	.12	.75	.035	.035
