I don't think my requirements for a power provider are very different from most Americans. I have three just requirements of them:

1. I want power when I want it
2. I want it produced safely
3. I want it as cheaply as possible

If I can't get 2 and 3, I'll just take number one.

I have read the studies and reports and feel the safety issue for power made with nuclear heat sources is safe with the current fuel mix and the proposed MOX fuels. I have already "voted" on this issue by the nature of where I have chosen to live. When I sit on my front porch in the evening, I can see the orange glow of the security lights on the McGuire Nuclear station. The station is four road miles from my driveway and only about two and a half as the crow flies. I look around at a lot of very upscale homes within the "LPZ", and don't see anyone trying to get away from a bad situation. We are not a bunch of dummies.

Thank you
