March 29, 1999

SUBJECT: MILLSTONE NUCLEAR POWER STATION, UNIT NO. 3 - CORRECTION TO
AMENDMENT NO. 165 (TAC NO. MA1085)

Dear Mr. Necci:

By letter dated January 20, 1999, the NRC issued Amendment No. 165 to Facility Operating License No. NPF-49 for Millstone Nuclear Power Station, Unit No. 3, in response to your application dated March 3, 1998, as supplemented May 7, 1998.

The amendment revised the Millstone Unit 3 licensing basis by eliminating the requirement to have the recirculation spray system directly inject into the reactor coolant system following a design basis accident, with the exception of loss-of-coolant accident (LOCA) scenarios involving a long term passive failure. The Millstone Unit 3 licensing basis maintains the direct injection requirement for scenarios, as a contingency, for situations where it may be needed - as in the case of a LOCA with a long term passive failure or for beyond design basis scenarios.

It has recently come to the NRC staff's attention that the wording in the related safety evaluation is not accurate. Specifically, on page 2 of the safety evaluation the staff states:

The licensee has evaluated the changes to the cold leg and hot leg recirculation modes and concluded that the flow provided by the two CHS [charging] and two SIH [safety injection] pumps was sufficient to assure the minimum flow for core cooling.

While this statement is true, it implies that the systems could not withstand a single failure. The sentence should have stated that the flow provided by one CHS and one SIH pump was sufficient to assure the minimum flow for core cooling. We regret any inconvenience this may have incurred.

Sincerely,

Original signed by:
