ADVISORY COMMITTEE ON REACTOR SAFEGUARDS

483RD ACRS MEETING

+ + + + +

WEDNESDAY

JUNE 6, 2001

+ + + + +

ROCKVILLE, MARYLAND

The Advisory Meeting met at the Nuclear
Regulatory Commission, Two White Flint North, Room
2B3, 11545 Rockville Pike, at 8:30 a.m., Dr. George E.
Apostolakis, Chairman, presiding.

PRESENT:

DR. GEORGE E. APOSTOLAKIS, Chairman

DR. MARIO V. BONACA, Vice Chairman

DR. DANA A. POWERS, Member

DR. WILLIAM J. SHACK, Member

DR. ROBERT E. UHRIG, Member

DR. GRAHAM M. LEITCH, Member

DR. THOMAS S. KRESS, Member at Large

DR. JOHN D. SIEBER, Member

DR. F. PETER FORD, Member

DR. GRAHAM B. WALLIS, Member

NEAL R. GROSS

P-R-O-C-E-E-D-I-N-G-S

(8:30 a.m.)

CHAIRMAN APOSTOLAKIS: The meeting will now come to order. This is the first day of the 483rd meeting of the Advisory Committee on Reactor Safeguards.

During today's meeting the Committee will consider the following: A status report on proposed risk-informed revisions to 10 CFR 50.46, and proposed revisions to the framework for risk-informing the technical requirements of 10 CFR Part 50.

The potential margin reductions associated with power uprates; the draft final safety evaluation report for the South Texas Project Nuclear Operating Company request to exclude certain components from the scope of special treatment requirements required by regulations; and the discussion of general design criteria and proposed ACRS reports.

This meeting is being conducted in accordance with the provisions of the Federal Advisory Committee Act. Dr. John T. Larkins is the designated Federal official for the initial portion of this meeting.

We have received no written comments or requests for time to make oral statements from members

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of the public regarding today's sessions. A
2 transcript of portions of the meeting is being kept,
3 and it is requested that the speakers use one of the
4 microphones, and identify themselves, and speak with
5 sufficient clarity and volume so that they can be
6 readily heard.

7 I will begin with some items of current
8 interest. The ACRS Subcommittee on Advanced Reactors
9 held a meeting on June 4th and 5th, 2001. We would
10 like to thank Commissioner Diaz for his outstanding
11 keynote speech.

12 Also, we would like to thank all the
13 meeting participants, especially the presenters and
14 the panel members. This meeting was successful
15 because of the outstanding support provided by the
16 ACRS management, and Richard Savio, Michael Markley,
17 and Medford L. Ztoftorie (phonetic).

18 Our special thanks to the administrative
19 support provided by the Operations Support Branch
20 personnel, especially Jenny Gallo, and Carol Harris,
21 Beverly Joe White, Tyrone Brown, Michelle Kelton, F.
22 M. Bernard, Tania Winfried, and Sherry Meadow.

23 I understand that we have a change in our
24 management of the ACRS staff, and Dr. Larkins will
25 tell us about that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. LARKINS: Good morning. It is a bit
2 of good news and a little bit of not so good news.
3 When you bring employees on board for a lot of
4 expectations and potential, your hopes are that they
5 are going to develop and move on, and do some other
6 things.

7 Unfortunately, other people recognize the
8 expertise and potential of the staff here, and Mr.
9 Lyons, who has been with us since I guess -- what is
10 it, September, Jim?

11 MR. LYONS: Yes.

12 DR. LARKINS: He has been selected to be
13 the new Director of the Future Licensing Organization,
14 which is going to be a tremendous job and
15 responsibility in the agency.

16 We just spent two days talking about
17 future licensing for advanced reactor designs. So,
18 Jim is going to have a major challenge, and although
19 I hate to lose him, we still wish him good luck.

20 (Applause.)

21 MR. LYONS: Thank you. First of all, I
22 would like to thank the committee for all the --
23 actually education that I have gotten since I have
24 been here on this staff.

25 And I would like to thank John and Dana

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 for selecting me to come to this position, and it has
2 really been very useful for me to see exactly how the
3 committee works, and to see all the breathe of
4 experience that you all have, and the issues that you
5 address.

6 And I really want to thank you for holding
7 the workshop the last two days to bring me up to speed
8 on my new job. It was very nice of you to do that.

9 CHAIRMAN APOSTOLAKIS: It was a parting
10 gift.

11 DR. LARKINS: With that, I am pleased to
12 announce that Dr. Sher Bahadur has been appointed the
13 Associate Director for Technical Support. Sher will
14 be replacing Jim effective July 9th.

15 For those of you who are not familiar with
16 Dr. Bahadur, he joined the NRC in 1984, and has held
17 a number of progressively more responsible positions.

18 It is interesting to note that I was the
19 technical assistant for Chairman Zech in the early
20 '80s, and when I left to take a position in NOR, Sher
21 was my replacement as the technical assistant to the
22 chairman.

23 So he knows his way around the Commission
24 and will be very helpful. He has worked both in the
25 Office of MNSS and he has also worked in research, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 I think his current position there is chief,
2 engineering research applications branch. So he will
3 bring a balanced perspective and I should be able to
4 dump lots of work on him.

5 Prior to joining the NRC, Dr. Bahadur
6 worked in a variety of assignments in the private
7 sector, including NUS, Acres American, Incorporated,
8 and Lundy Engineering.

9 Dr. Bahadur has a Ph.D. in geotechnical
10 engineering from the South Dakota School of Mines
11 Technology, but even more importantly, I think he
12 brings a wealth of experience and background in a
13 number of areas that will impact both committees, the
14 ACRS and the ACNW.

15 So I am looking forward to having Sher
16 around for a little longer, at least a year or two,
17 and working with the committee. So welcome aboard.
18 thank you.

19 (Applause.)

20 DR. BAHADUR: Thank you, John. As you
21 mentioned, I have been in research for about 12 years
22 now, and I have looked after three different branches
23 during this 12 years. So I think there is a wide
24 breathe of experience that I have received in that
25 office.

1 And I am looking forward to working here
2 now and learning with the committee, and also bringing
3 the expertise in certain areas, which we will be
4 useful to you, as will for my own development. So
5 thank you so much again, and I am looking forward to
6 it.

7 CHAIRMAN APOSTOLAKIS: Thank you. We have
8 three letters to complete at this meeting, and the
9 response, and they are all top priority. There is the
10 response to Chairman Meserve's May 7th memorandum on
11 the differing professional opinion on steam generator
12 tube issues.

13 And the response to the April 12th EDO
14 letter on topics raised by the ACRS pertaining to
15 issues associated with industry use of thermal-
16 hydraulic codes, and risk-based performance
17 indicators.

18 We will also discuss our letter on the
19 South Texas project exemption request, but the letter
20 will be completed in July, and so we have three
21 letters. And the first session is on proposed risk
22 informed revisions to 10 CFR 50.46.

23 As you see from the agenda, we had
24 allocated almost two hours or three hours or more --
25 well, more than two hours to this subject. But we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 will only take until 10 o'clock, and after the break,
2 we will come back and discuss Dr. Wallace's letter on
3 thermal hydraulic codes.

4 So with that, we will start on the
5 proposed risk-informed revisions to 10 CDR 50.46. Dr.
6 Shack will lead us through this.

7 DR. SHACK: We will be discussing the
8 status of the staff industry initiatives in 10 CFR 50-
9 46, and the industry proposal is fairly straight
10 forward.

11 They propose that -- and loss of cooling
12 accidents, and some other range defined upon a plant
13 by plant or a plant class basis through analysis and
14 experience.

15 The staff has a wider range of options
16 that they are considering for 50.46 and presumably we
17 will hear something about that range of options that
18 they are considering this morning, and Mark will start
19 us off.

20 MR. CUNNINGHAM: Thank you, Dr. Shack.
21 Good morning. My name is Mark Cunningham, and I am
22 the Chief of the PRA Branch in the Office of Research.
23 With me this morning is Alan Kuritzky, a senior
24 reliability and risk analyst in the branch.

25 As Dr. Shack indicated, we are going to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 try and give you some information on the options that
2 we are considering on making modifications to 50.46 to
3 make it more risk informed.

4 Right off the bat, I am going to take the
5 slides slightly out of order, and to go to slide three
6 and talk about the purpose of the meeting. Basically,
7 we had hoped to have a commission paper to you a
8 couple of weeks ago for you to review.

9 We weren't able to do that for a variety
10 of reasons, and so we want to give you a status report
11 today on our work to consider changes to 50.46, and
12 use this as an opportunity to solicit feedback, and
13 get questions from the committee on our proposals.

14 We are not requesting a letter at this
15 point. We intend to get the commission paper -- the
16 commission paper is due to the EDO in about three
17 weeks. We intend to get it to you in time so that you
18 could discuss it at the July meeting, and at that
19 point we would ask for a letter.

20 Going back to slide two then, and an
21 outline of the presentation, basically first we want
22 to provide some background just to remind people where
23 we are in the series of steps that are undertaken in
24 option three.

25 I want to spend a little time talking

1 about what is in 50.46, and the different aspects of
2 50.46. We want to give you some options for different
3 ways, and discuss some possible different ways to
4 change the requirements, and discuss a little bit
5 about what future technical work might be required to
6 support these possible changes.

7 And to summarize a couple of policy
8 issues, and then end up with some discussion of
9 schedule. Just as a reminder to the committee and
10 others, if we go back a couple of years to a
11 commission paper that laid out the plan for performing
12 option three, and it was described in Section 99.264.

13 It laid out a framework, and the framework
14 basically had two phases in it. The first phase was
15 a kind of identification and evaluation phase that we
16 went through or had gone through everything in Part
17 50, and tried to identify what aspects or what
18 requirements within Part 50 might be amenable to being
19 changed to be risk informed.

20 We prioritized those and identified 2 or
21 3 issues as the most likely or the most important
22 changes to tackle first. The first of those was 50.44
23 on combustible gas control.

24 As the committee knows, we provided
25 recommendations to the commission last September on

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that, and there is a rule making plan now before the
2 commission to make those rule changes.

3 The second priority that we identified
4 were potential changes to the ECCS requirements
5 contained in 50.46 and other places in the
6 requirements. And Part C of the first phase is --

7 DR. POWERS: Mark, remind me why you
8 thought that was 50.46 was particularly susceptible
9 to risk information?

10 MR. CUNNINGHAM: A couple of reasons
11 really. One was that there was a fair amount of risk
12 information already available that would help guide
13 you in possible changes to the ECCS requirements.

14 There is a lot known about the frequency
15 of breaks and the frequency of core damage associated
16 with different types of breaks, and that sort of
17 thing.

18 It was also recognized that there is a
19 fair amount or there are opportunities in 50.46 where
20 you could make some -- improve the realism of the
21 requirements.

22 DR. POWERS: Well, I think everybody
23 recognized that there were things that were bound in
24 the nature with 50.46, and I guess I am interested in
25 why you thought that particular regulation was just

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 right for risk information.

2 I think you are on the right track when
3 you say that a lot of information -- that we knew a
4 lot about breaks. I mean, we have looked at
5 everything from micro breaks to macro breaks, and we
6 know something about the reliability that the ECCS has
7 to have to counterman those breaks. It would seem
8 like pretty good reasons to go after that one.

9 MR. CUNNINGHAM: Another big factor I
10 think was that 50.46 is one of the centerpieces of
11 Part 50 if you will, in the sense that the --

12 DR. POWERS: It is a little linchpin with
13 it.

14 MR. CUNNINGHAM: It is a linchpin that you
15 start to change, and we saw an opportunity that if you
16 start with 50.46, you could have the opportunity not
17 only to change the ECCS requirements, but have an
18 opportunity downstream to make other changes to the
19 requirements, because there are many if you will
20 spinoffs from 50.46 and other parts of the
21 regulations.

22 And somebody has described it as an
23 octopus of having tentacles that reach out into many
24 other parts of Part 50. So there is an opportunity to
25 start working that whole set of issues.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And perhaps to put it another way, if you
2 don't tackle 50.46, you may have a hard time changing
3 other parts of Part 50 as well. So it was the
4 combination of things.

5 We thought that we could have some
6 successes that would be relatively low-cost and quick
7 to do. We had a good set of information to work from
8 on with the risks associated with different pipe
9 breaks, and again we saw that it was such a
10 centerpiece of Part 50, and we thought it was
11 worthwhile.

12 DR. SHACK: And I think you could also
13 argue that there is a substantial safety benefit.

14 MR. CUNNINGHAM: Yes.

15 DR. POWERS: I mean, I think that most
16 people would argue that what we are doing to the
17 diesels is not helpful.

18 MR. CUNNINGHAM: Yes, and certainly that
19 point has been made a number of times, and related
20 issues on diesel generators -- start times and that
21 sort of thing -- that have been argued to be counter
22 to safety in some respects.

23 And also to be clear, when we polled the
24 nuclear industry, and NEI provided us their ideas of
25 what they thought would be most important to change,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the ones that they identified right off the bat was --
2 the top two were 50.44 and 46.

3 DR. POWERS: You have a lot of information
4 on breaks from the studies that have been going on for
5 over -- gee, since '74, and we have been looking at
6 various kinds of breaks since then.

7 Do you really have a lot of information on
8 this hypothesized counter to safety or what we can do
9 to poor, innocent diesel generators?

10 MR. CUNNINGHAM: Do we have the same type
11 of level of information? No, we don't, I don't think,
12 but I think it is the more mechanical engineering
13 types and things like that will say that the
14 requirement to start these diesels as they are
15 required to do with having cold starts, and that have
16 to be extremely fast, it is counter to good sense if
17 you will in the design of these diesels.

18 They are very big machines, and it is not
19 a good way to pursue it.

20 DR. POWERS: Yes, but the only thing that
21 one would worry about is why not just go fix that?

22 MR. CUNNINGHAM: Because again there are
23 other opportunities, and looking at the complete issue
24 that I will come back to in a little while on ECCS
25 reliability, is that there are -- that the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 requirements that we have that are implemented today
2 cause us to perhaps over design some aspects of the
3 ECCS that can lead to potential safety issues in other
4 respects.

5 I have been before this committee several
6 times to talk about pressurized thermal shock risk.
7 One of the issues that comes up is that if you are
8 putting greater demands to pump in cold water to deal
9 with large LOCAs, then you may be improving the risk
10 associated with large LOCAs.

11 But you may be hurting our potential to
12 deal with pressurized thermal shock, or increasing the
13 risk associated with pressurized thermal shock.

14 DR. POWERS: To raise an event in order to
15 avoid an AB?

16 MR. CUNNINGHAM: Yes, that's right.

17 DR. POWERS: And so it is probably not a
18 good tradeoff.

19 MR. CUNNINGHAM: Yes. And given that we
20 think there are conservatisms in the current 50.46, I
21 think we can do a better balancing job if you will
22 between those two sets of requirements.

23 DR. LEITCH: Has it been decided at this
24 point which is the next regulation beyond 50.46 to be
25 considered?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. CUNNINGHAM: We have been spending
2 some time looking at special treatment requirements,
3 but by and large now I think for the near future our
4 focus is going to be on getting 50.44 done and 50.46,
5 our hands-on 50.46 if you will.

6 So as I said, with 50.44 in a sense, we
7 are down in this context of the framework option three
8 and we are down in the phase two part for 50.44. We
9 are into rule making and that sort of thing.

10 And in the context of 50.46, we are back
11 here, in terms of the latter part of the last phase or
12 the last part of phase one, and we are looking at the
13 feasibility of possible changes.

14 So in that sense what you will hear about
15 today is us talking about what is the technical
16 content of 50.46, and what would lead us to some
17 alternatives, and what is the basis for some
18 alternatives to the present 50.46.

19 Are there policy issues that have to be
20 resolved, and what would be the required technical
21 work to proceed, and in some sense the resources that
22 would be required to proceed with different
23 alternatives.

24 So the bulk of my presentation is really
25 going to cover that sort of thing. The paper that we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 owe to the commission in June is a set of
2 recommendations to proceed if we believe that it is
3 appropriate, to proceed to rule making.

4 And then if the commission approves, then
5 we would go on into the phase two work. But in a
6 sense this is setting you up to make it clear that
7 there are a lot of things that we don't have answers
8 for today.

9 We think there are some good opportunities
10 for change here, but we don't have all the detailed
11 technical work done to provide the real basis for
12 this, or the complete basis for this.

13 Moving on now to what is in 50.46. And
14 50.46, in a sense, has four parts. The first part
15 deals with the concept of assuring system safety
16 function, and to assure that the requirements talk
17 about basically ensuring that the system can operate
18 given single failures.

19 That the system can operate given the
20 assumption that there is a loss of off-site power. In
21 effect, this first box here is a first attempt at
22 defining a reliability requirement for the ECCS.

23 So we are going to come back to this later
24 that there may be a better way to ensure reliability,
25 rather than working with single failure and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 assumptional off-site power.

2 So a key theme of what you will hear today
3 is changes to the reliability aspect of the ECCS
4 requirements. The second part is dealing with what is
5 an acceptable ECCS performance, in the context of
6 ensuring that we don't have a core melt accident, or
7 a severely damaged core.

8 Right now there are five criteria within
9 50.46 and other places that are used to measure that.
10 The classic one or the most well known is 2,200
11 degrees F, in terms of peak clad temperature.

12 But there are others in terms of the
13 maximum allowed cladding oxidation, and hydrogen
14 generation, and a number of other things. Again, we
15 see in this case some opportunities for making -- and
16 some reasons to make this a little more general
17 perhaps, and improve the quality of the requirement in
18 general.

19 DR. POWERS: The requirements for maximum
20 clad oxidation of no more than 17 percent is not
21 really related to hydrogen generation is it? It is
22 really an embrittlement criteria?

23 MR. CUNNINGHAM: It is an embrittlement
24 criteria, exactly.

25 DR. POWERS: And as we are discovering

1 lots of things in embrittlement of the clad besides
2 oxidation and what not are you a part of the same
3 increased realism to change that to be an honest-to-
4 god embrittlement requirement, rather than a --

5 MR. CUNNINGHAM: We will come back to
6 that, but yes, that is a direction we are moving in.
7 The third aspect of 50.46 and related requirements
8 deals with the acceptable model that is used to
9 compare with the performance criteria or the
10 acceptance criteria.

11 Currently, there is an Appendix K approach
12 to modeling ECCS, the thermal hydraulics of it, and
13 then there is also another alternative for a realistic
14 with uncertainty analysis approach.

15 And we see some opportunities there worth
16 making some changes that could make or improve the
17 requirements. And finally the last part is the
18 definition of the range of break sizes that are
19 required to be mitigated by the ECCS system.

20 Basically now the requirement is that it
21 has to include up to and including the largest pipe
22 break in the system. Again, we will talk some more
23 about some possible changes to that as we move on
24 today.

25 DR. POWERS: I was intrigued by the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 requirement that a volume be able to withstand the
2 rupture of the largest pipe in that volume. I am
3 familiar with a reactor not located in the United
4 States, and which had that requirement for it, and it
5 is containment modules.

6 And it succeeded in blowing its
7 containment modules up completely because it broke
8 several of the largest pipes. But do you bear those
9 things in mind in thinking about these pipe breaks?

10 MR. KURITZKY: You mean in breaking
11 multiple -- in having multiple breaks at the same
12 time?

13 DR. POWERS: Well, I mean, the requirement
14 is not to blow up the containment volume or things
15 like that. I mean, it is coming in and taking it back
16 and saying, well, it is no bigger than this break that
17 takes you one step removed from what you really want
18 to accomplish, which is not to break the volume.

19 MR. KURITZKY: Right. I mean, we have
20 certainly taken into consideration the containment
21 integrity. I mean, changes that we will recommend
22 involving ECCS, we will always be keeping in mind that
23 we don't want to violate the containment, and we take
24 containment in strong consideration if that is your
25 question.

1 DR. POWERS: The containment that I was
2 speaking of was the internal containment, and with an
3 environment exactly like this, and that could
4 withstand the break of the largest pipe in the volume.
5 Unfortunately, it broke 12 of them, and that was more
6 than it could take.

7 MR. CUNNINGHAM: This slide is intended to
8 kind of provide the basic, if you will, kind of some
9 boundary conditions to what we will talk about for the
10 rest of the morning here.

11 As I mentioned earlier, I think a theme
12 that you will see is that I think there is something
13 to be gained and we have considered seriously ways to
14 improve the description of the reliability
15 requirements for the ECCS system.

16 And getting away from this rather
17 prescriptive statement of single failure criteria and
18 loss of off-site power, and there is ways to do things
19 better and perhaps improve the reliability of the ECCS
20 system.

21 Another one of our boundary conditions is
22 that we see some opportunities and parallel and as
23 part of being risk informed to improve the realism of
24 what we have here in the ECCS requirements.

25 You will see in each case, I think, a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 couple of different approaches to accomplishing our
2 goal, and in some cases we have changes that might be
3 still fairly prescriptive, but still improved over
4 what we have today.

5 But there is still a kind of more
6 prescriptive oriented changes, and we also have
7 approaches that are more performance based. So I
8 think in each case you will see alternatives that
9 might be somewhat less prescriptive than today, but
10 still prescriptive.

11 And then others that are more bigger steps
12 if you will and to be more performance based types of
13 approaches.

14 DR. WALLIS: And while we are talking
15 about ECCS reliability, you are not suggesting that
16 the ECCS be designed so that it cannot cope with a
17 double ended break?

18 You are just saying that the way in which
19 it copes with it doesn't have to be as reliable as we
20 thought it had to be? Is that what you are saying?

21 MR. CUNNINGHAM: What I was saying is that
22 in the present requirements the way of ensuring
23 reliability of the system for the spectrum of breaks
24 is a somewhat artificial way of -- well, it is done
25 somewhat artificially, and the assumed single failure

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in the system, and the assumed loss of off-site power.

2 And you can accomplish the same
3 reliability perhaps in a more risk informed way
4 without necessarily -- perhaps even improving the
5 reliability to cope with the system.

6 But we are not saying that the ECCS does
7 not have to cope with the largest break in the system.

8 DR. WALLIS: Are you doing something like
9 a product of the probability of the break, and the
10 reliability or probability of the success of the ECCS
11 or something?

12 MR. CUNNINGHAM: Yes, exactly.

13 DR. WALLIS: And if the probability of the
14 break is very low, then the probability of the ECCS
15 working can be less than 99.99 percent or whatever?

16 MR. CUNNINGHAM: Yes, exactly.

17 DR. WALLIS: That is the argument?

18 MR. CUNNINGHAM: Yes.

19 DR. WALLIS: And we are certainly not
20 backing off on the capability of the thing to respond
21 to a large break?

22 MR. CUNNINGHAM: No, it is not.

23 DR. WALLIS: I think that should be clear
24 to the public that you are not backing off on that
25 sort of requirement?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. CUNNINGHAM: That's right.

2 CHAIRMAN APOSTOLAKIS: So is the same
3 thinking then applicable to the reactor for which the
4 core damage frequency is very, very low, so we can
5 relax the reliability requirements of the containment?

6 MR. CUNNINGHAM: Relax the reliability
7 requirements on what?

8 CHAIRMAN APOSTOLAKIS: On the containment?
9 In other words, we are shifting. If you think in
10 terms of the cornerstones, we are saying that the
11 initiating event or the core damage frequency is so
12 low that now the barriers that follow may not be
13 needed.

14 MR. KURITZKY: I think we based everything
15 on our framework document, which maintains or which
16 states that we have to maintain the defense in depth
17 layers, which containment of course is one.

18 So in our framework, we should not be
19 doing anything that allows to get through a layer.

20 CHAIRMAN APOSTOLAKIS: In this case.

21 MR. CUNNINGHAM: Yes, in this case.

22 CHAIRMAN APOSTOLAKIS: But that is the
23 next logical step isn't it?

24 MR. CUNNINGHAM: Yes, that's right. If
25 you could take the same framework that we are working

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 on here, and we are applying the framework to existing
2 plants. So they have a containment, and they have a
3 ECCS, and that sort of thing.

4 And the next step in a direction of
5 advanced reactors is to think about this framework if
6 you have nothing but a paper reactor if you will. And
7 is today's balance the right balance for a new plant.
8 That's a good question.

9 DR. WALLIS: Well, I liked your argument
10 earlier that if you change some of these requirements
11 that you might actually make the system safer, because
12 you are not putting greater demands on the system in
13 some other scenario.

14 If you can make that argument, I think you
15 have a good one. If it is just backing off alone,
16 that is not such a good argument.

17 MR. CUNNINGHAM: It is not just backing
18 off it.

19 DR. WALLIS: It is actually improving
20 safety if you can make that argument, and I think that
21 is a good one.

22 MR. CUNNINGHAM: Yes. Again, one of the
23 last ground rules for the flavor of what we are doing
24 here is the issue that has been raised on the
25 definition of whether or not you can eliminate the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 large break LOCAs as a design basis accident.

2 I think you will hear some more later that
3 there are some possibilities that that could be done,
4 but there is also a lot of technical work that would
5 have to be done to justify that.

6 And how far we go in this particular paper
7 in opening the door for that is subject to some
8 discussion, and we will come back to that later.

9 DR. POWERS: But that would be the case
10 then where the ECCS would no longer be capable of
11 handling the largest break?

12 MR. CUNNINGHAM: Conceivably, yes. That
13 if you could make a convincing argument that there is
14 a set of pipe breaks, or pipe breaks of a greater than
15 certain size are extremely low frequency, then in a
16 sense you shift, and the pipe breaks over into the
17 category that we would do for a vessel rupture.
18 That it is an event of such a low frequency that you
19 do not require ECCS mitigation.

20 DR. WALLIS: However, if it did happen, it
21 would be embarrassing if you had already decided to do
22 away with the ability to cope with it, low frequency
23 or not.

24 MR. CUNNINGHAM: It would be embarrassing,
25 and a dangerous situation. And I believe as was

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 discussed about a month or so ago with a subcommittee,
2 I guess, there is a lot of technical work that the
3 staff believes would have to be done before you could
4 make that case.

5 And even if you did a lot of technical
6 work it is not clear that you could get to that end
7 point.

8 DR. KRESS: Mark, do you have a list of
9 potential changes that the licensee will make if you
10 change the definition of the pipe size for a large
11 break LOCA.

12 MR. KURITZKY: Industry has supplied us
13 with a couple of fairly extensive lists of things that
14 they would like to change if they could, and change
15 the definition of a large break.

16 DR. KRESS: Okay.

17 MR. CUNNINGHAM: And we didn't come
18 prepared to talk about that today. But I think it is
19 clear that if you could accomplish that that there
20 would be a lot that would change in the operations of
21 the plant, and in the design and in probably the
22 operations of the plant.

23 DR. POWERS: If all those things were
24 implemented, and I realize that it is kind of a
25 hypothetical list that maybe not all plants could

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 eliminate, and could do all things.

2 But have you taken a representative plant
3 and done a risk analysis on it to see if there is a
4 change very much?

5 MR. CUNNINGHAM: We have not done that at
6 this point. Again, we are in the -- and again to go
7 back to the slide on where we are in the procession of
8 tasks, we are at the point of do we think it is
9 feasible to make some changes.

10 And then if we were going to make those
11 changes, then we would proceed to do more work like
12 that, but we are not at the point of having to do
13 that.

14 DR. POWERS: Well, it seems to me that if
15 you found that the risk went up significantly that you
16 wouldn't want to bother trying to find out if it was
17 feasible to make the changes.

18 MR. CUNNINGHAM: Certainly, and that comes
19 into the feasibility part of it. And what you will
20 see in the presentation is that we are not coming in
21 and saying that our approach is to eliminate the large
22 break LOCA design basis accident.

23 We think that today there is a lot of
24 technical work that would have to be done to justify
25 that. We may want to start down that path, and I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 think that our goal was to start down that path to
2 talk about how that might be done.

3 But the changes that we are talking about
4 in the shorter term are less radical changes to the
5 requirements, but things where I think we can improve
6 a much better balance to what is in the ECCS
7 requirements.

8 DR. POWERS: And based on evidence from
9 yesterday, the Chairman here, who is looking for
10 radical --

11 DR. WALLIS: Well, Mark, not only do you
12 have to do what you think is right, you have to
13 respond to what industry is asking for.

14 MR. CUNNINGHAM: Yes.

15 DR. WALLIS: And if they come in with very
16 good arguments that do away with a large break LOCA,
17 you have to be on good technical grounds to respond.

18 MR. CUNNINGHAM: Yes.

19 DR. WALLIS: And you may have to do some
20 of this technical work or maybe all of it.

21 MR. CUNNINGHAM: Well, when we come back
22 later on and we talk about the future --

23 DR. SHACK: On page 57 of your notebook,
24 there is a fairly detailed description of the things
25 that they would like.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 DR. KRESS: Thank you, Bill.

2 DR. POWERS: And that they think they can
3 get out of this.

4 DR. KRESS: Thank you, Bill. Handwritten
5 on page 57?

6 DR. SHACK: Yes.

7 MR. CUNNINGHAM: Dr. Wallis, yes, the
8 industry or representatives of the industry have
9 proposed certain approaches, and we and the staff have
10 -- and again at the subcommittee meeting, we talked
11 about some of the issues that would have to be
12 resolved.

13 And I think that since then we have talked
14 with the industry, and are prepared to continue the
15 dialogue on how those issues could be resolved.

16 DR. WALLIS: And if you remember, they
17 said they would go away and prepare a really good
18 case. So you have to be ready for that.

19 MR. CUNNINGHAM: Yes, and I know that the
20 members of the staff are trying to set up a series of
21 meetings to talk about that. I don't think they have
22 been scheduled yet, but I think the idea is to go
23 forward and talk about that.

24 DR. WALLIS: I am just saying that talking
25 is fine, but someone has to do a really good technical

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 analysis which is convincing.

2 MR. CUNNINGHAM: Yes, we agree.

3 DR. KRESS: Mark, I have a bit of a
4 strange question, I guess. We have a number of design
5 basis accidents that the plants are required to meet,
6 and this is one of them. And we are talking about
7 changing or may possibly change the design basis
8 accident.

9 The question I have is that isn't there a
10 rationale that has been used by the agency to select
11 design basis accidents, their description and what
12 they are, and some sort of rationale that says we will
13 choose this as a design basis accident because it has
14 these attributes?

15 And it is sort of top down approach to the
16 question of the design basis accident; and then the
17 next question would be that if you had that rationale,
18 what pipe size goes into meeting those criteria or
19 whatever they are?

20 I suspect that we don't have such a
21 rationale, but I guess part of the question is should
22 such a rationale be developed in an explicit manner,
23 rather than -- I suspect that it has grown from
24 intuition and other things.

25 MR. CUNNINGHAM: The set that is in

1 existence today for the operating plants is this one
2 as you know that has evolved over time, and one of the
3 challenges in thinking about changing those is to go
4 back in 50.46 or something else and look at the intent
5 of the requirements when they were established.

6 And in some cases that is very hard to do
7 because the decisions were made 25 or 30 years ago, or
8 more, and it is hard to discern from the record what
9 all the intents were at the time.

10 DR. KRESS: Part of my motivation for
11 asking the question doesn't really have to do with
12 this one, but has to do with advanced reactors.

13 MR. CUNNINGHAM: That's right.

14 DR. KRESS: If the tendency or the choice
15 is to go with we will dream up some more design basis
16 accidents --

17 DR. POWERS: Well, I think you want to be
18 careful with that. I don't believe that you will find
19 that the design base accident set is capricious or
20 dreamt up.

21 DR. KRESS: No, I didn't mean to impugn it
22 like that.

23 DR. POWERS: It is developed in a fairly
24 disciplined fashion to test safety systems without a
25 great deal of duplication, but with some bounding

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 nature to it.

2 There are a whole bunch of accidents that
3 one can dream up that are not labeled design basis
4 accident accidents because they are covered by other
5 existing design basis accidents. It has been a very
6 disciplined process I think.

7 DR. KRESS: Well, it is the discipline and
8 rationale that I wanted to see explicit, so that I can
9 then apply that discipline to the advanced reactors
10 and say, all right, for this reactor type and style,
11 these are good choices for design basis accidents
12 because they have these attributes that you mentioned.

13 Plus, there may be others, and I would
14 like to have those attributes somehow based in risk
15 considerations, too, rather than --

16 DR. POWERS: Well, I actually think there
17 is an NRC document that maybe two minutes ago I could
18 have quoted the title to you, but I can't right now,
19 that actually outlines some of the philosophy on how
20 design basis accidents are --

21 DR. KRESS: Selected.

22 DR. POWERS: -- defined and selected,
23 because we have gone through this exercise before. I
24 mean, this is not the first -- well, when the FFTF and
25 Clinch River were in the offing, we had to go through

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 these exercises once before. So people have actually
2 looked at these kinds of things.

3 DR. KRESS: Yes, but I suspect it was
4 before we focused so heavily on reasons.

5 CHAIRMAN APOSTOLAKIS: Well, if I wanted
6 to have a design basis accident that would draw on
7 risk information as Dr. Kress just said, wouldn't I
8 need to know which accident sequences are affected by
9 this regulation? Did you collect those?

10 MR. CUNNINGHAM: You would want that
11 information, yes.

12 CHAIRMAN APOSTOLAKIS: Do you have it?

13 MR. CUNNINGHAM: I think we do, yes. But
14 again I don't have it here today, but I think we have
15 a sense --

16 CHAIRMAN APOSTOLAKIS: Right. I think it
17 would be nice for us to see that, and at least it
18 would be interesting to me to see it.

19 DR. KRESS: Yes, George, and it is those
20 sequences that I want to see that not only affect CDF
21 and our alert, but I would like to see the sequences
22 that have to do with possibly other regulatory
23 objectives. Frequency of releases of fusion products
24 of higher frequency, lower magnitude, in CDF alert
25 anyway.

1 CHAIRMAN APOSTOLAKIS: Well, that's
2 perfectly fine, but what I am curious about is that if
3 I have a bunch of sequences and ventries, then maybe
4 we can say, look, this particular design basis
5 accidents addresses this piece here, and that piece
6 there, and that piece there.

7 And see whether we cover the whole
8 spectrum of sequences and how, because the accident is
9 not just the way -- the way I understand it, the
10 design basis accident is not just a large break LOCA.

11 It is a stylizing, and plus single
12 failure, and so that would be an interesting thing to
13 see. And maybe something is left out. That would be
14 a basis for defining the DBAs. By the way, it is not
15 just the logic behind the position.

16 I think one of the great advantages of
17 having DBAs is really that they facilitate the
18 interaction with the licensee.

19 DR. KRESS: Yes, really great.

20 CHAIRMAN APOSTOLAKIS: I mean, it is one
21 thing to say go do a PRA, and then we talk, and quite
22 another to say these are the things that we expect you
23 to do, right?

24 DR. KRESS: If you had a risk in some
25 informed way to select design basis accidents, I think

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 we have a problem, and it is because your purpose of
2 making design basis accidents is to ensure that the
3 design ends up with a risk status that needs
4 acceptance criteria.

5 CHAIRMAN APOSTOLAKIS: Yes.

6 DR. KRESS: And we don't have acceptance
7 criteria that includes uncertainties, and defense in
8 depth, and releases the lower fusion products, and
9 worker exposure. We don't have risk related
10 acceptance criteria. So I think we have a problem.

11 CHAIRMAN APOSTOLAKIS: Well, I think
12 looking at the sequences --

13 DR. KRESS: Well, that would be well
14 worthwhile. That would give you a lot of insight.

15 CHAIRMAN APOSTOLAKIS: Is that out of the
16 question to do this month?

17 DR. KRESS: Could we have that tomorrow?

18 MR. CUNNINGHAM: Well, I will tell you
19 what we will be giving you in this part of the paper
20 at the end of the month, and maybe this at least
21 addresses part of what you are talking about.

22 DR. WALLIS: Well, I like what George is
23 saying because once you have got that, then you could
24 say, well, suppose we make this change in these DBAs,
25 how will that perturb the sequences.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN APOSTOLAKIS: Exactly. And are
2 there any sequences of any consequence.

3 VICE CHAIRMAN BONACA: I really wonder,
4 however, if there is that document that will have all
5 this information. I think that this thing has evolved
6 through 40 years. I mean, we have plants that were
7 designed originally without ECCS systems.

8 So somebody evidently did not think that
9 you could have a break of a pipe of the size of that
10 size. And then somehow we began to think that there
11 was a realistic possibility.

12 And at some point when all this
13 information was developed and put together into a
14 document, where a true companion to all the
15 information and guide was developed, and I am not sure
16 that it was.

17 DR. POWERS: This is an element of
18 history. The people that did the thinking that, gee,
19 there could be a break in this system and it won't
20 work, was the ACRS.

21 VICE CHAIRMAN BONACA: I don't know where
22 it came from, but what I am saying is that I am not
23 sure it only came only from the NRC. I mean, the
24 industry was very active. I mean, the NRC standards
25 had the specific particularization of events and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 postulation of those.

2 And there was a lot of interaction, and I
3 was just wondering if there was -- because there was
4 a document where all of these have been brought
5 together.

6 MR. CUNNINGHAM: I don't know of such a
7 document.

8 CHAIRMAN APOSTOLAKIS: I don't think there
9 is such a document.

10 DR. WALLIS: Well, there was a long set of
11 public hearings. I mean, there was the ECCS hearings
12 that went on for a long time, and as I remember it,
13 the view of some parts of industry and the AEC was
14 that this will never happen, and we don't have to
15 design for it. And there was all this public
16 hullabaloo when out of that came the ECCS criteria.

17 MR. CUNNINGHAM: Yes. I was speaking
18 slightly more generally. I am not aware of something
19 where you could look at all of the design basis
20 accidents and have that type of information available.

21 Again, part of our discussion in the
22 attachment to the June paper is here are from risk
23 analyses the important sequences that are associated
24 with ECCS.

25 And we have something like that that maps,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 you know, in a sense of trying to get to the issue of
2 what does PRA tell you about the importance of ECCS as
3 a function and that sort of thing.

4 So that piece of it will be there, and
5 that is just scratching the surface of what you are
6 trying to get at.

7 DR. POWERS: And an importance measure for
8 ECCS.

9 VICE CHAIRMAN BONACA: Actually, that kind
10 of reflection took place very much in the early PRAs,
11 because that was factored in with the set of accidents
12 from Chapter 15, and then there was a lot of
13 discussion of are they covering the whole spectrum,
14 and what else should be there.

15 And there were different issues,
16 especially initiation of events from electrical faults
17 that were added that were not considered in Chapter
18 15.

19 So maybe then there was a lot of -- I
20 don't know. Maybe in some of the early PRAs there was
21 a discussion of that.

22 MR. CUNNINGHAM: But you are right. The
23 PRAs started with a set of -- on the books were
24 already a set of design basis accidents, and then we
25 moved beyond that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But something like station blackout is --
2 I don't believe is a design basis accident, but we
3 have requirements to mitigate that.

4 CHAIRMAN APOSTOLAKIS: That came later in
5 the PRAs, right?

6 MR. CUNNINGHAM: I'm sorry?

7 CHAIRMAN APOSTOLAKIS: It is not the
8 design basis, but the rule came because of the PRAs,
9 right?

10 MR. CUNNINGHAM: Yes, but there is not a
11 Chapter 15 accident that is --

12 CHAIRMAN APOSTOLAKIS: How about the small
13 breaks? They are not a design basis?

14 MR. CUNNINGHAM: Yes, they are.

15 DR. FORD: Could I ask a question more for
16 my clarification? When you are looking at the
17 overview, and the thing that you showed before, when
18 you come down to the last box, the ECCS cooling
19 performance for number and sizes, and locations of the
20 breaks, that isn't a very plant specific, because
21 presumably it would be due to environmental
22 degradation, and the size, and the geometry of the
23 initiating defects in the pipe.

24 Is this something that is going to be
25 addressed later on this program? Am I way ahead of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the problem here?

2 MR. CUNNINGHAM: Okay. In this context,
3 basically it is -- well, the requirement is imposed in
4 a sense without the detailed analysis of what might be
5 the degradation mechanisms and that sort of thing. It
6 is that you have to have an ECCS that deals with the
7 biggest pipe break.

8 DR. FORD: So the question you are asking
9 is if I had this sort of geometry and disposition of
10 cracks, then this is what I would do. But when it
11 comes down to the practicality of a utility, or a
12 plant, coming to you, then could they not say, well,
13 we are never going to have -- the probability of my
14 having such a system of defects is very, very low.

15 And that would go into your probablistic
16 risk assessment, and you would come out with a very,
17 very low number. Is that a possibility for the
18 future, or is that ---

19 MR. CUNNINGHAM: Yes.

20 DR. WALLIS: And is that the way that you
21 are going --

22 MR. CUNNINGHAM: That's certainly from the
23 Westinghouse owners group and things like that, they
24 in a sense made an argument along those lines, or
25 started an argument along those lines.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 And they said for our piping and this type
2 of thing, we are not -- we don't see a credible way to
3 get the large double-ended pipe break. They don't
4 think it is credible.

5 DR. KRESS: Except for the large double-
6 ended pipe break, that argument would tend to be plant
7 specific. If you are going to hone in on a specific
8 size, it makes the regulation very difficult it seems
9 to me.

10 MR. CUNNINGHAM: And we get into this, and
11 it might be vendor specific.

12 DR. KRESS: It might be vendor specific.

13 MR. CUNNINGHAM: Or something like that.

14 DR. FORD: Or operational specific.

15 MR. CUNNINGHAM: Yes, that's right, and
16 that is a lot of the -- if we were to try and back
17 away from the, if you will, somewhat artificial
18 distinction that it will be the largest pipe break,
19 and try to back off from that, you have to get into
20 these issues.

21 DR. FORD: So right now -- and I am just
22 trying to calibrate myself as to what we are
23 discussing here, you are talking about really a worst
24 case scenario?

25 MR. CUNNINGHAM: Yes, and the question

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that we are trying to get to, or one of the questions
2 that we are trying to deal with is how can we -- is it
3 credible to back away from that worst case pipe break
4 history if you will, and do we have a technical basis
5 to back away from it.

6 DR. FORD: But that technical basis has
7 been something that we will discuss not today.

8 MR. CUNNINGHAM: Not today.

9 DR. WALLIS: And if you go back to the
10 history, you will find that the reason for this was
11 really not technical. It was all this hullabaloo in
12 public, and that this is what seemed to the public to
13 be the maximum credible scenario.

14 There is a lot of reason for that which is
15 not technical probably, and if you go back to the
16 history.

17 MR. CUNNINGHAM: I wanted to take the next
18 four slides or so and go back and talk a little more
19 about each of the four boxes that were on this slide
20 that we just showed.

21 In terms of the, if you will, the
22 reliability aspect of the ECCS or functionality --

23 CHAIRMAN APOSTOLAKIS: Did you do number
24 seven?

25 MR. CUNNINGHAM: This is number seven.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 I'm sorry.

2 CHAIRMAN APOSTOLAKIS: Oh, okay. Sorry.
3 So the answer was no, you didn't do it?

4 MR. CUNNINGHAM: No, not yet. Turning to
5 slide seven, in terms of the elements of the ECCS
6 requirements that deal with reliability of the system,
7 again we are considering a risk-informed alternative
8 to 50.46, and would basically turn it into, if you
9 will, a true reliability requirement.

10 DR. KRESS: Now, Mark, are you viewing
11 this as the LOCA frequency times the ECCS liability
12 equates to core damage frequency?

13 MR. CUNNINGHAM: Yes, basically. The
14 underlying concept for the more performance based part
15 of this is that the frequency of the challenge and the
16 reliability of the ECCS has to be balanced if you
17 will, so that you have reached some acceptable value.

18 So that the lower of the frequency of the
19 initiator, the lower the requirements on the
20 reliability of the ECCS.

21 DR. KRESS: Now, this balance, is it going
22 to be conditioned to 10 to the minus 4 per year level?

23 MR. CUNNINGHAM: I'm sorry, 10 to the
24 minus 4?

25 MR. KURITZKY: We have not decided on that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 level.

2 DR. KRESS: You have not decided on what
3 that level is?

4 MR. CUNNINGHAM: No. We think or we have
5 it in mind, and that will be the subject of other
6 discussions with the committee and things like that
7 later on as we get into more of the details of this.

8 It is really -- yes, there is a value that
9 we have in mind, 10 to the minus 4, or whatever.

10 MR. KURITZKY: One point is that we feel
11 that it should be derived from the framework. The
12 framework has quantitative guidelines and we feel that
13 whatever value we come up with should somehow be tied
14 to that framework.

15 DR. WALLIS: Well, this is a sort of a
16 one-by-one. You say that the large break is very
17 infrequent, and therefore the reliability or response
18 does not have to be so big.

19 But then the more sophisticated way is to
20 look at all spectrums of all breaks, and choose the
21 ECCS system so that there is some sort of integral of
22 a reliability frequency over all breaks is the best.

23 MR. CUNNINGHAM: Yes.

24 DR. WALLIS: And it may well be that
25 putting all the emphasis on the big break is very bad

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 for the optimization of the entire response.

2 MR. CUNNINGHAM: Yes.

3 DR. WALLIS: And that would be a really
4 good idea.

5 MR. CUNNINGHAM: Well, ideally, we would
6 have a well-defined frequency of a pipe break size,
7 versus frequency.

8 DR. WALLIS: And then we would match the
9 rotation as well.

10 CHAIRMAN APOSTOLAKIS: Can you really do
11 it so neatly?

12 MR. CUNNINGHAM: No.

13 CHAIRMAN APOSTOLAKIS: I mean, as you look
14 at the accident sequence, it seems to me that there
15 isn't such a thing as ECCS.

16 MR. CUNNINGHAM: That's part of it. In
17 effect, there is an ECCS function that covers many
18 things.

19 CHAIRMAN APOSTOLAKIS: Exactly.

20 MR. CUNNINGHAM: There is low pressure
21 injection, and high pressure injection, and things
22 like that. So you end up splitting this continuous
23 distribution if you will into probably ranges, and
24 that's probably more where we will end up.

25 And that is for the range of pipe sizes

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 between this and this, then you would have to have
2 commensurate reliability of this. And then break that
3 into however many pieces.

4 DR. KRESS: The reason that I threw out
5 this number of 10 to the minus 4 is because I was
6 hoping that you weren't going to use that, because
7 this is one little set of sequences among all of them,
8 and there is some other value that is more appropriate
9 than that.

10 MR. CUNNINGHAM: Yes, and it would not be
11 10 to the minus 4 for just the reasons that you are
12 talking about.

13 CHAIRMAN APOSTOLAKIS: Even though we
14 don't like to allocate, right? It may be a good idea
15 though to let Mark finish what he has to say on each
16 view graph.

17 MR. CUNNINGHAM: That could be.

18 CHAIRMAN APOSTOLAKIS: And then jump into
19 this.

20 MR. CUNNINGHAM: You may be right.

21 CHAIRMAN APOSTOLAKIS: Except for the
22 Chairman, of course. Shall we let him say what he has
23 to say? Go ahead.

24 DR. SHACK: We can try.

25 CHAIRMAN APOSTOLAKIS: We can try, yes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. CUNNINGHAM: So, again, we are looking
2 now at two possible ways of getting at this
3 reliability issue. One is what I was just saying, is
4 that it is a fairly performance based oriented type of
5 thing, and it was to match the reliability to the
6 frequency of the challenge.

7 And then you get into traditional if you
8 will reliability analyses if you will of the systems.

9 CHAIRMAN APOSTOLAKIS: So the word
10 performance there means what?

11 MR. CUNNINGHAM: Performance in the sense
12 that -- well, non-prescriptive in one sense.

13 CHAIRMAN APOSTOLAKIS: But it is not in
14 the sense that we are using it in performance based
15 regulation, right?

16 MR. CUNNINGHAM: But it could be. One
17 other aspect of this possibly is that we recognize
18 that frequency of challenges -- our state of knowledge
19 if you will about the frequency of pipe breaks --
20 changes with time.

21 So that the performance or the
22 requirements on the reliability may change with time
23 also. So one aspect of a performance based type of
24 thing might be that you say they have to meet some
25 value, the product has to meet some value; and as one

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 changes with time, then the other may be able to
2 change with time also.

3 CHAIRMAN APOSTOLAKIS: My personal opinion
4 is that you need a better word. Performance based is
5 something else. I mean, you collect evidence, and --

6 DR. WALLIS: I like it in contrast to the
7 second alternative.

8 CHAIRMAN APOSTOLAKIS: Right. But some
9 other word would be better, such as reliability based,
10 or reliability -- well, something like that.

11 MR. CUNNINGHAM: Well, it is different
12 than what we had talked about in other contexts.

13 CHAIRMAN APOSTOLAKIS: Right, and we don't
14 want to start using words. We have already a problem
15 with nomenclature.

16 MR. CUNNINGHAM: Well, perhaps non-
17 prescriptive approach or something.

18 CHAIRMAN APOSTOLAKIS: Non-prescriptive
19 or risk oriented, not based.

20 MR. CUNNINGHAM: All right. The second
21 alternative that we are considering is more
22 prescriptive. It is to recognize that in one aspect
23 of this somewhat artificial way that we look at
24 reliability today, is that we recognize that for the
25 very large pipe breaks that there is the probability

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of having this simultaneous loss of off-site power
2 that is a requirement, and could be a very low
3 probability.

4 And so the other option that we are
5 considering is in a sense for a set of pipe breaks
6 where we think we can argue that the simultaneous loss
7 of off-site power isn't credible, and you remove that
8 requirement for that set of pipe breaks.

9 But the rest of it still tends to look
10 like what is in the requirements today, with that
11 exception. It is more prescriptive, and it is a small
12 step towards ensuring towards a risk-informed
13 approach. But we are considering it as an option.

14 CHAIRMAN APOSTOLAKIS: What is functional
15 reliability? Is it the probability that it will do
16 its job?

17 MR. CUNNINGHAM: It's function, yes.

18 CHAIRMAN APOSTOLAKIS: Now, in the South
19 Texas exemption request, the word functionality is
20 used in that sense?

21 MR. CUNNINGHAM: I think so, yes.

22 CHAIRMAN APOSTOLAKIS: And so the
23 probability that it will do its job? I am not sure it
24 is the same meaning.

25 DR. WALLIS: I am not sure either.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN APOSTOLAKIS: It is not the same
2 meaning. I think it is asking to make sure that the
3 thing will work, and is not asking about the
4 probability that it will do the job for a period of
5 time.

6 MR. CUNNINGHAM: Yes, but the term
7 functionality -- and like in South Texas or something,
8 that is a little bit different. Functionality is
9 different than functional, and again perhaps
10 functionality here is not the right word.

11 CHAIRMAN APOSTOLAKIS: Oh. I think in the
12 South Texas context --

13 DR. SIEBER: If it will work.

14 CHAIRMAN APOSTOLAKIS: -- all we want to
15 know if it will work, and if it can do the job.
16 Actually, that is really what they mean. That it can
17 do the job. Now, how reliability it will do it is a
18 different story.

19 DR. WALLIS: It could do the job if it
20 were reliable.

21 CHAIRMAN APOSTOLAKIS: I'm sorry?

22 DR. WALLIS: It could do the job if it
23 were reliable. It is contingent upon it being
24 reliable.

25 CHAIRMAN APOSTOLAKIS: But it can be

1 unreliable and still capable of doing it.

2 MR. CUNNINGHAM: Yes, even if it is
3 unreliable, it could have functionality.

4 CHAIRMAN APOSTOLAKIS: Yes, and so I think
5 that when it comes to the treatment requirements, and
6 that is what they are worried about.

7 MR. CUNNINGHAM: Okay. We are not there
8 yet, and we are using the word -- again, this is
9 probably functional reliability. That is a good
10 point. We don't want to confuse this with the context
11 of functionality. Yes, you are right.

12 So this is where we are today in terms of
13 the reliability aspect of it, and I think I heard the
14 committee, or a couple of the members anyway weren't
15 overly enthusiastic about this, and the more
16 prescriptive oriented.

17 DR. WALLIS: Well, you wanted some input
18 don't you and comments?

19 MR. CUNNINGHAM: Yes.

20 CHAIRMAN APOSTOLAKIS: So is anybody
21 offering any comments?

22 DR. KRESS: About what?

23 CHAIRMAN APOSTOLAKIS: What you prefer.

24 DR. KRESS: Well, I have a comment, but
25 not necessarily about that slide.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN APOSTOLAKIS: Oh, okay.

2 DR. KRESS: But what it appears to me is
3 that we are at the heart of it, and what we are
4 beginning to embark on is allocating acceptable risk
5 among a subset of sequences without real
6 considerations of what the uncertainties are, and what
7 this does to the uncertainties.

8 And how or what the rigor of the
9 quantification of defense in depth is associated with.
10 I have some real concerns about the process, and as
11 you know, I have talked about this before.

12 CHAIRMAN APOSTOLAKIS: When I mentioned
13 the sequences, I included the uncertainties.

14 DR. KRESS: Oh, okay.

15 CHAIRMAN APOSTOLAKIS: You might say that
16 this requirement is here because the uncertainty of
17 the sequence is too large.

18 DR. KRESS: But we don't have a good
19 measure of what too large is, and a subset of
20 sequences, and so there is a lot of -- I mean, I am
21 not against this process, and I think it embarks on a
22 method that we can learn a lot from. But I think
23 there is --

24 CHAIRMAN APOSTOLAKIS: I will give you an
25 example. In some of the sequences, I am sure that the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 redundancy of the system is defeated by human error.
2 But yet that is not a single failure, part of the
3 single failure criteria is it?

4 MR. CUNNINGHAM: No, it's not.

5 CHAIRMAN APOSTOLAKIS: Single failure
6 criteria refers to hardware?

7 MR. CUNNINGHAM: Yes.

8 CHAIRMAN APOSTOLAKIS: And so there you
9 have it.

10 MR. CUNNINGHAM: Certain aspects of
11 hardware, too.

12 CHAIRMAN APOSTOLAKIS: Certain aspects of
13 hardware, exactly.

14 MR. CUNNINGHAM: That's right. Again, it
15 was an approximation to a reliability requirement, and
16 I think we could do a better job today.

17 CHAIRMAN APOSTOLAKIS: And that was
18 established 40 years ago or whatever.

19 MR. CUNNINGHAM: Yes.

20 CHAIRMAN APOSTOLAKIS: And the state of
21 knowledge was different than.

22 MR. CUNNINGHAM: Yes.

23 CHAIRMAN APOSTOLAKIS: So retaining the
24 single failure criteria doesn't sound like such a good
25 idea, unless you expound the definition.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. CUNNINGHAM: And that is a
2 possibility, too; is an intermediate step that is more
3 -- a little more current.

4 CHAIRMAN APOSTOLAKIS: I mean, I don't
5 know how much time you have because I know that 3 or
6 4 weeks is not a long time. If you could include some
7 of these thoughts regarding the sequences in your
8 report, that would be really very helpful.

9 And, you know, to speculate a little bit
10 on this when it was placed because at that time they
11 didn't have the benefit of sequences, but it is always
12 --

13 MR. CUNNINGHAM: The background document
14 that we will be providing was one of the attachments,
15 and it talks about some of the history of how the
16 requirements were established.

17 And it is looking at why are they as they
18 are, and then another piece is what does risk analysis
19 tell you about what the effect of those requirements
20 on the reliability.

21 CHAIRMAN APOSTOLAKIS: Are you going to
22 have any of those oldtimers reviewed that document,
23 people who were present when the ECCS hearings were
24 taking place?

25 DR. KRESS: Joe Murphy.

1 CHAIRMAN APOSTOLAKIS: Joe Murphy for
2 sure.

3 DR. POWERS: But he was so young at that
4 time that he --

5 CHAIRMAN APOSTOLAKIS: Yes, we are talking
6 about who were active in it, but are now retired.

7 DR. WALLIS: Well, Denny Ross was here
8 wasn't he?

9 MR. CUNNINGHAM: We have Dr. Wildben back
10 there who is very much involved in helping us look at
11 this issue, and he has been around a couple of years,
12 and has been through a number of these things. I
13 believe that he was involved in the ECCS requirements.

14 DR. POWERS: Please use the microphones.

15 CHAIRMAN APOSTOLAKIS: Okay. No comment.

16 MR. CUNNINGHAM: It is noted that Dr.
17 Wildben, who was involved in this, was around at all
18 of those times if you will.

19 CHAIRMAN APOSTOLAKIS: Okay. Good.

20 MR. KURITZKY: Mark, if I could make just
21 one point, is to make it clear that when we are
22 listing -- for instance, in this case, we have two
23 options under there. It is not that we are viewing it
24 necessarily as we are going either with one or the
25 other.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But that they would both go forward
2 possibly, and then the licensee could choose to do
3 either one.

4 MR. CUNNINGHAM: Or at this point again we
5 are at the point of feasibility, and we are going to
6 look in the further technical work that we are doing
7 after we have gone to the Commission, and we would be
8 investigating both of these options as to whether or
9 not they really make sense in terms of alternatives in
10 the rule.

11 CHAIRMAN APOSTOLAKIS: All right.

12 MR. CUNNINGHAM: Since I am running out of
13 time here fairly quickly, in the context of the
14 acceptance criterium, basically the goal if you will
15 is to revise the acceptance criteria such that the
16 ECCS performance during the course of the accident is
17 shown to maintain coolable core geometry.

18 So it is more of a fundamental thing of
19 getting to the issue of what is the point of 17
20 percent, and it really is not dealing with hydrogen,
21 and it is not dealing with that. It is a maintaining
22 a coolable core geometry.

23 CHAIRMAN APOSTOLAKIS: So this is a
24 functionality issue isn't it?

25 MR. CUNNINGHAM: Yes.

1 DR. WALLIS: We have to be careful there.
2 Almost any geometry is coolable eventually. I mean,
3 that is not a very good definition. Coolable without
4 the release of something, or put some constraint on
5 it. Eventually it is going to be cool, one way or
6 another.

7 MR. CUNNINGHAM: Yes, you're right.

8 DR. POWERS: This fascinates me. What do
9 you mean?

10 DR. WALLIS: Well, I mean to say that you
11 may well have a core geometry which is a terrible
12 mess, and which is still coolable. But it is not
13 coolable in a way that you would really like to see
14 happen.

15 DR. POWERS: I am still very confused. If
16 I put a bunch of core down on the bottom of the lower
17 plenum --

18 DR. WALLIS: It is coolable.

19 DR. POWERS: And it is coolable -- and I
20 don't imagine that it is coolable, but for a
21 hypothesis that it is coolable --

22 DR. WALLIS: Well, if it gets hot enough,
23 it will be cooled.

24 DR. POWERS: No, it won't. It will
25 penetrate the vessel.

1 DR. WALLIS: That's how it gets cool.

2 CHAIRMAN APOSTOLAKIS: We are going to run
3 out of time at 10 o'clock, and we have to stop this at
4 10 o'clock.

5 MR. CUNNINGHAM: So again in this case,
6 when we look at this issue of --

7 DR. WALLIS: Maybe we don't need to stop
8 at 10 o'clock.

9 MR. CUNNINGHAM: In this issue of the
10 acceptance criteria, we are considering a more
11 performance oriented one, which is that you show us by
12 test that the cladding integrity is maintained, and so
13 that gets to this issue of is a rubble bed an
14 acceptable end point.

15 So we are being a little more specific
16 there that it is not. Again, you could be more
17 prescriptive, more like the current requirements, and
18 say I want to have or I am going to require through
19 evaluation a certain temperature and cladding
20 oxidation be maintained.

21 DR. KRESS: Mark, if they wanted to show
22 that the cladding integrity was maintained, they will
23 have to show that it is below a peak cladding
24 temperature and that the oxidation is below a certain
25 level.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. KURITZKY: Well, actually, the first
2 point we are talking about is actually like a
3 recompression test. It actually would do an actual
4 physical experimental test to show that the cladding
5 maintained some feasibility. It would be an
6 analytical type of test.

7 DR. SHACK: Just before the LOCA.

8 DR. KRESS: Yes. I don't think that
9 anybody is going to offer to do that are they?

10 MR. CUNNINGHAM: Again, today I think --
11 well, we will be back to you to talk to you about all
12 of these points as we proceed into the second phase of
13 the work.

14 So, again, this will give you a flavor of
15 where we are going, but it is not trying to give you
16 the answer of whether or not either of these makes --
17 well, the rationale behind either of these. We will be
18 back with you, I'm sure, in the near future.

19 DR. LEITCH: The long term cooling bullet
20 would be retained?

21 MR. KURITZKY: The long term cooling
22 bullet? It would be subsumed in the fact that now in
23 the wording that revised ECCS acceptance criteria,
24 such as the ECCS performance for the duration of the
25 accident, or some such words.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. LEITCH: So it alludes to some time
2 constant?

3 MR. KURITZKY: Yes.

4 MR. CUNNINGHAM: We are also considering
5 possible changes to the evaluation model, the thermal
6 hydraulic model as well. We are looking at again a
7 series of options in things that we are considering.

8 One is to replace the current requirement
9 on the decayed heat with the 1994 ANS standard. It is
10 a more recent standard, with some description of the
11 uncertainty that would go with that.

12 And that's in lieu of something where it
13 is an older decayed heat curve with a 20 percent
14 margin on top of it. So we think 20 percent may be
15 excessive, and we could put something in more
16 realistic.

17 Again, the option is in -- and in the
18 requirements, if they are acceptable today, is to use
19 a realistic model with uncertainty propagation, and
20 they can do that today, and in typical practice,
21 people don't, because of the complexity of it.

22 Another option that we are considering is
23 that for certain low frequency pipe breaks, we might
24 be able to relax the modeling requirements to get away
25 from the requirement for uncertainties, and say you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 can do a best estimate for very low frequency
2 challenges.

3 In terms of the possible large break LOCA
4 redefinition, again the requirement on the books today
5 is that it has to be the largest pipe break in the
6 system.

7 One thing that we are considering is
8 changing the wording in the rule today so that you
9 could -- to open the door a little bit to say that it
10 is either that or some alternative that is deemed
11 acceptable by the commission.

12 In rule making that would introduce the
13 possibility of getting at the -- at perhaps the
14 Westinghouse issue of can we show you that the large
15 break LOCA, or that certain classes of breaks are not
16 credible.

17 This in rule space would allow you to
18 pursue that, and without having to go to another rule
19 change, permit that type of an analysis.

20 DR. POWERS: When Westinghouse says that
21 something is none, let me assure you something is not
22 credible. I mean, I am a very credible guy, credulous
23 guy. I mean, I can imagine lots of things. What is
24 the proof that something is not credible?

25 MR. CUNNINGHAM: This comes in a sense to

1 the next slide, which is in --

2 DR. WALLIS: I don't think anything is
3 incredible. You have to define it in terms of
4 probability.

5 MR. CUNNINGHAM: Well, what I just showed
6 you before would allow from a rule standpoint some
7 flexibility in what the staff could approve and what
8 licensees could use.

9 This is a summary of what was provided at
10 the subcommittee meeting a month or two ago on what
11 would have to be the technical justification, or some
12 of the technical issues that would have to be
13 addressed in order to demonstrate credibility or
14 incredibility if you will.

15 DR. POWERS: Again, Mark, could this be
16 done without the reg guide that defines this, and
17 leave that open, or you would really envision that
18 this change couldn't be made until you were ready to
19 issue a reg guide?

20 MR. CUNNINGHAM: Since we have today, that
21 change could be made to the requirement as part of the
22 rule making without a reg guide. I think that is the
23 sense that we have.

24 The reg guide could at least conceptually,
25 if we deal with these issues, then you could deal with

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that, and you don't have to go back and change the
2 rule.

3 There are a lot of practical problems that
4 would have to be dealt with in the course of that, but
5 we don't think that we would necessarily have to have
6 the reg guide when we made that wording change in the
7 rule.

8 DR. POWERS: I am still struggling with
9 what makes something incredible. You have up on your
10 slide in service experience. Well, we have not had a
11 whole lot of large pipe breaks, and so that certainly
12 is not a fertile field to mine there.

13 I mean, we have got a few cracks in them,
14 and maybe that is a more fertile field than I think.
15 And analyses, I am very confident that within obscure
16 computer codes and things like that, that you can
17 generate frequencies that are small.

18 But does it mean that I have to show that
19 never in the history of pipes in this world be a pipe
20 of this sized break?

21 MR. CUNNINGHAM: No, I don't think so. We
22 consider vessel rupture in regulatory space as an
23 incredible event, in the sense that it is not of
24 sufficiently low frequency that we do not have to
25 require ECCS to mitigate that type of failure.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 That is not to suggest that there has
2 never been vessels of that type that have failed or
3 not failed in world history if you will. But it is a
4 combination of -- that in a sense, and perhaps
5 implicitly, it becomes a sense that the probability of
6 such a failure is low or very low, and that the
7 confidence or the uncertainty in that probability is
8 small enough that you can have confidence that it is
9 not going to happen.

10 DR. POWERS: I am going to keep asking
11 because I am still struggling with this. Okay. When
12 these guys do these calculations, they usually
13 hypothesize about lipsoidal cracks and certain aspect
14 ratio, and what not.

15 Of course, there are no cracks that look
16 at all like that are hypothesized in the computer
17 codes. So there is a lot of uncertainty here and what
18 not.

19 What kind of percentile of a conceivable
20 distribution do they have to get to, to say okay, it
21 is incredible here?

22 MR. CUNNINGHAM: I don't know that I have
23 a good answer for that, because I think that at some
24 point it becomes that quantitative information leads
25 to a qualitative judgment that it is close enough.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. POWERS: Well, presumably it has to be
2 on the order of what you accept for a pressure vessel?

3 MR. CUNNINGHAM: Oh, yes, from that sense,
4 we accept certain things, and --

5 CHAIRMAN APOSTOLAKIS: What is that, 10 to
6 the minus 6?

7 DR. POWERS: Well, we are still debating
8 that, but on that order.

9 MR. CUNNINGHAM: Yes, on that order, and
10 in the PTS space, you say if the risk associated with
11 a PTS induced vessel rupture is 5 times to the minus
12 6 or less, it is acceptable.

13 DR. KRESS: But that doesn't seem like a
14 good choice to me, and I will tell you why. The
15 consequences of a pressure vessel rupture are surely
16 much greater than the consequences of this pipe
17 breaking.

18 DR. POWERS: That's right, but they will
19 never say that. I mean, I know this PMF guys. They
20 come along and they will say okay, the nominal
21 probability for a single crack is 3 times 10 to the
22 minus 45th, or something like that. I mean, they come
23 up with very low numbers for this sort of thing.

24 And they will say, yeah, but there is the
25 possibility that cracks will interlink and things like

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that, and I don't know how to deal with that. So it
2 could be a higher probability, and they will pick a
3 number like 10 to the minus 5th, and it could be up
4 that high.

5 And what Mark is saying is that there has
6 to be some confidence limit with that, and I am trying
7 to find out what the confidence limit has to be. Does
8 it have to be 99 percent confident that the
9 probability is 10 to the minus 6th or lower? Or does
10 it have to be 95 percent, or 80 percent, or --

11 DR. KRESS: Yes, I have wrestled with that
12 question on other issues.

13 DR. POWERS: I know you have.

14 DR. KRESS: And there is no clear
15 technical way to arrive at the confidence level unless
16 one goes to the utility function, which is not exactly
17 technically arrivable at.

18 DR. POWERS: Well, right now I am on a
19 very specific thing. What if Westinghouse said that
20 it takes to show something this is incredible? I am
21 very credulous. I mean, I can believe lots of things.
22 I even believe in 10 to the minus 45th for cracking in
23 BWR welds.

24 DR. LEITCH: Aren't we really saying then
25 that anything above this alternate size, if there was

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 some alternate size approved, that anything above that
2 is going to lead to core damage?

3 MR. CUNNINGHAM: It could be that or it
4 could be that anything above that size does not have
5 an ECCS system that has to meet the requirements of
6 50.46, although there may still be some mitigative
7 capability in the plant, but not safety related if you
8 will. There are several alternatives for that.

9 DR. KRESS: Anything above that alternate
10 size contributes a contribution to the CDF at a
11 probability or confidence level that is unacceptable,
12 or that is acceptable.

13 So you have a confidence level that the
14 contribution to CDF of any pipe above that is
15 acceptable, and none of those things have been
16 rigorously defined to my knowledge what the confidence
17 level is, or what is an unacceptable contribution to
18 CDF for a subset of sequences.

19 But that is their problem, and they have
20 to wrestle with something like that. I think that is
21 the basic concept.

22 MR. CUNNINGHAM: Again, there will be
23 other opportunities, and we will be back before the
24 subcommittee or the full committee to talk about all
25 of these issues that we are wrestling with here as

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 time progresses and as the rule making proceeds.

2 DR. LEITCH: Before although there you say
3 that the ECCS systems exist and no one is going to
4 tear out ECCS systems, yet some of the testing
5 criteria -- I mean, what will go along if this is
6 approved, and then people will start to ask for a
7 relaxation on testing criteria out of service time,
8 and diesel, and all those kinds of things.

9 MR. CUNNINGHAM: Yes.

10 DR. LEITCH: And they would no longer be
11 able to demonstrate to the same degree that we can
12 now.

13 MR. CUNNINGHAM: And clearly we see that
14 as one outcome, is that there could be relaxation in
15 the text specs and that sort of thing as an outcome,
16 and again using risk information that would suggest
17 that that could be justified without having a
18 substantial increase in risk or anything like that, at
19 least for the large breaks and things like that.

20 And to some degree there is an element
21 from risk analysis that would tell you that there is
22 some degree of over design of the ECCS for the very
23 largest breaks. Mr. Chairman, it is 10 minutes till.
24 Did you --

25 CHAIRMAN APOSTOLAKIS: Keep going.

1 MR. CUNNINGHAM: Okay. Just to give you
2 an idea of what things we think will be coming back to
3 the committee to talk about over or during this second
4 phase of our work, assuming that the Commission tells
5 us to proceed, we have hit on a number of these.

6 Such as developing the method and dealing
7 with, for example, on how you deal with uncertainties
8 on ensuring the reliability requirements match the
9 frequency of the challenge.

10 And the LOCA frequency versus size
11 information; and the resolution to what degree we can
12 either eliminate or modify the current large break
13 LOCA basis accident given the industry's interest in
14 that.

15 Again, the technical basis for some of the
16 changes to the evaluation methods, and what would a
17 new decay heat curve look like and that sort of thing.

18 And then this issue that we talked about
19 earlier of the technical basis, and saying what is an
20 acceptable post-quench ductility, and what does that
21 really mean. I think we would anticipate coming back
22 to the committee on all of those issues.

23 DR. FORD: I have a question on the first
24 bullet in engineering. There is going to be a time
25 dependence to that statement?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. CUNNINGHAM: Yes.

2 DR. FORD: What is your timing on all of
3 this, and who is going to do all this work? You have
4 got two problems with that particular bullet. One is
5 the information necessary, the factual information on
6 the time dependence of the development of the flaws.

7 MR. CUNNINGHAM: Yes.

8 DR. FORD: This is a very large
9 engineering topic. Another one is how you apply time
10 dependence to PRA, which I understand is not done
11 here; is that correct? There are two major problems
12 there; time and effort. Is there a limit to that, or
13 should we even be discussing this?

14 MR. CUNNINGHAM: Well, again, in the
15 concept of how you build time dependence and aging
16 effects and things into PRAs, we have done some first
17 steps, some good first steps along the way in that
18 regard.

19 In terms of the frequency versus size
20 information, I think we need to be able to -- in this
21 context is it sufficient to be able to deal with the
22 reliability requirements on the current ECCS systems.

23 So I think in this case be able to have a
24 fairly crude approximation of this, and still get
25 something that is satisfactory for being able to set

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the reliability requirements.

2 So I think at least in my mind that it is
3 achievable, because we can be fairly crude in what we
4 are doing. The people that we have talked developing
5 a fairly good curve of this if you will, and that is
6 years worth of work.

7 And I think we can do less than that and
8 get an acceptable answer for what we are trying to
9 accomplish on the reliability requirements. On the
10 second part of it, the resolution of whether or not
11 the large break LOCA definition could be -- the DBA
12 could be eliminated, there is a lot of work.

13 And again at this point, we are going to
14 be interacting with the industry to see if we can get
15 some agreement on what the extent of that work would
16 be.

17 DR. POWERS: Mark, why is it that you want
18 to remake the reliability requirements commensurate
19 with the challenge frequencies, and not the product of
20 challenge frequencies and the consequences of failure
21 to meet that challenge?

22 MR. CUNNINGHAM: The interest in -- to me,
23 I would say that those would be the same thing. That
24 you would end up with a product that is fairly -- of
25 the two that is fairly consistent across the spectrum

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of break sizes.

2 DR. POWERS: So what you are saying is
3 that the consequences are all the same?

4 MR. CUNNINGHAM: In this case, we are kind
5 of defining it so that the reliability of ensuring
6 that a certain consequence isn't achieved, or that the
7 reliability for ensuring that adequate coolable
8 geometry or that type of thing.

9 CHAIRMAN APOSTOLAKIS: You could look at
10 the spectrum of planned damage space that the PRAs
11 define and see which ones would be effective by these.

12 MR. CUNNINGHAM: Yes.

13 CHAIRMAN APOSTOLAKIS: And work with the
14 frequency of those, rather than the total --

15 MR. CUNNINGHAM: Yes, and we talked --
16 when we talked about this today, we talked about it in
17 terms of CDM, but containment performance is still --
18 we are going to deal with both.

19 The policy issues that we expect to see in
20 the paper, one is that we are attacking, if you will
21 the issue of the single failure criteria, and here in
22 the context of the ECCS requirements.

23 A single failure criterion applies to
24 other parts of the requirements as well. One is that
25 we are considering putting in a recommendation in the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 paper that would ask the commission's approval to
2 proceed to identify where else in the requirements of
3 Part 50 that we would take on this reliability concept
4 if you will, or attack the single failure criterion.

5 DR. POWERS: The ECCS really has a two
6 failure requirement criterion; is that right?

7 MR. CUNNINGHAM: I'm sorry, but I didn't
8 hear the question.

9 DR. POWERS: The ECCS really has a two
10 failure requirement?

11 MR. CUNNINGHAM: Yes.

12 DR. POWERS: There is a power requirement
13 and the failure of any other system?

14 MR. CUNNINGHAM: Yes, that's right, and so
15 we would be revisiting the combination of those
16 things. Another policy issue is in the context of
17 selective implementation.

18 We have talked about this in the context
19 of 50.44, and the same issue applies here, of whether
20 or not if somebody wants to use this risk-informed
21 alternative, whether or not they can pick and choose
22 within the risk-informed alternative, like 50.44 would
23 be.

24 And in 50.44, we recommended it, and the
25 commission approved it, that there not be selective

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 implementation within a rule.

2 CHAIRMAN APOSTOLAKIS: Right.

3 MR. CUNNINGHAM: And just quickly here
4 again, we owe you a copy of the commission paper here
5 towards the end of this month, and we would like to
6 come back to you in July, and --

7 VICE CHAIRMAN BONACA: How big is that?

8 MR. CUNNINGHAM: The paper itself is going
9 to be less than 10 pages. There will be 4 or 5
10 attachments. One of them will be --

11 MR. KURITZKY: It will probably be
12 comparable with the 50.44 report.

13 CHAIRMAN APOSTOLAKIS: So how can we
14 review it?

15 DR. POWERS: Read very quickly. Actually,
16 we have got lots of time, George, because July 4th is
17 a holiday. Dr. Shack, do you think we can review that
18 in time to write a letter?

19 DR. SHACK: We have to see it when it
20 arrives.

21 CHAIRMAN APOSTOLAKIS: And assuming it
22 arrives on the 29th of June.

23 DR. WALLIS: You can take it to Waterford
24 with you and read it.

25 CHAIRMAN APOSTOLAKIS: And if we don't do

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it in July, it has to go to September. Do you expect
2 the commission to take action from these -- I mean,
3 sometime soon, or --

4 MR. CUNNINGHAM: It is hard to tell. It
5 is hard to tell.

6 CHAIRMAN APOSTOLAKIS: It is going to be
7 very hard for us to write a letter I think.

8 MR. CUNNINGHAM: Well, we owe the paper to
9 the EDO like on the 23rd of something like that. So,
10 maybe we can get it to you in that same time frame.

11 Obviously, we would be interested in
12 getting a letter in July, and if it can't be done, it
13 can't be done. That is the committee's call
14 obviously.

15 CHAIRMAN APOSTOLAKIS: No, I mean, the
16 point is if we write it in September and the
17 Commission has already decided on whatever you ask
18 them to decide, then it doesn't make sense. Are there
19 any more questions or comments from the members?

20 DR. LEITCH: Mark, just a question as to
21 the total scheme of things here, and one of the things
22 that you said was that special treatment requirements
23 may be a follow along situation.

24 So we are looking at later on in our
25 agenda today, we are looking at South Texas with

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 respect to option two, which is really an exemption
2 from special treatment requirements. But further down
3 the road there may be a redefinition.

4 MR. CUNNINGHAM: Yes.

5 DR. LEITCH: I mean, we are putting a lot
6 of if's, and's, and maybe's in there, but what is in
7 our embryonic thinking here is that maybe rather than
8 seeking exemption from special treatment that special
9 treatment requirements could be changed.

10 MR. CUNNINGHAM: The option two work is
11 looking at the scope of special treatment
12 requirements, and that is obviously what you are going
13 to be hearing about today with Southern Texas and
14 others.

15 The longer term effort is getting at what
16 should be the environmental over qualification
17 requirements for the equipment that is subject to
18 special treatment requirements, and that sort of
19 thing.

20 But for the near future, our resources are
21 going to be principally focused on 50.44 and 50.46.

22 DR. LEITCH: I understand.

23 MR. CUNNINGHAM: So I wouldn't expect that
24 we are going to -- at least with the present
25 situation, in terms of funding and things like that,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 I wouldn't expect that we would have an ability to
2 deal with the special treatment requirements in the
3 near future.

4 But the goal, long term, is to go back and
5 revisit what should the requirements be.

6 DR. LEITCH: Okay. Thank you.

7 MR. CUNNINGHAM: But it is a long term
8 goal.

9 DR. LEITCH: I understand.

10 DR. SHACK: We are running over schedule.
11 So, Adrian, and we will have the industry perspective.

12 MR. HAYMER: Good morning. My name is
13 Adrian Haymer, and I am with NEI, and I am a program
14 manager working for the Risk Informed Regulatory
15 Group.

16 Tony Pietrangelo is the director, is our
17 director of the Risk Informed Regulatory
18 Group, and Bob Osterrieder is the project leader at
19 Westinghouse, dealing with option three and redefining
20 large break LOCO.

21 And what we would like to do today is just
22 to give you some feedback on where we think we are on
23 50.46, and risk informed regulation, or the technical
24 requirements in general.

25 Because we have had some discussion with

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the staff, and we have been meeting with the staff now
2 for -- certainly for 18 months or so, and discussing
3 option three.

4 In January of 2000, we sent a letter
5 saying where we need to focus our efforts in regard to
6 option three to the Commission, and I think we have
7 been consistent in our message, and we would like to
8 go forward and take a look at redefining the large
9 break LOCA activity.

10 And when we met I think a few months ago,
11 we had some discussions with you on that, and our
12 thought process has evolved a little bit, and perhaps
13 we need to make some clarifications in that regard.

14 But I guess our approach on 50.46 and
15 redefining the large break LOCA is what we might term
16 a graded approach, and I think some of the statements
17 that the staff made about their proposed language rule
18 is along the lines that we were thinking.

19 In other words, you would go forward as a
20 first step with taking a look at the co-incident loss
21 of off-site power, and defining a break size that goes
22 along with that.

23 So where they said there were two options,
24 we would blend those into one, and you would then get
25 a break size. But you would still have a commitment

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 or the ability to mitigate the large break.

2 But it wouldn't be the full design basis,
3 Appendix B, type requirements, but you would still
4 have to show the ability to mitigate the large break
5 or the largest break in the plant.

6 And the language that we think in the rule
7 would be very similar to what the staff mentioned a
8 few minutes ago. Tony.

9 MR. PIETRANGELO: Yes, I think that
10 summarizes it pretty well. We think you can treat the
11 double ended guillotine break more like you treat
12 things in severe accident management space than as a
13 design basis requirement that it currently is.

14 That double ended guillotine break
15 assumption drives many of the other regulatory
16 requirements in Part 50. That is a very, very
17 conservative assumption. And we see this first rule
18 making with 50.46 as really an enabling condition to
19 be able to go forward, and then take a more realistic
20 break size first for eliminating the coincident with
21 loop and single failure that is currently in the
22 regulations.

23 That would be the focus of the first rule
24 making. But once you have a redefined large break
25 LOCA, that assumption is used in many other

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 applications within the scheme of regulations, and we
2 can't possibly know all the impacts in the first
3 ruling making of taking a reduced large break LOCA
4 size.

5 But the point is that you can't make
6 changes to those other regulations based on the new
7 assumption without NRC approval in each of those
8 applications like we do via Reg Guide 1174 on risk
9 informed applications.

10 So this first one is really an enabling
11 rule. There will be a lot of effort to look at the
12 analysis and come up with a new break size will
13 probably be different for each NSSS reactor design.

14 But once that is done that really sets up
15 a very methodical comprehensive phased-in approach for
16 taking that assumption, and promulgating it through
17 the rest of the regulations, with tremendous benefits
18 in terms of the focus on safety and operational
19 benefits to the licensees, in terms of operating
20 margin and burden reduction and cost effectiveness.

21 And so we think that this is probably the
22 biggest fish in Part 50 to go after. I think we have
23 been consistent as an industry stating that since the
24 letter went in in January of last year.

25 We are anxious to get on with that, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the Westinghouse owner's group, and Bob will speak to
2 you about that in a moment, and they have already done
3 an extensive amount of work looking at the analysis to
4 get down to that reduced break size. But we think
5 that this is a very important effort.

6 MR. HAYMER: And I think with had a
7 question about what comes next, and I think when you
8 take a look at 50.46 and some of the activities that
9 we think would flow from what we have discussed, and
10 what the staff has discussed in regards to defining a
11 large break LOCA coincident with loss of off-site
12 power and single failure, when you see what flows from
13 that -- and we have given a list of those areas that
14 we think would be amenable to further review once we
15 have done this first step, that is a very large amount
16 of work.

17 And I think once we have gone through
18 that, we might then think about going back, but I
19 think we are talking about a fair way down the road as
20 regards those activities.

21 So that is where we see it at the moment.
22 The only other point that I would make is that we have
23 given consideration that if this is beginning to take
24 some time that we should think about breaking off the
25 decay heat requirement into perhaps a separate rule.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And that is something that we will look at
2 and then decide what needs to be done with regard to
3 that. Bob, did you want to say something?

4 MR. OSTERRIEDER: Yes, just a couple of
5 comments. The question was brought up, you know,
6 what does Westinghouse or the industry feel is a good
7 limit on CDF or LRF, or defining what is incredible,
8 and we certainly don't want to define what is
9 incredible.

10 But I do want to comment that first of all
11 the issue of the probability of these breaks occurring
12 is a key issue, and there is two areas here that we
13 need to get on with in interacting with the NRC.

14 That is, the estimates of the LOCA
15 frequency, and how they are obtained in this curve of
16 frequency versus break size, and about what there has
17 been a bunch of discussion here. That is the first
18 piece.

19 And the second piece is related, and that
20 is the technical justification related to the
21 frequency and what is enough rigor in the
22 calculations.

23 We feel -- there has been a lot of
24 comments here that this is a big wide open area that
25 is going to take a lot of work, and what we feel is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that we need to get some of these pinned down pretty
2 quickly so that we can decide if this work is worth
3 doing.

4 We think that we can get together and I
5 think somebody already mentioned that we are working
6 on setting up a meeting with the staff to talk about
7 some of these issues, and that is the next technical
8 meeting that we have to schedule.

9 And we need to get that scheduled, but
10 those key issues, we need to in our opinion work on
11 those quickly in the near term, and decide what do we
12 have to consider in these curves, and what are the
13 issues that have to be resolved.

14 And that's because right now it continues
15 to be an open-ended high level, and there is more
16 rigor required here, but we need to pin down what this
17 rigor is on these probabilities and on the -- if we
18 are going to use leak before break or something to
19 justify the specific size which relates to that curve,
20 we need to get those issues down on paper as to what
21 they are so we can decide how to deal with them, and
22 whether or not they are too extensive to deal with.

23 And I guess that is a key point, and for
24 us it is a key item for moving forward. We need to
25 get into some of that in the near term and get that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 pinned down further.

2 DR. WALLIS: I am intrigued by your
3 statement that you might need more rigor on the
4 probabilities. Maybe you need more rigor on the
5 effect of modal uncertainties.

6 MR. OSTERRIEDER: Well, that --

7 DR. WALLIS: And maybe eventually after a
8 decade, somebody is going to look at some aspect of
9 the codes that affect the probabilities.

10 MR. OSTERRIEDER: Well, the rigor again,
11 and when we presented our basis, and what high level
12 technical basis, we were told that we would need more
13 rigor in that area, and that is why I was focusing on
14 that area.

15 DR. WALLIS: Well, I am saying it is not
16 just probabilities, but it is the things that affect
17 the probabilities.

18 MR. OSTERRIEDER: That's correct.

19 DR. WALLIS: And it will always have an
20 effect on success and all that kind of stuff, and it
21 is all tied together.

22 MR. OSTERRIEDER: Right. But we are not
23 focusing on changing the acceptance criteria of the
24 codes, or the methods in the codes. And again when we
25 started the program, we were looking at the rigor that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 was applied in GDC-4 and the ISI programs as being
2 sufficient.

3 It has been brought up that the staff
4 feels that that is not sufficient, and we need to talk
5 in more detail. There were some details brought
6 forward at the March 16th subcommittee meetings, and
7 we need to meet, and we hope to cover some of that in
8 our next technical meeting.

9 Also, as to more specifics about why that
10 is so different, and what is the basis of some of
11 that.

12 MR. HAYMER: While we are pulling on from
13 that topic as we go on schedule, I think the industry
14 is very interested in getting down and looking at some
15 of the detailed work that the staff plans to do and
16 see what we can do or have done to address those
17 issues.

18 And working together, we can move it
19 forward, but we have got to get a better understanding
20 of what we are looking at from a technical perspective
21 so that we can move forward on this regulation.

22 And that brings into mind the overall
23 schedule of option three, and when we started this
24 activity, we said 50.44 and 50.46, and the reason that
25 we selected 50.44 is that we thought it was going to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 be fairly straightforward.

2 And in truth the staff moved very quickly.
3 There were recommendations made last September and the
4 Commission directed the staff to move forward with an
5 expedited rule making in January.

6 And things have seemed to have gone
7 silent, and now we hear that the only thing that has
8 been sent up is a plan, and we don't know what that
9 is, and we have been working on this now, for Option
10 3, for 18 months.

11 We probably are not going to have anything
12 to show the industry for at least another two years,
13 and that is beginning to concern some people.

14 MR. PIETRANGELO: Adrian is right and it
15 is frustrating from our standpoint, because 50.44, the
16 reason that it was selected was that it has benefited
17 the licensees and there are things that we do with the
18 plant with the recombiners and monitoring it that make
19 no sense from a safety standpoint.

20 And really that has been a belief since
21 about the late 1980s when this regulation was looked
22 at under the Marginal Safety Program. It was one of
23 the three final regulations that were looked at as
24 part of that program, and the only regulation that did
25 get changed was Appendix J for integrated leak rate

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 testing.

2 And then San Onofre went through an
3 exemption request on recombiners and on combustible
4 gas control, and after a 2 to 3 year review by NRR,
5 they finally got their exemption request in 1999.

6 We thought that was going to be the
7 principal basis for the 50.44 rule making. Yet, there
8 has been a lot of other things that have been brought
9 into play on 50.44 on certain containment types, and
10 I won't go into great detail here.

11 But we had something that already had a
12 technical basis, and was applicable to about 95
13 percent of the industry. But I think the kind of
14 business as usual approach to this says that we have
15 to make this rule perfect, and apply to everybody
16 equally, and make sure that is all dealt with in this
17 one rule making.

18 And as a result, I think you are seeing
19 the schedule dragged out on this for additional
20 technical basis for these other containment types, and
21 new gas source terms, and all the rest.

22 While the principal benefit of this for
23 the vast majority of the industry is kind of sitting
24 there, you have three exemption requests sitting in
25 NRR waiting to be reviewed, and others that probably

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 would be submitted if they knew that this rule making
2 was going to take so long.

3 So I think there has got to be a new
4 mindset when we look at these improvements via Option
5 3, especially when we get to something as complex as
6 50.46. When you see something that has benefit, and
7 is fairly straightforward, you need to take it.

8 There may be additional work done later on
9 to look at other aspects, but it should not preclude
10 or at a minimum slow down to this extent the progress
11 in making the regulations more risk informed.

12 That is our real message on this, because
13 on 50.46, if you wait until you know everything that
14 might ever happen when you go to a redefinition of
15 hard break LOCA, we will never finish this. We will
16 never finish.

17 DR. WALLIS: I am trying to disentangle
18 this. You are complaining about the way 50.44 was
19 handled?

20 MR. PIETRANGELO: Right.

21 DR. WALLIS: And you are extrapolating
22 this to 50.46, but what I think I detect is that you
23 realize that you have to do a lot of work on 50.46,
24 and that is sort of reducing the enthusiasm a little
25 here?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. PIETRANGELO: No, I think that's why
2 Adrian said there is a piece of decay heat --

3 DR. WALLIS: Decay heat may be handable,
4 but all these other things that we heard about this
5 morning are not trivial. You have to produce a really
6 good piece.

7 MR. HAYMER: Yes, and we agree that we are
8 willing to sit down and produce that, but --

9 DR. WALLIS: Well, that is what you said
10 last time.

11 MR. HAYMER: Yes, and we are willing to
12 work with the staff, and we are setting up meetings.
13 But our concern is that if you see the way that 50.44
14 has gone, and then if you say that is how we are going
15 to go in 50.46, with the amount of work that is
16 involved, that is going to be -- are we really going
17 to get there.

18 And picking up on Bob's point a few
19 moments ago, that's why we think it is important to
20 sit down with the staff and get a better
21 understanding, because we think we have the basis to
22 move forward with the case, and they had a plan laid
23 out of when certain work product would be produced,
24 and given to the staff so they could sit down.

25 Now, the staff has come back and said that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 we need more rigor, and now we are trying to find out,
2 well, we have got a program that Westinghouse and
3 others are working on, and it is meant to produce
4 these products in this period of time.

5 And now we are saying there is more rigor
6 and now what does that mean, and it is important that
7 we sit down soon and discuss what those are so that we
8 can work on that.

9 MR. OSTERRIEDER: Right, and we are not
10 afraid of the new work, or the work that needs to be
11 done. What we need to do is to get it defined so that
12 we understand it.

13 If it is such a massive effort, then like
14 any other business decision, you have to decide if it
15 is worthwhile. But my main point is that we need to
16 sit down and define the issues that we are talking
17 about, and what is additional rigor, and what is an
18 acceptable curve of frequency versus break size to
19 support the PRA aspects.

20 We need to sit down and move on with that
21 so that we can decide what the work is that we have to
22 do, because we have been talking too long and we need
23 more rigor.

24 And we keep saying there are a lot of
25 issues and there are, but we haven't --

1 DR. WALLIS: Well, it seems to me first of
2 all that you need to have a case which is persuasive
3 to you.

4 MR. OSTERRIEDER: Yes.

5 DR. WALLIS: And then it might be
6 persuasive to somebody else, and waiting for the staff
7 to tell you what that case has to be isn't really
8 going to achieve very much.

9 MR. OSTERRIEDER: Well, we believe that we
10 have a case, and what we are being told is that it is
11 not sufficient, and what we are trying to get from the
12 staff is please help us understand what is not
13 sufficient about it other than --

14 DR. WALLIS: But you remind me of the
15 student that keeps telling his professor to tell me
16 what should be in my thesis, and the professor says,
17 well, you know, it is up to you to figure that out.

18 MR. HAYMER: Well, they have a series of
19 work products, and a plan to develop those work
20 products. Now we are told that we have to be even
21 more rigor than that, and we are saying okay, what
22 more do we have to do beyond this.

23 CHAIRMAN APOSTOLAKIS: Is the report that
24 you guys are preparing for the end of June going to
25 answer some of these questions?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. KURITZKY: The report at the end of
2 June is going to discuss the technical issues that we
3 believe need to be resolved in order to proceed with
4 the large break LOCA redefinition, and I believe as I
5 said earlier that the staff has agreed to meet with
6 the industry to talk in technical terms about the
7 issues that have been raised.

8 CHAIRMAN APOSTOLAKIS: Okay.

9 MR. OSTERRIEDER: The only other comment
10 on the amount of work is we are concerned a little bit
11 that we are looking at such a wide variety of options
12 here -- the acceptance criteria, and the different
13 pieces here that we have looked at, because each of
14 these in themselves could be a lot of work and to do
15 the acceptance criteria.

16 And our feeling was that we should focus
17 on these issues related to redefinition to define
18 them, and get on with that first, versus having little
19 resources to have the meetings with us and to define
20 this, and do some work because there are so many
21 initiatives going on.

22 And these initiatives and to do all of
23 this would take many, many years we believe.

24 MR. PIETRANGELO: And the other factor
25 that was not on the table maybe in some of the earlier

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 meetings on this was -- I think there was some
2 miscommunication, or we weren't on the same page with
3 regard to the remaining mitigation capability for the
4 double ended guillotine break.

5 I think the perception was that there
6 wasn't going to be mitigation capability left for
7 that, and so that the approach has changed. We do
8 want to maintain mitigation capability, even for the
9 double ended guillotine break.

10 But the point is that that can't be the
11 design basis assumption that drives the rest of the
12 other regulations where that assumption is invoked.
13 And there needs to be more talk about, well, what does
14 that mitigation capability have to be, and what is the
15 acceptance criteria for that.

16 Is it the same as the ones for 50.46, or
17 do you keep core damage frequency below some number?
18 So there is a lot of details to be worked out, but you
19 can only have one design basis on a system. You can't
20 have that this is the more likely one, and this is the
21 less likely design basis.

22 That won't work in the current regulatory
23 framework. So there are issues that have to be worked
24 out, but I think you have another factor there that
25 can play on rigor.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 If you have remaining mitigation
2 capability for the double ended guillotine break, how
3 much more rigor do you need to demonstrate to produce
4 break size that is going to be the design basis.

5 So there is kind of a scale there that you
6 can use to make yourself comfortable that there is
7 assurance that you can handle those situations.

8 DR. WALLIS: I still get the impression
9 that there is technical work needed on both sides, and
10 that is what has to be done, and just arguing about it
11 is not going to resolve the positions.

12 MR. PIETRANGELO: I think part of the
13 reason this was selected was that you are building on
14 things that have already been done -- leak before
15 break, and risk informed ISI work. That is all work
16 that can be brought to bear on this subject.

17 So we are not starting from scratch. We
18 have gotten things that have been accepted in the
19 regulatory process already, and that is a good
20 foundation to go after this additional work. So we
21 are not starting from scratch.

22 DR. SHACK: Any more questions?

23 (No audible response.)

24 CHAIRMAN APOSTOLAKIS: All right. Thank
25 you. I would like to also thank the staff for their

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 presentations. We will recess until 10:40.

2 (Whereupon, the meeting was recessed at
3 10:20 a.m., and resumed at 11:22 a.m.)

4 CHAIRMAN APOSTOLAKIS: The next item on
5 the agenda is the potential for margin reductions
6 associated with power uprates, and this is Dr. Wallis
7 and Dr. Bonaca.

8 DR. WALLIS: I would simply say that you
9 all know that we are interested in this issue, and you
10 all know Gus, and we are looking forward to what he
11 has to tell us.

12 CHAIRMAN APOSTOLAKIS: Dr. Bonaca. Okay,
13 Gus.

14 DR. CRONENBERG: This is basically a
15 status report on some work that I have been doing that
16 came out of the retreat. So I started this in March,
17 and I titled it, "Signature Estimates of Margin
18 Reductions," because I think we have bits and pieces
19 of information, and sort of sign posts, but it is not
20 the full story.

21 In the outline of my talk, I am going to
22 give you a little bit of how margins is used in the
23 regulatory process, and then I am going to give you
24 some estimates of what I was able to find for a case
25 study that I did for the Hatch plant.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Hatch had two prior power uprates and is
2 under present review for license renewal. So I will
3 do the power uprates, and then some estimates from
4 basically time limited aging analysis for the Hatch
5 plant, and then some preliminary findings.

6 DR. KRESS: Are those bullets little land
7 mines or what are they?

8 DR. CRONENBERG: They are something or
9 other.

10 DR. LEITCH: Gus, the status report that
11 we got, is that what you are referring to, or is that
12 -- I guess what I am saying is some of the chapters
13 here seem to be not aligned with --

14 DR. CRONENBERG: Yes. That is just a
15 draft of --

16 DR. LEITCH: It is just a draft?

17 DR. CRONENBERG: Yes, the end product is
18 in September, and I want to give you a final report on
19 this study, and that is just where I am on what I have
20 to date. It is a little disjointed, but I just wanted
21 to show you where I am going.

22 And so that report will be in a final form
23 in September when I intend to wrap this project up.

24 DR. LEITCH: Okay. Off-line then, I will
25 give you a couple of comments here after just reading

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 through this.

2 DR. CRONENBERG: That's fine.

3 DR. LEITCH: Editorial type of things.

4 DR. CRONENBERG: Yes, okay. And then you
5 also have in your notebook like a four page summary of
6 what we did and where we are at. Okay. Margins, from
7 Webster, are as spare amount allowed for contingencies
8 or another definition of bare minimum below which
9 something is no longer desirable.

10 DR. WALLIS: It's marginally, you mean?
11 You mean marginal performance on a test or something
12 like that?

13 DR. CRONENBERG: Yes. Well, you
14 understand.

15 DR. WALLIS: Well, you go to Webster, and
16 in fact the agency doesn't define what it means by
17 margin.

18 DR. CRONENBERG: Margin is used in a
19 rather general sense, and what I did was go to the
20 general design criteria and just try to give you
21 examples of how margin is used in the general design
22 criteria.

23 And then actually you have to go to
24 regulatory guidance, and you have to go to ASME
25 pressure and pressure vessel, or code, or American

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 Institute of Standards type of thing to really look at
2 margin.

3 For example, Criterion 10. It says that
4 the reactor core and the associated cooling control
5 and protection systems shall be designed with
6 sufficient margin to assure acceptable design limits
7 shall not be exceeded.

8 Well, Graham, you might say, well, that
9 doesn't tell me anything, and it might be the kind of
10 thing that we would expect from Graham. This exactly
11 how -- and it goes on and on. They are all like that.

12 Criterion 31, the reactor coolant pressure
13 boundary shall be designed with sufficient margin,
14 blah, blah, blah, so that it behaves in a non-brittle
15 manner. Again, it doesn't tell you. You have to go
16 a step further, and that is coming in the next few
17 slides.

18 Criterion 50, the containment. Now, not
19 only the primary system, but the containment,
20 including openings, penetration, shall be designed
21 without exceeding a design leakage rate, and with
22 sufficient margin to reflect metal, water, and
23 chemical reactions.

24 DR. WALLIS: Doesn't sufficient margin
25 relate to uncertainty in all of these things?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN APOSTOLAKIS: Yes. Sure.

2 DR. WALLIS: It is tied in with
3 uncertainty, but that connection isn't explicitly
4 made.

5 DR. CRONENBERG: These are general design
6 criteria.

7 DR. POWERS: I think you would end up with
8 confusion if it made that tie, because the margins are
9 there for the things that are not included in the
10 analyses that are typically done.

11 CHAIRMAN APOSTOLAKIS: Not necessarily.
12 If you are uncertain about something, you don't know
13 what the value would be.

14 DR. POWERS: These are Chapter 15
15 analyses, George.

16 CHAIRMAN APOSTOLAKIS: Oh, oh, okay.
17 Thank you.

18 DR. POWERS: And there are things that you
19 may not know.

20 CHAIRMAN APOSTOLAKIS: That is what it
21 should be, yes.

22 DR. POWERS: And that nobody thought of,
23 and so those margins are things that are not taken
24 into account.

25 CHAIRMAN APOSTOLAKIS: But how can you do

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that?

2 DR. WALLIS: Then this is just a gut
3 feeling then, and if you don't know what they are,
4 then you can't assess them. You have to make some
5 sort of a guess as to what they are.

6 DR. POWERS: You've got it.

7 DR. WALLIS: And so margins are just
8 guesses about how unsure you might be.

9 DR. CRONENBERG: Well, for example, it
10 will say that you can't exceed -- that a pipe can't
11 exceed a design pressure of a thousand psi. The
12 licensee will come and say my LOCA now shows that this
13 steamline for design basis accident gets to 950 psi.
14 I have a 50 psi margin.

15 The licensee will say that to me is
16 sufficient margin to meet --

17 DR. WALLIS: But your uncertainty in your
18 prediction is plus or minus a hundred, and therefore
19 I am not going to --

20 VICE CHAIRMAN BONACA: They would come
21 back and say that we have built in considerations for
22 uncertainties for the conservatism. Now, to negotiate
23 whether those conservatism would in part account for
24 uncertainty or not.

25 DR. WALLIS: Well, you can't be so wishy-

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 washy about it.

2 DR. POWERS: Graham, in no case would you
3 come in and say the uncertainty in your calculations
4 here is plus or minus anything. You would always be
5 that your uncertainty in this is plus X, minus
6 nothing, because they are conservative calculations.

7 DR. CRONENBERG: Okay. That's -- we are
8 going top down. It starts with the general design
9 criteria, where margin is first, and that is the rule
10 of law. It says that you have to have sufficient
11 margin, and it doesn't define in psi what that margin
12 is, or percent, to some limit.

13 You have to go to a regulatory guidance,
14 and even there the regulatory guidance usually refers
15 to, let's say, the ASME pressure and pressure vessel
16 code.

17 But it will give you acceptance criteria
18 for design pressures, pressure temperature limits,
19 stress limits, allowable materials, ductility limits.
20 Those are the kinds of requirements that will be
21 placed on certain system structures and components --
22 a piece of pipe or whatever.

23 And basically it will then say go to the
24 ASME pressure vessel code, and then the ASME pressure
25 vessel code will tell you more detail. It will tell

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 you how you have to test, and how you have to remedial
2 this material if you are going to us the thickness of
3 this material with that alloy and composition.

4 And that this is the pressure that you
5 cannot exceed, and that is how it is all established,
6 and that is how we establish design criteria. We
7 build upon code upon code.

8 DR. WALLIS: I am puzzled about what Dana
9 said about having no error in the other direction, and
10 if it is a conservative analysis, why do you need a
11 margin if there is no error output?

12 DR. POWERS: It is put in there because
13 you may not have thought of everything. These are
14 complicated systems, and at the time they were built
15 they didn't know what --

16 DR. WALLIS: So it is an illusory to say
17 there is no error in your conservative analysis?

18 DR. POWERS: Well, there are presumably
19 things that get discovered all the time. One of the
20 reasons to put margin in there for is that the coding
21 analyses tells you how the thing is built, and as soon
22 as it is built, it starts degrading.

23 And it degrades in ways that may not be
24 reflected in things like corrosion allowances and
25 stuff like that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. CRONENBERG: And in the ASME code,
2 there is margin for design limits that will take into
3 account aging and rusting of field components and
4 those sort of things.

5 Those already have margins, and the way
6 that I am going to estimate margin is that I am going
7 to say that this is the ASME design limit for this
8 particular pipe, and how close are we to that design
9 limit.

10 There is margin above that, too, that is
11 supposedly built in, and if you test it right, and if
12 you subjected this material to the kinds of
13 environment that it was tested for. Sometimes, of
14 course, we have stress corrosion cracking, and those
15 sort of things that aren't in there, or irradiation.

16 We had a lot of things added to the
17 pressure vessel code and to the irradiation
18 embrittlement, and that sort of thing over time.

19 VICE CHAIRMAN BONACA: But even when you
20 talk about degradation -- for example, from corrosion
21 in vessels, even there, there are limits to how much
22 you accounted for. It's not that it is a indefinite
23 process of corrosion that lasts forever.

24 I mean, it is not a time limit as others,
25 but there were certain assumptions made which was

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 essentially limits of the acceptability to
2 inspections.

3 DR. CRONENBERG: I am going to show you
4 examples of this. Probably the best education is via
5 an example here. Let me go on. The first thing that
6 I wanted to look at is the impact of power uprates,
7 and changes in operating conditions, a change in
8 design basis accident conditions for increased
9 coolant, and that you have already associated with the
10 power uprate.

11 And you will have changes in primary
12 system conditions, and you will have changes in
13 secondary size steam generator flow rates, and feed
14 water flow rates, and you will have changes in coolant
15 and temperature, and flow rates and that sort of
16 thing.

17 Those are the kinds of things that are
18 changed with power uprates. Here is some current
19 power uprate applications. We have the Duane Arnold,
20 15 percent; and the Dresden plan, and the Quad
21 Cities, Brunswick, Clinton, and we have Arkansas 1,
22 and a PWR, and significant power uprates.

23 We are not talking now these days about 5
24 percent, or 3 percent uprates. We are talking major
25 uprates, and I guess in the conference yesterday they

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 were talking about 10,000 megawatts of electrical
2 generation, like building 10 new plants from power
3 uprates.

4 So we are talking about a major activity
5 here and a major responsibility of the ACRS. We are
6 also talking about plants that are pushing 30 years
7 old; mid-'70s, and vintage 25 or 30 years old.

8 So we are not talking about uprates, but
9 we are talking about uprates to an age depletive
10 plants.

11 DR. WALLIS: And some of these plants had
12 a power uprate before, because perhaps they were
13 operating conservatively initially or something. I
14 think some of them actually had a power uprate before
15 of a much smaller amount.

16 DR. CRONENBERG: The way I read this is
17 that these keep coming in. I don't know if they will
18 ever be an advanced light water reactor. I don't know
19 if they will ever be what you were talking about
20 yesterday.

21 But this train is already leaving the
22 station, you know, on the uprates. So your concern
23 about margins, I think, is a very timely, timely
24 subject at this point.

25 DR. WALLIS: The references that you made

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in your earlier report about --

2 DR. CRONENBERG: I am not talking about --
3 well, on Tuesday, there is a thermal hydraulics
4 meeting, and I intend to go back over that if Graham
5 wants.

6 We will look at operational experience
7 from prior uprated plants and what I found there
8 besides this talk today. So I plan to give both
9 talks, but not today.

10 DR. WALLIS: You will be there on Tuesday?

11 DR. CRONENBERG: Yes.

12 CHAIRMAN APOSTOLAKIS: Just one note. I
13 mean, many of the PWRs are not listed here, and they
14 went through the five percent, but they were really
15 designed originally, and even the accident analysis in
16 the FSAR was done at the construction stage of the
17 higher power level, and they were really operating at
18 95 percent power like this or whatever.

19 So that is not really a power uprates. It
20 is something that was designed to be that way. These
21 are substantial power uprates.

22 DR. CRONENBERG: Those are what are called
23 power stretches, I guess, in the G.E. vernacular.
24 Okay. I did a case study for the Hatch case, because
25 that is on the plant renewal, and it had two prior

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 uprates. It is a G.E. BWR/4 direct cycle plant. It
2 is an early '70s vintage plant.

3 It had a power -- it is a two unit plant,
4 and sister units, and the same power generation from
5 each unit. It is originally a 2,400 megawatts and
6 then to 2,500, and then to 2,700. And it is now on to
7 license renewal.

8 And Monticello had or was sort of case
9 studies for the G.E. guidance on power uprates.

10 DR. LEITCH: Gus, one of the things that
11 concerned me about the Hatch situation, but I don't
12 think it appears on your slide though and on your
13 paper, but it talks about the stress increase in the
14 access hole cover plate.

15 And it is really quite appreciable. I
16 mean, most of the rest of them are kind of what you
17 would --

18 DR. CRONENBERG: I am going to get to
19 that, to the cover plate story.

20 DR. LEITCH: You are going to talk about
21 that?

22 DR. CRONENBERG: Yes.

23 DR. LEITCH: Okay. Great.

24 DR. CRONENBERG: This is just a sketch or
25 a schematic of the direct cycle G.E. plant, and we are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 going to look at, for example, what the design
2 pressure for the main steam line is, and the design
3 pressure for the feed water system, and the design
4 pressures for the piping and the research evasion
5 pump.

6 We are going to march around this plant
7 and look at some design limits, and then some
8 calculated pressures and temperatures, and we are
9 going to look at some time aging analysis for piping
10 and that sort of thing.

11 So wherever I could glean some information
12 that is how I estimated margin. Okay. Here is a
13 summary of the uprate conditions for the Hatch, Units
14 1 and 2, and the years; 5 percent uprate, and then 8
15 percent, both of which change in operating system
16 conditions. So these are operating conditions.

17 As you can see, steam flows get higher
18 with uprate, and design pressure got higher on the
19 first, and the steam dome pressure got higher on the
20 first uprate, but remained the same for the second
21 uprate.

22 The dome temperature, the steam dome
23 temperatures got higher on the first uprate, but not
24 for the second. Feed water supply always is increased
25 and feed water temperature is a little bit for each of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 these uprates.

2 So these are some operating conditions and
3 then we will look at what the design limits are for
4 the temperature and pressure for those kinds of
5 operating conditions on various piping.

6 Basically what I said is what -- okay. We
7 just saw from the general criteria that there was no
8 definition of what margin is. It just is that there
9 shall be sufficient margin.

10 And so I said I will make -- this is my
11 definition of margin, and it will be the design limit
12 that is in a code, the ASME pressure vessel code, and
13 the value over the design limits, and how close we get
14 to the design limit.

15 So here we look at the main steam line
16 pressure and the design limit for that piping is 1,250
17 psi. And the original was 1,015. So we had an 18
18 percent margin to the design limit.

19 Then we went on the first uprate and the
20 pressure increased to 1,050. So we dropped down to 16
21 percent between the value of the operating condition
22 and the ASME allowable pressure for that type of
23 piping.

24 And the same thing with steam line
25 temperatures. There is a design limit for that pipe

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of 575 degrees F. We increased -- and sometimes I
2 could not get the information, and I want to talk
3 about that a little later, too.

4 The difficulty of getting information,
5 especially design basis calculational information, and
6 trying to retrieve historical data and historical
7 calculations to get the changes in margins over time.

8 DR. WALLIS: We are supposed to have
9 adequate margin, and I just can't quite grasp how we
10 decide what is adequate. Is 16 percent adequate, and
11 would 12 percent have been accurate? Would 5 percent
12 have been adequate? How do we know?

13 DR. CRONENBERG: Let me say that I am not
14 answering that question. That is a question before
15 the committee, the commission, the staff.

16 DR. WALLIS: Do you have any guidance
17 about how we can decide whether it is a reasonable
18 margin or not?

19 DR. CRONENBERG: Let me go on and then I
20 will come back.

21 DR. SIEBER: It is really not that easy,
22 because part of the margin is to accommodate
23 transient, and so you have to know what the transient
24 response for the plan is.

25 DR. CRONENBERG: The real degradation in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 margin is in your calculations for your design basis
2 event. An 8 percent could make a 20 percent
3 difference in a load to a pipe, okay?

4 VICE CHAIRMAN BONACA: And I think that
5 Gus has a good example on that, that we can use to
6 discuss this very issue, because the question will
7 then come on that issue that -- and when we get to
8 that issue, we can talk about it.

9 DR. SHACK: Well, from the code point of
10 view, it would be 1,250 gives you adequate margin.

11 VICE CHAIRMAN BONACA: That is correct.

12 DR. WALLIS: But there is already the
13 margin in that.

14 DR. SHACK: Right. There is the code
15 design limit provides what they believe is adequate
16 margin.

17 DR. SHACK: That's right.

18 VICE CHAIRMAN BONACA: And the degree to
19 which you can show that, for example, that as the
20 plant ages, that you still have a value of 1,250.

21 CHAIRMAN APOSTOLAKIS: So this is
22 additional margin.

23 DR. SHACK: It is a code margin, that's
24 correct.

25 DR. WALLIS: And this is one of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 debates; who does it belong to and all of that. I
2 think it would be very good if we could be clear do we
3 need any margin beyond what is already in the design
4 limit margin.

5 CHAIRMAN APOSTOLAKIS: Well, that is not
6 what he is addressing now.

7 DR. SHACK: Assuming there is no defects,
8 and that is a good point.

9 DR. WALLIS: There are always defects.

10 DR. SHACK: The code is part of the reason
11 that it is in fact lower --

12 DR. CRONENBERG: The value point or the
13 yield --

14 VICE CHAIRMAN BONACA: You may remember,
15 for example, on the primary side that the whole debate
16 in 50.59 for what the value documented in the FSAR
17 versus a set limit.

18 And the industry position was that from
19 the set limit up it is my margin, or below is our
20 margin, and above is your margin. And the position of
21 the NRC is that we want to control also the margin
22 between the maximum value that you have in your FSAR
23 and the set limit because it is a margin. So that is
24 still debated.

25 DR. CRONENBERG: Okay. The last

1 presentation was not surprising with the change in
2 LOCA. If you want to go into significant power
3 uprates, that is maybe where you had better or you
4 could see, because as I will show you in the next
5 couple of slides, when you look at margins for design
6 basis events, they are decreased rather dramatically.

7 DR. WALLIS: What I am trying to grasp is
8 what is the criterion for deciding when you stop? Is
9 it when you cross the design limit or something, or
10 what is the criterion for limiting uprates?

11 DR. CRONENBERG: You will have to ask the
12 staff on Tuesday. We have no standard review plan.
13 If we had a standard review plan, we might have
14 specified acceptance criteria for uprates.

15 And I have been talking about that point
16 for a few years now, and I will talk about it again on
17 Tuesday. Here is some more feed water piping where
18 actually the feed water pressure went down on the
19 second uprate.

20 So the residual margin was increased, but
21 the real story here I think is what happened with --
22 that each time you come for a power uprate, you have
23 to recalculate your design basis accident conditions,
24 and that is a good part of the safety analysis report
25 that accompanies a license amendment request for an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 uprate.

2 And these are design basis LOCA loads for
3 -- well, this is the pressure vessel, and in the
4 original the load was estimated at 8.9 kilopounds per
5 square inch, and the design limit is 15.

6 DR. WALLIS: Just remind me that these are
7 forces due to momentum effects during a LOCA?

8 DR. CRONENBERG: Yes. These are forces on
9 piping during a LOCA.

10 DR. WALLIS: So you have to have a good
11 momentum equation to predict them?

12 DR. CRONENBERG: Yes.

13 DR. SIEBER: Or a water margin.

14 DR. CRONENBERG: Okay. And the first
15 uprate, the prediction is nine. So you have a little
16 -- you decrease your margin a little bit. The vessel
17 shroud, and this is stress calculations.

18 One thing that was hard to do when you
19 chartered me to look at what this reduction in margin
20 is, you can only get results for little bits and
21 pieces of components in the system.

22 You don't have an ISO stress figures for
23 that margin of time for the LOCA. You will have a
24 summary table saying here is the stress on a bulk, and
25 here is the stress on a weld, and here is the maximum

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 stress during the LOCA, and that's all.

2 And that will be an appendix usually to
3 the SAR, and it is usually for a G.E. applicant, and
4 it will be G.G. proprietary information, and all it
5 will be is these five numbers of various stresses.

6 So it is hard to get a real good
7 comprehensive feel for what is going on, and it will
8 change with time. One operator will give you the
9 stress on a bolt, and the other one will give you the
10 stress on a weld.

11 The other one will be stress on a plate or
12 the pipe itself. So you can't get a good feel for
13 what is happening with time for just even one
14 component. You can see there is blanks in here.

15 You would rather see a better picture. So
16 if you guys are serious about requesting the staff to
17 estimate margin reductions for power uprates, where
18 are they going to get the information when they get
19 summary reports? And how are they going to retrieve
20 this information that is 10 years old?

21 CHAIRMAN APOSTOLAKIS: We are trying to
22 get a feeling right now for what the issues are. So
23 I think you are going in the right direction.

24 DR. CRONENBERG: Well, I just wanted to
25 bring that out to you. It was not easy to find the

1 information, and some of the information on the
2 license renewal, I had to request from the applicant
3 itself. It wasn't even in the agency.

4 And I will go on, but anyway, you see a
5 general trend of margin reduction for increased power
6 uprate, and here is this access cover plate.

7 DR. LEITCH: And that is exactly the point
8 that I wanted to address. That seems to be kind of
9 counterintuitive there, that large reduction in
10 margin.

11 And I wonder if we are really comparing
12 apples and apples, because it seems to me that in
13 about 1990 or so -- I don't remember the exact time
14 period -- that access cover plate had some problems
15 and was redesigned.

16 DR. CRONENBERG: Yes.

17 DR. LEITCH: And I was just wondering if
18 those stresses --

19 DR. CRONENBERG: These are the two
20 stresses. These are numbers that I took from the G.E.
21 appendix to the license amendment request for the
22 uprate, and it was on the same bolting. Now, that
23 access cover plate was replaced.

24 These are again to the design as to 107.7,
25 and this is an 8 percent power increase that you had

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 over a 20 percent reduction in margin for the 8
2 percent. The lows were significant, a significant
3 jump in loads from 60 to 90.

4 Now, that access cover plate is what they
5 found in Peach Bottom, a sister type of plant, was
6 that they had stress corrosion cracking in Peach
7 Bottom, and NRC required that that access cover plate
8 be replaced.

9 Hatch did -- all sister plants had to do
10 ultrasonic testing on theirs following shutdown, and
11 do ultrasonic testing. They found evidence of
12 cracking on their cover plate, but they could neither
13 confirm or deny how deep that cracking was.

14 NRC dictated that they put in a monitoring
15 program to monitor those welds, and they decided to
16 just preempt the problem and replace those cover
17 plates on Hatch because of what was confirmed at Peach
18 Bottom, but never really confirmed at Hatch.

19 They just replaced the cover plate, but
20 what is happening here is that Peach Bottom did have
21 confirmation of significant stress corrosion cracking,
22 and probably that design limit was not retained. And
23 I am always comparing it to design.

24 VICE CHAIRMAN BONACA: And I think this is
25 a good example because -- and we brought it up with

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the staff already. The staff was asking what kind of
2 questions do you want us to ask, and the questions, if
3 you have aging, that may challenge in fact the design
4 limit of 107 KSI because of the degradation that is
5 resulting as a part of aging.

6 The question is do you still have the
7 margin between 90 KSI and 107, and you probably don't.
8 As a minimum, the uncertainty is very much in
9 question, because you have only 16.4 percent of
10 margin. So that was simply an observation that as a
11 minimum, in reviewing the power uprates, the reviewer
12 should not just simply compare a apple with an apple.

13 They should ask some questions regarding
14 the operating history, and the inspections done, and
15 what is happening to the plant, because the plant is
16 aging, and it is a fact. So that is just one point
17 that I wanted to make that we brought up with this
18 stuff.

19 DR. CRONENBERG: But most of the time in
20 the license application, they will just quote we have
21 this limit to our design, and this much margin to our
22 design limit.

23 I have not seen the kind of discussions
24 that Mario was talking about in a license application.

25 CHAIRMAN APOSTOLAKIS: You have not really

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 addressed the strength here. You are just saying that
2 as a design limit and calculations show that the
3 predicted strength is this, but you are not saying
4 anything about how or what is happening to the design
5 limit today.

6 DR. CRONENBERG: Well, that does come in
7 the aging, but these are all numbers that I got from
8 a licensed application. I am comparing that this is
9 the licensee's numbers, and this is the degradation in
10 margins based upon the licensee's own numbers.

11 And I was hoping that I could get more
12 information, and I found it rather confusing because
13 we never say you shall give me -- if we had a more
14 structured approach to operate, you shall give me
15 these stresses for these bolts, for these pumps, for
16 this pipe weld, for that access weld, so I can compare
17 in time what is happening as I uprate the power.

18 The story to me is confusing because we
19 don't have a rigorous approach to how we review power
20 uprates, and so --

21 CHAIRMAN APOSTOLAKIS: But this is really
22 the residual additional margin, right? Wouldn't that
23 be more accurate, because there is already a design
24 limit.

25 DR. CRONENBERG: I gave you my definition

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of what I am using as margin.

2 CHAIRMAN APOSTOLAKIS: But I think if you
3 put the word additional there --

4 DR. POWERS: Residual he calls it.

5 CHAIRMAN APOSTOLAKIS: The concern here
6 was, and as we expressed before, was that when you go
7 with power uprate, the project engineer goes through
8 a checklist, but especially uprating plants that have
9 been running for 20 years or 30 years, there is a
10 history behind which involves aging, irrespective of
11 license renewal.

12 VICE CHAIRMAN BONACA: Is it adequate to
13 simply go back --

14 DR. SHACK: But again if he had any known
15 cracking, he would be operating under a different set
16 of rules. That is, that he would have to account for
17 the crack, the crack size, and he would have limits on
18 that.

19 VICE CHAIRMAN BONACA: I don't deny that
20 there are considerations like that, but I am only
21 saying that until now it seems to me -- and what Gus
22 has pointed out -- that without a specific more
23 thorough checklist almost of how you are going to do
24 it, it would be purely checking a number against a
25 number.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And if you have a residual margin of one,
2 it is enough to say yes, and the point that Graham was
3 raising before. And I think there has to be a more
4 thoughtful review given that you have an operating
5 history behind it.

6 CHAIRMAN APOSTOLAKIS: But you can't just
7 look at the incidents of aging, because there are also
8 inspection programs, corrective actions, and so all of
9 those have to come in, and so the assumption here is
10 I guess, but unless there is evidence of something
11 going on, the design limit is preserved.

12 VICE CHAIRMAN BONACA: Absolutely, and I
13 am not denying that, but I am only saying that we are
14 checking to see what kind of margins there are, and
15 how they are reduced, and the significance of those,
16 and the fact that as you get very close -- I mean,
17 originally they started with a blowdown pressure of
18 stress with a component of 64.5 KSI. That was the
19 original design. And the design was actually 107.7,
20 and a 40 percent margin, and so --

21 DR. CRONENBERG: That was on the first
22 uprate, and I don't even know what -- I couldn't find
23 it in the FSAR what it was on that bolt.

24 DR. LEITCH: But, Gus, that is the one
25 -- in all of this data, that is the one thing to me

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that is surprising, and almost counterintuitive, that
2 it would change that much.

3 And I guess what I am saying is that there
4 has been some redesign work done down there on that
5 access cover, and I am just wondering whether these
6 numbers are presenting the correct story, or whether
7 the numbers somehow got skewed by reanalysis,
8 redesigning.

9 DR. CRONENBERG: Which number are you
10 talking about, the design limit or the calculated
11 load?

12 DR. LEITCH: No, the design limit. I am
13 saying that maybe they went back and after finding
14 this problem at Peach Bottom, they might have gone
15 back and said, oops, maybe we had better recalculate
16 that 64.3, and maybe they found out it was 88 or
17 something like that.

18 And what we are saying is a significant
19 reduction in margin due to power uprate may be due to
20 something totally different than that. I am just
21 surprised that that order of magnitude of change.

22 The rest of the changes almost seem
23 intuitive to me, and I just want to be sure that that
24 one piece of data isn't taken as --

25 DR. CRONENBERG: That was just a number.

1 We get summary reports, and we don't get detailed on
2 what boundary conditions are on codes, and what
3 stresses are predicted, a time line. We just get a
4 summary table. I am going to show you the kind of
5 information that we get in an application.

6 DR. LEITCH: Yes, but all I am saying is
7 that I don't understand the phenomena that would
8 increase the stresses on those bolts by that much by
9 just --

10 DR. KRESS: It is strictly the pressure
11 doing that, and the pressure didn't change that much.
12 I think you are right. There is something wrong
13 there.

14 DR. LEITCH: Yes. I just don't want to
15 focus on that question and --

16 DR. CRONENBERG: Well, it is coolant and
17 higher flow rates, and --

18 DR. KRESS: But that is a lot of change.

19 DR. CRONENBERG: Well, this is in the
20 application, and these are reported numbers, and none
21 of these are anything else but reported numbers.

22 CHAIRMAN APOSTOLAKIS: I think you made a
23 good point, and we should be cautious about that.

24 DR. CRONENBERG: Okay. Here is some of
25 the containment again, and this is an inverted light

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 bulb type of BWR, and we can see that the pressures
2 there are going up and the drywell or the margin is
3 going down.

4 And the peak drywell gas temperatures are
5 exceeded for a small time. However, it is only for a
6 short time. So that was allowed. And then the design
7 limit, and the suppression pool temperatures, and the
8 design limit is 281, and we go from 198 to 202, to
9 208. We keep creeping up as we might expect the
10 margin to design limit goes down.

11 DR. KRESS: Should we be concerned about
12 all these decreasing margins?

13 DR. CRONENBERG: Well, let me get to the
14 end, and let me talk about a more holistic or
15 conclusion. We also have signatures of margins for
16 license renewal, and most of that was gleaned from
17 looking at the time limited aging analysis.

18 And basically that comes out of appendix
19 material for the Hatch, and this was surprising to me
20 that we had discussions of the accumulative usage
21 factors, and estimates of those cumulative usage
22 factors for various components for the Taurus, for the
23 piping.

24 But that was information that I couldn't
25 get from the staff here. I had to go back to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 licensee and the licensee had to request from G.E.,
2 and G.E. has a structural associate contractor that
3 G.E. uses to do this cumulative -- essentially fatigue
4 calculations.

5 So you really had to go back and reference
6 it, and it wasn't in the agency where I got these
7 numbers. I had to get it from the licensee, and Mario
8 saw all the E-mails back and forth to retrieve this
9 information.

10 So it is not just something that -- well,
11 you have got to work at getting it if you want to look
12 at margins. Okay. This is a cumulative usage factor,
13 and it is basically a fatigue estimate for various
14 components.

15 And they estimated for 40 years for the
16 end of the first renewal, and they gave estimates for
17 the license renewal period of 60 years. Basically,
18 they keep track of the number of SCRAMs, and the
19 number of bolt up and bolt down operations, and
20 anything that can fatigue a particular component, any
21 minor seismic events.

22 And if you exceed one, then you exceeded
23 the allowable fatigue limit for that particular
24 component. So you estimate these things, but a lot of
25 this is based on historical data. You have got to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 keep track of SCRAMing, SCRAMs, and bolt ups, and bolt
2 downs, and that sort of thing.

3 So the cumulative usage factor,
4 essentially you are going to one. The design limit
5 here is one. If you exceed the design limit, then you
6 have to negotiate something with NRC, whether the
7 surveillance has to be higher surveillance, or that
8 component has to be replaced, or whatever.

9 The suction piping, the cumulative usage
10 estimate for that is 57 at 40 years, and it goes up to
11 77 at 60 years.

12 CHAIRMAN APOSTOLAKIS: Again, let me
13 understand this. Does this include the impact of
14 inspections and corrective actions?

15 DR. CRONENBERG: No, this is just an
16 estimate of how close to a fatigue limit you might
17 have been if you had 35 SCRAMs, a combination of 35
18 SCRAMs, 60 head removals, a seismic event.

19 DR. SHACK: And we don't even know if
20 these are calculated based on actual cycles or some
21 projected design cycle?

22 DR. CRONENBERG: It is a combination.
23 When you look at them, they do have tables of historic
24 data for the SCRAMs, and then they estimated what it
25 is going to be in the future, and that is how they get

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it to 40, and that's how they get to 60.

2 It is a combination of historical data and
3 estimates. I think it is a pretty nice analysis. I
4 thought this was -- I thought this was somebody trying
5 to estimate margins, you know.

6 And it is for various things that you have
7 said, because you have a standard review plan for
8 license renewal, and you say you will do these kinds
9 of estimates on these kinds of components. And then
10 you can begin to see, well, at least there is an
11 estimate of margin here.

12 DR. FORD: On a procedural aspect, for
13 instance, the piping. This is based on a code
14 analysis, which takes into account normal fatigue and
15 corrosion, but it does not take into account, however,
16 corrupting, and corrosion would be an additional
17 effect. How is that taken into account?

18 DR. CRONENBERG: That is a good point. As
19 far as I can tell from looking at these contractor
20 reports, it is assumed that same power for the next 20
21 year cycle, and I did not see something in here that
22 related to if you had added on top of it a power
23 uprate.

24 Just that you had so many bolting
25 operations, and so many SCRAMs at power. So I can't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 be sure, but I would have to go back into this.

2 DR. FORD: Well, maybe I am asking a
3 question where there is no way of knowing the answer,
4 but how would the staff address the degradation mode
5 on this --

6 DR. CRONENBERG: This kind of thing never
7 comes up in an uprate. You don't have -- usage factor
8 estimates in the power uprate. Those are time limited
9 aging analysis, and that is what the whole -- Mario
10 and some of your concerns are.

11 We don't look at licensing of a plant in
12 a holistic sense. We look at one licensing action and
13 make a judgment. We will get another licensing action
14 and make a judgment, and we will look at fuel
15 replacement and we make a judgment.

16 But we don't make or you don't have to
17 have legacy tables in here, where I did this to my
18 system, and I did that, and this was an uprate, and
19 this was a license renewal, and this was a fuel
20 change, and these are the changes in design basis
21 loads for all these changes.

22 Maybe somebody has, but I can't glean that
23 kind of information from any of these reports on the
24 legacy of this plant and all the changes that have
25 been made, and how it impacts margin. We review

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 separate licensing actions.

2 DR. SHACK: Peter's direct question, and
3 I think they would argue do the code analysis, with a
4 very small thinning requirement allowance in the code,
5 which is done independently --

6 DR. FORD: So the worst --

7 DR. SHACK: That is the only way the flow
8 assisted corrosion affects the CUF, and there is no
9 other thing, but then you would address the flow
10 assisted corrosion separately.

11 DR. FORD: Separate and take the worst
12 one?

13 DR. SHACK: Yes. You would have to
14 demonstrate that you weren't violating any of your
15 code limits on thinning.

16 DR. SIEBER: Well, there is actually
17 margin built into the manufactured product, because
18 the code says here is the minimum wall, and when you
19 go and buy a new one, it is thicker.

20 DR. WALLIS: George, we are due back here
21 at 1:15 after lunch, and that is a fixed time isn't
22 it? So we have to move along.

23 CHAIRMAN APOSTOLAKIS: Yes, and there is
24 also a separate meeting in 10 minutes.

25 DR. CRONENBERG: Okay. Do you want me to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 wrap this up? okay.

2 CHAIRMAN APOSTOLAKIS: Okay. Why don't
3 you go to the conclusions, and summary and
4 observations.

5 DR. CRONENBERG: Okay. Margin estimates.
6 Again, I talked about not getting or having to go
7 through lots of steps to get numbers. This
8 information is not readily available as far as I can
9 see.

10 And I tried to tell you that we get
11 summary reports in the license applications. We don't
12 -- if you want margin estimates for a plant, you are
13 going to have more than just I got it for this bolt
14 and this piece of pipe, and that's all I am going to
15 give you. There is not a lot of information.

16 And summary and observations. Safety
17 margins is used in a broad sense in the regulatory
18 process, and we have already talked about this. There
19 is a lot of difficulty in getting self-consistent data
20 for an assessment of margin impact.

21 Not only do you get it for different
22 components, but calculational codes change, and
23 calculational procedures change for LOCA. You are
24 already talking about major calculational changes for
25 LOCA.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 So it is hard to get an apples and apples
2 comparison. Nevertheless, I think that we had some
3 success for this case study for Hatch. We were able
4 to estimate from the licensee's own number some
5 signatures of margin reductions, and it looks like
6 there is always some margin reductions for various
7 pipe.

8 DR. WALLIS: And it is not particularly as
9 severe, except for these bolts and that may be --

10 DR. CRONENBERG: Yes, but we have not
11 looked at it integrated. I have given you bits and
12 pieces of information, too. I never put it all
13 together.

14 To me, the SARs and the SERs do not appear
15 to have information of sufficient detail or
16 consistency for any in-depth quantitative assessment
17 of margin info for multiple licensing actions.

18 I don't think we have the kind of
19 information from the SARs and SERs, and the type of
20 information requirements that we have to date.

21 Uprate review. Again, I want to endorse
22 the prior recommendations for a standard review plan.
23 I have been talking about this, and you have other
24 studies in this agency. The Maine Yankee lessons
25 learned says why don't you have a standard review plan

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 for uprates, and it would probably be better if there
2 was a scientific study of power uprates from the early
3 '70s.

4 And it came to the same conclusion. It is
5 an ad hoc sort of process that is not in place, and I
6 think the agency would be better served if we had a
7 standard review plan, especially when we are talking
8 about the power uprates that we are talking about; 20
9 percent for an aged fleet of plants.

10 And it also came from my own review of
11 operational events for operated plants. I had some
12 suggestions on what could be included in a standard
13 review plan, and it goes on from there. I think I can
14 wrap it up.

15 CHAIRMAN APOSTOLAKIS: Okay. Thank you.

16 DR. LEITCH: Just one question. I thought
17 that one of the effects that we were going to look at
18 is increased fuel burn up, and I don't see anything
19 about that here.

20 In other words, in addition to power
21 uprates and license renewal, I thought that one of the
22 other major things was increased fuel burn up. And I
23 just wondered if you planned to take a look at that
24 yet.

25 In other words, is that coming along in

1 the future? Are you saying what we have here is just
2 a preliminary draft?

3 DR. CRONENBERG: I don't think I am going
4 to be able to get to it. I think I have about 6 weeks
5 left in my time, and I want to wrap up what I have
6 done in a coherent paper report. So this project ends
7 in September, and I work half-time.

8 So I don't plan to do anything on fuels or
9 another plant, or anything else. I just wanted to
10 give you a report and I wanted to give you a 10 page
11 summary paper if somebody wants to publish it.

12 And I also want to do the same on a prior
13 study that I did for operational events. I want to
14 write a 10 page summary and leave it with some of you
15 guys to publish it.

16 DR. LARKINS: Gus, is there any -- do you
17 have reason to believe that there may be information
18 out there that if someone were to follow on to this
19 activity, this project, to do something in this area
20 additionally, like high burn up fuels?

21 DR. CRONENBERG: Yes, I think you could.
22 You have got to delve into it, and yes, there is
23 corrosion limits, and irradiation, and brittleness on
24 control rods that march on with time.

25 DR. LARKINS: One of the things that I am

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 getting at, and one of the things that you might want
2 to do in finalizing your report is to make some
3 recommendations for any follow-on activities.

4 DR. CRONENBERG: Sure. Sure.

5 VICE CHAIRMAN BONACA: Are you going to
6 look at some of the PRA aspects that we discussed
7 before?

8 DR. CRONENBERG: I am going to try to, but
9 basically you know what is in PRA. You don't reach
10 your design limits, and you march on. You don't fail
11 components.

12 DR. WALLIS: I am trying to grasp what the
13 ACRS should do on this, and we have a meeting on
14 Tuesday about uprates, and are we expected to write a
15 letter for July on power uprates or are we just sort
16 of learning as we go along, and eventually we will
17 have to do that.

18 VICE CHAIRMAN BONACA: I think we are
19 learning.

20 CHAIRMAN APOSTOLAKIS: At this point, we
21 are learning.

22 MR. ELLIOTT: I think that would be up to
23 you guys, depending on what you hear at the
24 subcommittee meeting. One thing to note is that back
25 in December when you discussed this issue last time,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the research people came in and said that they were
2 proposing to look at the issue of synergism that Gus
3 has raised here.

4 But they said that they had no funding,
5 and what you are going to hear Tuesday is now that
6 they do have funding, starting in FY '02. So you may
7 want to think about commenting on that, depending on
8 what he has to tell you on Tuesday.

9 DR. POWERS: It seems to me that it would
10 be surprising if we didn't come back and say how come
11 you guys haven't developed the standard review plan
12 for power uprates.

13 DR. ELLIOTT: Well, you may recall back
14 again in December that they told you that they didn't
15 plan to do it, and the committee took no action at
16 that time. They basically accepted that, and they
17 claim that they have a template that they used based
18 on the last two reviews, the Hatch and the Monticello,
19 and that is what they are following.

20 VICE CHAIRMAN BONACA: I am still left
21 with some curiosity in my mind regarding how would
22 LRF be affected with a power uprate and containment
23 that is not any more capable of being assumed
24 strength, and assuming the PRAs. I would just like to
25 understand that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And maybe the sensitivity on the PRA would
2 give us some answer on what the sensitivities are. I
3 really don't know.

4 DR. KRESS: I think the answer is that the
5 containments fail at the discontinuity that Dana tells
6 us about, and those probably don't change much by this
7 process.

8 DR. POWERS: We can probably get rid of
9 the containments, and it is not doing any good for us,
10 and --

11 DR. KRESS: Yes, we might as well get rid
12 of them, as they don't help.

13 CHAIRMAN APOSTOLAKIS: Okay. We are
14 recessed until 1:15.

15 (Whereupon, at 12:15 p.m., the meeting was
16 recessed.)

17
18
19
20
21
22
23
24
25

A-F-T-E-R-N-O-O-N S-E-S-S-I-O-N

(1:18 p.m.)

1
2
3 DR. POWERS: I will bring this session
4 into order, and we can just go right ahead with the
5 presentation on the South Texas project.

6 DR. SIEBER: Okay. The lead speaker today
7 will be John Nakoski, as the senior project manager
8 for this project; and since I have read most of the
9 things that you have written, you must have a sore arm
10 by now.

11 I would also mention that we are getting
12 down towards the end one way or another of this
13 project, and I have received lots of mail from anyone.

14 DR. POWERS: There are sore arms and a lot
15 of us with sore fingers, right?

16 DR. SIEBER: I would expect today to have
17 us have concerns to ask questions to see if they can
18 be resolved, and I intend to do the same. And from
19 those questions, you probably will get some of the
20 gist of how we are thinking.

21 But right now, and until we are through
22 hashing this over, we don't have a consensus yet, and
23 hopefully we will arrive at one. So with that kind of
24 introduction, John, I would like you to begin.

25 MR. NAKOSKI: Okay. Thank you. To my

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 right is Jack Strosnider, and he is the Director of
2 the Division of Engineering; and to my left is Gary
3 Holahan, and he is the Director of the Division of
4 Systems Safety and Analysis.

5 I would like to go quickly just to refresh
6 everyone's memory where we are and where we have been.
7 This is an effort that started in July of 1999. We
8 have met with South Texas a number of times, and those
9 meetings are on here, but we talked about them before.

10 In January of 2000, we issued a request
11 for additional information. South Texas came in with
12 a revised submittal in August of last year, and as you
13 can see, we briefed ACRS on this issue a number of
14 times.

15 In December of last year on the draft
16 safety evaluation that we issued on November 15th, and
17 in February of this year, we discussed categorization
18 with the NCRS subcommittee. In April of this year, we
19 had a meeting with the full committee on treatment.

20 Recent activity is that the staff, the
21 risk informed licensing panel, met with South Texas on
22 the content of the FSAR. In the middle of last month,
23 we finally brought to closure all the open items
24 identified in the draft safety evaluation.

25 And yesterday, the SE was forwarded to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 EDO for his review in support of a July 20th
2 commission meeting. And we are here today meeting
3 with the ACRS to cover our findings that are described
4 in a preliminary safety evaluation that we made
5 publicly available yesterday in a letter to South
6 Texas.

7 Going forward, we expect to brief the
8 Commission on July 20th, and following that, we expect
9 to issue the notices of exemption and the final safety
10 evaluation in August.

11 DR. SIEBER: You will get a letter from us
12 and it will probably come out in July, but we won't
13 have enough time from this meeting to resolve
14 everything and get it printed, and I don't think we
15 will anyway.

16 MR. NAKOSKI: And on our expectation, we
17 would expect that after the July meeting, after you
18 have had sufficient time to review the final safety
19 evaluation, to provide us with your comments.

20 The conclusions that the staff reached in
21 categorization is that we found or that we concluded
22 that it is acceptable to categorize the risk
23 significance of both the functions and the
24 structure systems and components for use in reducing
25 the scope of structure systems and components subject

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 to special treatment.

2 It is also acceptable to define those
3 structure systems and components for which exemptions
4 from the special treatment requirements can be
5 granted.

6 DR. SIEBER: Let me ask a fundamental
7 question, and the answer is not in the FSAR, but when
8 you use PRA, you calculate CDF and LRF, but if you
9 look at the regulations, there are restrictions on
10 plants, and there are components that are basic
11 components according to 1.3 that are that way not
12 because they impact CDF or LRF so much, but that there
13 are other kinds of accidents or things that can
14 release radiation either inside the plant or outside
15 to the public, like a spent fuel pool, and accidents,
16 and so forth.

17 How do you assure yourself that you
18 effectively blanket everything that is necessary by
19 using just CDF and LRF as the metrics for
20 categorization, or the deterministic process to the
21 extent that it addresses that?

22 MR. HOLAHAN: This is Gary Holahan. In
23 part, I think the answer is buried in your question,
24 and that is that CDF and LRF don't measure --

25 DR. SIEBER: Everything.

1 MR. HOLAHAN: -- everything, and that is
2 part of the reason that the categorization process,
3 and the testing of what belongs in each of those
4 categories can't be done just by the risk importance
5 measures.

6 In effect, there are many components that
7 are not modeled in the PRAs.

8 DR. SIEBER: That's right.

9 MR. HOLAHAN: And that's because either
10 the subject matter doesn't relate to core damage
11 frequency, or even if it does, because they are
12 screened out, or because their judgment is that they
13 are not such important contributors, or they are
14 subsumed in other super components if you will.

15 For all these reasons, we have pressed in
16 this activity, as well as all our decision makings,
17 back to regulatory guide 1.174, and that you need to
18 have an integrated decision process that covers issues
19 like defense in depth, and respects barriers, and
20 safety margins, and good engineering processes.

21 So we don't have numerical metrics for all
22 of those other things. South Texas has a process that
23 they use, and other people have used other processes.
24 But we recognize that the issues are more than core
25 damage and large LOCA release.

1 And the measures are more than CDF and
2 LRF. So you have to look at the whole process, and we
3 think that we have done that in this case. So we hope
4 to learn more about that.

5 DR. SIEBER: So you are relying on the
6 expert panel?

7 MR. HOLAHAN: We are relying on the expert
8 panel and that whole process involving the expert
9 panel to capture the rest of the features.

10 DR. KRESS: And that is what we mean by
11 the categorization process and the whole thing.

12 MR. HOLAHAN: By the categorization
13 process, we mean the whole process and not just the
14 importance measures.

15 VICE CHAIRMAN BONACA: You know, on this
16 issue, I was looking at the five questions that they
17 have used as some question that would lead you to, for
18 example, FSAR Part 100, and I thought that they
19 related more to CDF and LRF conclusions, but you are
20 telling me that they don't.

21 Or they may lead you, insofar as answering
22 to those questions, to Part 100 releases, or for
23 example, a limited amount of fuel damage?

24 MR. HOLAHAN: I think that the questions
25 are intended to do more than that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 VICE CHAIRMAN BONACA: Okay.

2 MR. HOLAHAN: I mean, we could ask South
3 Texas for some practical examples, but for example, if
4 I look at one of their questions, does the loss of
5 function in and of itself directly cause an initiating
6 event.

7 Now, that could cover events, whether they
8 are dominant sequences in the PRA that might cover
9 other initiating events as well, and that there is a
10 value of protecting against.

11 VICE CHAIRMAN BONACA: And if we could ask
12 that question to South Texas?

13 MR. GRANTUM: There are several questions
14 that are used in the determination process, and this
15 is Rick Grantum, South Texas. The one that Mr.
16 Holahan mentioned is one covering initiating events to
17 cover a spectrum of initiating events.

18 We also have other questions that are
19 associated with is the component mentioned or taken
20 for in our emergency operating procedures. So that
21 carries another set of components, and a lot of those
22 components are used, and the basis for those
23 components being in the EOPs is Part 100 requirements
24 and others of those aspects.

25 So we have a catchall in the EOPs that we

1 take credit for, and we also ask questions relative to
2 could it fail another risk significant component, and
3 is it used to mitigate accidents or transients.

4 Those are the deterministic types of
5 questions that the working groups and the expert
6 panels deliberate on to encompass the concerns that
7 have been mentioned.

8 DR. KRESS: When you talk about the
9 categorization process here, does that also include
10 the sensitivities analysis?

11 MR. HOLAHAN: Yes.

12 DR. KRESS: You are considering that part
13 of the process?

14 MR. HOLAHAN: Yes. In fact, if the
15 sensitivity studies, which in fact I think are more as
16 a Delta CDF, Delta LRF test, and if they showed that
17 the cumulative effect of these proposed changes was
18 too large, then in fact I think you would have to cut
19 back on how extensive a list of low safety
20 significance items you would put in that category.

21 DR. SIEBER: That is the 1.174 test.

22 MR. HOLAHAN: Yes, that's right actually.

23 DR. SIEBER: I guess in my opinion that
24 you can categorize any reasonable engineering
25 happening, provided that you have the sensitivity

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 studies and apply the result to a comparison of 1.174.

2 MR. HOLAHAN: Well, we talked about this
3 subject before, and I think in terms of the things
4 that can be measured by a PRA, the delta CDT test is
5 more important than the importance measures.

6 DR. SIEBER: That's what I think.

7 MR. HOLAHAN: And the fundamental nature
8 of it shows, because it is in reg guide 1.174, and
9 importance measures are not.

10 Importance measures are discussed in some
11 of the other issues, specific regulatory guides, but
12 in all of those cases there really are subordinate to
13 the overall goal of -- that the net effect of the
14 change should be -- on risk should be small.

15 DR. SIEBER: Right.

16 MR. HOLAHAN: But neither of those
17 processes captures the engineering safety margins or
18 defense in depth issues.

19 DR. SIEBER: That's right.

20 MR. HOLAHAN: So you couldn't go directly
21 to the Delta CDF and say that is the only issue.

22 DR. SIEBER: If I performed the so-called
23 thud test, and how much does it weigh, and how much
24 space do you put in the FSAR for these various
25 aspects, I see on page 16 that there is a paragraph

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that looks at the Delta CDF and Delta LRF as compared
2 to the standard in Reg Guide 1.174.

3 MR. HOLAHAN: Yes.

4 DR. SIEBER: But as you described the
5 screening process in the PRA, that is multi-pages, and
6 indeed that is plant specific, because I think that
7 the screening values, they don't seek to make a whole
8 lot of difference on exactly what they are.

9 But you could choose another set of
10 importance measures and as long as you could perform
11 this test that is on the bottom of your page 16, you
12 are okay.

13 So if you go and read it, it looks like
14 this comparison was an after-thought, and all the
15 categorization was done, and then they said, oh, gee,
16 we have some metrics here that we can apply to the reg
17 guide to show that we are okay, and that is sort of
18 the impression that I get.

19 MR. HOLAHAN: That is an impression or a
20 perception that we would not like to have widely seen.
21 The real fundamental measure is that the change that
22 you are doing has a small effect on risk.

23 DR. SIEBER: That's right.

24 MR. HOLAHAN: And I think the reason
25 importance measures took a large place is that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 certainly in other applications we didn't know how to
2 calculate Delta-CDF, and as a substitute, we said --
3 for example, on graded QA and other issues, we said
4 that one way of showing that the change in risk was
5 small was by only allowing changes to components that
6 we knew were very unimportant.

7 And having done that, we had a qualitative
8 feeling that the Delta-CDF's risk effect was small.
9 In cases where we think we can calculate Delta-CDF,
10 even though it is only through a sensitivity study, or
11 give a range, I think that is important.

12 We have given some thought to the subject,
13 and I would say one other thing. I think you could
14 meet the small effect on risk goal by almost
15 arbitrarily picking the components and then doing this
16 test.

17 But I don't think you could meet one of
18 our other goals, and one of the goals of this whole
19 process is that we should be focusing the staff and
20 the licensee on those components that are most
21 important to safety.

22 So I think it is advantageous to give the
23 best shot we can at identifying important and less
24 important components. For example, you could approach
25 this issue from a purely economic point of view, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 go to the most expensive components and apply it, and
2 keep subtracting until you get Delta-CDF is equal to
3 whatever it is, and say that is where I am going to
4 go.

5 I think that is not the overall safety
6 approach that has been laid out. What we have said is
7 that that would not be focusing your attention on
8 safety. It is focusing your attention on the costs.

9 And though we recognize that we would like
10 to reduce unnecessary burden, we would like to do it
11 in a way that produces a better safety focus. So the
12 categorization process in my mind is not arbitrary.
13 You ought to take your best shot at it, and then you
14 ought to also test it with respect to its effect on
15 the overall result.

16 DR. KRESS: That leads me to believe sort
17 of in an indirect fashion you are giving a blessing to
18 the use of RAL and FSER vesely as a way to provide
19 this focus on risk significant items. Is that a
20 correct interpretation of what you said?

21 MR. HOLAHAN: In this case, yes. I think
22 what we have said in our general documents is that we
23 have given these as examples, and not to say that this
24 is the only way to do it.

25 But that you always ought to have more

1 than one -- I think what reg guide 1.174 says is that
2 you ought to have at least two risk matrix, and there
3 ought to be two complimentary ones. And it suggests
4 that these are two of the four that are mentioned.

5 DR. KRESS: The problem that I may have
6 with that is that I am not sure that developing the
7 RAL and FSER vesely for each individual component of
8 an entirely group, of which there may be many of,
9 correctly addresses the group importance, and in
10 giving a blessing to the process under those
11 circumstances.

12 And that's all right for one component,
13 and that's fine, or one or two components even. but
14 for a relatively large group of components, I am not
15 sure it is wise to give that blessing at this moment
16 to the use of RAL and FSER vesely of each individual
17 component as a threshold to decide safety significance
18 of the items. Could you respond maybe to that?

19 MR. HOLAHAN: I think there are a couple
20 of unresolved issues with the importance measures. So
21 at the moment, in this application, we are satisfied
22 with what was done. In part, because we watched them
23 do it, okay, and we saw how it was coming out.

24 And we know quite a lot about the PRA, and
25 we know what the dominant risk sequences are, and what

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the total CDF and LRFs are for this plant.

2 I don't think you can pick risk matrix -- FSER vesely,
3 RAL, or any of these things -- and use them
4 abstractly.

5 I think it makes a difference whether the
6 baseline risk is 10 to the minus 4 or 10 to the minus
7 6. I think that affects how you pick the components.

8 I think we all recognize that if you slice
9 the pieces down to the sub, sub, sub, subcomponent,
10 you could eventually show that everything isn't very
11 important, every little piece isn't very important.

12 So what we found is that as it was done
13 here is okay. I think you have to be a little bit
14 careful about extrapolating that to say any plant can
15 pick up these risk matrix and these thresholds and use
16 them in the future.

17 DR. KRESS: Will that be made clear in the
18 FSAR?

19 MR. HOLAHAN: Well, I think it is not so
20 important in the FSAR.

21 DR. SIEBER: It is in the FSAR.

22 MR. NAKOSKI: This is John Nakoski. I
23 believe we do mention or state in the FSAR that these
24 screening criteria, or FSER vesely and RAL, are pretty
25 much SDP specific.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. SIEBER: You say that, and you go a
2 little bit further to say that it is not necessarily
3 a template, and that is where I think we ought to be
4 with this.

5 DR. KRESS: And how is it that you know
6 that the screening criteria is appropriate even for
7 SDP? Is it because of the sensitivity analysis
8 verifies it?

9 MR. HOLAHAN: The sensitivity analysis
10 shows that the total of change can't be all that
11 large.

12 DR. KRESS: And if I do not have the
13 sensitivity analysis?

14 MR. HOLAHAN: It would be very hard to
15 judge that.

16 DR. KRESS: It would be hard to make a
17 judgment on that?

18 MR. HOLAHAN: Yes. And I think also when
19 you do a sensitivity analysis that you would find out
20 that 99.99 percent of that change can change just a
21 couple of components.

22 I think you would think that maybe you
23 didn't do it right either. In this case, I would have
24 been surprised to find that.

25 DR. SIEBER: Could you describe or give us

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 a list of the sensitivity studies that were done?

2 MR. HOLAHAN: I couldn't, but I think a
3 member of our staff could. Sam, Sam Lee.

4 MR. LEE: Hi. This is Sam Lee. I am not
5 sure if I understood the question. The question was
6 to give you a list of the sensitivity studies that was
7 done for this particular --

8 DR. SIEBER: What the perimeters were.
9 There was more than one study, right?

10 MR. LEE: Yes. First of all --

11 DR. SIEBER: There was 21 studies or
12 something like that.

13 MR. LEE: The particular study that we
14 focused our review on was the study where it took all
15 the components and took the mean failure rate and
16 multiplied by a factor of 10, and that gave us some
17 sense that there were to be a change in reliability in
18 these components.

19 And if we were to assume that it might
20 have changed by a factor of 10, what impact would that
21 have on the overall plant frequency. That was the
22 sensitivity study which we focused our view on, but I
23 believe that maybe South Texas can help me with this.

24 Is that there were many more sensitivity
25 studies done that were done to support that finding.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 The other one that we also focused on was as you
2 pointed out, that CDF and LRF were not the only matrix
3 that we looked at.

4 We did ask the question in our REI as to
5 how they accounted for the importance of those
6 equipment that are there to protect the containment,
7 and so one of the studies that the licensee performed
8 for us was the failure containment probability. That
9 is another one that we looked at.

10 MR. GRANTUM: This is Rick Grantum, and I
11 can give you some other examples if you want to hear
12 some more.

13 DR. SIEBER: No, I would prefer in the
14 interest of time, and we aren't even through the first
15 sentence yet.

16 MR. HOLAHAN: But there are only two
17 topics.

18 DR. SIEBER: On the other hand, it is
19 important for me to understand what the staff relied
20 on to come to the conclusions in this FSAR, as opposed
21 to how many thousands --

22 VICE CHAIRMAN BONACA: I would like to ask
23 just one more question before we move on, because I
24 asked the question before with regard to the other
25 measures of performance, and the answer was

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 satisfactory to me.

2 But you also spoke about that you don't
3 want to communicate, and when I read the FSAR, I
4 really did not appreciate from it that that integrated
5 process that really is the heart of 1.174 is truly
6 addressed here through those measures.

7 I mean, maybe I didn't read it right, but
8 it didn't come through, and so I am glad to hear that
9 it was used. But I think it could have been more
10 explicitly addressed in the terms.

11 Because one is left with the impression
12 that other subsumed goals, such as Part 100, are not
13 being addressed, and that is really what I concluded.

14 DR. KRESS: Before Sam Lee sits down, for
15 the sensitivity studies, could you maybe tell me why
16 it is that you feel comfortable with the factor of 10?
17 Do you have some database that says that?

18 MR. LEE: When we first were reviewing
19 their initial submittal, and we wanted to see --
20 again, we are postulating that there could be changes
21 in the reliability. We are not sure of the
22 reliability, but --

23 DR. KRESS: You may not change it at all.

24 MR. LEE: But what may be a good number,
25 and the factor of 10 was actually submitted by the

1 licensee. But what gave us a sense of comfort for
2 that was that if you look at most of the failure
3 rates, and the distributions for the components in
4 South Texas, you have a range of the 50th percentile
5 to the 95th percentile.

6 And typically for those components, the
7 error factor of three sort of lined up with the 95th
8 percentile. So in our view, if you had a factor of
9 10, that well exceeded the 95th percentile.

10 DR. KRESS: Somehow that doesn't give me
11 much comfort, because that is a distribution of
12 failure rates for things that have been given special
13 treatment.

14 MR. LEE: That's correct.

15 DR. KRESS: And what I am really
16 interested in is how would that change if the special
17 treatment were not given to them, which means that you
18 may shift the whole distribution one way or the other
19 and by some amount.

20 And so I am more interested in whether
21 there has been a comparison of things that have been
22 given the special treatment with things that have not
23 been given, and if you had any feeling as to that.

24 MR. LEE: Well, that is really a good
25 point, because a factor of three would be within the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 boundary of the 95th percentile. That's why if you
2 assume a factor of 10, it wouldn't actually exceed the
3 distribution, and that gave us some sense that even if
4 you were to shift the distribution to the right a
5 little bit, that that might be bound by that.

6 But you are right. It is hard for us to
7 tell how much of that shift will be, and a factor of
8 10 at this point gave us some sense that it would be
9 okay.

10 And again I would emphasize again that
11 when you do the sensitivity analysis and you look at
12 the results of the Delta changes, they are fairly
13 small.

14 DR. KRESS: They are really small with a
15 factor of 10, yes.

16 MR. LEE: Yes. So maybe perhaps we can
17 assume that if we were to extend the factor out even
18 further, and we haven't -- and I don't think that
19 South Texas has done that.

20 But even if we were to do that, my guess
21 would be that it might still be within the window.
22 But I am not suggesting that we ought to do that.

23 DR. SIEBER: One of the disappointing
24 things to me is that not only does it seem a little
25 arbitrary and we don't know the answer now, but we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 never will know it with the exemption on 50.65.

2 MR. STROSNIDER: This is Jack Strosnider,
3 and I would like to make a few comments on this
4 because it starts getting directly to the treatment
5 issue, and I guess just a few thoughts.

6 One is with regard to trying to quantify
7 how this distribution shifts. And I think we have to
8 recognize that we can't quantify right now what the
9 special treatment rules actually add in terms of CDF,
10 or LRF, or any of these.

11 We don't have that quantified to begin
12 with. There was a lot of judgment and the intent was
13 to maintain a high confidence and a high reliability
14 functionality.

15 DR. KRESS: Is there a database out there
16 for failure rates of things like these that have been
17 given the commercial treatment?

18 MR. STROSNIDER: There is some, and South
19 Texas did some work, and it is referred to in our SER.

20 MR. GRANTUM: On page 53.

21 MR. STROSNIDER: On page 53. They looked
22 at NPRDS, the nuclear plant reliability data system,
23 for information, and it indicates here between the
24 years of 1977 and 1996, and to try and answer the
25 question of reliability of commercial versus safety

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 related components.

2 And in fact I think the staff has tried
3 this a few times in the past, and I think the
4 conclusion was that there was no appreciable
5 difference in the reliability. In fact, it is not
6 like you can actually tell if you were given a
7 component and you tested it a while, it is kind of
8 hard to tell if it is safety related or commercial.

9 MR. STROSNIDER: I would just add that I
10 think that is true based on the sort of data that was
11 looked at, where you are looking at unavailability
12 times and that sort of thing.

13 But I want to come back again to that I
14 don't think you should really expect that there is a
15 quantitative correlation here, or that it is easily
16 quantified in terms of the change in treatment, and
17 what the quantitative effect is.

18 And to recognize a comparison with
19 commercial equipment and that the data does not
20 include would this equipment function under seismic or
21 harsh environments, or some of those things.

22 So you can get some insights certainly,
23 but also some of the specific things that we are
24 trying to look at are not directly addressed by that
25 database.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But that tells you that you shouldn't
2 expect necessarily a quantitative relationship, which
3 is a valid question, and in the ideal world you would
4 like to have that. But then if you go another --

5 DR. KRESS: Well, I just want a good
6 feeling that in fact --

7 MR. STROSNIDER: And to go another step,
8 too, talking about the sensitivity analysis, and what
9 does a factor of 10 tell you. We discussed this at
10 the last meeting on treatment, in terms of potential
11 for common cause failures, and you could argue that
12 changes in treatment could potentially influence that,
13 and that was one of the subjects that we did discuss.

14 And I would just point out in the safety
15 evaluation, which as John Nakoski indicated, is sent
16 to the licensee, we stated our understanding of that
17 sensitivity study and how it addresses the potential
18 for common cause failures.

19 In fact, the licensees indicated that for
20 certain groups of components, like MOVs, that it was
21 not explicitly addressed in their sensitivity studies.

22 But we put down our understanding of it so
23 that we could get confirmation from them when they
24 look at this to see if it is accurate. So those are
25 all issues that come up in terms of the sensitivity

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 studies, et cetera.

2 But the thing that I want to point out is
3 that the finding that we were trying to look at, and
4 I am getting a little bit ahead here, but what the PRA
5 staff told the engineering staff is that you want to
6 maintain functionality of this equipment.

7 And it might be with lower confidence, but
8 you need to maintain functionality because I don't
9 think that anybody concluded that these sensitivity
10 studies indicated that if you had common cause
11 failures of some significance that it might not impact
12 the CDF and LRF values.

13 So when we start to talk about treatment,
14 I would just point out and recognize that the intent
15 is to maintain functionality throughout the life of
16 the component under the design basis conditions.

17 DR. SIEBER: Well, the point that I was
18 trying to make though is that the maintenance rule is
19 a way to gather information, and with the NEI Maint
20 9.301, there is a lot of flexibility in how you group
21 components.

22 You can group them by TRAM, by system, or
23 by individual component, and it seemed to me that just
24 keeping what goes on in the maintenance rule, since
25 they already do it now, is not such a great burden.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And that you maybe get a better sense
2 after a process like this was in process for a couple
3 of years as to what those failure rates really were
4 and how they would change, provided there was enough
5 data to do it. You know, you don't have 50 failures
6 a day and so it takes a lot time to accumulate data.

7 MR. STROSNIDER: But I do think that if
8 you are going to try to address some of these issues
9 through the maintenance rules, you would have to make
10 sure that that program is really looking at some of
11 these issues that are addressed by special treatment.

12 Again, harsh environment and seismic
13 conditions, and those are tough things to get at, and
14 that's why I said that in the end that you end up
15 having to apply considerable judgment, in terms of
16 what is the appropriate level of treatment.

17 DR. SIEBER: Yes, but the problem is
18 without the maintenance rule, you have no
19 documentation, and so there is no chance of doing an
20 analysis, even though you may not know what the answer
21 is. Well, that is my feeling on that subject.

22 DR. KRESS: Could you give me a better
23 idea of what you exactly mean by maintain
24 functionality?

25 MR. STROSNIDER: Well, let me go back and

1 say let's start by thinking about what it is that we
2 are looking at exempting. If you look at the special
3 treatment rules, at least to some extent, or I think
4 to a large extent, the purpose of those was to make
5 sure that that structure systems and components, when
6 called upon to mitigate an accident, would perform
7 their safety related functions.

8 And so this is mitigating an accident, and
9 so you are into a situation where perhaps there is
10 steam, radiation, humidity, whatever the environment
11 is, and the component has to be able to function, and
12 that is to deliver its safety related function under
13 that environment.

14 Similarly, if you postulate the seismic
15 event, that it will perform its safety related
16 function under that seismic event. So those are two
17 easy examples of what the special treatment rules were
18 intended to address.

19 Now, the question is if you go look at
20 what is required by those rules and everything, can
21 you for low safety significant components, can you
22 relax some of the treatment, and the amount of rigor
23 that is in those special treatment rules and to come
24 up with a program that would still maintain
25 functionality, but might not require as much in terms

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of whether it be documentation or testing, or whatever
2 it is.

3 DR. POWERS: I guess I am still struggling
4 with the difference in your mind between functionality
5 and availability is.

6 MR. STROSNIDER: Well, there is in my
7 mind, because if you look at availability, if a
8 component fails to function under normal operating
9 conditions, then you have probably got a pretty good
10 indication that it is not going to perform under these
11 more challenging conditions that I referred to.

12 But if a component does function under
13 normal operating conditions, or if it is not called
14 upon to function under normal operating conditions,
15 but is called upon during the accident and the more
16 severe conditions, you have to ask yourself are you
17 getting information that says, yes, will it operate
18 under those conditions.

19 Those are very difficult things to get and
20 they always have been, and that should not be a
21 surprise. When you talk about collecting information
22 on-line, how often do you really do a test under those
23 sort of environments or seismic conditions? You
24 don't.

25 That's why the special treatment rules try

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to address that in terms of the other elements that we
2 will get to in the treatment program. You know,
3 procurement, and maintenance, and those sorts of
4 activities.

5 CHAIRMAN APOSTOLAKIS: So functionality
6 here means the ability to function as expected? It
7 has nothing to do with the probability that it will do
8 it?

9 MR. HOLAHAN: It has to do with
10 capability.

11 CHAIRMAN APOSTOLAKIS: Capability.

12 DR. SIEBER: I think a better comparison
13 is to equate availability with operability, and
14 operability according to the rules is a pretty high
15 standard.

16 You have to meet a number of rigid
17 parameters for a component, and you can fail to do
18 that, and it won't be operable or available, but it
19 will still function, because maybe the service demand
20 is not as severe as the envelope in which the
21 component is supposed to be maintained to be operable.
22 I don't know if that makes sense or not.

23 MR. HOLAHAN: I know of some utilities who
24 use the terminology of big "O" operability and little
25 "o" operability, because there is some legal

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 implications.

2 CHAIRMAN APOSTOLAKIS: There is no Greek
3 "O" there. Remember Greek "O"? Well, let's go back
4 to the categorization, because we are mixing too many
5 things.

6 And the thing that concerns me is that
7 -- well, first of all, I agree with what Gary said
8 earlier and what is in the FSAR, that the overall
9 approach makes a convincing case, at least in my mind,
10 that the risk 3 and risk 4 components belong there,
11 and we can discuss their treatment and so on. But
12 what worries me is that if we approve this and list
13 everything they have done, and put it in the FSAR and
14 so on -- and I will use a word that was used a lot in
15 our meetings with the Commission, that we will ossify
16 the methodology, okay?

17 And that is not only -- I mean, that
18 concern doesn't only have to do with the importance
19 measures, but it is also the questions that the expert
20 panel used with some issues here regarding the degree
21 to which they overlap and so on, and evidently nobody
22 really thought about them.

23 It was a purely -- and that reminds me a
24 little bit of the old days when we were dealing with
25 expert judgment. If an academic was doing the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 exercise, they would tend to invite academics, and so
2 they would talk about pumps in the abstract.

3 If engineers were to do it, they would
4 invite pump experts, and they would have no idea as to
5 the normal part of dealing with expert opinion. It
6 dawned on us with 1.150 and later studies, that
7 actually you need both kinds of expertise.

8 And you need the normative expert and the
9 substantive expert, and here I think the expertise
10 that was missing was the normative kind. You know,
11 the structuring, and maybe it was missing in the
12 actual work that you did.

13 But if I look at the paper that I have in
14 front of me, and questioning the overlapping, and at
15 the same time if I read the whole thing, I say, my
16 goodness, the overall conclusion makes sense. It does
17 make sense.

18 I may pick one page and say why did you do
19 it this way, and you could do it better, but does that
20 really change the conclusion? But what worries me is
21 that what if you have 20 licensees tomorrow who come
22 and repeat everything that South Texas did and a
23 factor of 10?

24 Why not a factor of five? It seems to me
25 that to shift the mean value by a factor of five is a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 heroic effort. You are shifting the mean.

2 DR. KRESS: That would be a hard thing to
3 do.

4 CHAIRMAN APOSTOLAKIS: And you are taking
5 the whole distribution and putting it up there, you
6 know. And judging from the weak evidence we have,
7 Gary, you said that they couldn't tell the difference
8 between the failure rates.

9 So all this stuff, it would be nice to
10 have some incentive to think about it without
11 necessarily -- you know how it is. If these guys
12 approve something, that's it.

13 MR. HOLAHAN: If they can get away with a
14 factor of five that would be an incentive.

15 DR. SIEBER: One wonders whether that
16 would make any difference.

17 CHAIRMAN APOSTOLAKIS: But you know how it
18 is. The moment it is approved though, everybody else
19 says we are going to get it, too, and that's it.

20 MR. HOLAHAN: I am not so concerned about
21 the ossification problem. It is not as though this is
22 the lead plant in an exercise where we expect other
23 plants to follow this model.

24 Remember that the overall context of this
25 is we are working risk informed regulation, Option 2,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 rule making. And this is sort of a proof of principle
2 that shows that we are capable of defining a program
3 and a licensee is capable of implementing such a
4 program.

5 I think the issue of how to do this more
6 generically so that it applies to everyone still faces
7 us, and it is an integral part of Option 2 and the
8 rule making activity.

9 So I don't see this as the model that will
10 last and be used by many people. I see that as being
11 framed by how we deal with these issues in Option 2
12 and in a rule making context.

13 CHAIRMAN APOSTOLAKIS: And when is that
14 going to take place by the way?

15 MR. HOLAHAN: Well, we have already
16 started.

17 DR. SIEBER: Is there any more questions
18 on this first sentence?

19 DR. LEITCH: I am in the first paragraph,
20 and I guess that's all one sentence. So, yes. I am
21 concerned about the reliability of the instruments,
22 particularly control room instruments that the
23 operator uses to make significant decisions.

24 And there is a subset of those instruments
25 described in what I think is Reg Guide 1.97 if my

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 memory serves me correctly.

2 CHAIRMAN APOSTOLAKIS: That's it.

3 DR. LEITCH: And the operators are trained
4 in accident situations to specifically rely on those
5 instruments. And I guess my question is whether is it
6 fair to assume -- and I think it is, but I just would
7 like to hear confirmation, but is it fair to assume
8 that none of those instruments would have been
9 categorized as Risk 3?

10 MR. HOLAHAN: Well, let me answer the
11 question a little differently. The staff is approving
12 a process, and so we can't give you a list of how
13 these components fall out in the process.

14 As a matter of fact, probably most of that
15 categorization hasn't been done. We approve a process
16 and over a period of time a licensee will implement
17 this system by system. So many of those components
18 may not have been categorized yet.

19 DR. LEITCH: But what you understand of
20 the process, would you expect that the process --

21 MR. HOLAHAN: From what I understand of
22 the process, I would think that particularly the part
23 of the process that addresses the expert panel and the
24 look at the emergency operating procedures would go
25 directly to those instruments that are referred to in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the emergency operating procedures.

2 And that would push them into the high category.

3 DR. SIEBER: Well, this is question two in
4 the deterministic section on page 18, which tells me
5 that if it is in the EOP or an ERG, it is category one
6 or two.

7 CHAIRMAN APOSTOLAKIS: Now, one other
8 thing about ossification. The extensive use of
9 conservative assumptions in a risk-informed framework,
10 I think we ought to be very careful before we start
11 doing that.

12 And a factor of 10 is one, and I think it
13 is conservative from everything that I know about it.

14 MR. STROSNIDER: I guess I would just
15 suggest that we probably need to think about that. If
16 I could give some examples. There was a discussion on
17 just one of the open items that we had, which was how
18 you treat metering test equipment and whether you
19 found that that metering test equipment was out of
20 calibration if you needed to go back to some of these
21 slow safety significant equipment and recalibrate it.

22 The original proposal was not to do that,
23 and the only reason that I bring that up is because
24 there is the potential if you look at something like
25 that for treatment.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 If you had something that was really way
2 out of calibration, and to go off and mis-calibrate a
3 set of equipment, such that it wouldn't function
4 -- and the shift there is much greater than -- could
5 be much greater than a factor of 10. We dealt with
6 that open item, and --

7 CHAIRMAN APOSTOLAKIS: A shift of what?

8 MR. STROSNIDER: In the probability of
9 functioning. If you take equipment -- and let's say
10 it starts at 10 to the minus 3rd probability of
11 functioning, and you go out and you mis-calibrate it,
12 it may go to a point where it is not going to
13 function.

14 And if you do that across a number of
15 different components, you could have an issue. Now,
16 like I said, that is an open item that we dealt with,
17 but when you start talking about treatment, there is
18 the potential to have impact on functionality.

19 And if you are starting at 10 to the minus
20 3rd, and you say I am going to go from one in a
21 thousand chance that it doesn't work to one in a
22 hundred --

23 CHAIRMAN APOSTOLAKIS: Yes, but mis-
24 calibration is not part of the failure rate as far as
25 I know. Mis-calibration is a human error that is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 found separately, and they didn't increase that by a
2 factor of 10.

3 If a failure rate is due to random causes,
4 and it is very hard to say that going up by a factor
5 of 10, the mean value.

6 MR. STROSNIDER: I would suggest that
7 there is random causes, but one of the other issues
8 that you really want to think about when you are
9 talking about changing treatment is the potential for
10 common cause failures; common cause maintenance,
11 common cause calibration and the sort of things that
12 I was mentioning, which could affect more than a
13 factor of 10.

14 CHAIRMAN APOSTOLAKIS: Were these
15 analyzed?

16 MR. STROSNIDER: Well, again, I would like
17 to put that into the context of that is one of the
18 reasons when we get to the treatment discussion, where
19 we will say that the objective of the treatment
20 program is to make sure that these structure system
21 components will function, and that functionality is
22 being maintained.

23 And that is one of the reasons it is
24 important to put that as a goal of the treatment
25 program because of those kinds of considerations.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 MR. HOLAHAN: I would like to go back and
2 say something about conservatism, because there is
3 some forms of conservatism that I think are
4 detrimental to a risk informed process and others that
5 are not necessarily.

6 If you make some conservative assumptions
7 in the PRA in some areas, you will distort the
8 perception of what is important and what is not, and
9 those are I think destructive. That sort of
10 conservatism will in fact change the importance
11 measures, and it will change what goes into the
12 categories.

13 The kind of conservatism associated with
14 picking a factor of 10, as opposed to something else,
15 I don't think distorts the results. It may put a
16 little more margin in some way in your decision.

17 It may restrict you in how many components
18 go in this category versus that one, but I don't think
19 it is as serious a concern as sort of distorting your
20 views so that you are not really focusing on the most
21 important things.

22 You are simply focusing on the things that
23 you assumed were problems, and drove those to be the
24 answers.

25 CHAIRMAN APOSTOLAKIS: On the other hand,

1 if a factor of 10 is used 2, 3, or 4 times, then it
2 becomes part of the tradition, and then the first guy
3 who cannot show that a CDF has been small with a
4 factor of 10 is stuck.

5 Now what do you do? If he dares go down
6 to a factor of five, all hell is going to break loose
7 again. So that is the danger of that, and also the
8 treatment of common mode failures, and taking the
9 whole importance of the therm, and putting it under
10 one component, that is also a conservative thing to
11 do.

12 And again we don't want to bless those and
13 have them there forever. For a particular regulatory
14 decision, I think conservatism is fine, but again this
15 works now and it doesn't work tomorrow.

16 And the whole idea of risk informing the
17 regulations is to be as realistic as possible.

18 DR. SIEBER: But it seems to me that that
19 kind of literary discussion would go on with the
20 writing of the rule and its companion reg guide, which
21 would be the suggested implementation; as opposed to
22 trying to somehow or other weave it into this
23 particular set of requests for exemption, provided
24 that those documents appear within my lifetime.

25 CHAIRMAN APOSTOLAKIS: So let me

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 understand you. You are asking STP to put all this
2 stuff in the FSAR, right?

3 MR. HOLAHAN: All this stuff?

4 CHAIRMAN APOSTOLAKIS: The thresholds that
5 they use for all --

6 MR. HOLAHAN: Yes. Yes, we are.

7 CHAIRMAN APOSTOLAKIS: So I guess you have
8 categorized all the components, right? Are there any
9 more?

10 MR. CHINSEL: Yes. We have done about
11 45,000 systems.

12 CHAIRMAN APOSTOLAKIS: How many all
13 together?

14 MR. CHINSEL: There is a few over a
15 hundred-thousand per plant.

16 CHAIRMAN APOSTOLAKIS: But these remaining
17 55,000 are not in the PRA and so the importance
18 measures are irrelevant, right? It would be part
19 basically of the expert --

20 MR. CHINSEL: Some of the components are
21 still in the PRA that we have not yet categorized.

22 MR. HOLAHAN: I think we are going system
23 by system.

24 MR. CHINSEL: That's correct, going system
25 by system.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN APOSTOLAKIS: So you are blessing
2 this particular process with the 50,000?

3 MR. CHINSEL: Yes.

4 DR. SIEBER: And that's probably why you
5 are putting the metrics in there specifically as
6 numerical value.

7 MR. HOLAHAN: I think we are also putting
8 it in there --

9 DR. SIEBER: It describes the process that
10 they are using.

11 MR. HOLAHAN: Yes. I think we are also
12 somewhat constrained by the fact that this is an
13 exemption, and that we have not been through a rule
14 making process, and in fact we are making a finding
15 that this is an appropriate substitute for the normal
16 regulations in these areas.

17 I think we were probably somewhat more
18 constrained in being less flexible in how a licensee
19 can change this process than we may be at the time
20 when the rule making is done.

21 If you think of it analogously, we have
22 50.59, and which allows licensees in other areas in
23 effect to make changes and through a certain set of
24 tests, they are basically saying that they judge that
25 they are still in conformance with the regulations

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 under this change situation.

2 In this case, if we were to allow
3 additional flexibility, in effect what we are saying
4 is that the licensee doesn't meet the regulations, but
5 we have defined some other process.

6 And to allow them to change that process,
7 and for them to decide that they still don't meet the
8 regulation, but they have some other standard which
9 they decided as good enough to grant them an
10 exemption, it is not something that we would normally
11 do.

12 I mean, we really don't have a process for
13 doing that. So there are some constraints associated
14 with the fact that this is an exemption, as opposed to
15 a license amendment, or even a rule change.

16 DR. SIEBER: Okay. John, maybe we can
17 move on.

18 MR. NAKOSKI: Okay. This is John Nakoski
19 again. If we can get to bullet two on slide three.
20 This deals with the conclusions that we drew on
21 treatment, and what we concluded was that the
22 alternative treatment program proposed by South Texas
23 includes the necessary elements, and that if South
24 Texas effectively implements them, can result in the
25 safety-related low risk components remaining capable

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of performing their safety functions under design
2 basis conditions.

3 CHAIRMAN APOSTOLAKIS: Why do you need to
4 say if effectively implemented? I mean, was there any
5 intended proposed alternative treatment program and
6 was that effectively implemented?

7 MR. NAKOSKI: It is not -- it doesn't
8 indicate that, but we believe that it would be
9 ineffectively implemented. It is just that it is an
10 indication that the burden for effective
11 implementation remains with South Texas.

12 MR. NAKOSKI: This is Jack Strosnider, and
13 just to point out that is where that burden always is.
14 The licensee has that responsibility, and it
15 emphasizes that, but it also was intended to point out
16 the fact that the staff did not do a detailed review
17 of how this treatment would actually be implemented.

18 Normally our more traditional approach is
19 that we get down into looking at procedures, and we
20 get down into a lot of very specific issues. We tried
21 to avoid that in this review.

22 The reason for that is that recognizing
23 that this is, given the robust categorization process,
24 that this is low safety significant components, so
25 that we didn't need to go into that level of detail.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But we wanted to make sure that the people
2 understood that we didn't, all right? And what we
3 looked at was the high level programmatic elements,
4 the expected outcomes, and I will acknowledge that in
5 some cases that we expanded on what was meant by some
6 of that, in terms of what we thought needed to be in
7 the FSAR.

8 But we tried to focus, and you have heard
9 some of the prior discussions on the what's; that is,
10 what is expected, versus how it is actually going to
11 happen.

12 And it would have been a different review
13 if we really had gone down into how are you
14 specifically going to treat this piece of equipment or
15 that piece of equipment.

16 DR. SIEBER: I think one of the
17 interesting things is that the way that this is laid
18 out is pretty good, because it actually quotes what is
19 going to go into the FSAR, and when I examined the
20 proposed treatment requirements, I noticed in a number
21 of places where decisions are being made, or where
22 things are happening, and engineering decisions, like
23 equivalency, and that kind of stuff.

24 And in the training program, my program is
25 just as good as the vendor's recommended program. The

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 last sentence in every one of those is that no
2 documentation is required. I don't see how you can
3 manage your engineering department or your training
4 department without documentation, which is the basis
5 upon which you make decisions.

6 So I am wondering if you are putting the
7 time in to make the decision, or to do the analysis,
8 why can't you spend a little extra time and write it
9 down.

10 MR. NAKOSKI: This is John Nakoski. It
11 is not that we would not expect South Texas to have
12 some sort of documentation. It is just that we would
13 not require that to be documented.

14 For their business practices, you are
15 right. They would need to have some sort of records.

16 DR. SIEBER: I don't understand how you
17 could do a good job of organizing engineering without
18 writing down the basis of the decisions that you make.

19 And I guess the other thing that strikes
20 me then is what if issues come up where enforcement is
21 necessary by the NRC, you wouldn't have a basis upon
22 which an enforcement action could occur, because they
23 wouldn't be required to keep the record.

24 MR. STROSNIDER: And there was actually a
25 lot of discussion internally with regard to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 documentation. Of course, again trying to look at
2 this from a risk-informed perspective, and looking at
3 various areas where you can reduce unnecessary
4 regulatory burden, the discussions were what sort of
5 documentation is really essential and needs to be
6 maintained in accordance with existing special
7 treatment, and what can we let go of in a sense.

8 We talked about equipment qualification as
9 an example, and that is one area where if you look at
10 the special treatment rules, there are some
11 significant requirements for documentation, and
12 quality assurance, et cetera.

13 DR. SIEBER: Yes, I didn't discuss those.

14 MR. STROSNIDER: And if you accept the low
15 safety significance of some of these components, then
16 you might not need that same amount of rigor. Yes,
17 the expectation as I said, and if you look at each one
18 of the elements in this program, there is an
19 expectation stated at the beginning of it in terms of
20 maintaining functionality.

21 Whatever the licensee needs to do in order
22 to keep track of that, they would have to do, but that
23 is their determination at this point. EQ might be an
24 example where you say if you want to understand the
25 qualified life, and at what point do you need to deal

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 with that.

2 And the expectation is that they would
3 maintain the functionality of this equipment, and if
4 there is something that needs to be checked at some
5 period, then they would have to do that.

6 But we are not prescribing, like what is
7 prescribed in the special treatment rules, what is
8 necessary, so that they could get by with just what is
9 necessary for them to meet these outcomes.

10 So it is a different approach and you have
11 to look at it and recognizing its low safety
12 significance components.

13 MR. HOLAHAN: I think you also have to
14 look at this issue in the context of the new reactor
15 oversight process, and which the expectation would be
16 that because these are low safety significant
17 components, it is very unlikely that they will ever be
18 above the licensee response zone.

19 And so you would expect the licensee to
20 find and fix these issues, but you wouldn't expect
21 them to require any elevated attention by the NRC. I
22 am not saying it is impossible, but normally you
23 wouldn't expect that.

24 DR. WALLIS: You took the trouble to put
25 in this phrase of "if effectively implemented by the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 licensee." That kind of implies that someone is going
2 to check up on it. So what is the mechanism for
3 checking up on this effectiveness of implementation?

4 MR. STROSNIDER: I think you are looking
5 at the reactor oversight process. I don't think it
6 would be the intent to focus our inspections on low
7 safety significant components unless something drives
8 you into that from the perspective of the oversight
9 process, in which case then it would be dealt with.

10 DR. WALLIS: If you are going to take the
11 trouble to mention it though implies that you are
12 saying that someone has to check up on it in some way
13 from time to time, and I am just wondering where it
14 falls in the inspection process.

15 MR. HOLAHAN: In the reactor oversight
16 process, because it is a low safety significance, they
17 are not likely to be focused on. So the normal place
18 to see them is in the inspection of the corrective
19 active program, which is one of the central elements
20 of the inspection program.

21 DR. SIEBER: And no exemption was
22 requested from any element of that.

23 MR. NAKOSKI: That's correct. Corrective
24 action requirements of Criterion 15 and 16 of 10 CFR
25 50, Appendix B, continue to apply.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. SIEBER: That's right.

2 MR. HOLAHAN: And the reason that the
3 reactor oversight process includes corrective action
4 is because obviously we have put a lot of these lower
5 issues into the licensee response area, and so we need
6 to have some mechanism -- and not just for these
7 specific components, but for the whole program -- to
8 see that they are responding effectively to all of the
9 issues that are below the green light threshold

10 DR. SIEBER: So the documentation
11 obviously for Risk 4, and also now for Risk 3, is of
12 no regulatory concern?

13 MR. HOLAHAN: That's correct. Quality
14 records would not be required.

15 DR. SIEBER: On the other hand the
16 licensee has to understand that even in a coal plant
17 that you keep records when you maintain things, and
18 when you calibrate them, and what engineering
19 decisions that you make, and operating difficulties,
20 and that type of thing. That is standard business
21 practice.

22 MR. HOLAHAN: I think we have talked about
23 documentation, but this exemption does not remove
24 documentation completely. There are certain areas --

25 DR. SIEBER: I know that, right.

1 MR. HOLAHAN: -- of design and corrective
2 action and documentation will still be there.

3 MR. NAKOSKI: Okay. We can move off the
4 third slide, and go to findings that the staff made.
5 These are really findings that we have to make in
6 order to grant the exemptions.

7 The first one is that we found that
8 relaxing the special treatment requirements on these
9 low risk components poses no undue risk to public
10 health and safety.

11 We also found that the categorization
12 process is a material circumstance that wasn't
13 considered when the special treatment requirements
14 were adopted.

15 And we may have considered risk insights
16 when some of these regulations were adopted, but we
17 have never I believe considered an integrated decision
18 making process like proposed by South Texas.

19 We have also concluded that it is in the
20 public interest to grant the exemption. That is
21 primarily that we have improved efficiencies and
22 effectiveness in the application of our oversight. We
23 target our attention better on those risk significant
24 components and functions at South Texas, and South
25 Texas can do the same.

1 Now, we also found that the proposed SFAR
2 section is a sufficient basis for granting the
3 exemptions.

4 South Texas requested -- I believe it was
5 18 -- exemptions from 18 regulations, and to one
6 extent or another, exemptions for low safety
7 significant, non-risk significant components that fall
8 within the scope of these regulations.

9 And the ones that are listed here on the
10 slide are being granted. If I can talk just a little
11 bit about some of the rules and where there are some
12 limitations.

13 On 10 CFR 50.49(b), which would exempt
14 essentially all of these LSS and NRS components from
15 the scope of the environmental qualification rule,
16 there are some design aspects that continue to apply,
17 and it is covered in the safety evaluation.

18 The exemption to 10 CFR 50.59, really it
19 only applies to changes to treatment that result from
20 the granting of these exemptions. For any other
21 change to the FSAR or any other licensing basis
22 document, the requirements of 50.59 continue to apply.
23 The Appendix B --

24 DR. SIEBER: The change to treatment was
25 to cease maintaining the item and turn it into a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 breakdown of maintenance, where would that fall under
2 50.59?

3 MR. NAKOSKI: If it was covered by the
4 scope of an exemption that we granted, they would not
5 have to seek prior staff approval for that. If it
6 wasn't covered by an exemption that we granted, they
7 would have to come in if when they were doing their
8 50.59 evaluation that it required prior staff review
9 and approval. Did that answer your question?

10 DR. SIEBER: Even if it was Risk 3?

11 MR. NAKOSKI: If it was outside the scope
12 of an exemption we granted, yes, they would have to
13 come in for -- if it was for the threshold of 50.59.

14 In other words, if they have a commitment
15 in their licensing basis that isn't part of this --

16 DR. SIEBER: Well, you have a commitment
17 to the PM program, but you exempt portions of that,
18 basically saying that just a PM program to match
19 commercial standards, whatever they are.

20 Then there is a phrase that is in there a
21 couple of times that the licensee is not obligated to
22 list all the commercial standards, and what the State
23 of Texas says they ought to do, which could be the
24 State of Pennsylvania, or Maryland, or whatever. They
25 all do the same stuff.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And so I could picture taking that to its
2 extreme limit, and somebody deciding that I am going
3 to save money and I am not going to change the oil
4 except every 10 years.

5 MR. HOLAHAN: I don't think that you could
6 make that decision and be consistent with a
7 description of the program in the FSAR.

8 MR. NAKOSKI: That's correct.

9 MR. HOLAHAN: And what this is basically
10 saying is that you can't change -- you can change the
11 programs so long as it still conforms to what is in
12 the FSAR, and there is probably a lot of flexibility
13 for doing that.

14 MR. NAKOSKI: I think there is actually
15 confusion, and this is John Nakoski again. The 50.59
16 process is basically -- the exemption that we are
17 granting them for 50.59 basically applies to changes
18 that they will need to make to their FSAR as a result
19 of the exemptions that we grant.

20 There is going to be an addition. They
21 are going to add a section to the FSAR that lays out
22 their categorization and alternative treatment
23 processes.

24 In there also will be a change control
25 process for how they control changes to that Section

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 13.7 of their FSAR. It kind of lays over any
2 requirement that 50.59 would impose on that section.
3 So if the wanted to change the treatment that is
4 described in Section 13.7 of their FSAR --

5 DR. SIEBER: They have to ask you first.

6 MR. NAKOSKI: -- and if it reduces the
7 effectiveness, it has to come back in, because it will
8 undermine or has the potential to undermine the basis
9 for our exemption.

10 DR. SIEBER: And 50.65.

11 MR. NAKOSKI: And 50.65, the maintenance
12 rule, there is recently 50.65(a)(4), which came into
13 effect, and that continues to apply to all components
14 within the scope of the maintenance rule.

15 DR. SIEBER: Maybe to help us, you could
16 tell us what (a)(4) does.

17 MR. HOLAHAN: And I am drawing a blank.
18 Well, (a)(4) requires licensees to assess and manage
19 the risk associated with taking components out of
20 service.

21 DR. SIEBER: Okay. And since these are
22 low risk things, it is not hard to manage.

23 MR. HOLAHAN: Right.

24 DR. SIEBER: On the other hand, you lose
25 again some of the tracking and records, like taking

1 20,000 components out of the maintenance rule, and
2 that gets back to my --

3 MR. NAKOSKI: I will say that part of the
4 South Texas monitoring program is if a low risk
5 component impacted an HSS or MSS function, they would
6 capture that failure. So that data would be captured.

7 But if its failure impacted or affected a
8 low risk or non-risk function, it wouldn't be
9 captured. So again it is targeting the attention on
10 the high risk, medium risk functions that we want to
11 focus on.

12 DR. SIEBER: And if I go through the
13 deterministic screening questions, it would seem to me
14 that there would not be a low risk component that
15 would affect or disable a high risk frame, right,
16 because it wouldn't get screened out. It would not
17 get screened into a risk series.

18 MR. NAKOSKI: That is our expectation;
19 that if it does occur that it would be infrequent.

20 DR. SIEBER: And it would almost seem like
21 it was impossible. On the other hand, you are
22 expecting functionality of even RSC-3 components, but
23 you won't have a record.

24 MR. NAKOSKI: I'm sorry, but I didn't
25 catch that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. SIEBER: There won't be a record as to
2 whether it was functional or not.

3 MR. HOLAHAN: But from a safety point of
4 view, it isn't that important.

5 MR. NAKOSKI: I would modify that to say
6 that there wouldn't necessarily be a quality record
7 under an Appendix B program.

8 DR. SIEBER: You aren't requiring any
9 record?

10 MR. NAKOSKI: That's correct.

11 MR. HOLAHAN: Except corrective action
12 program and design basis.

13 MR. NAKOSKI: And design control. Under
14 10 CFR 50, Appendix B, quality assurance criteria, as
15 we discussed previously, Criterion 3, design control,
16 and Criterion 15, with non-conforming materials,
17 components, and parts; and 16, correction actions,
18 continue to be in effect.

19 The exemption to Appendix J is for type
20 leak rate testing only; and the exemption to Part 100,
21 the design requirements continue to apply as described
22 in Part 100.

23 And the exemption is to the specific
24 engineering analysis and testing requirements in Part
25 100.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 There were some exemptions that we
2 determined that we would not grant, and primarily the
3 general design criteria -- really because what the
4 licensee proposed met the regulations for GDC-1, and
5 this relates to the other two at the bottom of the
6 slide, 50.35(b)(6)ii), and 50.54(a)(3).

7 Early in the review process, we recognized
8 and South Texas recognized that really we needed to
9 have a quality assurance program updated to reflect
10 the changes in treatment, and if for nothing else, as
11 a record keeping tool.

12 And as a result, they submitted and we
13 found acceptable as discussed in the safety evaluation
14 their proposed revision to the operating quality
15 assurance plan, and so that met the requirements of
16 GDC-1.

17 GDC-2, 4, and 18, they deal with design
18 requirements, and the design isn't being changed under
19 this exemption or under Option 2. So really they
20 don't fall within the scope, and there is no special
21 treatments for which exemptions should be granted.

22 Now, as I said, the last two, we
23 determined that an update to the QA program should be
24 done and South Texas agreed. So we aren't granting
25 those exemptions either.

1 And with that, that is the prepared
2 material that I had for the meeting today, and we
3 would be happy to answer any additional questions.

4 DR. SIEBER: I suspect there are no
5 shortage of questions. If anyone would like to ask
6 questions that are disturbing them at this time, this
7 would be a great chance as we are ahead of schedule.

8 DR. POWERS: I guess my question is have
9 we resolved the question.

10 DR. SIEBER: Well, it all depends on what
11 you would call resolution, and that it may not
12 necessarily be pertinent. On the other hand, I think
13 that the question that I have asked will cover the
14 areas of concern, and we are trying to decide now how
15 important my feelings really are to the success of
16 this project, and that will take a little bit more
17 thinking on my part.

18 But I am sure that others have asked a lot
19 of questions of me that seem to be pretty burning.

20 DR. POWERS: Let's come back to the
21 question on the cut-offs for FSER vesely -- well, the
22 issue is that they picked some values and used them in
23 this application. But it seems to me that those
24 weren't particular outlandish values that they picked.

25 In fact, they seem kind of common, but

1 there seems to be some interest in claiming that those
2 aren't not be a template for others to use, and so my
3 question is why not?

4 DR. SIEBER: Well, that was my comment of
5 10 days ago, and it was really responding to Dr.
6 Apostolakis' remark about ossifying some methodology
7 industry wide, and that was really the purpose why I
8 said it shouldn't be bound to use those screening
9 criteria for bound to use questions that they asked in
10 the rating system that went alongside that.

11 And the general methodology was okay, and
12 I basically say that because my personal opinion
13 really is it doesn't make a lot of difference how you
14 do the categorization provided that you have no heavy
15 hitters in there, and that you meet the criteria of
16 Reg Guide 1.174. And so it was an attempt to satisfy,
17 and it could go either way.

18 DR. KRESS: My problem with that, Dana, is
19 two-fold. One of them is that those importance
20 measures have the absolute value of the CDF and the
21 LRF, if you are using LRF also, in the denominator.

22 Therefore, almost automatically it makes
23 them plant specific. Now, that may look like a simple
24 fix. You just take the numbers and multiply them by
25 the -- or ratio them by the CDF, and you have got

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 another set of numbers.

2 MR. HOLAHAN: Or perhaps we should put the
3 safety code quantitative objectives in the
4 denominator.

5 DR. KRESS: That would be another way to
6 fix it.

7 DR. SIEBER: But that may change
8 categorization.

9 DR. KRESS: So that was one of my
10 problems. The other problem that I had though -- and
11 I think it is a deeper problem -- is that I am not
12 quite sure that I agree with Jack that the
13 categorization process doesn't matter.

14 You have got the expert opinion, and you
15 could use a ouija board, and you could throw darts,
16 and as long as you validate it with your sensitivity
17 analysis, but I am not quite comfortable with that
18 because I have a feeling that there is a way to decide
19 what thresholds to use for RAL and FSER vesely that
20 would give you a given change or a given percentage
21 change in CDF and LRF.

22 I am not certain of that because I have a
23 real problem -- what we found with each of these RALs
24 is the individual RAL for each component, and I don't
25 know how to combine those for a bunch of components.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 You just don't multiply by a number of
2 components, or you don't add them up, but what I am
3 afraid of that we will quit here. When I think there
4 may be somewhere in these definitions of RAL and FSER
5 vesely a way to actually technically defend their use
6 in bounding the group RAL, and the group LRF, and I
7 just did not want them to quit here and say now it
8 doesn't matter.

9 But if there is a way technically to come
10 up with that group RAL, that would be a value for a
11 lot of the risk-informed things that we are going to
12 do later on, and we may want to use those things.

13 And it is extension of the technology of
14 using RALs and FSER vesely, and other important
15 measures, to the other risk informed processes that
16 worries me.

17 And I just did not want them to quit
18 because while we have got this sensitivity study or an
19 uncertainty analysis, whichever you want to use, to
20 validate it, because it doesn't matter how you got
21 there.

22 I think it does matter because I think it
23 is going to be used in other processes and it could be
24 misused, and I think it is an opportunity to further
25 develop the concept so that it is technically

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 defensible. That was my worry.

2 DR. SIEBER: And I guess if I were South
3 Texas, I would wonder why I am getting stuck with
4 doing the extra part.

5 DR. KRESS: And that is the other part.
6 I didn't to penalize South Texas, because I do agree
7 that they have jumped through enough hoops and that I
8 do believe that the sensitivity study does confirm
9 that their process fits into the 1.174.

10 I just didn't want to -- I think this is
11 an additional research project that needs to be done,
12 and I didn't want to bless the process as it is for a
13 group RAL or a group FSER vesely, and I wanted to be
14 sure in the whole letter or whatever we do that we
15 don't bless that, because I don't want to stop with
16 that.

17 CHAIRMAN APOSTOLAKIS: Isn't that a little
18 related, Tom, to the issue identified with respect to
19 the risk-based performance indicators?

20 DR. KRESS: It is related definitely, and
21 I am afraid that there may be other places in the
22 risk-informed process where it is related. I didn't
23 want to leave the impression that just because it is
24 okay to give South Texas their exemption because they
25 did this that we have a process that is technically

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 defendable, in terms of actually determining -- well,
2 the process is here because it was confirmed by the
3 sensitivity analysis. That is the technical defense
4 of it. You may not have a sensitivity analysis for
5 all these other things.

6 DR. SHACK: You are always going to have
7 to compute, or bound, or estimate Delta-CDF for it to
8 work.

9 DR. KRESS: Well, this is what I am
10 saying.

11 DR. SHACK: The sensitivity study in this
12 case is a substitute for computing Delta-CDF.

13 DR. KRESS: What I am saying though is
14 there may be a way to use RAL, and FSER vesely to
15 determine that bound without going to the sensitivity
16 analysis if you did it right.

17 That is what I am saying ought to be
18 developed. You wouldn't have to do the sensitivity
19 because we were able to do the sensitivity here
20 because we got a good warm feeling that Factor 10
21 really does bound the effects.

22 We may not have a warm feeling about some
23 other thing, and we may not be able to do this
24 calculation. It would be useful to have a RAL and a
25 FSER vesely that you actually knew did bound a group

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 effect, and that is what I am saying.

2 CHAIRMAN APOSTOLAKIS: We can put it in a
3 different way. I think it is defensible the way it
4 is, but we wouldn't want it to stay that way. I mean,
5 we want it to stay defensible. We would not want the
6 methodology to be frozen for all these reasons.

7 DR. SHACK: Well, I would agree with that.
8 I would look at it in a different way. I mean, we --

9 CHAIRMAN APOSTOLAKIS: There is always a
10 third way.

11 DR. SHACK: When you select these
12 components, you are satisfying other things other than
13 the Delta-CDF and the Delta-LRF, and you get other
14 things.

15 You know, as we argued, the FSER vesely
16 looks at the risk significant components, and the RAL
17 looks at the stuff with the low failure rates if it is
18 really safety significant here.

19 You are gathering things together, and so
20 those populations that you do gather and test, and see
21 if the Delta-CDF have different characteristics, and
22 I think that should be researched.

23 DR. KRESS: Well, I also felt that this
24 was a one-way test, and that you took those components
25 that were downgraded and did all of them with a factor

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of 10. But you had 40,000 other components that you
2 didn't do that to.

3 And if you did the FSER vesely and RAL
4 correctly for group components, you may find out that
5 some of those actually would have been risk
6 significant; whereas, they weren't even -- you didn't
7 --

8 DR. SHACK: The reason that you had a FSER
9 vesely for a RAL was in the PRA.

10 CHAIRMAN APOSTOLAKIS: Well, let me give
11 you another example and a possible improvement. Did
12 you consider at all the idea -- and this question is
13 addressed to South Texas -- of surrogate components
14 like they use in risk-informed inspections?

15 DR. KRESS: And that's what I had in mind.
16 You could surrogate some of those other 40,000.

17 MR. GRANTUM: There are some components
18 that are surrogate components when you look at the
19 components like diesel generators that encompass large
20 skid mounted equipment.

21 CHAIRMAN APOSTOLAKIS: And how about the
22 thousands of components that are not in the PRA? Just
23 like pipes are not in the PRA, but in the risk-
24 informed inspection program, they consider -- well, at
25 least the Westinghouse approach, considers the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 surrogate component.

2 So you look at the impact of the failure
3 of that pipe on that component and that super
4 component isn't in the PRA. I mean, that is a lot of
5 work, and you don't necessarily have to do it in your
6 case. But did you consider it at all?

7 MR. GRANTUM: Yes, that has been
8 considered whenever we have talked about the
9 applications of risk-informed in-service inspection
10 and that was in fact some of the discussion on how
11 robust the categorization process was, because there
12 was an issue about -- well, we contended that we did
13 look at surrogate components.

14 And taking out a section of a pipe or
15 several piping segments could be the same as assuming
16 that the pump has failed, but have the same impact on
17 the CDF.

18 CHAIRMAN APOSTOLAKIS: And that is an
19 inspection problem?

20 MR. GRANTUM: Right. But it is also in
21 the PRA, because we had the FSER vesely of that
22 component failing, which one could make an argument
23 that the piping segments would be the same.

24 I would say that the staff had concerns
25 about that because they indicated that they didn't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 think that accounted for dynamic effects; pipe failing
2 and special interactions types of effects.

3 CHAIRMAN APOSTOLAKIS: But the exemption
4 request, this one, and not the risk-informed
5 inspection program; did you do any of these surrogate
6 component business?

7 MR. GRANTUM: Not --

8 CHAIRMAN APOSTOLAKIS: Or is it strictly
9 based on the expert panel --

10 MR. GRANTUM: It is based on the series of
11 sensitivity studies that PRA comes up with a statement
12 of the importance based on the 21 sensitivity studies,
13 the working group combines the deterministic
14 questions, and the expert panel approves that.

15 So the surrogate components that you are
16 referring to weren't directly done as part of the
17 categorization for this.

18 CHAIRMAN APOSTOLAKIS: If I take a
19 component that is not in the PRA, and the expert panel
20 categorizes it based on the five questions, and there
21 was no further analysis to see whether that component
22 could belong to a bigger component that is already in
23 the PRA so I could have some sense of what would
24 happen if we do it the same way for the --

25 MR. GRANTUM: Well, yes, we answered the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 five questions, and we are asking the question could
2 it fail a function.

3 CHAIRMAN APOSTOLAKIS: And then one could
4 conceivably find the RAL for that system and somehow
5 come up with an intelligent method that Tom is asking
6 for.

7 MR. GRANTUM: Right.

8 CHAIRMAN APOSTOLAKIS: Again, this not
9 something that you might have done, but that could be
10 an improvement in the matter.

11 MR. GRANTUM: Well, with a series of
12 sensitivity questions, I would say the answer is yes.
13 I mean, for looking at all the questions that we
14 asked, it is subsumed in those answers.

15 DR. SIEBER: When I think what Dr. Kress
16 said, that he could eliminate the sensitivity studies
17 and have the proper definition of the thresholds for
18 the importance measures, I guess then that I would
19 object to that.

20 DR. KRESS: I don't know if it is possible
21 or not.

22 DR. SIEBER: I think the regulatory basis
23 -- what you are doing here is Reg Guide 1.174, and
24 without the sensitivity studies, it can't apply.

25 DR. KRESS: Oh, yeah, because you are

1 bounding the delta, if they actually bond the delta,
2 but I don't know if it is possible or not.

3 DR. SIEBER: I guess you could, but I
4 would still like to see it directly applied the way
5 the regulation states, as opposed to --

6 DR. KRESS: But you may not be able to do
7 that all the time.

8 MR. HOLAHAN: Those two could come
9 together, if for example, you could calculate the
10 Delta-CDF contribution at the component level, and
11 then you simply add them up, and that is equivalent to
12 doing the sensitivity study.

13 So you pick a bunch of small ones, but you
14 make sure that the cumulative effect is still small.

15 DR. SIEBER: Well, I guess I still don't
16 believe that South Texas ought to get that rock in
17 their knapsack.

18 DR. KRESS: Well, I actually wasn't
19 proposing that either.

20 DR. SIEBER: Well, nobody is proposing
21 that.

22 MR. GRANUM: Dr. Apostolakis, I have been
23 asked to clarify something. There are comments over
24 here that, no, we didn't explicitly go and take a
25 component, and extrapolate out in the form of a super

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 component to look at the impact of that.

2 On the other side of the coin, when we
3 looked at a component deterministically, if it was
4 going to fail a function or it would have failed a
5 risk-significant function somehow, it would have
6 gotten the same ranking as the highest significant
7 function that it was associated with.

8 CHAIRMAN APOSTOLAKIS: It was the panel
9 that did this?

10 MR. GRANUM: Right. I wanted to clarify
11 that, and I will allow my colleague here to further
12 clarify that if you would like.

13 MR. SCHNIZEL: Glen Schnizel, South Texas.
14 Now, again, if a component's model is in the PRA, we
15 looked at it from the function standpoint, and if
16 there are other components that are necessary to
17 satisfy that same function, if those components would
18 fail, they received essentially the same
19 categorization as would the PRA reflected. So, from
20 that perspective, that is how we captured that.

21 MR. HOLAHAN: Let me say something on this
22 subject, and that is that I share some of the
23 committee's concern, but not another part of it.

24 I am not a particular fan of FSER veselies
25 and RALs. I think there are a lot of limitations and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 difficulties with them, and I think there is room for
2 improvement, and we ought to be encouraging that.

3 And I am supportive of that, and I think
4 the fundamental goal is to identify components issues
5 to be focused on, and also to be judging whether the
6 small change standard in 1.174 is met. I don't share
7 the committee's concern over ossification.

8 DR. SHACK: Well, Appendix T is the place
9 where ossification is concerned.

10 MR. HOLAHAN: Amen. That's right. I
11 think before we get to that point that there is plenty
12 of time to lay those issues out. Plus, the way that
13 we have been thinking of Appendix T, it would say that
14 you can do it this way, or you can propose something
15 else.

16 And the purpose of an Appendix T is to say
17 we are sure that this is okay, and so you can do it
18 without review and approval. I don't see that the
19 staff is in a mood or is not receptive to new and
20 good ideas. The whole reason we are here is -- this
21 whole thing is a new and different idea.

22 CHAIRMAN APOSTOLAKIS: Well, what happens,
23 Gary, until we have a new -- which could be some time,
24 and let's say you have three other licensees, and they
25 hear that South Texas was granted the exemptions, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 they go line-by-line, and they try to reproduce what
2 South Texas did.

3 Now, they might have problems because of
4 the extreme redundance that those guys would get, but
5 the --

6 MR. HOLAHAN: That could happen. As a
7 matter of fact, we are granting this for Unit 1 and
8 Unit 2. I mean, so you already have two. So what is
9 wrong with that?

10 DR. POWERS: Well, I'm ready to ossify
11 them.

12 CHAIRMAN APOSTOLAKIS: What?

13 (Laughter.)

14 DR. KRESS: Too late.

15 DR. POWERS: For the life of me, I have
16 not seen anything here that is going to change or that
17 causes any heartburn to people. The only thing that
18 looks at all suspectively is this business of okay,
19 suppose I take a low safety significant component, and
20 let's say it is dead and died.

21 And now I do the raw for the other
22 components and one or two of them might come up, and
23 we don't find that out. We don't know that. I don't
24 know why we don't do that. It seems like an easy job
25 to do.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HOLAHAN: Except the number of
2 combinations is astronomical.

3 DR. POWERS: It is a modest common
4 editorial problem.

5 CHAIRMAN APOSTOLAKIS: It is modest when
6 you want to calculate a number, but actually doing it
7 is different.

8 DR. POWERS: I am sure that these things
9 could be imaginatively done.

10 MR. HOLAHAN: This is getting simpler all
11 the time.

12 DR. POWERS: I mean, that seems to be the
13 only thing that would represent a significant
14 improvement in the technology. Otherwise, I am ready
15 to ossify. Why not have somebody do it line by line.

16 CHAIRMAN APOSTOLAKIS: Wait. Wait. Has
17 anyone come to you yet or hinted that they might come
18 with Option 2 exemptions request using the top event
19 prevention methodology? That is really different.

20 MR. HOLAHAN: No.

21 CHAIRMAN APOSTOLAKIS: Nobody has done
22 that?

23 MR. HOLAHAN: I have not heard that. We
24 have had discussions of the top event methodology in
25 other contexts, and not as an exemption.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN APOSTOLAKIS: Well, that would be
2 very different.

3 MR. HOLAHAN: I have not heard it. Tim
4 Reid, have you heard anything?

5 MR. REID: Top event prevention has been
6 discussed at some of our meetings, and those
7 individuals have attended our meetings, but I haven't
8 heard any exemption or any idea like that being
9 proposed so far.

10 CHAIRMAN APOSTOLAKIS: Okay. Because that
11 would be a very different approach. Okay. Thank you.

12 DR. SIEBER: Any further questions?

13 CHAIRMAN APOSTOLAKIS: Or comments.

14 DR. SIEBER: If not, Mr. Chairman, I think
15 we have concluded. Thank you very much, and I thought
16 it was very productive.

17 CHAIRMAN APOSTOLAKIS: Thank you,
18 gentleman. Well, we are due for a break. So we can
19 go with a break. We will recess until 3:35.

20 (Whereupon, at 2:53 p.m., the meeting was
21 recessed, and was resumed at 3:35 p.m.)

22 CHAIRMAN APOSTOLAKIS: We are back in
23 session, gentlemen. The last presentation of the day
24 is by Mr. Sorensen, ACRS Senior Fellow, and he will
25 talk to us about the general design criteria, and some

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 work that he did the last few months for us. Jack.

2 DR. SORENSEN: Thank you. This assignment
3 actually had its genesis during the ACRS planning
4 session, and the scope was basically to take a look at
5 the Federal design criteria and Appendix B from the
6 standpoint of their place in the grand scheme of
7 things if one is going to risk-informed regulation.

8 There was sort of an underlying thought
9 that Appendix A and Appendix B would be key to risk-
10 informed revisions to the regulations, and that
11 probably is not quite true.

12 The questions that I tried to address and
13 will touch on in this presentation -- and in the paper
14 which follows it -- are the GDC risk-informed as
15 written, and the answer to that question is yes,
16 insofar as that concept was understood at the time the
17 criteria were written.

18 The second question is are they an
19 impediment to risk-informing Part 50, and the answer
20 to that is that some are, and many are not, and we can
21 go through some examples of it later.

22 How can they be made risk-informed, and I
23 have addressed that in a very general way, and in a
24 somewhat naive way perhaps, but I hope in a way that
25 will be useful.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And the final question today apply to new
2 reactor types or non-light water reactors, and the
3 answer to that is that some do and some don't, and I
4 will try to touch on these.

5 The general design criteria as they exist
6 right now, and have existed since about 1971, are 55
7 individual criteria in six groups. The overall
8 requirements protection by multiple fission product
9 barriers and protection and reactor control systems,
10 and fluid systems, and reactor containment, and fuel
11 and radioactivity control, and the scope and content
12 of the individual criteria, vary very greatly from one
13 to the next.

14 DR. KRESS: What happened to 6 through 9?

15 DR. SORENSEN: Funny you should ask that.
16 I think I actually touch on that in a later slide, but
17 the earliest -- the GDC, as they exist now in Appendix
18 A to part 50, were published in February of 1971, or
19 incorporated into Part 50 in 1971.

20 The earliest version that I could find
21 was written in 1965, I believe. I found a memo from
22 Harold Price, who was then the Director of Regulation
23 to the Commissioners, forwarding general design
24 criteria for consideration. There were 27. And the
25 evolution of the criteria as far as I can tell was

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 primarily in negotiation between the staff and the
2 ACRS over a period of several years.

3 Following that 1965 version, I know that
4 around 1969 that there was a version published for
5 comment that contained 70 criteria, and they were
6 numbered consecutively from 1 through 70.

7 When they were finally incorporated in
8 Appendix B, some had been combined with others, and
9 some had been dropped, and for reasons which are a bit
10 mysterious, they tried to maintain something of the
11 original numbering scheme.

12 So there are gaps in the numbering scheme.
13 They reflect the state-of-the-art in reactor design at
14 the time that they were published, and when we get
15 into looking at individual criteria that becomes very
16 evident.

17 Another observation is that they reflect
18 the phenomenology important for light water reactor
19 safety. The early version that I mentioned, the 1965
20 version, clearly made an attempt to cover other
21 technologies that are references to unclad fuel,
22 vented fuel, and other features that are not typical
23 of light water reactors.

24 What evolved into the 70 criteria and
25 later into the 55 is clearly focused on light water

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 reactor technology, and indeed the introduction to
2 Appendix A says that.

3 And the criteria contained 4 or 5
4 different kinds of information, and in hopes that it
5 might at some point be useful, I tried to characterize
6 them in that sense.

7 Typically, each criteria either
8 establishes a need for conservatism, a list of things
9 that need to be accounted for, which I have decided to
10 call completeness. They call for a capability to be
11 provided.

12 They call for reliability of some of the
13 systems or functions that are required, or they simply
14 require a defense in depth feature of one kind or
15 another.

16 In the package of material that I gave
17 you, at the end of that, there is a spread sheet that
18 summarizes all 55 criteria, and some of the different
19 ways that I have tried to characterize them, though I
20 don't plan to use that directly in the presentation.
21 But it might be a useful reference at some point.

22 I have also included in what I gave you
23 verbatim copies of the text of Appendix A, the general
24 design criteria, and Appendix B, the QA criteria, in
25 case you want to refer to those.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 In the introduction to Appendix A are the
2 following major -- or what I would call the major
3 points. The application for construction permit must
4 include the principal design criteria for the system.
5 That is a requirement in Appendix A.

6 And by implication one option would be to
7 simply play back the general design criteria that are
8 listed there. The criteria to establish requirements
9 for structure, systems, and components important to
10 safety, and again this is from Appendix A directly.

11 Important to safety is defined as those
12 systems, structures, and components that provide
13 reasonable assurance of no undue risk; and what that
14 means is that what we are dealing with in Appendix A
15 is an adequate protection standard, because there is
16 a legal equivalence established between the phrase,
17 "No undue risk," and "adequate protection."

18 So the standard is not risk. It is
19 adequate protection. And the criteria as written
20 establish minimum requirements for water cooled
21 nuclear plants. That is specifically stated.

22 It is also stated that there are
23 considered to be generally applicable to other types
24 and can provide guidance in establishing criteria for
25 other reactor types.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Appendix A also goes on to say, or the
2 introduction goes on to say, that the development of
3 the general design criteria is not yet complete, and
4 that there are four issues enumerated that need
5 further consideration, which are:

6 Single failures of passive components;
7 redundancy in diversity requirements for fluid
8 systems; type size and orientation of primary system
9 breaks; systematic non-random concurrent failures or
10 redundant elements. As far as I know, those words
11 have been since 1971 unchanged.

12 Also, within the introduction there are
13 two exceptions listed, the first two points on this
14 slide. The introduction specifically says that the
15 general design criteria may not be sufficient for some
16 plants, in which case the applicant is expected to
17 propose additional criteria.

18 And it also says that some general design
19 criteria may not be necessary for some plants, and
20 again the applicant is in principle to propose his own
21 set.

22 One observation that is kind of
23 interesting is that we really don't know without
24 examining individual license conditions to what degree
25 the operating plants comply with the general design

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 criteria.

2 Over half of the currently operating
3 plants received their construction permits before the
4 GDC were made part of Part 50. There are some
5 important definitions in Appendix A, and specifically
6 definitions for loss of coolant accidents, which that
7 has been discussed in a number of presentations today,
8 earlier, and in the previous couple of days.

9 And they define loss of coolant accident
10 as including all pipe breaks up to and including the
11 double-end break of the largest pipe in the system.
12 There is a definition for single failure and there is
13 a definition for anticipated operational occurrences.

14 So those phrases are self-supported within
15 the appendix. Before we get into this possible
16 specific changes to Appendix A, I think there is some
17 observations that are worth making.

18 One is that past regulatory reform
19 efforts, and I am thinking specifically of the
20 marginal safety program that was conducted during the
21 1980s, and the regulatory review group in the early
22 '90s, judged the GDC to be important to safety and to
23 not be a significant burden, insofar as the regulatory
24 structure was concerned.

25 In support of that thought, one can

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 observe that there are 160 division one regulatory
2 guides, and of those, 129 support some aspect of one
3 or more of the general design criteria.

4 I think an additional 10 of those are QA
5 related, which in a sense also supports the GDC,
6 because the first criteria is a QA criteria. Part 50
7 incorporates a lot of material by reference. So
8 specifically the ASME code, Sections 3 and 11, and I
9 think Section 8 now as a matter of fact.

10 Several IEEE standards, and so the GDC are
11 a relatively small part of the total volume of
12 regulation that one has to deal with, and in reality
13 risk-informing the GDC only makes sense in conjunction
14 with other changes in the regulations.

15 The reason for making particular note of
16 that is that from this point on, and in order to keep
17 the scope of what I was doing reasonable, I had looked
18 basically at the GDC in isolation. I didn't try to
19 look at all the tentacles from each of the criteria.

20 There are basically three options for
21 risk-informing the general design criteria. The first
22 and simplest is to modify the scope, and I will give
23 an example of that in a second.

24 The second is to modify the individual
25 requirements. The third is basically to replace the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 GDC as a body with safety goals, and/or risk
2 acceptance criteria, and move something like the GDC
3 into the realm of guidance documents.

4 What I mean by modifying the scope is
5 something akin to what the approach that the staff is
6 taking on Option 2 for risk-informing special
7 treatment requirements.

8 As we will see in a minute, a number of
9 the criteria incorporate the term, important to
10 safety. Equipment important to safety must be treated
11 in a particular way. The simplest change you can
12 envision is replacing that phrase or redefining it
13 with perhaps the phrase, "important to risk."

14 And then you have to agree on what that
15 means. One possibility, of course, is to use the
16 risk-informed classification safety class scheme that
17 the staff has come up with as part of Option 2, where
18 one might put risk one and risk two components into
19 the important to risk class, and then subject them to
20 the criteria, and whatever special treatments that is
21 implied there.

22 And we will look at some examples of where
23 that might be the case. The second element or second
24 option, modifying the individual requirements, is
25 similar again to what the staff is doing in Option 3

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to risk-inform the technical requirements in Part 50.

2 And where you look at each regulation,
3 each provision, each design criterion, and try to
4 determine how it might be changed to improve its risk
5 focus.

6 There is actually a number of things that
7 you can do there. The simplest thing is to look at
8 the criterion and tender to find the minimum change
9 that you have to make to shift the focus from
10 important to safety, or safety related, to important
11 to elements important to risk, but not change the
12 basic intent of any of the requirements.

13 CHAIRMAN APOSTOLAKIS: I thought in Option
14 2, Jack, when the staff speaks of the importance to
15 safety, they really mean work risk.

16 DR. SORENSEN: Yes.

17 CHAIRMAN APOSTOLAKIS: Tool safety
18 significance components is really low risk
19 significance?

20 DR. SORENSEN: That's correct. They have
21 come up with this four box scheme.

22 CHAIRMAN APOSTOLAKIS: That's right.

23 DR. SORENSEN: But I think the path
24 involves actually changing the words, because they
25 didn't want to -- they do not want to have important

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to safety to mean one thing for people who have not
2 adopted risk-informed options, and another thing for
3 applicants who have.

4 CHAIRMAN APOSTOLAKIS: It is a mystery to
5 me why they went that way, although you might say that
6 core damage is not really risk. It is core damage
7 frequency.

8 And to say something is an important risk
9 because it is core damage, most likely it is, but
10 strictly speaking, it is not risk. It is
11 categorization. But what is confusing, of course, is
12 that they talk about safety related, and the
13 importance to safety. They are two different things.

14 DR. SORENSEN: And as far as the path they
15 are on in Option 2 as I understand it, they are kind
16 of taking those two definitions -- important to safety
17 and safety related, and then replacing them with the
18 words, "important to risk" in certain of the
19 requirements.

20 And using this four box scheme to classify
21 components, the systems and components that are
22 important to risk. Okay. So that is a second way of
23 doing this and modifying individual requirements is
24 actually going in and rewriting every requirement in
25 risk terms, which one could do.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And the third possibility would be to go
2 a step further and not only rewrite them, but make
3 them technology independent.

4 One of the projects that NEI has embarked
5 on is to have by the end of the year a proposed draft
6 of general design criteria that are technology
7 independent. I am going to be interested to see what
8 they come up with.

9 CHAIRMAN APOSTOLAKIS: Did they give us an
10 example yesterday?

11 DR. SORENSEN: Well, in Adrian Haymer's
12 presentation yesterday or the day before, he had one
13 example which was kind of an easy one. I mean, he
14 picked one of the easy ones, and as Dana observed I
15 think in one of the sessions on Monday, at some point
16 you have got to talk about the phenomenology, and it
17 is a question of whether you talk about that in
18 something called the design criteria, or someplace
19 else, but it is obviously very hard.

20 CHAIRMAN APOSTOLAKIS: Are these criteria
21 sort of principles of good practice when you design
22 them?

23 DR. SORENSEN: Some of them are, yes.

24 CHAIRMAN APOSTOLAKIS: So you can't really
25 replace them --

1 DR. SORENSEN: Well, it is a question of
2 where you put them, I think. If I were starting over,
3 a lot of them I would adopt pretty much the way they
4 are.

5 Whether I left them as part of the
6 regulations, and whether I put them in the guidance
7 documents is another question.

8 CHAIRMAN APOSTOLAKIS: Well, the ones that
9 refer to, for example, to water, and design, and so
10 on, I don't see how one could put those in a safety
11 program.

12 DR. SHACK: Well, commensurate with the
13 importance.

14 DR. SORENSEN: Yes, most designers do not
15 start with a blank sheet of paper. They start with
16 something that has worked in the past, and good design
17 practice evolves in any technology.

18 CHAIRMAN APOSTOLAKIS: How about in a
19 purely risked-based, or risk-based, it seems to me
20 that there would still be a place for something like
21 the general design criteria.

22 DR. SORENSEN: Absolutely. Somebody will
23 have to go from your regulatory requirements to a set
24 of design criteria that a designer can work to. You
25 can't just hand the safety goals to the designer of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 every system in the plant and say, okay, come up with
2 a design.

3 At some point, you have got to allocate
4 your safety budget amongst systems, and whether you
5 like risk allocation or not, that happens at some
6 point in the design process, and it is just a question
7 of how.

8 So you have got to have a place to start,
9 and I think there is a fairly good argument for these
10 general design criteria or something very much like
11 them being or staying as part of the regulatory
12 structure.

13 This may become a little bit easier to
14 talk about when we look at a couple of specifics. I
15 don't have any particular or any specific proposal to
16 offer with respect to replacing the GDC with safety
17 goals.

18 Conquest, a couple of months ago, I guess,
19 when I was trying to get some advice from him on how
20 to proceed with this project, came up with an E-mail
21 proposal that I think he sent to everybody involving
22 risk-accepted or safety goals, and risk-acceptance
23 criteria.

24 I think that would certainly work, but
25 somewhere in this hierarchy of design documents, you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 have to have something equivalent to the general
2 design criteria.

3 Just a couple of other thoughts, and then
4 we will look at some individual criteria. Going back
5 primarily to Option 1 and changing the scope.

6 Of the 55 criteria, 13 of them have a
7 scope that is now defined as important to safety, and
8 with a change of a couple of words could be redefined
9 in terms important to risk, and change virtually
10 nothing else, and have I think a good impact.

11 The single failure criterion which was
12 mentioned in this morning's presentation appears
13 specifically in nine of the criteria, and if you
14 decide what to do about it in the context of one of
15 those criterion, you could probably make a similar
16 change in others.

17 But that is basically a reliability
18 consideration, and there are probably better ways to
19 state that now than the single failure requirement.
20 And overall 13 could be changed from important to
21 safety to important to risk.

22 And 30 probably would require no change,
23 although I think all of these judgments are arguable
24 at this point; and 19 could be recast in risk terms by
25 looking at the individual requirements. And I think

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 now I would like to go to looking at a couple of --

2 DR. WALLIS: I was wondering about that.

3 There are many things that are important to safety
4 which aren't included in risk, if you think of risk as
5 being simply a typical PRA.

6 There are other things that have some
7 effect on safety. That is always the problem. I
8 think risk is only interpreted in terms of PRAs.

9 DR. SORENSEN: Yes, and in my thinking on
10 these, those are the terms that I was thinking in.
11 Some of these you might examine closely and decide
12 that you don't want to change important to safety to
13 important to risk. I'm not sure.

14 But in a first reading or a second reading
15 even, it looked to me that that would be a
16 straightforward change. And there is one other point
17 that I wanted to bring up.

18 In terms of applicability to non-light
19 water reactors, there is 36 of them that are probably
20 applicable to virtually all reactor types, and there
21 are 19 that probably are not applicable to some
22 reactor types.

23 And again I think that judgment is in the
24 case of some criteria could go either way. Some of
25 them are clearly general, and some of them the intent

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 applies, but you might end up with an inappropriate
2 word in the criterion, a reference to cladding, for
3 example, where you might in fact not be dealing with
4 clad fuel. And I will try to touch on these in the
5 examples.

6 Okay. A good example of criterion -- this
7 is not in your slides, but in the text of Appendix A
8 immediately behind the slides, you will find each of
9 the criteria.

10 And the significant words here from a risk
11 standpoint, and I think this is one where you could
12 change important to safety to important to risk, and
13 perhaps improve the focus.

14 DR. SORENSEN: What is this thing tsunami?
15 What is it?

16 DR. SORENSEN: Tidal wave. The source may
17 be different.

18 DR. POWERS: It is on a lake isn't it?

19 DR. SORENSEN: You're right. One is an
20 ocean and one is a closed body of water. This one, I
21 think simply changing the scope would be pretty
22 straightforward. I am not sure that the changes that
23 were in Haymer's examples provide much benefit
24 frankly.

25 DR. POWERS: Well, he left that nice

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 prepositional phrase, "With sufficient margin."

2 CHAIRMAN APOSTOLAKIS: So what was the
3 difference with yesterday?

4 DR. SORENSEN: I should have brought that
5 with me and I did not. I'm sorry. Basically, the
6 three numbered points have been combined and
7 generalized in some way, which I have now forgotten.
8 I apologize for not bringing that along.

9 CHAIRMAN APOSTOLAKIS: So what would you
10 do to this one?

11 DR. SORENSEN: I would simply take the
12 phrase, "important to safety," and replace it with
13 "important to risk." And use whatever definition of
14 risk that I had decided to use in my regulations in
15 general. I think the staff proposal --

16 DR. POWERS: It seems to me that this is
17 where the absolute has to be confronted. I think you
18 have to come in and address the absoluteness here.

19 DR. SORENSEN: Well, my thought on that,
20 Dana, was that in fact is done in the numbered points,
21 where it says, appropriate consideration. I saw those
22 words as softening the requirements in the first
23 paragraph.

24 DR. POWERS: I see that as non-helpful,
25 because you come down and say, well, how do I define

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 appropriate. Well, I define that based on risk. I am
2 still stuck with the problem that I can at any site,
3 if I am willing to go back far enough in the
4 geological history, I can find an earthquake that the
5 planet simply cannot withstand, that no structure
6 could ever withstand, because far enough back there
7 were some pretty horrendous earthquakes. So it seems
8 to me that the absolute term here shall be designed to
9 withstand has to have something in it that puts it
10 within the context of some sort of probability here.

11 DR. SORENSEN: I guess it was not clear to
12 me that that had to be done here, as opposed to
13 someplace else in your regulatory structure.

14 CHAIRMAN APOSTOLAKIS: What I would
15 suggest is that this would be eliminated in a risk-
16 informed, because you would naturally consider the
17 contribution from --

18 DR. POWERS: Well, it is the naturally
19 part that I have a little trouble with.

20 CHAIRMAN APOSTOLAKIS: Why?

21 DR. POWERS: It is not so obviously to me
22 that that would be natural.

23 CHAIRMAN APOSTOLAKIS: In a PRA?

24 DR. POWERS: In a PRA, and I use that --
25 I substantiate that by pointing out that in all of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 applications of 1.174 that have been presented to the
2 committee, when they go to set the horizontal access
3 value, the CDF value, they don't use the seismic
4 contribution of risk. They have not at any time that
5 we have come up here. And when asked to do that, they
6 said, oh, it moves it up a little bit.

7 CHAIRMAN APOSTOLAKIS: If you read Option
8 2, they do refer to it. They do. And they say the
9 reason why they did the --

10 DR. POWERS: George, I am saying that it
11 is not natural. I am not disagreeing with you that
12 there places where it says take into account seismic
13 risk.

14 CHAIRMAN APOSTOLAKIS: But we are
15 confusing now two issues. What I am saying is that in
16 a risk-informed licensing regulatory system --

17 DR. POWERS: You would want to have a
18 design criteria that said that shall make it natural
19 to include seismic contributions to risk.

20 CHAIRMAN APOSTOLAKIS: No, no. This says
21 design, and what I am saying is that if it is risk-
22 informed, you are going to have -- if you submit a PRA
23 that does not have external events, and you are
24 regulating on the basis of core damage frequency or
25 something else, then that PRA would be unacceptable.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 In fact, all three refer to the load from
2 the earthquake and not the strength. So you still
3 have the problem with what does withstand mean.

4 DR. SHACK: Let's put it this way.
5 Lawyers have not interpreted this to mean that you
6 have to withstand the effects of tectonic plate
7 shifting.

8 DR. POWERS: The problem is that it is
9 like an EPA criterion. The better I get at my
10 geology, the more that historical record in fact is
11 appropriate and it seems to me that appropriate
12 consideration gets me out of it.

13 DR. SORENSEN: Possibly.

14 DR. POWERS: But, George, that is not
15 useful unless you tell them what a good PRA is. That
16 is what the good general criteria would be for a PRA.

17 CHAIRMAN APOSTOLAKIS: Well, it would
18 state all modes of operation and contributors and all
19 causes of failure.

20 DR. POWERS: If you say those things, then
21 no PRA is adequate, because no PRA currently takes
22 into account sabotage, and that is clearly
23 contributable.

24 CHAIRMAN APOSTOLAKIS: And I would exclude
25 sabotage.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. SORENSEN: This is fairly typical of
2 the discussions that one would get into in virtually
3 every one of these. I would with your permission
4 move on to a couple of examples.

5 CHAIRMAN APOSTOLAKIS: Sure. So we can
6 repeat the arguments.

7 (Laughter.)

8 CHAIRMAN APOSTOLAKIS: The PRA doesn't
9 tell you that you should design things to the quality
10 standards that industry has, and the PRA will just
11 assess the risk, and since we were told that there is
12 no difference between --

13 DR. SORENSEN: Well, I think the function
14 of something like the general design criteria in a
15 risk-informed system is the same as it is in the old
16 deterministic system. It is to give the designer a
17 road map, a path that he can go down and be reasonably
18 assured that he will end up with a design that is
19 acceptable.

20 CHAIRMAN APOSTOLAKIS: Is it general
21 principles or a road map? There is a difference,
22 Jack.

23 DR. SORENSEN: Well, a road map is perhaps
24 the wrong word.

25 CHAIRMAN APOSTOLAKIS: Is it the

1 constitution or is it the law?

2 DR. SORENSEN: But I think you can
3 establish a hierarchy of design documents that
4 includes the regulations at the top here, and then
5 going down perhaps to the next step, something like
6 the general design criteria, and then to industry
7 codes and standards.

8 And functional requirements and so forth,
9 and I think that something like this belongs somewhere
10 in that hierarchy, and whether you put them into the
11 regulations or you put them someplace else is probably
12 not of great import.

13 Part of what is embedded here is a list of
14 all the things that the designer has got to take into
15 account if he is going to end up with an acceptable
16 design.

17 CHAIRMAN APOSTOLAKIS: Right. And that's
18 doing a good PRA.

19 DR. SORENSEN: In a sense it is a
20 checklist.

21 DR. POWERS: But is this guidance for the
22 designer or for the PRA guy?

23 CHAIRMAN APOSTOLAKIS: No, the designer
24 must know that eventually his design would be
25 subjected to a PRA, and go back and forth. So he has

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to know.

2 VICE CHAIRMAN BONACA: Well, many of these
3 criteria actually are defense in depth.

4 DR. SORENSEN: There is five that I see
5 that where the primary purpose is defense in depth,
6 and there is another half-a-dozen where there is an
7 embedded defense in depth requirement; and then there
8 is quite a few where defense-in-depth is perhaps the
9 underlying thought.

10 The second one that I wanted to take a
11 quick look at was environmental and dynamic effects
12 design bases. Again, this is a list of things that
13 the designer has to take into account.

14 But the thing that I especially wanted to
15 take note of here is that this is one of the few
16 criterion that has been modified since 1971, and
17 specifically the however, "however, dynamic effects
18 associated with postulated pipe ruptures," and so
19 forth.

20 And this obviously is the leak before
21 break consideration. The only other one where the
22 criterion itself has changed is control room
23 criterion, which we will get to later, but that was
24 changed to accommodate the new source term. But this
25 has the same kind of arguments that I think --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN APOSTOLAKIS: Is there a
2 criterion that says or refers to human error?

3 DR. SORENSEN: No. These are design
4 criterion.

5 CHAIRMAN APOSTOLAKIS: Well, the control
6 room design affects human error.

7 DR. SORENSEN: Possibly. But the straight
8 answer to your question is no.

9 CHAIRMAN APOSTOLAKIS: Well, the point
10 that I am making is that if you start writing down
11 GDCs and trying to figure out dynamic effects, and
12 this and that, you are going to be incomplete, because
13 you can't predict everything. So that's where you
14 make a blanket statement and whatever is important.

15 DR. SORENSEN: But again between that
16 statement and the designer executing the design has
17 got to be something like this that lists everything
18 that you know about it. You don't want them leaving
19 out things.

20 CHAIRMAN APOSTOLAKIS: If I do a PRA
21 wouldn't I naturally consider dynamic effects?

22 DR. POWERS: None of them do.

23 CHAIRMAN APOSTOLAKIS: Gus, you are so
24 unfair. The good ones do. This is called spacial
25 common cause failure analysis. We did it for Indian

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Point, for heavens sake, 20 years ago.

2 DR. POWERS: How many other PRAS have it
3 in it?

4 CHAIRMAN APOSTOLAKIS: Well, I can't, but
5 in fact people have experimented at that time using
6 the sense code that were developed, and you ended up
7 with something that was three feet high. It is the
8 spacial analysis that you do for fires, for floods,
9 for dynamic effects. Sure, otherwise it is not a good
10 PRA. I am talking about 20 year old technology now.

11 DR. SORENSEN: Okay. Criterion 5. This
12 one is interesting for primarily because it is the
13 only one that I saw by inspection that is probably
14 counterproductive as far risk information is
15 concerned.

16 The decision of what functions to share or
17 not share seems to me to be exactly the kind of
18 question that modern PRAs could help answer, and this
19 criterion as written biases the designer against
20 sharing.

21 It is kind of interesting to note that in
22 the Manshan station blackout event of a month or two
23 ago, one of the options that was not available to the
24 operators was to cross-connect the unit one diesel
25 with unit two. And the reason was that that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 plant was built to the general design criteria.

2 That particular plant was built to satisfy
3 Part 50. Those were the criteria that they adopted.
4 And it was noted in the one of the incident analysis
5 reports that I read that they did not have the option
6 of cross-connecting the units.

7 DR. WALLIS: Well, why not, because it
8 would actually help the orderly shutdown and cool down
9 of the remaining units.

10 DR. SORENSEN: Well, this criterion biases
11 you against establishing that connection.

12 DR. WALLIS: Unless it can't be shown.

13 DR. SORENSEN: So the designer, to satisfy
14 this easily, says don't do it.

15 DR. WALLIS: And doesn't read the rest of
16 the sentence.

17 DR. POWERS: Well, if you are a designer,
18 you are sitting there saying I can do one job or I can
19 do two. Gosh, let me think. Which should I do.

20 DR. SORENSEN: Obviously, we have 55
21 criterion, and we are not going to get through all of
22 them. I will try and finish up in the next few
23 minutes, but let me touch on one that I think is the
24 next one, which I think is probably all right the way
25 it is written. I am not sure that I would change that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 from a risk-informed standpoint.

2 Basically what it says is that you
3 shouldn't have a design that is going to incur fuel
4 damage during normal or anticipated operational
5 occurrences.

6 DR. POWERS: And that is where you get
7 into a risk problem again. Is something that has some
8 probability of occurring an anticipated operational
9 occurrence. At the time that these were written that
10 meant something that would happen in the lifetime of
11 the plant.

12 DR. SORENSEN: Right.

13 DR. POWERS: Do you want to extend that
14 definition as you move into a risk-informed
15 environment, and if you do, then you run into an
16 absolutism problem.

17 DR. SORENSEN: I think you have to reach
18 for it.

19 DR. POWERS: A little bit.

20 DR. SORENSEN: But if I understand your
21 comment, the underlying concern is really dealt with
22 in other criterion here. I mean, it becomes evident.

23 DR. POWERS: It could be, but what I am
24 saying is a lot of this have this anticipated
25 operational occurrence phrase in now, and we knew from

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the definitions someplace that that means within the
2 lifetime of the plant..

3 DR. SORENSEN: Right.

4 DR. POWERS: It is a 10 to the minus 2
5 probability. Do you in a risk-informed world want to
6 extend that, and say that okay, rather than having an
7 absolute thing for anything that is 10 to the minus 2,
8 have something that has some sort of a rated
9 characterization for incredible, which I am reliably
10 informed now is 5 times 10 to the minus 7.

11 DR. SORENSEN: I think you are reading
12 more into this criterion than I would read into it,
13 but as I noted earlier, we can generate these kinds of
14 discussions on virtually every one.

15 CHAIRMAN APOSTOLAKIS: The last line there
16 doesn't belong, anticipated occurrences.

17 DR. POWERS: What it is saying is that you
18 are precluding something or certain kinds of high
19 probabilities.

20 CHAIRMAN APOSTOLAKIS: Right.

21 DR. POWERS: Well, there is nothing wrong
22 with that.

23 DR. KRESS: This is one of those things
24 where I keep talking about high frequency, lower
25 fission product release.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. POWERS: Well, you can imagine doing
2 something that says, okay, with a high confidence
3 level, which we could define as 95 percent or any
4 other number, you precluded.

5 Or we could also take it and say now you
6 preclude it, but the confidence level and reliability
7 of doing it varies as the probability goes down from
8 this 10 to the minus 2 level.

9 DR. KRESS: Well, if you had the FC curves
10 as the regulatory thing, it would automatically do
11 that.

12 DR. POWERS: They could do that for you,
13 yes.

14 CHAIRMAN APOSTOLAKIS: It seems an option
15 that it does not ask for margins. But ultimately it
16 seems to mean in a risk-based system that it would be
17 a combination of margins and defense in depth that
18 would give you the wrong numbers. They are not
19 separate things. I don't see why you should limit
20 yourself to the anticipated occurrences.

21 VICE CHAIRMAN BONACA: Well, this was
22 purely a word that was tied to it that meant it would
23 happen 40 years ago in an operation.

24 DR. SORENSEN: Okay. Well, let's take a
25 look at another one that is interesting, and this one

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 I think is a clear illustration of how these criterion
2 reflect the state of knowledge at the time.

3 I have never understood why this one
4 exists. It seems to me that it is completely covered
5 by Criterion 10, which we just looked at, and I think
6 the answer is that the phenomena had become of
7 possible power oscillations and spacial power
8 oscillations in large cores had become recognized in
9 the preceding few years.

10 Interestingly enough the 1965 criteria,
11 the earliest version that I found, that this was not
12 addressed specifically in power oscillations. It was
13 addressed to process variable oscillations, which
14 would include flow, for example.

15 DR. WALLIS: Isn't this just another
16 anticipated operational occurrence?

17 DR. SORENSEN: Yes, I would consider that
18 this is completely covered by Criterion 10, which
19 preceded it. But I thought it was an interesting
20 example of reflecting the state of the art. I guess
21 we have time for one or maybe two more.

22 DR. KRESS: What does it say about
23 containment?

24 DR. SORENSEN: Okay. That is the next one
25 that I thought that I would look at. Actually, there

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 is probably 12 separate criteria that deal with
2 containment, and the basic requirement is here;
3 "Reactor containment and associated systems shall be
4 provided to establish an essentially leak tight
5 barrier."

6 And this is one of those where clearly
7 there is some advocates of some reactor types that say
8 this should not apply. I would suggest that if we
9 were starting over for light water reactors, we
10 probably would not want to specify essentially leak
11 tight containment the way this one does.

12 You may want to allow other concepts since
13 the early containment failures seems to dominate risk
14 as far as we already know.

15 DR. POWERS: What this does is preclude
16 confinement.

17 DR. SORENSEN: Yes.

18 DR. POWERS: And when you preclude
19 confinement, then you are condemning yourself to
20 eventually having an uncontrolled release in the event
21 of an unmitigated accident.

22 DR. SORENSEN: This would as worded would,
23 yes. Of course, the containment bypass, you have to
24 deal with containment bypass sequences anyway.

25 But this is one that I think I would give

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 some thought to, and I would hasten to add that I
2 don't have the expertise in either PRA or severe
3 accident phenomenology to know how to rewrite it.
4 I just suspect that if you were to redo the GDC that
5 you might decide to rewrite this one.

6 This criterion, of course, is supported by
7 another 12 or 15 criteria that deal with containment
8 related phenomena and containment heat removal,
9 atmospheric cleanup, and penetrations, and isolations,
10 and system isolation, and so forth.

11 But this is pretty unequivocal as to what
12 is needed.

13 DR. KRESS: Mine would have been very
14 equivocal. I would have said thou shall provide a
15 reactor system such that the frequency is at least to
16 a 95 percent confidence level.

17 CHAIRMAN APOSTOLAKIS: Well, yes, some
18 language like that, because that allows you to take
19 credit for the release that you want. The probability
20 of it.

21 DR. SORENSEN: Just as a last offering
22 here, I would suggest looking at Criterion 17 on
23 electric power systems. This is the first one where
24 the single failure criterion is specifically invoked,
25 and the first one that you come to if you go through

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 them in numerical order.

2 It is also, I think, the longest of the
3 criteria.

4 CHAIRMAN APOSTOLAKIS: Does a single
5 failure have a definition somewhere?

6 DR. SORENSEN: Yes, it is defined up in
7 the introduction in terms of inability to perform the
8 specified safety function.

9 CHAIRMAN APOSTOLAKIS: If what happens?
10 If it fails? Assuming a single failure.

11 DR. WALLIS: If you have a hundred
12 batteries, that means that one battery will disable
13 the safety function that you are trying to deal with?

14 DR. SORENSEN: Yes. But the other thing
15 to note here is that this gets to be a very specific
16 criterion, electric power supplied by two physically
17 independent circuits.

18 You can have a common switch yard, and
19 that is acceptable. There are underlying assumptions
20 as to where the unreliability is, or where the risk
21 might be.

22 And again this seems like a perfect
23 candidate for recasting, in terms of a reliability
24 goal that could be supported by modern risk analysis
25 techniques. I would not attempt such a wording.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 VICE CHAIRMAN BONACA: Jack, if we could
2 go to Criterion 55.

3 DR. SORENSEN: Sure. You are talking
4 about monitoring releases.

5 VICE CHAIRMAN BONACA: No, it is one that
6 tells you that you would have penetrations of pipes
7 that would be -- well, it --

8 DR. SORENSEN: Well, that is clearly one
9 that I think you might end up rewriting in terms of
10 risk considerations. It is very specific. In fact,
11 criteria 50 through 55 I think you would rethink in a
12 risk-informed environment.

13 CHAIRMAN APOSTOLAKIS: No, the question
14 here is what do we do with all of this? I mean, we if
15 have Commissioner Diaz come down here and talk to us,
16 are we going to write a letter, or how does the
17 committee feel about this? And if we write a letter
18 to whom do we address it and why?

19 DR. SORENSEN: I have a couple of thoughts
20 that might go in to the committee's thinking on this.

21 CHAIRMAN APOSTOLAKIS: Go ahead.

22 DR. SORENSEN: One is that it seems to me
23 that Appendix A, and Appendix B for that matter, are
24 not keys in any significant way to risk-informing the
25 body of regulations. They are a part of it, but they

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 are no more important than a lot of other things.

2 So I think sort of the underlying
3 implication in Commissioner Diaz's comments that they
4 were key to proceeding I think is simply not right.

5 CHAIRMAN APOSTOLAKIS: But you also I
6 think claim that you could not risk-inform the
7 regulations unless you go back to the GDCs and change
8 them.

9 DR. SORENSEN: That is probably true.

10 DR. POWERS: And I agree with him on this.
11 If I look at Part 50, and I imagine anything in there
12 that is changed to be somewhat risk informed, and I
13 say now what do I do different, it ends up that I do
14 nothing different, because I get controlled by the
15 GDCs.

16 And if you hit this one first just to get
17 it out of the way, then you can go and look at the
18 regulations and know that you are not going to run
19 contrary -- you are not going to get into this mouse
20 trap, and where the guy does nothing different.

21 CHAIRMAN APOSTOLAKIS: So what would be a
22 wise course of action for this committee; to raise the
23 issue with the Commission or support Diaz?

24 DR. POWERS: Well, it depends a little bit
25 on how aggressive you want to be. It seems to me that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 your options vary.

2 CHAIRMAN APOSTOLAKIS: Well, should this
3 be part of Option 3?

4 DR. POWERS: Well, it is part of Option 3.

5 DR. SHACK: It should be, but it is just
6 that they have prioritized it in a different way.
7 They have chosen to do it a different way.

8 CHAIRMAN APOSTOLAKIS: So does the
9 committee feel otherwise?

10 DR. POWERS: Well, right now they have got
11 them -- I mean, we don't know what they are going to
12 come back with, but they seem to have themselves in a
13 conundrum on 46. They are going to try to get out of
14 it, but I don't see how to get out of it with the
15 approach they are taking, but maybe they will.

16 But if they are going to continue to be
17 boxed on 46, it seems to me that you go the other
18 route.

19 CHAIRMAN APOSTOLAKIS: What does that mean
20 for us now?

21 DR. POWERS: Well, that is one way to
22 approach it, is to ask the staff what they are going
23 to do about that, and then engage in these debates
24 that Jack wants to cut off.

25 The other approach it seems to me is that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 you go through and say pick the juicy, easy ones. And
2 there are a couple of them. I think 17 and a couple
3 of others in there that seem particularly ripe to make
4 risk-informed, and send the Commission a letter and
5 say, gee, we can do these, and do one for them.

6 CHAIRMAN APOSTOLAKIS: Well, we really
7 shouldn't write a letter without hearing more. We
8 have to give them an opportunity.

9 DR. SORENSEN: Both Option 2 and Option 3
10 will, if pursued to their logical conclusion, will end
11 up touching the GDC. In Option 2, in the first sense,
12 I talked about changing the scope in some way, and in
13 Option 3, in changing individual requirements, and
14 which you have no way of knowing right now is how many
15 actual changes they will end up recommending.

16 Now, my own thought is that the option
17 three process in particular is biased against making
18 changes to the GDC. The process starts with what they
19 call the defense in depth concept or philosophy, and
20 it doesn't lead easily to specific changes.

21 And that's because defense in depth rules
22 that framework, and I think there is a little more
23 hope for option two.

24 CHAIRMAN APOSTOLAKIS: Well, they
25 interpret defense in depth differently. It is their

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 justification for failing for different values, which
2 as releases and core damage, and so on. I don't think
3 this is the kind of defense in depth they refer to.

4 DR. SORENSEN: You may well be right. My
5 reading of the framework document is that the process
6 ends up being biased against change.

7 CHAIRMAN APOSTOLAKIS: Okay. So that
8 brings us again to the question; what do we do now?

9 DR. SORENSEN: But clearly the staff would
10 argue that they are on a path where both option two
11 and option three deal with some aspect of this, and
12 will presumably come to some recommendations to the
13 commission.

14 VICE CHAIRMAN BONACA: It seems to me that
15 some individual applications, unless you deal with
16 some of the principles, you have no idea if you are
17 still going to have the confusion like here. And it
18 seems to me that if you want to have a radical
19 rewriting on a risk-informed basis, you should start
20 from the top, and first attempt to see how they could
21 be converted to risk-informed criteria.

22 CHAIRMAN APOSTOLAKIS: Well, is it worth
23 doing this now, or do other things that are more
24 practical?

25 DR. SHACK: Well, what do you gain if your

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 goal is ultimately to have a whole new risk-informed
2 regulatory system. If you are looking at the moment
3 to try to identify the things that have the largest
4 impact on safety and reduce regulatory burden,
5 unnecessary regulatory burden, I am not sure that
6 starting with the GDCs would rank terribly high on
7 that list. They never show up on the NEI --

8 DR. KRESS: I think risk-informing the
9 GDCs, I agree with Bill first that what he just said,
10 that risk-informing the GDCs probably is important for
11 the advanced reactors, if they ever have one.

12 That's where there is a collision, and a
13 discontinuity in things, and what I would -- my choice
14 of things would be to don't do these one at a time,
15 except in the context that Bill said, where you are
16 trying to -- you have picked the ripe ones, and you
17 see where you have to change the GDCs so they are not
18 in conflict.

19 And you do that like they are progressing,
20 and to have a parallel effort, and have somebody say
21 I want to rewrite these GDCs completely, starting from
22 a blank page. This was my recommendation to Jack
23 actually when I wrote it.

24 And I would start out with writing down
25 all my regulatory objectives that I want to achieve,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and figure out to do them in a risk-based way that
2 includes the prior definition of defense in depth, and
3 the proper use of uncertainties, and to cover the
4 whole range of fission product releases that I am
5 interested in.

6 And I would work my way down on how do I
7 achieve this type of design that would meet this
8 criteria by specifying it in a risk-based way, but
9 risk-informed because I am going to have a proper
10 definition of defense in depth.

11 And end up with a whole new set of design
12 criteria that are not very prescriptive like this, but
13 may end up saying things like redundancy and
14 diversity, and may even have things like you shall be
15 sure to be able to shut down the reactor, and you may
16 be sure to have emergency cooling. You may be sure to
17 have long term cooling.

18 You may have things like that in it which
19 are --

20 CHAIRMAN APOSTOLAKIS: So what you are
21 saying is that the Gen-4 guy --

22 DR. KRESS: Yes, put this off to the Gen-4
23 system.

24 CHAIRMAN APOSTOLAKIS: But NEI told us
25 that they are working on these things, and they would

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 have something by December.

2 DR. KRESS: Yes, but I suspect they are
3 going to pick out --

4 CHAIRMAN APOSTOLAKIS: But that might be
5 the first good opportunity for us.

6 DR. KRESS: To have a letter, yes. But I
7 am in favor of sort of approaching it like Bill said.

8 VICE CHAIRMAN BONACA: But looking at the
9 other side, you know, if you leave this stuff behind,
10 I agree they are more important to certainty if they
11 have priority in many ways, and it seems to me that
12 ultimately we are going to have patch work to patch
13 work.

14 DR. KRESS: That is exactly what we are
15 doing. That's why I wanted to have a parallel effort
16 to get away from that.

17 DR. POWERS: There is a perception,
18 George, that these things are past history. They are
19 not. I mean, GDC-3 is actively invoked regularly.

20 CHAIRMAN APOSTOLAKIS: But I think in Bill
21 Shack's world that that would be singled out where
22 they try to reach some benefits by risk-informing fire
23 protection requirements. So the question is should we
24 do it as the need arises or shall we have an all out
25 attack of the GDCs?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. POWERS: Well, it seems to me that
2 coming in that you have got two approaches. The staff
3 chose an approach and now you are boxed. They are
4 getting boxed right now.

5 DR. KRESS: It may not work is what you
6 are saying.

7 DR. POWERS: Well, if their approach is
8 not going to make substantive program progress, it
9 seems to me that the alternate approach, which I
10 happen to think is what should have been the approach
11 all along, is to go after ANB.

12 VICE CHAIRMAN BONACA: Well, the thing
13 that troubles me about the whole thing is that all
14 they can us is Reg Guide 1.174, and I wonder how many
15 of the changes that will happen at South Texas will
16 conflict with some of this GDCs. I could bet you that
17 there will be some conflicts.

18 And we have not gone back to what is the
19 foundation of the original of the existing systems
20 are, and so we are changing things here, and I think
21 they can go only so far.

22 DR. POWERS: Well, you have maintained
23 function, and you have maintained all your Chapter
24 15s.

25 CHAIRMAN APOSTOLAKIS: Did you guys raise

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 the issue of containment earlier with South Texas?

2 DR. KRESS: Yes, it came up. Somebody
3 mentioned it.

4 CHAIRMAN APOSTOLAKIS: So it is not an
5 issue anymore?

6 DR. KRESS: Well, I think Sam Lee did.

7 CHAIRMAN APOSTOLAKIS: So again what do we
8 do here with this thing? Should we let it rest until
9 December and see what NEI comes up with?

10 DR. KRESS: Yes, I don't think we are
11 ready yet.

12 CHAIRMAN APOSTOLAKIS: I really don't
13 think we should be writing letters without hearing
14 from the staff, and to ask them to come and talk about
15 the GDCs, they will love us for it.

16 DR. SHACK: Do you have another
17 presentation on Option 2 scheduled?

18 CHAIRMAN APOSTOLAKIS: Option 2? Not in
19 the near future. Option 3 doesn't come to mind,
20 except in 50.46.

21 DR. POWERS: But Option 2 follows along
22 somewhere.

23 DR. SHACK: Right. It is a few months
24 behind.

25 CHAIRMAN APOSTOLAKIS: But South Texas is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 done.

2 DR. POWERS: But it is the generalization
3 of the rule.

4 CHAIRMAN APOSTOLAKIS: Oh, that is going
5 to take --

6 DR. SORENSEN: That originally was the
7 quick fix.

8 CHAIRMAN APOSTOLAKIS: Okay. If we don't
9 write the letter now, how do we make sure that Jack's
10 work is documented and reviewable?

11 DR. SORENSEN: There is a paper that I can
12 put out as soon as --

13 CHAIRMAN APOSTOLAKIS: A paper or report?

14 DR. SORENSEN: It is 20 or 25 pages of
15 this kind of discussion, one criterion at a time.

16 CHAIRMAN APOSTOLAKIS: So why don't we get
17 a report from you and maybe wait until NEI does
18 something. And if we find there another opportunity
19 where there is a reason to bring it up, then we bring
20 it up.

21 DR. SHACK: And Jack's conclusions aren't
22 so different from what the NEI people said.

23 DR. POWERS: And GDCs were not such a
24 problem.

25 CHAIRMAN APOSTOLAKIS: Okay. So let's

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 recess -- oh, I'm sorry.

2 DR. KRESS: I have another view of what
3 the GDCs are before we leave them and while we are on
4 it.

5 CHAIRMAN APOSTOLAKIS: Okay.

6 DR. KRESS: If I think about it, and if I
7 had a system of this risk-based concept that I
8 mentioned, and if I viewed defense in depth as being
9 an allocation of the risk contribution through both
10 the sequences and things like initiating events and
11 mitigation, if I were reviewing defense in depth as an
12 allocation among those things, then I would view the
13 general design criterion as almost wholly defense in
14 depth, because what it does is do that in a
15 prescriptive constructionist way of doing it.

16 So I think if you had the proper
17 definition of defense in depth, in terms of this
18 allocation and in terms of related uncertainty that
19 you would end up with something like -- if you carried
20 it on down to lower and lower tiers, you would end up
21 with something like the GDCs, and that's why I say
22 that if they could start over from a top level
23 concept, they might end up with a different type.

24 CHAIRMAN APOSTOLAKIS: I think the Option
25 3 guys have already done some of that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. KRESS: They may have.

2 CHAIRMAN APOSTOLAKIS: But they didn't
3 call them GDCs, but by the mere fact that they started
4 by assigning values, upper bounds to intermediate
5 events, that is a structural manifestation of defense
6 in depth at that top level. Okay.

7 Thank you very much, Jack. It was very
8 informative and we look forward to your report.
9 And send it in draft form to all the members at some
10 point.

11 DR. SORENSEN: I had planned to do that,
12 yes.

13 CHAIRMAN APOSTOLAKIS: And seek comments.
14 Okay. And we will recess until 10 minutes past 5:00.

15 (Whereupon, the meeting was recessed at
16 4:58 p.m.)

CERTIFICATE

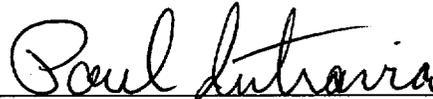

This is to certify that the attached proceedings before the United States Nuclear Regulatory Commission in the matter of:

Name of Proceeding: 483rd ACRS Meeting

Docket Number: (Not Applicable)

Location: Rockville, Maryland

were held as herein appears, and that this is the original transcript thereof for the file of the United States Nuclear Regulatory Commission taken by me and, thereafter reduced to typewriting by me or under the direction of the court reporting company, and that the transcript is a true and accurate record of the foregoing proceedings.
