Subject: IP2/W/NRR Discussions 6/22/00

Dave:

A quick review of subject discussions today:

- 1. Questions by E. Murphy re flow stress used in U-bend analyses by Westinghouse, information on OD crack bursts, and tubesheet dp (what will secondary pressure be?)**
- 2. Questions by S. Coffin re sludge pile tube assessment.**
- 3. (Important) Licensee asked E. Murphy how long will this take to complete. Murphy stated that they were in process of review of orinal items and subsequent questions of responses. They have as yet not looked at all 17 RAI responses.**

In summary, NRR must assess whether an adequate story has been presented by Westinghouse to support their conclusions.

Pressed for an estimate, Murphy stated his personal opinion was that completion would take till mid-July.

- 4. Discussions will continue tomorrow 10:00 am.**
