Calculation

Title: Corner Drop of 21-PWR Waste Package Document Identifier: CAL-UDC-ME-000008 REV 00

Page 4 of 30

#### 1. PURPOSE

The objective of this calculation is to determine the structural response of the waste package (WP) dropped on its corner from a specified height. The center of gravity and the outside edge of the WP must form a straight line perpendicular to the unyielding surface on which the WP is dropped. The WP used for that purpose is the 21-Pressurized Water Reactor (PWR) WP. The scope of this document is limited to reporting the calculation results in terms of stress intensities. This calculation is associated with the WP design and was performed by the Waste Package Design group in accordance with the development plan *TDP for Corner Drop of 21-PWR Waste Package* (Ref. 16). AP-3.12Q, *Calculations* (Ref. 11) is used to perform the calculation and develop the document. The sketches attached to this calculation provide the potential dimensions and materials for the 21-PWR WP design.

#### 2. METHOD

The finite element calculation was performed by using the commercially available ANSYS Version (V) 5.4 and LS-DYNA V950 finite element codes. The results of this calculation were provided in terms of maximum stress intensities.

With regard to the development of this calculation, the control of electronic management of data was evaluated in accordance with AP-SV.1Q, *Control of the Electronic Management of Information* (Ref. 10). The evaluation (Ref. 17) determined that current work processes and procedures are adequate for the control of the electronic management of data for this activity.

#### **3. ASSUMPTIONS**

In the course of developing this document, the following assumptions are made regarding the structural calculation.

- 3.1 Some of the temperature-dependentmaterial properties are not available for SB-575 N06022 (Alloy 22), SA-516 K02700 (516 carbon steel [CS]), and SA-240 S31600 (316 stainless steel [SS]). The room-temperature (20 °C) material properties are assumed for both materials. The impact of using room-temperature material properties is anticipated to be small. The rationale for this assumption is that undetermined mechanical properties of said materials will not significantly impact the results. This assumption is used in Section 5.2.
- 3.2 The Poisson's ratio of Alloy 22 is not available in literature. The Poisson's ratio of Alloy 625 (SB-443 N06625) is assumed for Alloy 22. The impact of this assumption is anticipated to be negligible. The rationale for this assumption is that the chemical compositions of Alloy 22 and Alloy 625 are similar (see Ref. 2, Table 1 and Ref. 3, p. 143, respectively). This assumption is used in Section 5.2.

Calculation

Page 5 of 30

- 3.3 Some of the rate-dependent material properties are not available for SB-575 N06022 (Alloy 22), SA-516 K02700 (516 carbon steel [CS]), and SA-240 S31600 (316 stainless steel [SS]). Linear approximations are assumed for both materials. The impact of using such an approximation is anticipated to be small. The rationale for this assumption is that this is the most common and accepted way of approximating these properties. This assumption is used in Section 5.3
- 3.4 Poisson's ratio was not available for 516 CS. Therefore, Poisson's ratio of cast carbon steel was assumed for 516 CS. The impact of this assumption was anticipated to be negligible. The rationale for this assumption was that the elastic constants of cast carbon steels are only slightly affected by changes in composition and structure (see Ref. 2). This assumption was used in Section 5.2.
- 3.5 The exact geometry of the loaded internals was simplified for the purpose of this calculation. The fuel baskets, thermal shunts, spent nuclear fuel, and all other internals were created as a solid cylinder with an appropriate mass value. The rationale for this assumption was to simplify the finite element representation (FER). This assumption was used in Section 5.4.
- 3.6 The elongations of Alloy 22 and 316NG SS at elevated temperatures were not available from traditional sources. However, vendor data is available (Ref. 6 and Ref. 18). The percent difference between elongations at room temperature and elevated temperatures can be normalized and applied to the data available from accepted codes. The rationale for this assumption was to be as reasonably accurate as possible. It would not be logical for the elongation values to remain constant over the range of temperatures under consideration. This assumption is used in Section 5.2.1.

Title: Corner Drop of 21-PWR Waste Package Document Identifier: CAL-UDC-ME-000008 REV 00

#### 4. USE OF COMPUTER SOFTWARE AND MODELS

#### **4.1 SOFTWARE**

The finite element analysis computer code used for this calculation is ANSYS V5.4, which is identified with the Computer Software Configuration Item (CSCI) 30040 V5.4 and was obtained from Software Configuration Management in accordance with appropriate procedures. ANSYS V5.4 is a commercially available finite element analysis code and is appropriate for structural calculations of WP as performed in this calculation. The calculations using the ANSYS V5.4 software were executed on a Hewlett-Packard (HP) UNIX workstation, Civilian Radioactive Waste Management System (CRWMS) Management and Operating Contractor (M&O) tag number 700314. The software qualification of the ANSYS V5.4 software is summarized in the Software Qualification Report for ANSYS V5.4 (Ref. 8). Qualification of ANSYS V5.4 on the Waste Package Operations (WPO) HP UNIX workstations is documented in Reference 5. The ANSYS evaluations performed for these designs are fully within the range of the validation performed for the ANSYS V5.4 code. Access to the code was granted by the Software Configuration Secretariat in accordance with the appropriate procedures.

Livermore Software Technology Corporation (LSTC) LS-DYNA V950, is unqualified software (Ref. 7). The interim use of LS-DYNA V950 (SAN: LV-2000-103, STN: 10300-950-00) in support of the site recommendation is delineated in AP-SI.1Q, *Software Management*, Section 5.11 (Ref. 9). LS-DYNA V950 qualification is being performed as part of the qualification of ANSYS V5.6 since LS-DYNA V950 is available both as a component (module) of ANSYS and as a separate finite element code. Currently, the Waste Package Department licensed LS-DYNA V950 directly from Livermore Software Technology Corporation (LSTC). Software Activity Plan (SAP) for ANSYS V5.6, SDN: 10145-SAP-5.6-00, SAN: LV-2000-103, identifies the intended use of LS-DYNA V950 prior to qualification. LS-SYNA V950 was obtained from the Configuration Management. LS-DYNA V950 is appropriate for its intended use. LS-DYNA V950 validation will be performed in accordance with AP-SI.1Q, Section 5.11. The calculations were executed on a Hewlett-Packard (HP) 9000 series workstation (CRWMS M&O tag number 700314).

The input and output files are defined on page 30 of this document. They may be located in attachment III to this document.

#### **4.2 SOFTWARE ROUTINES**

The commercially available software used in this calculation is Pro/Engineer Release (R) 2000i. This software is executed on the HP workstation. Pro/Engineer R 2000i is not controlled computer software and it is not required to be qualified in accordance with Section 2.1 of AP-SI.1Q, *Software Management*.

Attachment IV contains the input/output data obtained from Pro/Engineer R 2000i. The mass densities given in Section 5.2 are used as inputs to Pro/Engineer R 2000i, and corresponding masses of WP components are obtained for the use in structural evaluations. There are no user-operated

Calculation

Page 6 of 30

Page 7 of 30

equations of mathematical models, algorithms, or numerical solution techniques applicable to the software routine since Pro/Engineer R 2000i is an engineering drawing software package and the subject mass calculations are performed by the source code, based on the dimensions of structural components and the mass density of materials. Verification of this software is accomplished by a test case, as described in Section 5.1.1. The range of input parameter values is limited to the dimensions of the structural components used in those cases; all mass calculations depend on specific geometry of the subject components. No limitations are identified on software routine applications or validity.

#### 4.3 MODELS

None used.

### 5. CALCULATION

#### 5.1 MASS AND GEOMETRIC DIMENSIONS OF WASTE PACKAGE

This calculation was performed using mass and geometric dimensions of the 21-PWR Waste Package (see pp. I-1 and I-2):

Total mass of the loaded WP =  $42,277 \ kg$ Length =  $5.165 \ m$ Outer diameter of outer shell =  $1.570 \ m$ Outer diameter of trunnion collar sleeve =  $1.644 \ m$ 

#### 5.1.1 Verification of Masses Obtained from Pro/Engineer R 2000i

One of the structural components of the 21-PWR WP, the extended lid reinforcement ring (ELRR), was selected for verification of the mass obtained from Pro/Engineer R 2000i. The mass of this component was determined as the product of the mass density (see Section 5.2) and the volume, using the dimensions provided in Attachment I:

 $EOSLT \equiv$  Extended Outer Shell Lid Thickness = 0.025 m  $OSCL \equiv$  Outer Shell Closure Lid Outside Diameter = 1.527 m  $Gap1 \equiv$  Gap between OSCL and Outer Shell = 0.004 m  $Gap2 \equiv$  Gap between Outer Shell and Extended Outer Shell Lid = 0.004 m  $ELRRT \equiv$  Extended Lid Reinforcement Ring Thickness = 0.050 m

ELRR Outer Diameter = OSCL + 2 \* (Gap1 - Gap2 - EOSLT) = 1.477 mELRR Inner Diameter = (ELRR Outer Diameter) - 2 \* ELRRT = 1.377mELRR Mass =  $8690 kg/m^3 * ELRRT * ((1.477 m)^2 - (1.377 m)^2) * \pi/4 = 97.39432 kg$ 

The mass obtained by the preceding calculation is identical to the mass provided on page II-20.

Title: Corner Drop of 21-PWR Waste Package Document Identifier: CAL-UDC-ME-000008 REV 00

### 5.2 MATERIAL PROPERTIES

Material properties used in these calculations are listed in this section. Some of the temperaturedependent and rate-dependent material properties are not available for Alloy 22, 316NG SS, and 514 CS. Therefore, room-temperature density and Poisson's ratio obtained under the static loading conditions are used for for Alloy 22, 316NG SS, and 514 CS (see Assumption 3.1 and 3.3).

SB-575 N06022 (Alloy 22) (Outer shell, outer shell lids, upper and lower trunnion collar sleeves):

- Density =  $8690 \text{ kg/m}^3$  (0.314 *lb/in*<sup>3</sup>) (at room temperature) (Ref. 2, SB-575 Section 7.1)
- Yield strength = 310 MPa (45 ksi) (at room temperature) (Ref. 2, Table Y-1) Yield strength = 229 MPa (33.2 ksi) (at 400 °F = 204 °C) (Ref. 2, Table Y-1) Yield strength = 222 MPa (32.2 ksi) (at 600 °F = 316 °C) (Ref. 2, Table Y-1)
- Tensile strength = 690 *MPa* (100 *ksi*) (at room temperature) (Ref. 2, Table U) Tensile strength = 657 *MPa* (95.3 *ksi*) (at 400 °F = 204 °C) (Ref. 2, Table U) Tensile strength = 641 *MPa* (92.9 *ksi*) (at 600 °F = 316 °C) (Ref. 2, Table U)
- Elongation = 0.45 (at room temperature) (Ref. 2, SB-575 Table 3)
- Poisson's ratio = 0.278 (at room temperature) (Ref. 1, p. 143; see Assumption 3.4)
- Modulus of elasticity = 206 GPa (at room temperature) (Ref. 6, p. 14) Modulus of elasticity = 196 GPa (at 400 °F = 204 °C) (Ref. 6, p. 14) Modulus of elasticity = 190 GPa (at 600 °F = 316 °C) (Ref. 6, p. 14)

SA-240 S31600 (316NG SS, which is 316 SS with tightened control on carbon and nitrogen content and has the same material properties as 316 SS [see Ref. 19]) (Inner shell and inner shell lids):

- Density = 7980  $kg/m^3$  (at room temperature) (Ref. 14, Table X1, p. 7)
- Yield strength = 205 MPa (30 ksi) (at room temperature) (Ref. 2, Table Y-1) Yield strength = 148 MPa (21.4 ksi) (at 400 °F = 204 °C) (Ref. 2, Table Y-1) Yield strength = 130 MPa (18.9 ksi) (at 600 °F = 316 °C) (Ref. 2, Table Y-1)
- Tensile strength = 515 *MPa* (75 *ksi*) (at room temperature) (Ref. 2, Table U) Tensile strength = 496 *MPa* (71.9 *ksi*) (at 400 °F = 204 °C) (Ref. 2, Table U) Tensile strength = 495 *MPa* (71.8 *ksi*) (at 600 °F = 316 °C) (Ref. 2, Table U)
- Elongation = 0.40 (at room temperature) (Ref. 2, SA-240 Table 2)
- Poisson's ratio = 0.298 (at room temperature) (Ref. 13, Figure 15, p. 755)

Calculation

Title: Corner Drop of 21-PWR Waste Package Document Identifier: CAL-UDC-ME-000008 REV 00

- Modulus of elasticity = 195 GPa (28.3 \* 10<sup>6</sup> psi) (at room temperature) (Ref. 2, Table TM-1) Modulus of elasticity = 183 GPa (26.5 \* 10<sup>6</sup> psi) (at 400 °F = 204 °C) (Ref. 2, Table TM-1) Modulus of elasticity = 174 GPa (25.3 \* 10<sup>6</sup> psi) (at 600 °F = 316 °C) (Ref. 2, Table TM-1)
- SA-516 K02700 (516 CS) (Sideguides, stiffeners, and baskets):
- Density =  $7850 \text{ kg/m}^3$  (at room temperature) (Ref. 2, SA-20/SA20M, Section 14.1)
- Yield strength = 262 *MPa* (38 *ksi*) (at room temperature) (Ref. 2, Table Y-1) Yield strength = 224 *MPa* (32.5 *ksi*) (at 400 °F = 204 °C) (Ref. 2, Table Y-1) Yield strength = 201 *MPa* (29.1 *ksi*) (at 600 °F = 316 °C) (Ref. 2, Table Y-1)
- Tensile strength = 483 *MPa* (70 *ksi*) (at room temperature) (Ref. 2, Table U) Tensile strength = 483 *MPa* (70 *ksi*) (at 400 °F = 204 °C) (Ref. 2, Table U) Tensile strength = 483 *MPa* (70 *ksi*) (at 600 °F = 316 °C) (Ref. 2, Table U)
- Elongation = 0.21 (at room temperature) (Ref. 2, SA-240 Table 2)
- Poisson's ratio = 0.3 (at room temperature) (Ref. 3, p. 374) (see Assumption 3.4)
- Modulus of elasticity = 203 GPa (29.5 \* 10<sup>6</sup> psi) (at room temperature) (Ref. 2, Table TM-1) Modulus of elasticity = 191 GPa (27.7 \* 10<sup>6</sup> psi) (at 400 °F = 204 °C) (Ref. 2, Table TM-1) Modulus of elasticity = 184 GPa (26.7 \* 10<sup>6</sup> psi) (at 600 °F = 316 °C) (Ref. 2, Table TM-1)

### 5.2.1 Calculations for Elevated-Temperature Material Properties

The values for elongation at elevated temperatures are not listed in conventional listings such as American Society for Testing and Materials (ASTM) Standards or American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code. However, the elongation values at elevated temperatures are available from vendor data. This vendor data will be used in a *qualitative* manner (see Assumption 3.6).

For Alloy 22, the vendor data shows a 5.7% increase in elongation values between 400 °F and room temperature and a 13% increase between 600 °F and room temperature (Ref. 6).

Therefore the elongation values for Alloy 22 at elevated temperatures will be as follows:

Calculation

Title: Corner Drop of 21-PWR Waste Package
Document Identifier: CAL-UDC-ME-000008 REV 00

Elongation  $_{400 \text{ °F}} = 0.45 * 1.057 = 0.48$ Elongation  $_{600 \text{ °F}} = 0.45 * 1.13 = 0.51$ 

For SS 316, the vendor data shows a 25% decrease in elongation values between 400 °F and room temperature and a 29% decrease between 600 °F and room temperature (Ref. 18).

Therefore the elongation values for SS 316 at elevated temperatures will be as follows:

Elongation  $_{400 \text{ °F}} = 0.40 * (1 - 0.25) = 0.30$ Elongation  $_{600 \text{ °F}} = 0.40 * (1 - 0.29) = 0.28$ 

Since the components made of SA-516 will not be analyzed for stresses, its elongation is not needed at elevated temperatures. The SA-516 components are only needed for their density.

#### 5.2.2 Calculations for True Measures of Ductility

The material properties in Sections 5.1 and 5.1.1 refer to engineering stress and strain definitions:

$$s = \frac{P}{A_0}$$
 and  $e = \frac{L - L_0}{L_0}$ 

Where P stands for the force applied during static tensile test, L is the deformed-specimen length, and  $L_0$  and  $A_0$  are original length and cross-sectional area of specimen, respectively. It is generally accepted that the engineering stress-strain curve does not give a true indication of the deformation characteristics of a material during the plastic deformation since it is based entirely on the original dimensions of the specimen. Therefore, the LS-DYNA V950 finite element code requires input in terms of true stress and strain definitions:

$$\sigma = \frac{P}{A}$$
 and  $\varepsilon = \ln\left(\frac{L}{L_0}\right)$ 

The relationships between the true stress and strain definitions and engineering stress and strain definitions can be readily derived based on constancy of volume  $(A_0 \cdot L_0 = A \cdot L)$  and strain homogeneity during plastic deformation:

$$\sigma = s \cdot (1+e)$$
 and  $\varepsilon = \ln(1+e)$ 

These expressions are applicable only in the hardening region of stress-strain curve that is limited by the onset of necking.

The following parameters are used in the subsequent calculations:

Title: Corner Drop of 21-PWR Waste Package Document Identifier: CAL-UDC-ME-000008 REV 00

 $s_v \approx \sigma_v \equiv$  yield strength

 $s_{\mu} \equiv$  engineering tensile strength

 $\sigma_{u} \equiv$  true tensile strength

 $e_v \approx \varepsilon_v \equiv$  strain corresponding to yield strength

 $e_{\mu}$  = engineering strain corresponding to tensile strength (engineering uniform strain)

 $\varepsilon_{\mu}$  = true strain corresponding to tensile strength (true uniform strain)

In absence of the uniform strain data in available literature, it needs to be estimated based on stressstrains curves and elongation (strain corresponding to rupture of the tensile spacimen).

The stress-strain curves for Alloy 22, 316 SS and 316NG SS do not manifest three-stage deformation character (Ref. 12). Therefore, the elongation, reduced by 10% for the sake of conservativism, can be used in place of uniform strain.

In the case of Alloy 22 ( $e_u = 0.9 * elongation = 0.41$  at room temperature), the true measures of ductility are

 $\varepsilon_u = \ln(1 + e_u) = \ln(1 + 0.41) = 0.34$  $\sigma_u = s_u * (1 + e_u) = 690 * (1 + .41) = 973 MPa$ 

 $\frac{400 \text{ °F } (204 \text{ °C}) \text{ Alloy } 22}{\varepsilon_u = \ln(1 + e_u) = \ln(1 + 0.43) = 0.36}$  $\sigma_u = s_u * (1 + e_u) = 657 * (1 + .43) = 940 \text{ MPa}$ 

 $\frac{600 \text{ °F } (316 \text{ °C}) \text{ Alloy } 22}{\varepsilon_u = \ln(1 + e_u) = \ln(1 + 0.46) = 0.38}$  $\sigma_u = s_u * (1 + e_u) = 641 * (1 + .46) = 936 MPa$ 

For 316NG SS at room temperature,  $e_u = 0.9 * elongation = 0.36$ , therefore:  $\varepsilon_u = \ln(1 + e_u) = \ln(1 + 0.36) = 0.31$  $\sigma_u = s_u * (1 + e_u) = 515 * (1 + .36) = 700 MPa$ 

 $\frac{400 \text{ °F } (204 \text{ °C}) \text{ SS } 316\text{NG}}{\varepsilon_u = \ln(1 + e_u) = \ln(1 + 0.27) = 0.24}$  $\sigma_u = s_u * (1 + e_u) = 496 * (1 + .27) = 630 \text{ MPa}$ 

 $\frac{600 \text{ °F } (316 \text{ °C}) \text{ SS } 316\text{NG}}{\varepsilon_u = \ln(1 + e_u) = \ln(1 + 0.26) = 0.23}$  $\sigma_u = s_u * (1 + e_u) = 495 * (1 + .46) = 624 MPa$ 

#### 5.2.3 Calculations for Tangent Moduli

As previously discussed, the results of this simulation are required to include elastic and plastic deformations for Alloy 22, 516 CS, and 316NG SS. When the materials are driven into the plastic range, the slope of stress-strain curve continuously changes. Thus, a simplification for this curve is needed to incorporate plasticity into the Finite Element Representation (FER). A standard approximation commonly used in engineering is to use a straight line that connects the yield point and the tensile strength point of the material. The parameters used in the subsequent calculations in addition to those defined in Section 5.1.2 are modulus of elasticity (*E*) and tangent modulus ( $E_1$ ). The tangent (hardening) modulus represents the slope of the stress-strain curve in the plastic region.

In the case of Alloy 22, the strain corresponding to the yield strength is:

 $\varepsilon_{y,rt} = \sigma_y / E = 310 * 10^6 / 206 * 10^9 = 0.0015$  (see Section 5.2.1)

Hence, the tangent modulus at room temperature is:

 $E_{l,rt} = (\sigma_{u,rt} - \sigma_{y,rt}) / (\varepsilon_{u,rt} - \varepsilon_{y,rt}) = (0.973 - 0.310)/(0.34 - 0.0015) = 2.0 GPa$  (see Section 5.2, 5.2.1, and 5.2.2)

For Alloy 22 at 400 °F (204 °C)  $E_{I,400°F} = (\sigma_{u,400°F} - \sigma_{y,400°F}) / (\varepsilon_{u,400°F} - \sigma_{y,400°F}/E_{400°F}) = (0.940 - 0.229)/(0.36 - 229/196e3) = 2.0 GPa (see Section 5.2, 5.2.1, and 5.2.2)$ 

For Alloy 22 at 600 °F (316 °C)  $E_{1,600°F} = (\sigma_{u,600°F} - \sigma_{y,600°F}) / (\varepsilon_{u,600°F} - \sigma_{y,600°F}/E_{600°F}) = (0.936 - 0.222)/(0.38 - 222/190e3) = 1.9 GPa$  (see Section 5.2, 5.2.1, and 5.2.2)

Similarly, for 316NG SS at room temperature:

 $E_{l,rt} = (\sigma_{u,rt} - \sigma_{y,rt}) / (\varepsilon_{u,rt} - \sigma_{y,rt}/E_{rt}) = (0.700 - 0.205)/(0.31 - 205/195e3) = 1.6 GPa$  (see Section 5.2, 5.2.1, and 5.2.2)

For 316NG SS at 400 °F (204 °C)

 $E_{I,400°F} = (\sigma_{u,400°F} - \sigma_{y,400°F}) / (\varepsilon_{u,400°F} - \sigma_{y,400°F} / E_{400°F}) = (0.630 - 0.148) / (0.24 - 148/183e3) = 2.0 GPa (see Section 5.2, 5.2.1, and 5.2.2)$ 

For 316NG SS at 600 °F (316 °C)

 $E_{1,600°F} = (\sigma_{u,600°F} - \sigma_{y,600°F}) / (\varepsilon_{u,600°F} - \sigma_{y,600°F} / E_{600°F}) = (0.624 - 0.130) / (0.23 - 130/174e3) = 2.2 GPa (see Section 5.2, 5.2.1, and 5.2.2)$ 

Waste Package Department

Title: Corner Drop of 21-PWR Waste Package Document Identifier: CAL-UDC-ME-000008 REV 00

The tangent modulus for 516 CS was not calculated at any temperature. This is because none of the parts made from this material are critical. The parts made from 516 CS are not vital. The density is the most important physical property for these parts. The overall mass comparison will validate the density value chosen for 516 CS (see page 15).

#### 5.3 INITIAL VELOCITY OF WASTE PACKAGE

To reduce the computer execution time while preserving all features of the problem relevant to the structural calculation, the WP is set in a position just before impact and given an appropriate initial velocity as can be seen in Figure 1.

Figure 1. Corner Drop Geometry

Using the following parameters:

 $g = \text{acceleration due to gravity} = 9.81 \ m/s^2$   $M = \text{total mass} = 42,301 \ kg \text{ (Section 5.1)}$   $S = \text{Drop Height} = 2.4 \ m$   $I = \text{length} = (5.165 \ m)/2 = 2.583 \ m \text{ (Section 5.1)}$  $w = \text{Outer Diameter of trunnion collar sleeve} = (1.644 \ m)/2 = 0.822 \ m \text{ (Section 5.1)}$ 

and Newton's equation of motion:  $V^2 = V_o^2 + 2a(S - S_o)$ 

Substituting values in yields

 $V^2 = 0^2 + 2*(9.81 \text{ m/s}^2)*(2.4 \text{ m})$ , which reduces to V = 6.86 m/s

The angle of inclination that the WP makes with the unyielding surface may be calculated using the following method.

$$\tan \theta = ({}^{\text{Opposite}}/_{\text{Adjacent}})$$
$$\tan \theta = ({}^{l}/_{\text{w}})$$
$$\theta = \tan^{-1} ({}^{2583}/_{822}) = 72.3^{\circ}$$

Title: Corner Drop of 21-PWR Waste Package Document Identifier: CAL-UDC-ME-000008 REV 00

#### 5.4 FINITE ELEMENT REPRESENTATION

A full three-dimensional (3-D) FER of the WP was developed in ANSYS V5.4 using the dimensions provided in Attachment I. The FER was created with the largest possible radial gap of 4 mm between the inner and outer shells (Ref. 4). The same gap was used between the fuel basket and the inner shell. The initial orientation of the inner shell maintains this 5 mm gap around the circumference of the shell.

The internal structure of the WP was simplified. The internal components of the Inner Shell (fuel basket, thermal shunts, side guides, spent nuclear fuel, etc.) were modeled together using solid elements as a solid cylinder (Assumption 3.5). This significantly lowered the number of contacts within the FER while still maintaining the proper mass needed for the computer run.

The target surface was conservatively assumed to be unyielding. This was accomplished using the \*RIGIDWALL command within LS-DYNA. This command creates an invisible rigid wall within LS-DYNA. The unyielding surface shown in the plots has no function. A volume was placed with one of its surfaces coincident with the rigidwall plane. This surface is solely for visual representation.

The mesh of the FER was appropriately generated and refined in the contact region according to standard engineering practice. Thus, the accuracy of the results of this calculation is deemed acceptable.

The initial drop height of the WP was reduced to 0.01 m before impact and the WP was given an initial velocity equal to 6.86 m/s (see Section 5.4 and Assumption 3.3).

The FER was then used in LS-DYNA V950 to perform the transient dynamic analysis for the 21-PWR Waste Package corner drop.

Calculation

#### 6. RESULTS

This document may be affected by technical product input information that requires confirmation. Any changes to the document that may occur as a result of completing the confirmation activities will be reflected in subsequent revisions. The status of the input information quality may be confirmed by review of the Document Input Reference System Database.

Attachment III includes the input files and results files that show execution of the programs occurred correctly. The stresses were reported via plots that have been made interactively using the postprocessor LSPOST. The stresses were recorded every 0.001 seconds after impact. The stresses in all components peaked between 0.011 and 0.024 seconds. However, the solution was allowed to reach 0.030 seconds to ensure that all stresses had climaxed.

The results file, d3hsp (Attachment III), lists the calculated masses used by LS-DYNA. The sum of the masses of the WP equals 40,100 kg, with the mass of the loaded WP 42,277 kg from Section 5.1. However, the top and bottom lids of the inner shell were thinned to 50 mm. The change in mass would be to lessen this number by 1,320 kg, to 40,957 kg.  $((1.530 m)^2 * \pi/4 * 0.900 m * 7980 kg/m^2 = 1,320 kg)$  The percent difference in mass would then be ~2.1%. This difference is considered to be negligible.

It should also be noted that an extra section was added. A "Crush Ring" was added in-between the Support Ring and the Inner Shell. This Crush Ring absorbs energy that normally would be transferred to the Inner Shell if it were not present. Thus, it effectively lowers the stresses in the Inner Shell. This Ring is not shown on the drawings in Attachment I since it was added as a result of this calculation. This addition also changes some dimensions, which would account for some of the differences in total mass.

The following pages contain figures that show various parts at states of maximum stress. These start on the next page with Figure 2, which shows the maximum stress in the lower trunnion collar at room temperature.

### Title: Corner Drop of 21-PWR Waste Package Document Identifier: CAL-UDC-ME-000008 REV 00

Time = 0.017 Contours of Maximum Shear Stress min=1.04536e+06, at elem# 59243 max=7.87049e+08, at elem# 57183

Figure 2 is a cut away picture. All of the stresses that are reported in the legends of the plots are Tresca Stresses or Maximum Shear Stresses. The units are Pascals. This plot shows that the maximum stresses in the lower trunnion collar are 787 MPa at 0.017 seconds.

Figure 3 may be found on the next page. It shows the maximum stress in the same part, but at 400 degrees Fahrenheit.
