The Subcommittee Meeting was called to order at the Nuclear Regulatory Commission, Two White Flint North, Room 2B3, 11545 Rockville Pike, at 8:31 a.m., Dr. Mario V. Bonaca, Chairman, presiding.

PRESENT:

- DR. MARIO V. BONACA, Chairman
- DR. STEPHEN L. ROSEN, Member
- DR. WILLIAM J. SHACK, Member
- DR. F. PETER FORD, Member
- DR. NOEL F. DUDLEY, ACRS Staff Engineer

3 CHAIRMAN BONACA: Good morning. The
4 meeting will now come to order. This is a meeting of
5 the ACRS Subcommittee on Plant License Renewal. I am
6 Mario Bonaca, Chairman of the Subcommittee.

7 ACRS Members and consultants in attendance
8 are Peter Ford, William Shack, and Stephen Rosen.

9 The purpose of this meeting is to discuss
10 the staff's safety evaluation report, with open items,
11 related to the application for the renewal of the
12 operating licenses for Units 3 and 4 of the Turkey
13 Point Nuclear Plant, and associated Westinghouse
14 Topical Reports.

15 The Subcommittee will gather information,
16 analyze relevant issues and facts, and formulate the
17 proposed positions and actions, as appropriate, for
18 deliberation by the full committee. Noel Dudley is
19 the Cognizant ACRS Staff engineer for this meeting.

20 The rules for participation in today's
21 meeting have been announced as part of the notice of
22 this meeting previously published in the Federal
23 Register on September 11th, 2001.

24 A transcript of the meeting is being kept
25 and will be made available as stated in the Federal

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Register Notice. It is requested that speakers first
2 identify themselves and speak with sufficient clarity
3 and volume so that they can be readily heard.

4 We have received no written comments or
5 requests for time to make oral statements from members
6 of the public regarding today's meeting.

7 We will now proceed with the meeting --
8 well, before we do that actually, I would like to make
9 just a couple of brief announcements. One is that you
10 all know that one of our members, Graham, had a heart
11 attack, and he had a second one, I believe, on Friday.

12 He is in good shape, but certainly could
13 not join us here. So I gave him our best, and I think
14 we hope to have him back for the Hatch application.
15 So, that is one issue.

16 The second one is John Barton could not
17 make it. He had some problems with transportation and
18 things of that kind. He sent us a number of good
19 comments, and if the applicant and the NRC will be
20 patient with us, we will try to do justice to his
21 comments.

22 And as we walk through the presentations,
23 we will go through them and where they seem to be
24 significant, we will talk about them. That may force
25 me to break the flow of the presentation and go back

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to his comments, but I think that is the only way we
2 can do justice to them.

3 So with that we will now proceed with the
4 meeting, and I call upon the Florida Power and Light
5 Company to begin.

6 MS. THOMPSON: Good morning. My name is
7 Liz Thompson, and I am the project manager for Florida
8 Power and Light. With me here today is Steve Hale,
9 and he is the licensing and design basis leader for
10 FPL as well.

11 We have prepared a presentation to go
12 through the process that we used for generating the
13 application, the IPE portion, or excuse me, the IPA
14 and the TLAA portions, and Steve is going to lead us
15 through that using the overhead projector.

16 MR. HALE: Good morning. Like Liz said,
17 I am Steve Hale, and I am the licensing lead for FPL's
18 nuclear plants and terms of license renewal. I will
19 try to keep this as interesting as I can.

20 The topics identified by the ACRS
21 Subcommittee that they were interested were to go
22 through a background, and go through our scoping and
23 screening process, go into how we performed our aging
24 management reviews, and then talk about our time
25 limited aging analyses.

1 In terms of background, FPL began
2 strategic planning for license renewal of our nuclear
3 plants around the 1992 time frame. This followed
4 issue of the original version of the license renewal
5 rule.

6 We have been active in the license renewal
7 industry groups, like the Westinghouse Owners Group,
8 the license renewal group, and the NEI task force and
9 working groups since about 1993.

10 We began in earnest our IPA and TLAA
11 efforts in 1999, and we submitted the application in
12 September of 2000. The safety review requirements and
13 guidance that we had available to us at that time were
14 the 10 CFR Part 54, the revised version that was issue
15 in the mid-1990s.

16 We had a draft standard review plan for
17 license renewal, but that has changed drastically. We
18 tried to keep up with the GALL report. We had
19 technical reps on the groups at NEI that reviewed the
20 mechanical, civil structure and electrical sections of
21 GALL as it was going along.

22 We had a draft version of the Reg guide,
23 and we also had available to us NRC position letters
24 on certain particular issues like consumables and that
25 sort of thing.

1 We were active participants on the
2 development and issue of NEI 95-10, and we also had as
3 part of the Westinghouse Owners' Group effort
4 developed some guidelines on how to do an IPA, as well
5 as review your TLAAAs.

6 In terms of our work process itself, and
7 namely that scoping, screening, aging management
8 reviews, and TLAA identification and evaluation, we
9 piloted our initial procedures in 1996.

10 And by piloting we actually tried to
11 produce sample products and that sort of thing, and
12 then factored in improvements that we could see. We
13 tried to structure them around the design basis tools
14 that we had available to us.

15 We have a controlled electronic database,
16 and we have design basis documents that were developed
17 in the late '80s and early '90s, and those were very
18 useful in performing this process.

19 We made a number of information trips to
20 various applicants that were very active in license
21 renewal at the time.

22 And then we went back to the one that we
23 felt more compared -- you know, fairly well with, to
24 the tools that we had available to us, and we spent a
25 lot of time reviewing your detailed technical

1 documents.

2 Some of the other things that we did was
3 that we tried as best we could, because it was kind of
4 a moving target, to factor in lessons learned from a
5 review of previous applications, looking at REIs, and
6 REI responses, and looking at resolution of generic
7 issues.

8 And we tried to factor those into our
9 procedures and output documents as best we could. We
10 did perform all the work in support of our license
11 renewal application in accordance with our quality
12 assurance program, and we also chose to have
13 independent peer review groups, both internal, as well
14 as external peer review groups, come in and look at
15 our products and our procedures.

16 And these were folks from various
17 applicants, as well as some technical experts in the
18 field.

19 DR. SHACK: I was just curious about that.
20 One of the more contentious issues that always seems
21 to come up on a license renewal is how you handle the
22 effect of the environment on fatigue life. And
23 through the REI resolution, you seem to have come up
24 with a good solution to that problem.

25 But I was a little curious as to why you

1 didn't anticipate that question was going to come up.
2 It has come up in every license renewal so far, and I
3 am sort of waiting to see it built into the
4 application, rather than coming out of an REI.

5 Well, I think one of the reasons is
6 because we were the first B-31(1) plant, and we didn't
7 really know what the issues would be. Now, we did try
8 to address concerns relative to NEUREG 62-60, which we
9 did include in our application.

10 And we tried to address the concerns as we
11 saw them, and we factored in, in fact, the commitments
12 regarding the surge line consistent with what ANO had
13 committed to.

14 But there was a lot of questions that came
15 out regarding the pressurizer, which had not been
16 asked previously, and the GTR, the Westinghouse GTR
17 that was submitted as a stand alone document for all
18 Westinghouse plants, had flagged some high fatigue
19 areas in the pressurizer.

20 DR. SHACK: That was one of the more
21 curious things in the thing. They had it flagged, and
22 for you it was a "no, never mind" thing.

23 MR. HALE: Right, but we went back and
24 looked at the pressurizer specifically for Turkey
25 Point. And I think that is probably where a lot of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 those REIs were based on. Whereas, you didn't really
2 see a lot of that in the previous applicant.

3 CHAIRMAN BONACA: I have a question that
4 is more general to the same. Clearly, your
5 application is somewhat one of a kind again, because
6 you didn't have final documents, like NEI finalized
7 documents, or the SRP, or the GALL report.

8 How different do you think it would be,
9 this application today, if you had had started from
10 scratch?

11 MR. HALE: I think that probably we would
12 have figured in GALL as much as we could. It is
13 interesting that you ask that, because we are in the
14 process of developing the application for St. Lucie
15 right now, and we are facing that.

16 We want to try and use the approach that
17 we took at Turkey Point, but at the same time
18 integrate what we have available to us in GALL. And
19 we are doing things like including GALL references in
20 the component commodity listings.

21 And where our programs fit within the
22 bounds of the GALL programs, we are simply going to
23 say that we are consistent with GALL. So, we are
24 doing that.

25 CHAIRMAN BONACA: Okay.

1 MR. HALE: We see the GALL as the main
2 area where we can benefit from what is out there.
3 With regards to scoping, we kind of walk through a
4 two-stage process. When you go to look at the plant,
5 our plants define the terms of systems and structures.

6 So the first step that we wanted to take
7 is to identify which systems and structures had
8 portions that were safety related, and we said that
9 the whole thing was safety related.

10 And then the next step is that we looked
11 at the various components that make up that system,
12 and determine which ones support the functions and
13 which ones don't.

14 So we started first in the system and
15 structure level, and when I say system, we are at the
16 cooling system, and safety injection system, and our
17 HR system, and structures, containment and this sort
18 of thing.

19 And you can see those results which are
20 presented, and I believe it is in Section 2.2 of the
21 application. The purpose of scoping is to identify
22 systems and structures which are either safety
23 related, non-safety, which can affect safety related.

24 And then the five regulations regarding
25 fire protection, environment qualification, PTS, ATWS,

1 and station blackout. More safety related, when you
2 compare the safety related definitions in Part 54,
3 they are consistent with what we call safety related
4 in our quality instructions, and consistent with how
5 we classified safety related components in our plant.

6 The sources of information that we used in
7 defining what was safety related -- and again, even if
8 only a portion of the system was credited, in terms of
9 -- or had components that were safety related, the
10 whole thing was considered safety related for future
11 component scoping.

12 We used the UFSAR, and we used the tech
13 specs. We used our license correspondence database.
14 We have all of our licensing correspondence, both to
15 and from the FPL and the NRC electronically.

16 Our design basis documents, and our
17 component database, and our control design drawings.
18 And again we reviewed all systems and structures to
19 determine if there were any safety related components
20 within them.

21 For non-safety which can affect safety,
22 this is probably one of the more challenging portions
23 of scoping, especially for an older plant, where you
24 are looking at non-safety related systems which could
25 potentially affect safety related systems.

1 Again, we looked at the UFSAR tech specs,
2 our licensing correspondence files, our DBDs. We have
3 a section of our design basis documents that walks you
4 through all the assumptions like for pipe break,
5 seismic criteria, and that sort of thing that we
6 source when we are looking at interactions.

7 Our design drawings, as well as pipe
8 stress analysis, because you have to go and look at
9 what portions where you have a boundary, and you
10 credit an additional piece of pipe in support of that,
11 and we had to include that pipe in the scope of
12 license renewal.

13 We saw two categories. You have a
14 category of non-safety related system, which actually
15 performs a function that supports the safety related
16 system. An example would be a NVAC system on a long
17 term basis that needs to run to support a safety
18 related function. And then we had interactions.

19 MR. ROSEN: Hold on for a minute.

20 MR. HALE: Yes.

21 MR. ROSEN: Why wouldn't a system that is
22 needed to provide functional support for a safety
23 related system also be safety related?

24 MR. HALE: The design of Turkey Point
25 originally in the late '60s and early '70s didn't

1 classify HVAC systems similar to what you would
2 classify them today.

3 Now, control room HVAC is safety related,
4 but you had some of those heating or cooling
5 functions, or ventilation functions, that weren't as
6 clear, in terms of criteria, when Turkey Point was
7 originally licensed.

8 We carry a special augmented quality for
9 those ventilation systems, but they aren't classified
10 safety related.

11 MR. ROSEN: They would be classified
12 safety related, for instance, at St. Lucie, a later
13 plant?

14 MR. HALE: Yes. Yes, they are.

15 MR. ROSEN: Okay. Thank you.

16 MR. HALE: But when you look at the older
17 plants HVAC, it is a little different than what you
18 would see in a newer plant. In terms of license
19 renewal, they are all in the license renewal.

20 And the other was in the area of
21 interactions, where you have a safety related or non-
22 safety related systems based on assumed failures could
23 impact the safety related system. So those two
24 categories are what we looked at.

25 With regards to the regulated events, we

1 have a lot of design tools at our disposal, in terms
2 of determining what is in the scope and what isn't.
3 Again, we used our UFSAR and tech specs, and licensing
4 correspondence, DBDS, our component data base, and
5 design drawings.

6 But in addition to that, we have a safe
7 shutdown analysis and a central equipment list with
8 regard to Appendix R. We have the EQ list as
9 integrated into our component database.

10 And for station blackout, we have load
11 lists, in terms of what is required post-station
12 blackout in order to support the plant.

13 Okay. Now that we have identified what
14 systems and structures are in the scope of license
15 renewal, we proceed to screening, the purpose of which
16 is to identify structures and components which require
17 an aging management review.

18 We step through this by first looking at
19 all the components or structural components that make
20 up the system or structure, and determine whether that
21 component or structural component supports the
22 functions of the system or structure.

23 And then we look at the screening
24 criteria. Is it passive as defined in the
25 regulations. You know, performing the intended

1 function without moving parts or change the
2 configuration or properties.

3 And is it subject to replacement based on
4 qualified life. And we decided in screening that it
5 made sense to us to segregate the three major
6 disciplines; mechanical, which is more system oriented
7 in the structural area, and had very similar
8 components in each one of the buildings.

9 And then in the electrical area, based on
10 the types of components that you have in the
11 electrical 9C systems, and it was best to take a
12 different approach there.

13 So for mechanical systems, we established
14 valuation boundaries and interfaces, in terms of where
15 the systems were, and this is that system, and this is
16 this system. And we made sure that we had everything
17 picked up.

18 And then we identified or actually mapped
19 functions of the system, the license renewal system
20 intended functions, on to the drawings to establish
21 what pieces support the various functions.

22 And then we identified the various
23 components in that system that support those
24 functions. After we got that, we have a list of
25 components that support the system intended functions,

1 and this is all three scoping criteria.

2 And then we identified whether they were
3 passive or not, which is fairly extensive information
4 in the NEI and standard review plan regarding how you
5 do that.

6 And then long lived. We looked to see if
7 these things were procedurally replaced on a regular
8 basis, in terms of qualified life. And then after
9 that, we identified individual component functions.

10 You know, like pressure boundary, heat
11 transfer or whatever it might be for that particular
12 function, or for that particular component.

13 CHAIRMAN BONACA: I don't know if this is
14 the right time to ask questions.

15 MR. HALE: Sure.

16 CHAIRMAN BONACA: But in the plant level
17 scoping results, you know, you have tables in the
18 back, Table 2.2.1., where you do have an
19 identification of systems or components, and then
20 structures, but the structures are later.

21 And we have a number of questions about
22 the number of systems that were excluded, and I would
23 like to ask you, first of all, penetration cooling
24 that was excluded from scope.

25 MR. HALE: Yes, there is a particular

1 analysis that was performed at Turkey Point. Our hot
2 penetrations go to the outside. I mean, we don't have
3 a building around where the main steam and feed water
4 blowdown penetrations come out.

5 And it was an actual analysis, and it is
6 in the UFSAR, in the structural section, that says
7 that even without cooling, temperatures will not
8 exceed 150 degrees.

9 CHAIRMAN BONACA: Okay.

10 MR. HALE: And so all of our peer reviews
11 -- well, that is a good question.

12 MR. ROSEN: What do you mean by hot
13 penetrations that don't exceed 150 degrees?

14 MR. HALE: Well, the area around -- the
15 concrete around. You know, you have a flute head
16 inside containment on the steel side, and you have a
17 main steam pipe that comes out.

18 So you have an air space around the
19 penetration, the actual containment penetration proper
20 in the pipe that comes out. That goes to the outside.
21 So that space right there is exposed to an outdoor
22 environment.

23 MR. ROSEN: What do you mean by high
24 penetrations?

25 MR. HALE: Penetrations that are hotter

1 than 150 degrees.

2 MS. THOMPSON: Classically -- this is Liz
3 Thompson speaking. Classically, you would talk about
4 those as being, for instance, lines that you look at
5 for high energy evaluations.

6 MR. HALE: Yes, typically they are your
7 main steam, feed water, and a blow down lines for a
8 PWR.

9 CHAIRMAN BONACA: The next question I had
10 was -- and actually this came from John Barton, and is
11 regarding RAD waste building ventilation, and why that
12 was excluded.

13 MR. HALE: We have a document basis in the
14 application regarding RAD waste systems in general.
15 We basically looked -- our RAD waste building is an
16 independent building.

17 The consequences of radioactive, both
18 liquid and gaseous releases, are so small that we
19 looked at the scoping criterion under Part 54, and it
20 is a small fraction of Part 100 limits for all of our
21 radioactive waste accidents. So we excluded RAD waste
22 system on that basis.

23 CHAIRMAN BONACA: And some of this, you
24 know, I looked at myself, and I could not find a
25 discussion, however, in the application. I mean, the

1 results is here in the table, but --

2 MS. THOMPSON: On the other side of the
3 table, there is a copy of the application, Steve.

4 CHAIRMAN BONACA: So there is a
5 discussion. You don't have to give me -- well, you do
6 have a discussion.

7 MR. HALE: I will give you a reference
8 after we are done.

9 CHAIRMAN BONACA: Okay.

10 MR. HALE: We did cover it, I believe, in
11 the methodology section.

12 DR. FORD: Could I come back to Steve's
13 earlier comment about the classification of non-safety
14 related items, which would affect a safety rating, and
15 which are not included in your proposal because of the
16 age of your plant, and which would be included, for
17 instance, in St. Lucie.

18 I can understand that maybe there is a
19 regulation reasoning for this, but is there a physical
20 justification?

21 MR. HALE: We just said that they weren't
22 classified safety related. We have included the HVAC
23 system in the scope of license renewal, regardless of
24 classification.

25 DR. FORD: Okay. So it is not just a

1 question of putting the rules because of the age of
2 the plant in one era, and changing them for --

3 MR. HALE: And there are various
4 classifications. Typically what we find is that, for
5 example, we credit the exhaust building exhaust fans.
6 They are not safety related, but they are credited for
7 fire protection, and they are credited for station
8 blackout.

9 And they also carry an augmented quality.
10 It doesn't go to the full extent, but they do -- but
11 they are treated special, and they are controlled
12 under our QA program.

13 MR. ROSEN: Can you identify what the
14 differences are? For example, if today you declared
15 them safety related. What additional controls and
16 processes would be applied to those components that
17 are not now applied?

18 MR. HALE: Really none, because I think
19 probably -- because even in new plants the only tech
20 specs you have are typically associated with charcoal
21 filter systems.

22 Well, I take that back. Well, control on
23 the air-conditioning is one. But in terms of material
24 control, quality assurance, we maintain a similar
25 level to safety related for our HVAC systems at Turkey

1 Point.

2 So I think it was more of an evolution of
3 the industry, you know, when you look at the old
4 plants versus the newer plants. I think the important
5 thing those is that we have included them all in the
6 scope, and they have got an aging management review,
7 and they were determined to be in the scope for the
8 maintenance rule as well.

9 CHAIRMAN BONACA: All right.

10 MR. HALE: So they are already under
11 observation inspection and being managed.

12 CHAIRMAN BONACA: The next question is
13 that it says on screen wash. Why are screen wash not
14 in the scope?

15 MR. HALE: Our screens are, but our screen
16 wash isn't. And the reason there is that when you
17 look at the flow rate for intake cooling water, it is
18 very small as compared to circ water. We need screen
19 wash for circulating water, but under accident
20 conditions, our circ water pumps are not running. So
21 you are looking at a very small percentage. So we
22 included the screens to preclude any small debris, and
23 that sort of thing which may be in the intake.

24 But we didn't credit the fact that the
25 screens have to run and you need to rinse this stuff

1 off of it. And we still have our strainers that are
2 downstream of that, and which are cleaned periodically
3 as well.

4 CHAIRMAN BONACA: So you do have in any
5 event programs to clean them and to inspect them?

6 MR. HALE: Oh, yes, but we just didn't
7 need to credit them for license renewal.

8 MR. ROSEN: I understand your comment as
9 to safety related water flows through those screens.

10 MR. HALE: Yes.

11 MR. ROSEN: And even after the main pumps
12 trip.

13 MR. HALE: Right. But it is such a small
14 amount that it wouldn't -- that you wouldn't get a
15 backup to where you would actually block flow in water
16 cooling.

17 MR. ROSEN: So the service water system
18 takes suction from the same bays as the main
19 circulating water system?

20 MR. HALE: Right. Right.

21 MS. THOMPSON: And for clarification, the
22 safety related service water system at Turkey Point is
23 called the intake cooling water system. The service
24 water system at Turkey Point is actually a non-safety
25 related, like potable, water type of a system just for

1 clarification.

2 MR. ROSEN: Thank you again.

3 CHAIRMAN BONACA: And that is one thing,
4 that when you read through, you are left with the
5 question of how come this is not, and then you think
6 about it and you say, well, I am sure that they have
7 some programs ongoing now that are not described, even
8 among existing programs and that are being used to
9 monitor the systems and this was one.

10 MR. HALE: Right.

11 CHAIRMAN BONACA: But to some degree -- I
12 mean, I guess it is the format of the applications
13 that we received that it just doesn't provide that
14 information. It leaves the reader with the impression
15 that things are not being done.

16 One question, for example, that was raised
17 by John Barton that comes later, but I can raise it
18 now, is that I believe on the fire protection, the
19 sprinkling systems.

20 There is a one time test, I believe,
21 during the last 10 years of the license life -- and
22 maybe we have to wait until we get there, but is the
23 testing of wet pipe sprinkler systems starting in the
24 50th year of operation.

25 And it leaves us with the question of is

1 this system never tested before?

2 MR. HALE: Oh, no. If you look at the
3 fire protection program description, we have extensive
4 testing that we do on the fire protection system. The
5 issue that was raised there was that there was a
6 particular criteria in NFPA 25 regarding sprinkler
7 head inspections at year 50.

8 And so as a result of the staff review,
9 they had asked us to include that in our commitments,
10 which we did.

11 CHAIRMAN BONACA: Yes, and this I think
12 came up in previous applications.

13 MR. HALE: Right. Right.

14 CHAIRMAN BONACA: Okay. I remember now.
15 Okay. I understand. It is just the impression that
16 one is left with, is this question, you know. And in
17 many cases, we know that there is a lot of going on.

18 But since you are referencing existing
19 programs, one would expect some mention of that and at
20 times we don't see it. So --

21 MR. HALE: The NRC regional inspections --
22 and I can tell you this much right off. They did a
23 very detailed review of the programs, and Hibo Wang,
24 who was the civil rep, can tell you about that.

25 But they spent a lot of time looking at our

1 programs, in terms of -- and comparing them against
2 our AMRs to ensure that our programs are managing the
3 effects that need to be managed.

4 CHAIRMAN BONACA: Yes, and if you can be
5 patient with me, I will go through this list so that
6 we can get through them under the plant scoping.

7 MR. HALE: No problem. No problem. There
8 were three electrical systems. One is a C-Bus
9 electrical switch gear and closure, the main auxiliary
10 transformers, and the start-up transformers. And that
11 was not clear to me why they were excluded from the
12 scope.

13 MR. HALE: The C-bus was a bus that we had
14 installed that was powered from the switch yard, and
15 it powers non-safety related loads. It was basically
16 to -- you know, like a feed pump, main feed pumps.

17 It was really to take some of the load off
18 the existing plant buses. The auxiliary and start-up
19 transformer, our assumption was that you have your
20 diesels, in terms of on-site power supply from a
21 safety related standpoint.

22 And you don't need your aux and start-up
23 transformers for safety, and non-safety, which can
24 affect safety, and certainly not station blackout.

25 CHAIRMAN BONACA: But the basic

1 assumptions in the accident analysis is that you have
2 also no low power in some cases, right? You would
3 depend on that. I mean, it is not only that the --

4 MR. HALE: We don't rely on it, you know,
5 in terms of our accident analysis, or in any of the
6 regulated events. And fire protection, the assumption
7 is that you have to demonstrate that you can handle it
8 with some loss of off-site power.

9 CHAIRMAN BONACA: Okay. So you don't
10 consider them because of that?

11 MR. HALE: There are components, certain
12 terms of plant availability. You know, you want your
13 aux transformer and that sort of thing.

14 CHAIRMAN BONACA: And then the other thing
15 that we had on the list here from John Barton is the
16 off-site communications tower is not in scope, and --

17 MR. HALE: Well, we have on-site
18 communications. In fact, after Hurricane Andrew, we
19 developed 3 or 4 different alternatives on-site. So
20 it is not required.

21 CHAIRMAN BONACA: No, this would be off-
22 site.

23 MR. HALE: Right, but the off-site one is
24 not required, in terms of communications.

25 CHAIRMAN BONACA: Okay. It is not

1 required?

2 MR. HALE: No.

3 CHAIRMAN BONACA: For an emergency plan or
4 anything?

5 MR. HALE: Right.

6 CHAIRMAN BONACA: And finally the switch
7 yard relay inclosure and the condenser.

8 MR. HALE: We don't credit the condenser
9 for any of the scoping criteria, 54.4, nor the switch
10 yard.

11 CHAIRMAN BONACA: Okay.

12 DR. SHACK: Just to continue on the
13 scoping a little bit. One of the things that we sort
14 of looked at and suggested in other reviews is do
15 people look at EOPs, because again this is sort of
16 discussing equipment that people are relying on.

17 And just making sure that that equipment
18 is somehow checked in license renewal, but I noticed
19 that it is not one of the documents that you look at
20 here for your scoping study. Are you confident that
21 everything that you need in your EOPs is somehow
22 covered here?

23 MR. HALE: Yes. Yes, we are. One of the
24 things that we did do was compare our scoping results
25 against maintenance real scoping results for

1 consistency, and one of the items under the
2 maintenance rule is the EOPs.

3 So we felt confident by doing that
4 comparison that we could -- that we would capture any
5 differences that there may be. So that was the main
6 thing. We found that we didn't really need to go into
7 the EOPs themselves.

8 MR. ROSEN: I am taking your answer as you
9 relied on the maintenance rule scoping for the EOPs.

10 MR. HALE: Well, we don't -- the EOPs is
11 not a scoping criteria for license renewal. And we
12 don't have to check the maintenance rule files as part
13 of our license renewal scoping. There are differences
14 between license rules and maintenance rules.

15 But we did go compare against the
16 maintenance rule for consistency. It still is not a
17 criteria under license renewal to do that.

18 CHAIRMAN BONACA: Okay. I have another
19 question which probably will go to the staff more than
20 you, but I think it is about the spent fuel pool. And
21 I noticed that you included the spent fuel pool
22 cooling in scope.

23 MR. HALE: Yes.

24 CHAIRMAN BONACA: In fact, you identified
25 for the spent fuel pool system three intended

1 functions. One is the pressure bundle integrity, and
2 two is heat transfer, and three is culling.

3 And so you have a number of components in
4 scoping, including the cooling of the pumps and so
5 forth. Now, you do have an emergency makeup system to
6 that pool outside of the cooling system. Is it tied to
7 the high pressure injection system or something?

8 MR. HALE: I am not sure. Do you know,
9 Liz?

10 MS. THOMPSON: Well, yes, there are makeup
11 systems. I am not sure if it is tied to high pressure
12 injection, but we certainly have that capability.

13 MR. HALE: We had to upgrade after our
14 second rerack, and we upgraded our system to a seismic
15 category one safety related system. We felt that we
16 were managing the system.

17 CHAIRMAN BONACA: Well, actually, I feel
18 that you went beyond the normal scope that we saw
19 before. I mean, for other plants that we have
20 reviewed before, the only function identified was
21 pressure bundling integrity, and then the steel liner
22 was the only component in scope because there was an
23 emergency makeup water coming from high pressure
24 injection.

25 And I am just questioning why there is

1 this variability in different applications. Is it
2 tied to just the design basis? I mean, how come you
3 have such differences in functions being identified,
4 and I guess that is a question for the staff.

5 MR. HALE: Well, I can tell you from my
6 own experience looking at our two sites that the
7 original design, for example, at Turkey Point was an
8 emergency makeup.

9 But as a result of fuel consolidation in
10 the spent fuel pits, you go through a upgrade as you
11 license that. For example, at Turkey Point, we
12 upgraded the cooling system to seismic category one,
13 and we replaced the liner with a quarter-inch
14 stainless steel liner plate which was not there
15 originally.

16 Redundancy. I go look at Unit 2, and you
17 have got a totally redundant system at St. Lucie Unit
18 2. At Turkey Point, we didn't originally, but it was
19 upgraded. So I think that has something to do with
20 it, is based on where various plants are regarding
21 upgrades that might have taken place through time.

22 CHAIRMAN BONACA: But I still -- I mean,
23 I feel at some point, for example, the GALL report
24 will have to have some base line acceptance of both
25 functions which are credited for license renewal for

1 that system, and therefore, the specific components
2 that come through that scoping and screening process
3 that identifies those functions.

4 I mean, I am just uncomfortable about the
5 difference in scope, particularly the one that has to
6 do with the inclusion of the cooling system that was
7 excluded from the previous applications.

8 MR. KOENICK: This is Steve Koenick with
9 the staff. You have to look at the licensing basis.
10 A lot of these other plants, they were required to be
11 safety related. They did have the boiling and makeup
12 as a design basis.

13 So there will be variability like Steve
14 was saying between the vintage of plants and what they
15 were designed and licensed to.

16 CHAIRMAN BONACA: I understand that, but
17 I certainly wasn't very happy with the exclusion of
18 the cooling system from scoping and screening in the
19 previous applications.

20 But I understood the logic of that. Now
21 I see an application coming and it goes beyond the
22 requirements we saw applied before, whatever the
23 reason may have been.

24 And I am left with the question in my mind
25 not regarding this application or the previous one of

1 why those components should be excluded to start with.

2 I mean, is there something regarding the
3 license renewal rule that allows you maybe not to
4 include things that should be there? You see, that is
5 really the question, and this is a significant
6 discrepancy here.

7 MR. KOENICK: Well, as Steve was saying on
8 Turkey Point, in order to rerack their pool, I don't
9 know all the details, but they essentially needed to
10 upgrade to become safety related.

11 And other plants, if you look at the
12 scoping criteria, today they are not safety related
13 cooling systems. It's not that they are not being
14 maintained and that there is not programs and
15 procedures.

16 But when you look at what the criteria for
17 license renewal are, these systems on some of the
18 other plants that you have looked at don't meet that
19 criteria, and that is the way that they are operating
20 today.

21 CHAIRMAN BONACA: But do you feel
22 comfortable that those systems then are going to be
23 effective for the next additional 20 years of
24 operation?

25 MR. HALE: Yes.

1 MR. KOENICK: Yes. You know, license
2 renewal is only looking at select systems that are
3 based on the scoping criteria that are safety related
4 or that can in effect fail safety related.

5 The licensees have programs and
6 maintenance procedures for all the other systems, too.
7 It's just that we are taking a particular look at
8 certain ones for renewal to ensure that the plants
9 will continue to have the safety margins that they
10 need.

11 CHAIRMAN BONACA: Okay. Anyway, I don't
12 have a problem with your application. I mean, you
13 went beyond what we have seen before.

14 MR. HALE: We are very happy.

15 CHAIRMAN BONACA: And I think you have
16 certainly recognized the intended functions that I
17 always thought had to be there. So, that's good. I
18 have one more question.

19 MR. HALE: Okay.

20 CHAIRMAN BONACA: Your Table 2.2.1 is a
21 list of all of the component mechanical systems, and
22 then when I got to Table 2.3.2, I find that there is
23 a very effective, I think, resolution of the renewal
24 applicant action items coming from the supporting
25 Westinghouse documentary report.

1 MR. HALE: Okay.

2 CHAIRMAN BONACA: And although you did not
3 reference it in the application; however, you do have
4 significant discussion into the application and also
5 in the SER. I could not find the one for the
6 pressurizer.

7 MR. HALE: Well, at the time that we
8 submitted the application, we had two draft SERS. We
9 had piping and we had supports. So, when we
10 submitted, we did not have that available to us for
11 the pressurizer or for the internals. Now, what
12 happened --

13 CHAIRMAN BONACA: But you must have used
14 it, because the SER, all the pressurizers specially
15 identifies four renewal applicant action items, and
16 then discusses the reason why or whatever you are
17 proposing is acceptable.

18 MR. HALE: As part of our REI process, and
19 the staff I'm sure will describe this to you, and
20 maybe this afternoon, but we got REIs relative to the
21 open items on the pressurizer.

22 They reviewed our application and in those
23 cases where the applicant action items weren't
24 addressed, they asked us in the REI and we responded
25 to it.

1 In the case of the internals, they asked
2 us all 11 of the applicant action items as an REI. So
3 what you will find is our responses to those in our
4 REI responses, and it might have been in the reactor
5 coolant system REI response.

6 I am not sure about that, and so it was a
7 combination of considering where they were with the
8 WCAPs at the time.

9 CHAIRMAN BONACA: Okay. I understand.

10 MR. HALE: They all have SERs now, and we
11 have also done a check where we stand against them,
12 and we took them either through our application or in
13 the REI responses.

14 CHAIRMAN BONACA: Well, I bring it up
15 because I thought it was an excellent way of
16 documenting resolutions in an open fashion so that you
17 understand the true linkage between the supporting
18 topical reports, and the way they had been used in the
19 application.

20 And I liked it so much that when I went to
21 the pressurizer, I said where is it, and so I
22 understand now.

23 MR. HALE: That's good feedback. Thank
24 you.

25 CHAIRMAN BONACA: Okay.

1 MR. HALE: With regards to civil
2 structural screening, we took a very similar approach
3 to what we had done in the mechanical area to each
4 structure. We identified the various structural
5 components that make up each structure.

6 One point that we wanted to make is that
7 the non-current carrying electrical 9-C components,
8 these are enclosure supports for conduit, and conduit
9 cable trays were included in the civil structural
10 area, because they are really structural components.

11 We looked at the various structural
12 components that support each of the structure intended
13 functions, and then we went through the passive, long-
14 lived checks in the regulations with regard to
15 screening.

16 Of course, most of the civil structural
17 items are passive, and typically they are not replaced
18 on a regular basis. So most of the stuff comes
19 through in terms of requiring an aging management
20 review.

21 And then we identified the individual
22 functions of the structural components. In the
23 electrical 9-C area, for efficiency, it makes a lot
24 more sense to walk through this in a little different
25 order.

1 For example, if I do a download in our
2 database of electrical components associated with a
3 480 volt load system, I may get 18,000 components, and
4 to go through that one when a majority of them are
5 active, it makes more sense to -- you know, let's look
6 at the active stuff, and get it out first, and then
7 look at what we have left.

8 So we identified all the component
9 commodity groups, and we identified the functions as
10 being very similar to approaches taken by previous
11 applicants. And then we identify the component
12 commodity groups that were passive.

13 One point that I wanted to make was that
14 if it was in the EQ program, we said that it is
15 subject to replacement based on qualified life, and I
16 think that's it. Yes, that's it. I'm sorry, I
17 thought I had another slide on there.

18 Well, that pretty much takes us through
19 screening. Did you have any questions regarding
20 screening?

21 CHAIRMAN BONACA: Well, actually again I
22 thought that your tables laid out, 3.2.1., are quite
23 effective, because you are summarizing in those tables
24 the function, and the material environment, and
25 therefore you are going to the scoping and screening,

1 and it comes through. That's very good.

2 MR. HALE: And six column tables were
3 lessons learned from the Oconee. In fact, it came
4 from our Duke Brothers that indicated that if you had
5 it all in one table -- and in fact we are thinking of
6 carrying that forward long term, in terms of
7 configuration control and management.

8 CHAIRMAN BONACA: Yes.

9 MR. HALE: I think that is a good way to
10 reflect the entire IPA.

11 CHAIRMAN BONACA: Yes, that's good.

12 MR. HALE: Now to the aging management
13 reviews. This is really the purpose as defined in the
14 regulation for each structural component or component
15 requiring an aging management review. You demonstrate
16 the effects of the aging will be adequately managed.

17 So the intended function would be
18 maintained consistent with the current license basis
19 for the extended period of operation. Now, that is a
20 long definition.

21 I thought that the best way to go through
22 this was to talk about the inputs that we utilized for
23 doing our aging management reviews. I am going to
24 touch on the technical resources, and talk about the
25 operating experience reviews that we performed, and

1 also mention peer reviews that we had done on our
2 aging management reviews.

3 CHAIRMAN BONACA: Before you start with
4 that, I would like to ask you a question.

5 MR. HALE: Yes.

6 CHAIRMAN BONACA: Of course, through the
7 application there is a description of the exposure
8 that you have to salt air. You do have a pretty
9 peculiar auxiliary building, right? I mean, you have
10 no walls there. It is all open.

11 MR. HALE: The turbine building. The
12 auxiliary building is enclosed, with the exception of
13 the CCW area, which has walls, but steel grating for
14 a roof.

15 CHAIRMAN BONACA: For those components
16 which are not enclosed -- I mean, what is the
17 experience of the past? It is more curiosity than
18 anything else.

19 MR. HALE: It is actually pretty good.
20 What we found is a large bore stainless piping, thin
21 wall, in the heat affected zones. We have had some
22 experience with St. Lucie, which in terms of external
23 stress corrosion cracking, and this is piping in
24 trenches.

25 But overall it has been very good. As

1 part of our aging management review, we walk down all
2 our systems that were outdoor. I mean, we walked them
3 all indoor as well, but outdoor we specifically were
4 looking for certain aging effects, like pitting. You
5 know, cracking.

6 We have had 30 years of experience at
7 Turkey Point, in terms of SSC and that sort of thing,
8 and so we know where the problems area would be. But
9 actually it has been pretty good.

10 There is a couple of isolated areas which
11 have challenged us, and we have talked about them in
12 the application.

13 CHAIRMAN BONACA: Yes.

14 MR. HALE: Our previous heat traced line
15 in the CDCS system, where you had insulation, and you
16 get some leakage or something and it holds it on to
17 the pipe, we actually had some experience with it.
18 But overall the performance has been very good.

19 MR. ROSEN: Let's come back to the
20 stainless steel piping that was found to have external
21 stress corrosion cracking. Was that piping that was
22 wetted continuously or underwater because it was in
23 trenches?

24 Were the trenches filled with water, or
25 was that cracking, do you think, experienced just

1 because the piping was exposed to salt there?

2 MR. HALE: No, there was some wetting
3 involved, and Liz, maybe you can speak a little better
4 to this. We have not really experienced this at
5 Turkey Point yet. We experienced it at St. Lucie, but
6 we made it an assumption for Turkey Point.

7 MS. THOMPSON: Well, in a trench,
8 sometimes in a subtropical climate like we have, we
9 get rains, very hard rains, all at once. And
10 sometimes you will get some wetting. If nothing else,
11 you are getting a very moist environment, with some
12 salt present there from the ocean and the canal water
13 at the two different sites.

14 And both are salt water environments, and
15 what you don't see -- and what is different about
16 trenches -- is because it has a cover, you don't get
17 the rinsing effect basically of the rainwater, which
18 basically in a trench, you know, you would tend to
19 expect that you may see a little bit higher chloride
20 concentrations.

21 And you don't get the rinsing and then the
22 sun drying from afternoon thunderstorms and stuff like
23 that that you get in most other areas.

24 And as Steve mentioned, Turkey Point --
25 you know, we are dealing with about 30 years of

1 experience, and at St. Lucie, about 25 years of
2 experience. And so far that has been all that has
3 really come up. The rest seems to be a pretty stable
4 environment for outdoor areas.

5 MR. HALE: And it was very specific to the
6 heat affected zone on that thin wall pipe where they
7 welded it.

8 MS. THOMPSON: But the stresses of the
9 heat affected zone, you know, plus a thinner wall,
10 would tend to cause higher stress and complications.
11 So it took the combination of all of that before we
12 have seen anything, and of course those have been
13 addressed through our correction action program under
14 our quality assurance program.

15 MR. ROSEN: How severe was the cracking?

16 MS. THOMPSON: We had just seen minor
17 boric acid indications. I mean, nothing from a
18 leakage perspective or whatever. Early detection, of
19 course, is what we deal with everywhere.

20 But we have found it in more than just one
21 location. So once we found it in one location, then
22 the next step is to look for applicability, and
23 expanding out until you confirm that you have really
24 got your arms around the full scope of the issue.
25 And so we did see it in more than one location.

1 MR. ROSEN: And this was at St. Lucie and
2 not Turkey Point.

3 MS. THOMPSON: It was at St. Lucie. We
4 took that experience and applied it to Turkey Point.
5 We do have a few lines that are somewhat comparable,
6 although we have not seen the conditions at Turkey
7 Point.

8 MR. ROSEN: And can you tell me what
9 systems at St. Lucie it was experienced in?

10 MS. THOMPSON: They were ECCS section line
11 systems. Basically, they are section line to the
12 piping systems, and we had to work through one train
13 at a time making repairs, and replacements, and so
14 forth to address those. So they were definitely
15 systems of great interest to us.

16 MR. ROSEN: Thank you.

17 DR. FORD: On this full page, fairly
18 recent Mr. Lochbaum, a concerned scientist, sent a
19 note to Mr. Grimes pointing out that in the last year
20 in several, in quite a few, in over 10, incidents
21 where reactors have been shut down prematurely,
22 unplanned, and probably because of a failure of aging
23 management programs.

24 How good do you feel about this programs,
25 in terms of their ability to see or to detect a

1 problem before it occurs?

2 MR. HALE: We are very confident in our
3 programs. In fact, I think the inspection that was
4 recently performed upholds that. We look at those and
5 we factor in any of those failures in consideration of
6 our own instances.

7 For example, the V.C. Summer, we looked at
8 the applicability there to Turkey Point. You know,
9 they had penetrations, and that's identified as an
10 open item in the application.

11 DR. FORD: But these are really all
12 reactive.

13 MR. HALE: Well, that penetration issue,
14 I think there was some recent information that came
15 out regarding the failure mode that had not been
16 originally, but we all had plans for reactor vessel
17 head penetration inspections as part of 97.01.

18 You know, it's just that -- I think there
19 was some -- the new information that came out
20 available, but it is not as if we were ignoring it,
21 you know. I think that -- well, my perspective on it
22 is that I have been at FPL for over 30 years.

23 And I have been at both of these plants,
24 and I think you pretty much see most everything, or
25 have seen most everything based on the long term

1 operations at length.

2 DR. FORD: Yes. Unfortunately, you always
3 see something the next day which you didn't predict
4 the day before. I guess my frustration to a certain
5 extent about this whole procedure is that I keep
6 seeing -- for instance, the frequency of inspections,
7 and the depth of inspections.

8 It is dependent on how good your
9 disposition algorithms are, and we keep seeing in all
10 of these license renewal aging management programs
11 reference to ASME 11 procedures.

12 And yet the data upon which those curves,
13 those disposition curves, are not always good quality,
14 and they are always being revised. And unfortunately
15 when you find that we need to revise them after we
16 have had a fairly catastrophic event.

17 And maybe this will come out this
18 afternoon as we are discussing from the NRR
19 perspective, but do you have any feeling as to where
20 we are at risk? For instance, baffle bolts right now.
21 Could you predict when the baffle bolt cracking
22 occurrence would in fact take place, and what would
23 the impact be on, for instance, delta-LOCA, or LRF?

24 MR. HALE: I feel very confident about the
25 baffle bolt area because we have had an extensive

1 probing program going on right now as part of the WOG
2 to address that specifically.

3 And including safety evaluations
4 regarding, you know, failures. We were doing -- and
5 Roger Newton is back there, and he can tell you,
6 because they pulled theirs at Point Beach and
7 inspected them.

8 And George Roble was also there for GANE,
9 who has done the same. So I feel in terms of the WOG
10 that we have a good feel for the baffle bolt issue.
11 With regard to Section 11, where we credited Section
12 11, at least the mechanical systems, was for Class One
13 inspections.

14 Now, we are moving to a risk informed in-
15 service inspection at Turkey Point. We factored in
16 things like risk, fatigue, into what we are going to
17 be looking at.

18 For example, we are going to look at every
19 weld in the surge line in the next 10 year interval,
20 because that is the critical location to Turkey Point.

21 DR. FORD: Well, that's great. What is
22 the area of your greatest risk right now?

23 MR. HALE: Greatest risk?

24 DR. FORD: Well, you have about 7 or 8
25 programs that I see listed in your application, but no

1 details in there about them. How good do you feel
2 about their worth, and which ones would you want to
3 upgrade from a risk point of view?

4 MR. HALE: I feel -- well, what we
5 described in the application, behind every one of
6 those on site is what we call our program basis
7 documents.

8 DR. FORD: Okay.

9 MR. HALE: And details specifically how
10 the plant specific procedures that implement those, as
11 well as specific enhancements to procedures, in terms
12 of what we feel that we need to do.

13 If you look at what is happening in
14 industry over the last few years, you know that
15 inconel is an issue. I mean, that seems to be one of
16 the underlying things behind a lot of these issues
17 that have been raised.

18 At St. Lucie, we have a number of inconel
19 instrument penetrations, and we have had leakage there
20 before. So we have been following the inconel issue
21 for some time, and what I have seen through the years
22 is they started saying, well, it is a bad heat.

23 And then, oh, here is another one, and
24 here is another one. But certainly inconel poses a
25 challenge for all of us, and to me I think that's

1 where the risk is.

2 But I think we are learning a whole lot
3 more over the last couple of years, because the V.C.
4 Summer event was related to an inconel safe end, I
5 believe. You know, certainly the penetrations on the
6 inconel head are all centered inconel.

7 DR. FORD: I bring it up now because the
8 information for making those decisions come out of
9 those three sub-bulleted items there.

10 MS. THOMPSON: I think an important thing
11 to note is that the aging management reviews
12 -- and Steve will get into this a little bit, and
13 factor in operating experience, both at our plants and
14 at other plants.

15 And that is part of an ongoing process
16 that we always do. Operation of our plants is based
17 in a defense-in-depth, you know, multiple barriers
18 type of a concept.

19 And we have to recognize that those
20 multiple barriers really are what provide the ultimate
21 level of safety from redundancy, between systems. You
22 know, systems backing up other systems.

23 And the fact that we have and have
24 included in our aging management program are most of
25 our early detection processes that we have in place

1 now under the current term.

2 And in a couple of cases we have suggested
3 enhancing those to further cover a broader scope
4 basically for the renewal term. Those are the
5 processes that put us in a position where that
6 operating experience is identified early, and then we
7 as an individual operator of the plants, as well as an
8 industry, share that.

9 And that's where I think we really have
10 the strength and the safety performance of this
11 industry. We don't want to let problems get us to the
12 point where they force us undue shutdowns, unplanned
13 shutdowns.

14 And we know that we have to take the right
15 actions to address those based on not just our own
16 specific planned experience, but also what we find as
17 we move forward basically in this industry and
18 managing these plants.

19 And a lot of our early detection programs,
20 from the systems and structures monitoring program,
21 and to our boric acid programs, are the types of
22 things -- just to name a couple of examples, that
23 really put us in that early indication type of a
24 process that allows us that additional layer of
25 defense really to ensure our plants are safe.

1 CHAIRMAN BONACA: And on the other hand,
2 you might reference to the V.C. Summer issue. They
3 are more -- and I am not as much troubled by the fact
4 that you have an inconel problem, and you have some
5 cracks developing, than about the fact that the
6 programs which were in place there did not detect
7 those cracks.

8 In fact, they didn't see any when the
9 inspections were performed. And then we had to wait
10 until the crystals were out, and that's really what is
11 our concern the most. I mean, these programs are
12 great in many ways.

13 I look at it and there is a full life
14 cycle management here being laid out, and developed in
15 front of us. You know, the concern is always about
16 how able are we to detect in the inspections, because
17 the inspections are many and thorough.

18 DR. FORD: These are more general
19 comments, and not specific, as those will come out
20 this afternoon. But it just concerns me that as an
21 industry that we tend to go by industry experience,
22 and by implication is the mean of the experience.

23 And what we are really interested in is
24 the first occurrence. For instance, before V.C.
25 Summer, the day before, we didn't know it was going to

1 occur. And when it did occur, it was, "oh, shit," and
2 what are we going to do about it.

3 And time and time again throughout our
4 history we have done exactly that, that in large pipes
5 and BWRs, they are never going to crack, but for
6 whatever reasons yet they did.

7 And this is why I have got great suspicion
8 of these aging management programs which can't see
9 forward.

10 CHAIRMAN BONACA: We left behind an issue
11 on scoping that I would like to get back to, because
12 I think it is important, and that has to do with the
13 October 1 issue of known break location line piping.
14 I guess support by known break location line supports,
15 seismic. Why are they not in scope?

16 MR. HALE: The supports are in the scope.

17 CHAIRMAN BONACA: I understand that. Why
18 are the segments not in the scope?

19 MR. HALE: In looking at our licensing
20 basis regarding high energy line break and flooding,
21 we felt that we had already accommodated pipe failure
22 aspects.

23 Now we are working with the staff right
24 now and understand the concern they have raised, and
25 we are in the midst of responding to their open item.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Our feeling is that our current licensing
2 basis is acceptable based on approved flooding
3 evaluation and our high energy line item, but we
4 understand the staff's concern. So we are taking an
5 additional step, and looking at our plant regarding
6 the assumptions that are being proposed.

7 And essentially the assumption is that
8 aging would change the assumed break locations and
9 this sort of think for systems containing fluid and
10 steam. So we are evaluating that.

11 The supports have always been in the
12 scope, and another point that I need to raise is that
13 we have got a number of non-safety related systems
14 already in the scope, including the piping.

15 The Turkey Point fire protection brings in
16 numerous systems in the Aux building that are non-
17 safety related. So the pipes wouldn't even scope
18 there.

19 So we are walking or we are in the midst,
20 and in fact we are going to work with the staff,
21 understanding their concerns. And we will probably
22 identify some additional lines that we will include in
23 the scope.

24 CHAIRMAN BONACA: And I am sure that you
25 will agree that if you had a segment between supports

1 that is likely to corrode, or whatever, and then fail,
2 and then fall over into other systems, that would not
3 be acceptable. You don't disagree with that do you?

4 We are trying to understand the logic.
5 This is the second application that we have seen in
6 which there is this issue. The first one I think had
7 different connotations there, because they, I believe,
8 had seismic qualified supports.

9 And then they were looking more at zones
10 and you are not here. But try to understand why this
11 issue is there, and whether or not -- and we will
12 understand that this afternoon that there will have to
13 be specific items on the part of the staff for
14 licensees in this particular area.

15 MR. HALE: A lot of it has to do with your
16 current licensing basis. You know, when do you assume
17 the seismic occurrence. You know, we all went to the
18 older plants when they went through A-46, and you just
19 had to show that you had shut down the plant with a
20 seismic -- a given seismic occurrence.

21 If you jus say that failure can impact
22 safety related equipment, period, well, that is a
23 difference basis behind -- you know, that is saying,
24 okay, I have got the seismic occurrence, and I have
25 got the LOCA.

1 And so if you take the definition,
2 "affects safety related period," you have to go back
3 and look at your licensing basis as to what your
4 assumptions are. Typically most of us don't assume an
5 earthquake with design basis events.

6 MR. ROSEN: Notwithstanding all of that,
7 and going back and looking at the license basis, and
8 all of that, where we end up on this issue I think is
9 that we have an unsafety related piping out to a non-
10 safety related support, where we have the support in
11 the aging management program, and the aging management
12 review. But the piping itself, which is the load
13 carrying member out to that support, is not.

14 MR. HALE: Well, let me correct that. We
15 did include piping segments that provide structural
16 support in the scope for that very reason, because it
17 is an extension of the support.

18 What we are talking about here is a non-
19 safety related line that sits above a safety related
20 piece of equipment.

21 MR. ROSEN: Where the non-safety related
22 line does not provide any kind of structural support.

23 MR. HALE: Right. We did include the pipe
24 segments. Remember when I was talking about screening
25 and stress analysis? We actually took whatever

1 portion of the piping was credited downstream of the
2 boundary, as in the scope of licensing. That pipe is
3 in the scope of licensing.

4 MS. THOMPSON: I would also like to add
5 that in addition to what Steve described, which was
6 the piping segment that is connected to the safety
7 related portion being considered in the scope, the
8 support is being considered in the scope.

9 We also considered protective features,
10 such as sump pumps and actual protective features for
11 leakage considerations in the scope as well. So our
12 difference between the staff's open item and what we
13 have already considered in our application is actually
14 very small.

15 We feel like we understand that, and we
16 would like to -- you know, we have asked our project
17 manager if we could actually go through our resolution
18 on that next week. So we feel like we can move
19 forward on that.

20 And for Turkey Point, as I think you all
21 mentioned earlier, a number of the areas are outdoor
22 as well, and so the things that are underneath, those
23 safety related pieces of equipment, are actually
24 designed for wetted environments.

25 MR. HALE: Outdoor service.

1 MS. THOMPSON: Outdoor service. So our
2 scope tends to be quite small in this area. but we
3 feel like we can move forward on that. So our delta
4 is actually a relatively small delta.

5 And we understand the staff's position,
6 and we will work forward on that. I think our
7 difference has been consideration of what we consider
8 our current licensing basis.

9 But I think aside from that, we understand
10 the staff, and we will work forward to resolution.

11 CHAIRMAN BONACA: Okay.

12 MR. HALE: Okay. Any other questions? If
13 not, I would like to go through these three points.
14 With regards to the AMR technical resources we had
15 available to us, although only five generic technical
16 supports were submitted to the NRC for review, the
17 Westinghouse Owners Group, we generated over 15 of
18 these generic technical documents.

19 And it incorporated basically the history
20 of all of the Westinghouse plants. So we have that
21 integrated in it, and it pretty much covered every
22 component that you would have in the power plant.

23 And certainly in the early '90s, NUMARC,
24 with EPRI, had the industry reports, which were
25 submitted to the NRC for review. The B&W tools, I'm

1 sure you have heard this, all of the owners' groups
2 have bought those tools that look at the evaluation of
3 aging effects for non-Class One mechanical systems and
4 civil structures.

5 You have to tailor it to your plant. You
6 know, we did an evaluation which took the tools, and
7 applied to Turkey Point. We looked at the Aging
8 Management Reviews performed by a particular
9 applicant, and that we felt did a fairly detailed
10 review of.

11 We looked at submitted applications in
12 certain cases, and if you have some unique materials,
13 you actually get into materials handbooks. We also
14 have a materials group and a materials lab, and so we
15 also had at our disposal laboratory results of
16 analyses that have been formed through the years in
17 support of corrective actions.

18 And we are very active in the industry
19 groups, and so those were the technical resources that
20 we had at our disposal.

21 And with regards to operating experience
22 review -- and I feel that this is one of the strengths
23 of the aging management reviews that we performed.

24 Not only did we look at the industry stuff
25 that was out there, both in the INPO and the NRC, and

1 how we responded to that, but we also looked at all
2 the non-conformance reports and condition reports in
3 our database.

4 We looked at our event response team
5 reports. These were teams that are formed after a
6 major event. License event reports. We looked at all
7 the FDL metallurgical laboratory reports that we had.

8 And then we actually -- we were on site,
9 and so we spent a lot of time with the system and
10 component engineers in going over our aging management
11 review results as to what they are actually seeing out
12 in the field.

13 We used this as input for identification
14 of our aging effects, but another positive though is
15 that it also shows that we are managing aging. If you
16 are identifying items requiring corrective action, it
17 says that you are out in the field and you are out
18 there and actually managing aging of these systems.

19 So we draw on a fairly extensive database,
20 in terms of input into our operating experience.

21 CHAIRMAN BONACA: Did you look at the GALL
22 report that was being developed at that time?

23 MR. HALE: Yes. In fact, we were very
24 active. You know, the industry established technical
25 review groups -- mechanical, civil structural, and

1 electrical -- and we have representatives on all three
2 of those.

3 In fact, our mechanical lead, he is
4 probably one of the most knowledgeable of the
5 mechanical folks in the group. In fact, he is
6 providing most of the input to upgrades to the B&W
7 tools right now.

8 And in addition to all of that, we felt
9 that it was worthwhile to have independent eyes come
10 in and look at the results. And not only the results,
11 but out of procedures, and the way we approached this.

12 We had license renewal staff members that
13 actually gone through the process with the NRC review
14 it. We actually had some ex-NRC and other consultants
15 come in and look at the way that we had done our aging
16 management reviews.

17 We felt that because Framatome had
18 submitted generic reports, and gone and gotten SERs,
19 that we wanted to have the technical experts from
20 Framatome review all of our Class One AMRs.

21 CHAIRMAN BONACA: Which components were
22 manufactured by B&W?

23 MR. HALE: Our reactor vessel, but in
24 terms of just what are the aging issues associated
25 with rack cooling components, they had gone through

1 quite an extensive review of the generic reports for
2 the B&W plants.

3 So we felt that the type of aging issues
4 and that sort of thing were worthwhile to have him
5 come in and actually review in detail the results and
6 conclusions we had reached.

7 And then in the electric/I&C areas, we
8 actually had our corporate electrical chief, who is
9 also -- I guess, Liz. that he is an IEEE chair,
10 actually review our electrical/I&C aging management
11 review results.

12 CHAIRMAN BONACA: I had a question, and I
13 don't know if it fits here, but what is the -- well,
14 material-wise, what is the basic difference between
15 Class I piping and non-Class I piping?

16 MR. HALE: It is essentially the
17 definition consistent with what we call Quality Group
18 A, reactor pressure boundary up to the second normally
19 closed valve.

20 It's just that you have orifices sometimes
21 breaking the boundary between Class I and non-Class I.
22 For example, attached to the reactor coolant system,
23 and that's why you will see a section in the RCS on
24 non-Class I.

25 Well, what I was looking at was the aging

1 -- the facts to be managed. There were some
2 differences there. For example, you know, Class I
3 piping not subject to wear.

4 And then non-Class I piping subjected to
5 loss of material by a different means or several
6 means. And I was just asking in general the
7 difference in materials.

8 DR. SHACK: Well, a lot of it is stainless
9 steel versus carbon steel. So one is essentially
10 immune to erosion, and the other is going to be
11 susceptible to erosion.

12 CHAIRMAN BONACA: But non-Class I piping
13 has no cladding of any type?

14 MR. HALE: The Westinghouse plants, the
15 piping is stainless.

16 CHAIRMAN BONACA: For non-Class I.

17 MR. HALE: No. Well, it depends.
18 Typically systems that are exposed to boric acid are
19 stainless steel.

20 CHAIRMAN BONACA: Well, boric acid wastage
21 -- I mean, you have those for Class I, and need for
22 chemical control, and starts corrosion and cracking
23 issues.

24 So there was just such a difference in the
25 application between the issue of where, and where

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 simply there is no monitoring for wear of Class I
2 components, and were identified by several means on
3 non-Class I. But I understand, and that is really the
4 difference in the material.

5 DR. FORD: Could I ask again a very
6 generic question. If you look at this slide and the
7 two previous ones, can you -- and everything is great,
8 great words.

9 Can you give an example -- for instance,
10 for the specific situation of baffle bolt cracking,
11 there is a physical phenomena. How do you use these
12 technical tools, the technical resources, the AMR, the
13 operating experience and the peer reviews, to solve
14 that particular problem?

15 And I realize that I am asking you a half-
16 an-hour talk, but if you could just kind of bulletize
17 things. What information did you get from these
18 various resources to come up with a better inspection
19 program and correction actions for baffle bolts.

20 MR. HALE: For baffle bolts, the WOG
21 report, we utilized that.

22 DR. FORD: Yes, I have got this thing
23 here, but there is no data shown in this.

24 MR. HALE: Oh, I understand. You will see
25 some data that we have presented in our REI responses,

1 where we have provided more data as they are analyzing
2 and looking at these various baffle bolts.

3 But we identified radiation system and
4 stress corrosion and cracking, stress relaxation. All
5 these aging effects for the baffle bolts, and this is
6 based on the experience that we have seen, and also on
7 expected experience in the future.

8 So we have established for those bolts
9 -- that is part of our -- the rack vessel internals
10 inspection program over and above Section 11. I
11 believe we are planning to do one early in the renewal
12 period on Unit 3.

13 DR. FORD: And inspection process?

14 MR. HALE: Well, the inspection process
15 will follow very closely what has been done at the
16 previous Westinghouse plants, where they have actually
17 done ultrasonic examinations of the bolting material.
18 I believe you also -- and, Roger, correct me if I am
19 wrong, but you actually pulled all the bolts; is that
20 right, or just the ones that had indications?

21 MR. NEWTON: At Point Beach?

22 MR. HALE: Yes.

23 MR. NEWTON: At Point Beach, we had a
24 removal program, where we were taking the bolts out
25 and replacing them with new material, and a --

1 CHAIRMAN BONACA: Could you come up to a
2 microphone, please?

3 MR. NEWTON: Yes. I am Roger Newton, and
4 I am or was the Chairman of the Westinghouse Owners'
5 Group on the baffle bolt program. I am also from
6 Point Beach Nuclear Plant, an older plant, and we did
7 participate as part of the Westinghouse and EPRI
8 baffle bolt program.

9 And as part of that program, we were
10 looking for actual experience of bolts in nuclear
11 plants, and Point Beach is one of the older plants. So
12 we volunteered to do a bolt inspection and replacement
13 program to add information to the industry.

14 We have 347 stainless steel bolt material,
15 and older plants have that, and newer plants have 316
16 stainless steel bolt material. So there are two
17 different categories of plants in the Westinghouse
18 family. I think Turkey Point has 347 don't you?

19 MR. HALE: I believe so. I would have to
20 check it out.

21 MR. NEWTON: You are old enough to have
22 347. WE did this just to provide information to the
23 industry on what aging was looking at in this
24 particular area and to answer questions for the NRC,
25 and provide a benchmark that at this age and time what

1 are we seeing.

2 And as part of the program, we inspected
3 all of the bolts, and for those bolts that had
4 indications, we said, well, let's see if we can
5 replace the pattern, plus the additional bolts that
6 had indications.

7 So we ended up replacing -- well, I knew
8 those numbers by memory at one time, but about 170
9 some bolts throughout the internals. Most of them did
10 not have indications because they were in the pattern
11 that we wanted to replace to.

12 But we did replace about 50 that had
13 indications. We found that of those 50 that 9 did
14 have cracks. We tested almost all of the bolts that
15 were removed by structurally, and put them in a took
16 and breaking them to indeed see what their
17 characteristics were.

18 All of this information was put together
19 in a very extensive report and provided to EPRI, which
20 was also provided to all of the Westinghouse Owners'
21 Group members. So that's part of the operating
22 experience for 347.

23 Similarly, an older plant that had 3/16ths
24 stainless steel replaced their bolts as well. They
25 found that for that aged plant that there were no

1 indications and no failures.

2 So we have a mark in time with respect to
3 the bolt behavior in a Westinghouse plant. So that is
4 part of the operating experience that the industry is
5 now relying upon.

6 The MRP program of EPRI is continuing to
7 pursue the bolting issue, and looking at longer term
8 effects of aging, and looking at whether voids play a
9 role in it.

10 There was an integrated program that will
11 support all of us out into the future and that pretty
12 much all of us will take credit for as part of the
13 Aging Management Program, and deciding what the next
14 steps are. And so that is somewhat of the operating
15 history.

16 DR. FORD: So your aging management
17 program for Turkey Point is sort of a living document?

18 MR. HALE: Yes.

19 DR. FORD: And tomorrow it will change?

20 MR. HALE: Yes. If you look at the --
21 right, and because I am a member of the Westinghouse
22 Owners' Group, we have all this information available
23 to us either in the WOG technical reports, or
24 information as brought forward.

25 So in answer to your question, in terms of

1 where, the participation in the Westinghouse Owners'
2 Group is the primary source of information relative to
3 baffle bolts.

4 But, yes, if you look at our application,
5 as well as our response to REIs, you will see that --
6 and in fact the staff has asked us to submit our
7 inspection plan, detailed inspection plan, in advance
8 of performing the inspection.

9 DR. FORD: And the fact that the distance
10 rate tends to go on logarithmically with fluence, your
11 response time to these changes frequency will
12 increase, or your response frequency will increase?

13 MR. HALE: Yes.

14 MR. ROSEN: The response time will go
15 down.

16 DR. FORD: Will go down, yes.

17 MS. THOMPSON: I think that you have to
18 look at all of these as living programs, and I think
19 the most current example is the Alloy 600 program,
20 where when we submitted the application, it was prior
21 to any of the discoveries that happened at Oconee and
22 so forth.

23 And now you look at it, and we are
24 shutting down one of the units for a scheduled
25 refueling outage next week, and we have an inspection

1 that the reactor had planned.

2 And that will be factored in, and that is
3 one of the open items. We have responded to the
4 bulletin. It is going to be a living program. We are
5 going to incorporate that in, and I think that
6 particular open item really just becomes a matter of,
7 yes, this is a living process.

8 And we just happened to be in the middle
9 of our licensing process here for renewal, but you
10 would expect this type of change as items come up.
11 And we will do the right thing and update our programs
12 accordingly.

13 MR. HALE: I think the one thing -- and
14 this has been a good learning process for us all, in
15 terms of -- well, because the aging effects evaluation
16 that we have performed, it not only looks at what
17 experience has happened, but what we would expect to
18 happen, in terms of aging effects.

19 So I think that we have improved our
20 knowledge level, in terms of trying to get at the
21 issue that you are raising in terms of avoiding the
22 failure before it occurs. I know that I know a whole
23 lot more about aging of the plant.

24 DR. FORD: Thank you very much.

25 MR. HALE: And one of the things that we

1 did that I mentioned previously was the development of
2 our program basis documents. For each program that
3 you see in the application, we have what we call a
4 program basis document.

5 The program basis document provides a
6 detailed evaluation of the 10 attributes, the summary
7 of which you see in the application, and we felt early
8 on that we needed to do this, because if you show the
9 program to someone, and they say, well, show me the
10 program, and it may be as many as 10 to 20 procedures
11 that are being implemented, but you don't have this
12 umbrella that says this is what defines what the
13 program is.

14 And in some cases, you do, but in other
15 cases, especially some of these non-regulated
16 programs, it is not as clearly defined. So we felt
17 that it would be a good idea to have a basis document
18 which bridges the program described in the application
19 with actual implementation in the field.

20 This basis document identifies specific
21 plant procedures which will implement the inspections,
22 the walkdowns, or whatever may be involved, and it
23 also is a place to capture all of our specific program
24 commitments.

25 I think as a result of going through this

1 process, we identified about 80 program commitments,
2 and it is down at the procedural level as to when we
3 will do the inspection, and what changes to programs,
4 and what specific procedures need to be made.

5 And this was also one of the topics that
6 the inspection team came down and looked at when they
7 did the aging management review inspection.

8 MR. ROSEN: When this kind of a program
9 requires you to change a procedure, does the procedure
10 reference back to that this change was as a result of
11 the aging management review done on the license
12 renewal?

13 MR. HALE: Yes, we are going to put a
14 statement on every procedure that implements that
15 program that this is a commitment for license renewal,
16 and we will identify -- because some of the procedures
17 may be broader than the specific scope related to
18 license renewal.

19 And we will highlight the specific steps,
20 and the specific components that are covered in that
21 particular procedure for license renewal. So any
22 change that occurs in the future is going to have to
23 go through a review process to ensure that it
24 addresses license renewal.

25 MR. ROSEN: This is to preserve the

1 license renewal commitments for the extended period of
2 operation?

3 MR. HALE: Yes, because where the rubber
4 hits the road is in the procedures at the site. With
5 regards to TLAAs, you have got six criteria that are
6 specified in 10 CFR 54.3.

7 We did a fairly extensive review of all of
8 our current licensing basis documents, and our
9 licensing correspondence is tech searchable. We
10 looked at tech specs, and the USFAR, as well as the
11 DBDs.

12 We identified potential candidates for
13 TLAAs, and then we reviewed them against the six
14 criteria. The methodology is prescribed in NEI 95-10,
15 and we were consistent with that methodology.

16 As part of that process, we also looked to
17 see if there were any exemptions involving TLAAs, and
18 we did not find any. The TLAAs for Turkey Point as
19 described in the application, a reactor vessel
20 irradiation embrittlement, Class I and non-Class I
21 fatigue, EQ, containment tendon relaxation, and
22 containment liner fatigue.

23 And then we had a case of wear/erosion,
24 where there was a TLAA associated with -- a couple of
25 cases where there was wear/erosion associated with our

1 current licensing basis, and then crane fatigue in
2 some of the major cranes.

3 With regard to our conclusions, the aging
4 management programs at Turkey Point we feel are
5 adequately managing aging effects so that the intended
6 functions will be maintained consistent with our CLB
7 for the period of extended operation.

8 And, secondly, all our TLAAAs from Turkey
9 Point were identified and evaluated, and shown to be
10 acceptable for the extended period of operation. That
11 concludes our presentation. Are there any more
12 questions?

13 CHAIRMAN BONACA: I have a number of
14 questions. However, our component are systems
15 specific, and so we will go through when we go through
16 the SER. I am sure that you are going to be here for
17 the rest of the day.

18 MR. HALE: Yes. Yes, I will be here.

19 CHAIRMAN BONACA: And so we can ask you to
20 provide information at that time, and that will be the
21 best way to do it.

22 MR. HALE: Okay.

23 CHAIRMAN BONACA: Thank you. And with
24 that, I think we should take a break now, and we will
25 resume the meeting at 20 after 10:00.

1 (Whereupon, the meeting was recessed at
2 10:03 a.m., and was resumed at 10:21 a.m.)

3 CHAIRMAN BONACA: All right. Let's resume
4 the meeting, and we have now a presentation by NRR of
5 the Safety Evaluation Report by Mr. Raj Auluck.

6 DR. AULUCK: Good morning. My name is Raj
7 Auluck, and I am the project manager for the Turkey
8 Point license renewal effort, and the purpose of
9 today's meeting is to brief the subcommittee on the
10 staff's SER related to the Turkey Point license
11 renewal application, and to respond to the questions
12 that the committee members may have.

13 I will provide an overview of the safety
14 evaluation report, followed by other staff members
15 summarizing their research of the review. As the
16 slide shows, we have a number of staff members
17 scheduled to speak.

18 We do not have that many open items, but
19 for discussion purposes, we have tried to make the
20 slides complete so that when the appropriate time
21 comes, you can ask your questions, and we can respond
22 to your questions.

23 And most of these staff members have
24 participated in the NCR, and at this time, I would
25 also recognize Mr. Steve Koenick, and he is my backup

1 project manager, and helped prepare the SER also, and
2 he is getting ready to take on any other future
3 applications.

4 As you can see, this is an application
5 submitted on September 8th, 2000, and this is a little
6 over a year. It is a three loop Westinghouse,
7 Pressurized Water Reactor, and a two unit site, and
8 each is designed for 2300 Megawatts.

9 Now, the site is shared by two gas and oil
10 generating units. The plant is located about 25 miles
11 from Miami in Florida City, the same distance from the
12 Keys, Key Largo.

13 The license expires on July 19th of 2012
14 for Unit 3, and April 24th for Unit 4 -- well, for
15 Unit 4, April 10, 2013. And they are requesting a 20
16 year extension to these dates.

17 DR. ROSEN: So those are typos on the
18 slide that is Unit 3 and 4?

19 MR. AULUCK: Yes, correct. It should be
20 Unit 3 and 4. And for the different applications, we
21 performed an acceptance review and sent a letter to
22 the applicant in October, and attached to the letter
23 was this targeted schedule.

24 As you can see, we have met most of the
25 milestones. The next important milestone other than

1 ACRS meetings is for the applicant to respond to the
2 open items in the SER.

3 Now, this schedule is based on our
4 standard 30 months schedule. Since there is no
5 hearing -- the hearing proceeding has been closed --
6 and so this will be changed to 25 months, and we are
7 in discussion with the applicant, and we will see
8 where we are.

9 They have requested with respect to this
10 schedule an earlier date, and so we are in the process
11 of discussing that with them and with our staff how to
12 support any new date.

13 The SER format follows pretty much the
14 application for. The difference is that we have in
15 Chapter 3 all the AMRs and AMPs that are in the
16 application contain that information in Appendix B and
17 Appendix C.

18 And Chapter 1 is the introduction and
19 general discussion; and Chapter 2 is the structures
20 and components; and Chapter 3 is the AMRs as I
21 mentioned; and Chapter 4 is the TLAAs.

22 As was mentioned by Steve a little
23 earlier, this is the first PWR and FPL participated in
24 many industrial groups, and they were an active
25 participant in the Westinghouse Owners Group.

1 CHAIRMAN BONACA: It is the First
2 Westinghouse PWR.

3 MR. AULUCK: Westinghouse PWR. And the
4 four Westinghouse Generic Reports were submitted to
5 the staff for a staff review, and as mentioned
6 earlier, the reports were not finalized. So the
7 applicant did not incorporate those Westinghouse
8 reports by reference.

9 They addressed all the issues there, and
10 for the other reports we had several REIs, and all the
11 applicant items, the action items, were in the report.
12 But the safety evaluation of these Westinghouse
13 reports were stand alone documents, which were not
14 completed at the time of the application.

15 As far as the staff review, the staff
16 identified open items, and the list is quite short.
17 The first one is the scoping of seismic II over I
18 piping systems, which was already discussed earlier,
19 and we will go over it in more detail in the following
20 presentations this morning.

21 There was an open item at Plant Hatch, and
22 we especially asked the applicant to wait until the
23 resolution on Hatch is reached, and the staff's
24 position is clarified, which has been done now.

25 So now we are in the process of discussing

1 further the applicant's position on Turkey Point. The
2 staff's position will be given later on, but it is
3 very clear that all II over I piping should be within
4 the scope of license renewal, and we will go from
5 there.

6 CHAIRMAN BONACA: What kind of additional
7 burden does this inclusion of all II over I piping --
8 for example, for Hatch. I understand this morning
9 from the presentation that it is not much of a burden
10 for Turkey Point. It doesn't have much piping.

11 MR. AULUCK: Well, Hatch probably did some
12 several walkdowns and they did have to include some
13 systems which were not previously included.

14 CHAIRMAN BONACA: No, what I am trying to
15 understand here is the logic of the applicant, because
16 this issue is a current issue, and clearly there must
17 be a significant difference in scope to justify this,
18 and so we will try to understand the logic.

19 MR. AULUCK: I think we will have that
20 later, and it depends on how each plant briefs and
21 identifies those systems. In the case of Turkey
22 Point, they went with area approach, and what is
23 contained there.

24 If I remember there were 7 or 8 areas only
25 where they have this potential interaction. So, the

1 staff is prepared to discuss that this morning.

2 A second open item is the reactor vessel
3 head alloy 600 penetration inspection program.
4 Leaking from the vessel head penetration nozzles has
5 been identified recently at some plants, and so the
6 staff is working with them to resolve this issue.

7 And so our expectation is that whatever
8 resolution is reached with industry that Turkey Point
9 will follow that, and we will have a presentation on
10 this issue also.

11 CHAIRMAN BONACA: So this is not an open
12 issue because there is a difference of opinions
13 between the staff and the licensee, and there is an
14 emerging event issue that you just are expecting ot
15 have some commitment from Turkey Point?

16 MR. AULUCK: I think whatever resolution
17 is reached between the staff and industry, and Turkey
18 Point is part of that -- and since we do not know the
19 resolution of that is, we consider it an open issue.

20 MS. THOMPSON: I would consider this an
21 emerging issue, and we have responded to the bulletin,
22 but of course that just happened very recently.
23 Whereas, our application and the REI process happened
24 before the Ocone discovery.

25 CHAIRMAN BONACA: Yes. I am trying to

1 understand what the closure means. It will be quite
2 a while before there is a full resolution of the
3 technical issues. What is necessary to close this
4 issue from the perspective of the license renewal?
5 It seems to me just a commitment to --

6 MS. THOMPSON: Right. Right.

7 MR. AULUCK: And so we don't perceive any
8 problems here, but at this time we are not in a
9 position --

10 CHAIRMAN BONACA: No, I understand.

11 DR. SHACK: Just out of curiosity. You
12 have an outage coming up. How inspectable is your
13 plant from a visual point of view? Do you have
14 insulation on the head?

15 MS. THOMPSON: Yes. The insulation issue
16 tends to be more of an issue for the combustion
17 engineering plants. So Turkey Point being a
18 Westinghouse plant, there is insulation present, but
19 we feel like we can perform the inspection.

20 We are feverishly planning this activity.
21 Obviously it is something that has just come up
22 recently and the timing of it, and to try and take
23 action this quickly truly is a challenge for us to do
24 at the station.

25 We have taken one of our main managers off

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to the side basically, and he is focusing all of his
2 attention on trying to get this activity planned to be
3 ready to go really next week.

4 So for those plants, just for your
5 understanding of the type of impact this is, it is not
6 easy to plan something that is done in a such a high
7 dose area. Plus, it is relatively costly.

8 So it is something that we really are very
9 focused on right now to try to accomplish it at ALARA,
10 and also in a cost effective manner to be able to get
11 it done in this period of time.

12 CHAIRMAN BONACA: This inspection that you
13 are planning, is it imminent?

14 MR. AULUCK: In October, I think.

15 CHAIRMAN BONACA: In October? All right.
16 I didn't understand that from the SER. I thought that
17 you advanced your inspection based on the NEI schedule
18 as shown here, but I didn't realize that you had one
19 so soon.

20 MS. THOMPSON: Yes, that is the advanced
21 schedule. Our refueling outage was scheduled to start
22 this coming Monday. So we are basically within a week
23 now of when we would start, and when the head is
24 removed from the reactor is really our start time for
25 performing the inspections. So that is the first week

1 of the outage.

2 CHAIRMAN BONACA: Okay.

3 MR. AULUCK: The third item is reactor
4 vessel underclad cracking. In their application the
5 applicant indicates that the generic evaluation of
6 underclad cracks have been extended to 60 years using
7 fracture mechanics evaluation space on a
8 representative set of design transients with
9 occurrences extrapolated over 60 years.

10 And they also mention that the number of
11 design cycles and transients are presumed to encompass
12 the WCAPS 15338 analysis, and this WCAP was submitted
13 for staff review in March of this year.

14 So it is undergoing a review, and the
15 review has been completed, but the SER has not been
16 issued. The current schedule that the staff
17 evaluation will be issued by the middle of next month.

18 CHAIRMAN BONACA: Now, the reactor vessel
19 was designed and constructed by B&W.

20 MR. AULUCK: Yes, to Westinghouse
21 specifications.

22 CHAIRMAN BONACA: All right. So this
23 evaluation is being done by Westinghouse, but -- well,
24 I am trying to understand why wouldn't it be
25 -- that you would have an B&W evaluation on that.

1 MR. HALE: Well, B&W fabricated the
2 vessel, but it was built -- the vessel was built with
3 Westinghouse specifications.

4 CHAIRMAN BONACA: Okay.

5 DR. SHACK: There was a question that I
6 meant to ask before. Your fatigue management program,
7 I take it that wasn't a new program for license
8 renewal. What was the driving force for instituting
9 that? What problems were you addressing when you
10 instituted that?

11 MS. THOMPSON: I think you are referring
12 to the fatigue or what we call the fatigue monitoring
13 program. Basically it is a confirmatory program, and
14 whether you look at the current term or the renewal
15 term, we are confirming that we are not exceeding the
16 number of cycles that were assumed for operation.

17 DR. SHACK: But you had some locations
18 though that were approaching usage factors of one?

19 MS. THOMPSON: No, not necessarily. We
20 had some that were higher as I think all plants do.
21 Some of the surge lines and so forth that have been
22 evaluated in some plants you will find some of the
23 nozzles and spray lines, and so forth, just depending
24 on the particular plant.

25 But I think that has been a confirmatory

1 program to make sure that we are staying within our
2 design analysis regardless, and to keep track of that.

3 MR. AULUCK: Okay. The next item is an
4 open item and is acceptance criteria for field erected
5 tanks internal inspection. We will have a discussion
6 on this item later on in the presentation, but this is
7 a new program used to manage in part aging and effects
8 of loss of material due to corrosion of the tanks
9 within the scope of the program.

10 And this chemistry control program will --
11 two of these programs will manage corrosion inside the
12 tanks. At this time, at the time of the staff's
13 evaluation, the applicant had not developed a program
14 with acceptance criteria and limiting procedures.

15 So that is one of the reasons that is an
16 open item. So as soon as we receive the information,
17 we will review it and take the next step.

18 CHAIRMAN BONACA: And this includes all
19 the other RWST and --

20 MR. AULUCK: Yes.

21 CHAIRMAN BONACA: And on the third item
22 that you had, that is the Westinghouse topical report
23 being reviewed for the reactor vessel underclad
24 cracking. When do you expect to have that review
25 completed?

1 MR. AULUCK: The middle of October. It is
2 pretty close. The staff is completing the process of
3 management review.

4 CHAIRMAN BONACA: So it seems to me that
5 the potential for closure of this open item is in the
6 very short term. What is the understanding that you
7 have of that?

8 MR. AULUCK: As I understand, right how
9 the current scheduled date for a response to the open
10 items is December 17th. The applicant is targeting
11 for the end of October or the first week of November.
12 Around that time. So at least six weeks.

13 CHAIRMAN BONACA: Okay. Thank you.

14 MR. AULUCK: And this is a slide on
15 inspection activities. So far we have performed two
16 inspections. The first was for a week in may for
17 scoping, and a two week inspection on the AMRs, split
18 into one week segments.

19 This is in addition to the staff audit
20 done on the scoping in November of last year. I think
21 that besides --

22 CHAIRMAN BONACA: So in total you had four
23 inspections?

24 MR. AULUCK: Yes, we had four site visits
25 in four weeks, yes. Once we were there, we discovered

1 that all the projects developed for license renewal
2 were under the plant's QA program, as I understand
3 there were no QA procedures for license renewal.

4 So they overlooked procedures or
5 instructions on quality instructions, numbering 5.2
6 5.3, 5.4, and 5.5. And each of these documents
7 provide guidance to their engineers and staff members
8 how to scope the document, and how to scope the
9 systems, and how to screen the system, and how to
10 review the AMR.

11 This is more like a step-by-step, and so
12 we looked at the application here things were not as
13 clear and there was a lot of questions from the staff,
14 and which were answered by redirecting elsewhere in
15 their applications.

16 But once we went to the site and looked at
17 some of those quality instruction procedures, and
18 taking it step-by-step, it was really helpful. And
19 then in addition to that there was backup
20 documentation as Steve mentioned for each program
21 basis documents. And descriptions for procedures and
22 assistance.

23 And they were easily accessible. So these
24 inspections did not find any major findings, but there
25 were several minor discrepancies and the drawings were

1 not consistent with each other, or with different
2 documents there were some discrepancies.

3 And then once we told them, they were
4 reported to the appropriate programs and followed up
5 on, or they were addressed elsewhere. And the team
6 did review several documents for the new programs, and
7 for the existing programs.

8 With that, if you have no questions that
9 I can answer, we will then move to the next
10 presentation.

11 CHAIRMAN BONACA: We as a committee have
12 expressed interest in the form and clarify of the
13 documentation, because it is a complex evaluation, and
14 it is important to have documents that will be
15 understandable.

16 Some of the members of the subcommittee
17 had an impression that this was a good application
18 insofar as clarity of the form. What is the
19 perspective that you have?

20 MR. AULUCK: I think it is -- I mean, this
21 is my first -- and I have been involved in project
22 management of plants, and licensing, and operating for
23 a long time. But this is my first experience with
24 license renewal.

25 And I had worked at Turkey Point maybe 10

1 years back as the operating director. So I knew a
2 little bit more about the plant. But they have a good
3 staff and that might have helped.

4 The application contents were not as good
5 as you would expect. An example, when we first
6 received the application, and it was assigned to
7 different staff members, and started talking and had
8 requests for additional information.

9 So we received more than 300 REI requests
10 -- and approximately 325 -- and when we started
11 reviewing them and found that several of them were
12 simple, then we had several conference calls, and we
13 found that the information is already available in the
14 application elsewhere and in different documents.

15 And as a result of those few meetings and
16 telephone interactions, we reduced the number without
17 any new information from 325 down to 215. So once we
18 go to the site and we see those additional
19 documentation, and which verifies the application.

20 And I am sure the next applicant will look
21 at Turkey Point's REIs and their process procedures,
22 and follow it and improve on it.

23 DR. ROSEN: Would you say that the hundred
24 or so REIs that were really answered in the document,
25 but the staff didn't find them, that was the result of

1 the staff's inexperience, or the documents being so
2 opaque?

3 MR. AULUCK: I think it was not the
4 staff's experience, but it was a navigational problem
5 within the application. The information was not
6 readily available in the sections that the staff was
7 looking at.

8 And it was rational for the applicant to
9 include that information elsewhere, and sometimes
10 there is a time factor and only a short time to review
11 the whole thing, and come up with requests for
12 additional REIs.

13 DR. ROSEN: We are always searching for
14 more ways to be more efficient.

15 MR. AULUCK: Exactly. And do we have
16 lessons learned from the different applications? We
17 are preparing lessons learned for internal use so that
18 it gives us more time up front to review the
19 application, and then we will have fewer REIs, and
20 will improve the process.

21 DR. ROSEN: Yes, to improve the process,
22 and no search for blame.

23 CHAIRMAN BONACA: Now there is a standard
24 form that pretty much is being proposed between NEI
25 and the staff, and so on, and so forth. So that is

1 why we are asking this question. I think we want to
2 monitor as a committee how this is taking place, and
3 in-part I think also that when you do review the
4 application that you have different reviewers, to
5 which you assign individual chapters, right?

6 MR. AULUCK: Right.

7 CHAIRMAN BONACA: And that's why probably
8 the issues with various problems. There isn't one
9 person that reads it all and says this is there or
10 there.

11 MR. AULUCK: Well, yes, and that's part of
12 the process.

13 DR. FORD: I have another question. These
14 things that we have been talking about have been
15 navigational and procedural as technical people. When
16 you look at the application, there is a whole lot of
17 technical questions that will come up.

18 Some of them might be minutia and some of
19 them will be major impacts. How does your staff go
20 through deciding what they should be really looking at
21 technically, as opposed to the minutia? And how do
22 they evaluate that, and how do they get the
23 information necessary to have an informed review, a
24 technical review of the application?

25 MR. AULUCK: Well, I think as a technical

1 person, they want to feel fully comfortable with what
2 they are preparing in the safety evaluation, and
3 whether it is minor or major, they put it in writing.

4 And if they don't put it in writing, they
5 will call the project manager or their immediate
6 supervisor, and say, hey, you know --

7 DR. FORD: But that does not answer the
8 question of how do they prioritize what is important
9 and what is not. For instance, boric acid wastage may
10 or may not be of higher importance than, for instance,
11 baffle board cracking, or the other way around.

12 How do you decide? Is it based on the
13 formality of a risk-informed analytical approach or
14 what?

15 MR. AULUCK: I think there is no priority
16 basis. I think it is because the information is not
17 sufficient in the application, and the application is
18 not sufficient. There is no priority of REIs that
19 should go first than the other.

20 MR. KOENICK: For all structures and
21 components that are within scope, they have to have
22 full confidence that they can make the findings. So
23 they have to address that to their satisfaction, and
24 that's where you get the capabilities of your
25 reviewers and their supervisors to ensure that they

1 have done a thorough review and can make the findings
2 that they need to for every structure and component
3 that is within the scope.

4 DR. FORD: I just keep coming back to this
5 concern I have. We might find a crack in the pressure
6 vessel and which was not perceived yesterday, and it
7 was not predicted yesterday, but that would be a major
8 event.

9 In your process of when you are looking
10 through these applications does it go through your
11 mind how are they managing the program proactively to
12 decide whether they are going to have a major event
13 tomorrow?

14 MR. AULUCK: That will be under the part
15 of the current license.

16 MR. KOENICK: You have to go back to what
17 the fundamental principle of the Commission when they
18 developed the rule; that you rely on the regulatory
19 process, and the regulatory process is continuing.

20 DR. FORD: I guess I am questioning the
21 approach. I am questioning the technical completeness
22 of the regulatory process that was developed years ago
23 and before we had some experience.

24 MR. ELLIOT: Barry Elliot, Materials and
25 Chemical Engineering Branch. He is describing the

1 regulatory process. The best example is the one that
2 we just finished talking about, which was the reactor
3 vessel head penetration cracking.

4 When we originally did the review it was
5 fine. It met all the requirements that we had
6 established at that time. That's why it became an
7 open issue, because it was a new thing.

8 So the answer to your question is if we
9 find a new issue, and it is at the time that we are
10 reviewing the application, it becomes an open issue.
11 If we have already finished the review, then it is
12 handled as part of the regular licensing process.

13 That is our procedure, and you are seeing
14 it right here on Turkey Point. We are putting it into
15 effect.

16 CHAIRMAN BONACA: For example, you may
17 question why we did not inspect the heads before
18 because we didn't see any cracks. That is really a
19 question regarding the current licensing approach to
20 it, and not really the elements of license renewal,
21 which is the assurance that the program that you
22 believe is correct or adequate will be carried over
23 the period of the license renewal.

24 And the basis for which you believe it is
25 going to be effective from 40 to 60 years. So the --

1 DR. FORD: I can understand the replies,
2 but I keep coming back to we approved Oconee, and then
3 we had the embarrassing situation two months later to
4 have the vessel head penetration cracking, which to
5 the technical community was no surprise.

6 CHAIRMAN BONACA: I don't think there is
7 any expectation that we would not have new events
8 taking place that would were never seen before. I
9 mean, there is no doubt in my mind about that.

10 DR. FORD: I am just questioning the
11 process.

12 MR. ELLIOT: We had a vessel head
13 penetration program before Oconee, and we could argue
14 all day long how effective it was. But we had it, and
15 all we are doing now is trying to figure out do we
16 have to revise it. How much do we have to revise it.

17 We've had a program, and the issue now is
18 what do we need to do to revise it, and whatever
19 answer we come up with will affect Turkey Point, and
20 will be part of the resolution of the open issue.

21 DR. FORD: I guess I am on a crusade.

22 CHAIRMAN BONACA: But I think it is a
23 significant question that you are asking, and it is a
24 legitimate question, because it goes to the heart of
25 how long are you going to run these plants, and we

1 don't have an answer to that, except that we feel
2 comfortable evidently with the current process to go
3 from 40 to 60 years.

4 But there is no doubt that for components
5 that there will be surprises coming through, because
6 they age, and that's why the focus is on long-lived
7 passive components.

8 So I think it is a good question that you
9 have. Unfortunately, I don't think we will be able to
10 predict all that is going to happen.

11 MR. AULUCK: Okay. Our next presentation
12 will be by Greg Galletti, on the scoping and screening
13 methodology.

14 MR. GALLETTI: Good morning. My name is
15 Greg Galletti, and I am with the Division of
16 Inspection Performance Management Branch of NRR. I am
17 responsible for the scoping and screening methodology
18 Review.

19 What I would like to do is briefly go over
20 the scoping and screening method with you that we have
21 performed, and then discuss the one open item on
22 seismic two over one that we still have currently.

23 Initially let me start off by saying that
24 when we do the scoping and screening methodology
25 review that we really have three goals in mind.

1 The first goal is primarily to ensure that
2 the program that is described by the applicant is
3 comprehensive and detailed enough to ensure that the
4 requirements of 55.4 are completely covered.

5 The second goal that we have is to go and
6 review design documentation and supporting information
7 that the licensee has developed to ensure that they
8 have done a comprehensive review to ensure that the
9 current licensing basis has been considered for the
10 purposes of the review.

11 And the third main goal that we come into
12 this review with is to go and review the implementing
13 guidance that is provided by the licensee for their
14 own personnel to try to get an understanding of how
15 they have implemented the requirements, ensure that
16 the implementation is consistent across their
17 engineering staff, to ensure that they have done a
18 comprehensive and detailed review of the guidance and
19 the requirements for the performance of the review.

20 And in doing this three goal tiered
21 approach, the staff usually uses a two-tiered
22 approach. This is the approach that we have taken in
23 the past.

24 We initially start off with a desktop
25 review, which is done in-house, where we review the

1 application in detail, and we also review some of the
2 background documentation that is provided, such as the
3 updated safety FSAR.

4 We would look at any other design
5 documentation that we would have on the docket that
6 may be pertinent. The question that had come up
7 earlier this morning about looking at the EOPs, while
8 we don't specifically look at the EOPs, we did in fact
9 look at the Westinghouse ERG, emergency response
10 guidelines, the parent documentation for the
11 development of the procedures.

12 And just to get a better fundamental
13 understanding of the design of the plant, the
14 application of mitigation strategies that the licensee
15 has used, and just to get a better general
16 understanding of how the plant was designed and is to
17 be operated. The second --

18 DR. ROSEN: With respect to that, with the
19 EOPs and the ERGs, earlier this morning we heard that
20 it was not a criterion under the license renewal rule
21 to review equipment used in EOP for aging management.

22 MR. GALLETTI: That's correct. If you
23 look at the guidance in NEI 95-10, for example, source
24 documentation that could be used to support the
25 scoping and screening methodology, there is a litany

1 of information that is available to a licensee to use
2 for that purpose.

3 It is really left up to the applicant as
4 to which of those documents best serves them for that
5 purpose. They may or may not choose to use the ERGs
6 or the EOPs because there may be some other design
7 documentation like the maintenance rule scoping, and
8 there are equipment lists, and which provides the same
9 level of information, and gives them a reasonable
10 source for coming up with the conclusions as to what
11 should be scoped and screened in accordance with 54.4.

12 So while it is not a firm requirement that
13 they look at those documents, for the purpose of the
14 staff's review and getting a fundamental understanding
15 of the plant, the staff had that information available
16 to it, and felt that it was appropriate to use that
17 information.

18 DR. ROSEN: Well, let's cut to the chase
19 on this one. What I am concerned about is did the
20 staff or does the staff have an adequate basis to
21 conclude that the equipment that operators would use
22 throughout the extended period of operation for
23 responding to not normal events, or accidents, would
24 in fact function and not be degraded by some aging
25 effect that we have not identified yet?

1 MR. GALLETTI: Yes. I think that is clear
2 that the basis for the entire approach as to how we
3 perform these reviews, and how the application was put
4 together in the first place.

5 It is really fundamentally if you look at
6 the requirements of 54.4, those criterion in the 54.4
7 must be addressed by the applicant. They must ensure
8 that the safety equipment is in scope.

9 They must ensure that non-safety that
10 could affect the function of that safety is in scope.
11 By doing so, we ensure that all that equipment that is
12 necessary for vent mitigation is in fact covered, and
13 perhaps subject to an aging management review.

14 And the second tier of the approach that
15 the staff has used is to actually do an on-site audit
16 of the documentation and the process implemented by
17 the applicant.

18 The on-site audit is typically about a
19 week long, and generally we have 3 to 5 people on the
20 staff on the team for the audit. We go through a
21 detailed review of the design basis documentation that
22 the applicants have used for the purposes of their
23 review, and to ensure that the current licensing basis
24 has been captured.

25 We go through in very strong detail the

1 implementing guidance that they have provided to the
2 staff, and we go through and we use certain samples.
3 We will sample a couple of systems in detail to ensure
4 that the implementing guidance as written was actually
5 performed, and those systems were scrutinized
6 consistent with that guidance.

7 And based on the two-tiered approach, the
8 desktop, as well as the on-site audit, the staff, for
9 the purposes of the Turkey Point review have concluded
10 that in general the approach that was taken by the
11 applicant was consistent with the scoping and
12 screening methodology that they have described.

13 It is consistent with the requirements of
14 54.4, and we believe it is robust and comprehensive
15 that we had a positive safety finding.

16 We did have one issue that was brought up that I would
17 like to discuss in a little bit more detail on the
18 seismic two over one.

19 DR. ROSEN: Let me interrupt you again.
20 Pardon me for making one point, and ask the question
21 that you said that in your on-site audit that you
22 looked at the instructions and guidance with the
23 staff, and found them to be reasonable and
24 appropriate.

25 MR. GALLETTI: Right.

1 DR. ROSEN: But the other piece of getting
2 a process done correctly is the qualifications of the
3 people using that guidance, and the training of the
4 people using that guidance. Did you look at either of
5 those things?

6 MR. GALLETTI: The way we captured the
7 training of the people that were involved in the
8 review was generally on the on-site inspection, we
9 will go through as I said certain systems, and we will
10 go through those systems with the cognizant staff that
11 was responsible for the review.

12 So in doing so, we will question them to
13 understand how they applied the implementing guidance
14 to ensure that it was consistently applied. We
15 discussed specifically the training aspects, and how
16 did you train your people on these implementing
17 guides.

18 And in fact the responses have been
19 generally that the guidance is a quality document. It
20 is reviewed by each of the staff. There were certain
21 internal meetings if you will during the development
22 of this implementing guidance to ensure that the
23 guidelines were specific and did in fact reflect the
24 approach that the applicant wanted to take.

25 So basically through a dialogue with the

1 staff, the applicant's staff that is, we had a
2 reasonable assurance that they were well trained.

3 DR. ROSEN: Did you look into whether this
4 guidance was included in the engineering support
5 personnel training programs?

6 MR. GALLETTI: Not as such, no.

7 CHAIRMAN BONACA: I think that this is a
8 good question and it also goes to the NRC stuff. I
9 mean, how do you -- are the same individuals assigned
10 to the same areas of different license renewal
11 applications so that there is experience being built
12 there, and the learning curve is high?

13 MR. THOMAS: Maybe I should answer that.
14 My name is Brian Thomas, and I am in the Division of
15 Systems Safety Analysis, Plant Systems Branch. And
16 that division is responsible for the scoping and the
17 screening of the SSEs that are within the scope of
18 license renewal.

19 To the extent that we can, we are forming
20 a license renewal review team if you will. To the
21 extent that they are within the resource limitations
22 and so forth, people are pretty much are assigned to
23 the same areas.

24 So we have folks that have expertise in
25 structures, structural engineering, for example, that

1 would review the scoping of the SSEs that pertain,
2 let's say, to the structures, the yard structures, the
3 containment structures. And similarly we take a
4 similar approach with the systems.

5 CHAIRMAN BONACA: Okay. Thank you.

6 MS. THOMPSON: To address the FTL Turkey
7 Point specific training, the engineers that
8 participated in generating the actual license renewal
9 documents that yielded the application, all received
10 specific training on the procedures -- they were
11 called quality instructions as what we refer to them
12 as -- as part of their job orientation.

13 And there was a specific group of people
14 that developed those documents, and then more of an
15 overview and understanding of the concepts and bases,
16 and how those would be applied in a long term basis
17 from a commitment management perspective, as well as
18 a configuration control perspective, the engineering
19 technical personnel training program also included
20 sections that were specifically dealing with license
21 renewal.

22 And we have done that a couple of times
23 already, and plan to continue to do that, particularly
24 upon issuance of a renewed license favorable decision
25 there.

1 DR. ROSEN: Well, thank you. That's
2 helpful. Now, I understand what you said is that you
3 have included the license renewal process, as well as
4 those things that come out of the process that will
5 have to be carried forward for the life of the -- for
6 the extended life of the plant in the engineering
7 support training program, so that it gets built into
8 the infrastructure of the engineering organization as
9 an ongoing matter.

10 MR. GALLETTI: Absolutely. That's
11 correct.

12 MR. GALLETTI: If there is no other
13 questions on the scope and screening review itself, I
14 did want to discuss specifically the seismic two over
15 one issue.

16 CHAIRMAN BONACA: And then after that I
17 have questions regarding 2 or 3 systems, and why they
18 were not included, and I will ask those questions
19 after you.

20 MR. GALLETTI: Sure. I think that Brian
21 will cover that as part of the scoping results
22 section. As was brought up earlier today, the one
23 open issue that we do currently have is characterized
24 as seismic two over one.

25 And really for the purposes of the review

1 the staff is looking at this in terms of a little bit
2 broader. It is really the application of the 54.482
3 requirement for inclusion of non-safety related SSCs
4 whose failure could in fact impact a safety related
5 SSC from performing its function.

6 As you know the genesis of this issue
7 really came out of the Hatch review, where some
8 questions were asked on some auxiliary systems, and
9 whether or not certain segments of piping were in
10 scope or not scoped.

11 As a result of that staff review and
12 working with the licensee, several key issues came
13 out. Generally for the application of 54.482, the
14 staff would consider any non-safety SSC whose failure
15 could impact a safety SSC as potentially within the
16 scope.

17 What a licensee or applicant would have to
18 do is really first of all identify what are their
19 safety related SSCs, and then take in essence a
20 spacious approach to determine what other components
21 and systems structures within that vicinity could in
22 fact impact those SSCs.

23 Once that is determined, then they would
24 have to do a credible job of reviewing what sorts of
25 failures could these non-safety related SSCs have that

1 could potentially impact those safety related SSCs.

2 With that fundamentally laid out the staff
3 really came up with two options for applicants. In
4 doing this review, they have the ability to either
5 take credit for certain mitigative features if they
6 could show through analysis that those features in
7 fact would mitigate the effects of the failures of the
8 non-safety SSEs that they are trying to credit.

9 A good example would be if a non-safety
10 related pipe were to break and leak, or spill fluid on
11 a safety related component, if there was some sort of
12 shielding or mitigative feature that they could show
13 could in fact ensure the safe function of that
14 component, then we would consider that mitigative
15 feature could be brought into scope.

16 And not necessarily requiring inclusion of
17 the piping segment. The other alternative if they
18 cannot show that that mitigative feature is sufficient
19 to protect that safety related function, the actual
20 segment itself would be brought into scope.

21 I think that is consistent with the staff
22 policy as we have developed it, and now it is a matter
23 of going to each of the applicants and making sure
24 they understand that general approach is the approach
25 that the staff is trying to provide people.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN BONACA: But this is an approach
2 as you said has been standing for a while.

3 MR. GALLETTI: Yes, certainly since the
4 Hatch review.

5 CHAIRMAN BONACA: And you have in some
6 specific cases where you have in fact mitigated
7 protection of the component that you are concerned
8 about.

9 DR. SHACK: This didn't seem to arise in
10 three of the applications that you have approved
11 already. Is that because of differences in their
12 licensing basis or just the way that they have
13 interpreted it? Have they interpreted it closer to
14 what you have interpreted it?

15 MR. GALLETTI: I think it is probably a
16 combination of those two things really. It's how
17 certain systems in the plant are credited in their
18 design basis as to whether or not they are performing
19 a safety related function or not.

20 But then once that is actually determined,
21 reviewing the non-safety equipment that could impact
22 that needs to be done by those applicants as well.

23 Now, in the past, I think what we found is
24 that in certain cases it was clear that this was a
25 question raised by the staff and then in response

1 those applicants did something.

2 In other cases, they were more proactive,
3 and as part of the application that level of detail
4 was provided. But it is something as a result of the
5 Hatch review that we are actually going back and
6 revisiting some dialogue with those previous
7 applicants to understand and clarify that.

8 CHAIRMAN BONACA: Now, for Hatch, the
9 supports were seismic highly qualified are?

10 MR. GALLETTI: Yes, sir.

11 CHAIRMAN BONACA: And for Turkey Point,
12 are they seismic highly qualified?

13 MR. GALLETTI: I don't think so, but could
14 you answer that.

15 MR. HALE: They are non-safety related,
16 but we are a fairly low seismic area, and we have
17 demonstrated that the supports can hold up the
18 structural components under seismic loading.

19 MR. GALLETTI: I think the key issue here
20 is for the supports themselves. The applicant may be
21 able to credit those supports for mitigating a seismic
22 event. But there are other mechanisms in play here
23 that may render that non-safety related piping to
24 fail.

25 And that seismic support may not provide

1 the mitigative feature that is necessary to handle
2 that particular failure. So other mitigative features
3 may have to come into play, such as shielding, splash
4 guards, pipe restraints, and other mitigative features
5 would have to also be considered.

6 And in addition the mitigative features
7 that are already in the plant may in fact not be
8 sufficient to ensure that failure of these non-safety
9 related components would not render a safety system
10 inoperable.

11 Therefore, regardless of what mitigative
12 feature you do have, you may in fact still need to
13 include that segment of piping.

14 CHAIRMAN BONACA: Is this issue a generic
15 issue just because of two different plants with really
16 different kinds of issues still to do with two over
17 one, and is NEI involved as a part of this resolution
18 representing the industry?

19 I mean, is it an open issue for the
20 industry, or is it just specific to the application
21 itself?

22 MR. GALLETTI: I wish Kris was here. I
23 don't get involved with the NEI discussions.

24 CHAIRMAN BONACA: This is a plant specific
25 as of now?

1 MS. THOMPSON: Well, it is on the list of
2 remaining open items with respect to the GALL being
3 issued for the industry, and I believe there was a
4 steering committee meeting last week, and a
5 demonstration meeting a week or two before that when
6 it was raised as one of the items on the list.

7 MR. GALLETTI: I think it is fair to say
8 that there is certainly generic interest in the
9 industry as to how this issue is going to be handled
10 and resolved, and how it has been handled and
11 resolved.

12 MR. HALE: There is a list of what we call
13 issues for ongoing dialogue between NEI and the staff,
14 both associated with the SER. Well, not the SER, but
15 the standard review plan, and the GALL, and two over
16 one is one of those.

17 And to get a better handle on guidance and
18 the approach, and trying to get a little more
19 consistent approach, especially with the older plants.

20 DR. ROSEN: What is the Turkey Point
21 design basis earthquake? You said it was low seismic?

22 MR. HALE: Yes.

23 DR. ROSEN: And what is it?

24 MS. THOMPSON: It's about .15G if I
25 recall. It is very low.

1 MR. HALE: Yes, .15 horizontal, and .1
2 vertical.

3 MS. THOMPSON: We are the lowest in the
4 country.

5 DR. ROSEN: I don't think so.

6 MS. THOMPSON: Well, I thought we were.
7 Perhaps not.

8 MR. GALLETTI: So again as you have heard,
9 we are going to have some additional dialogue with the
10 applicant next week to try to better understand their
11 resolution or proposed resolution to that issue.

12 MR. THOMAS: As I mentioned before, DSSA
13 is responsible for the review of the scoping and
14 screening, and the results of that review in
15 accordance with the applicable regulations.

16 Basically, what I have before you is just
17 a slide that captures the scope of our review. Our
18 review -- let me say that the review team that I spoke
19 of consists of about 11 individuals, each with their
20 specific areas of specialty.

21 Now, I spoke before of the team if you
22 will, and let me add that that review process could
23 get complicated because of the addition of new team
24 members, and utilization of staff for various reviews
25 outside of the license renewal review.

1 But to the extent that we can, we try to
2 keep some consistency across our applications so that
3 there is consistency in the focus on the issues that
4 are addressed.

5 For example, the fire protection, or the
6 seismic two over one issue. In this review of the
7 Turkey Point application, certainly it was much less
8 of a navigational challenge than the Hatch. And when
9 I heard Raj say that the review resulted in a number
10 of REIs following some interaction with -- several
11 interactions with the licensee.

12 And it turned out that a lot of the REIs
13 were just a matter of providing clarification. But
14 basically the licensee took the approach of -- took a
15 system approach and a structural approach if you will
16 also, where systems, and compliments, and the related
17 structures were decompartmentalized if you will.

18 So it was not a very complicated
19 application to follow. It was a matter of looking at
20 a particular system, and getting a complete listing of
21 all the SSEs within that system, including the
22 commodities.

23 Now, there are some areas -- and a lot of
24 our REIs have to do with clarification or with regard
25 to some other commodity groups. For example, the

1 review of the office building, for example, and the
2 containment building, there were REIs that had to do
3 with fire retardant components, fire doors, et cetera,
4 et cetera, and fire barriers.

5 Those types of complimentaries resided
6 under another section, titled, "Fire Rated
7 Assemblies." So in terms of the navigation of a few,
8 it wasn't very involved after we got some
9 clarification from the licensee.

10 But basically we used the FSAR, the tech
11 specs, and any licensing correspondence as stated
12 earlier by the licensee, and specifically there were
13 design drawings that accompanied the application.

14 And the design drawings highlighted and
15 the -- well, let me back up a second. The FSAR and
16 the application, there were high points between those,
17 and so it was not from that standpoint. It was a
18 fairly simple review.

19 But the design drawings highlighted the
20 extent of the systems to the system boundaries, and
21 they were easily read. We really had no major
22 problems in the review process.

23 As you can see, we basically reviewed --
24 well, these just highlighted the major systems that
25 were reviewed by the DSSA, and reviewed the reactor

1 coolant systems, and the engineering safety feature
2 systems, and what is presented here is just some
3 examples of the systems.

4 But what I have given you is a count of
5 the number of systems involved in the review, and all
6 together there was 43 systems, and I want to say --
7 no, I'm sorry, 37 systems and 16 structures, separate
8 structural facilities, that was reviewed.

9 Raj mentioned that we had something on the
10 order of 300 REIs, and then that is whittled down to
11 like 200, and I think we ended up with maybe about 30
12 of those REIs.

13 So as you can see altogether, initially I
14 think we had something on the order of 60 REIs. So
15 half of our REIs were more of the clarification
16 concern than anything else.

17 And in the end we really had no major open
18 items. Still to come though is how the seismic total
19 one item is resolved, and I heard a question before
20 about what sort of additional burden that will impose
21 on the staff.

22 As was mentioned before, because they took
23 a spacial approach if you will, and because they took
24 a functional approach, which is as we have seen in
25 previous reviews, like with the Oconee and Talbot

1 plants, if the approaches to identify an area, and
2 identify the safety related systems in that area, and
3 identify the non-safety related systems that are in
4 that area that are believed to be within the
5 proximity, that if there is a failure, will infringe
6 upon the functional capability of the safety related
7 system, then that I think would not be much of a
8 burden.

9 But the burden of a follow-on review then
10 would be much reduced, and that is all that I have.

11 MR. AULUCK: Any questions?

12 CHAIRMAN BONACA: Thank you. If we have
13 any questions, we will raise them as we move through
14 the systems.

15 MR. AULUCK: Next is Meena Khanna.

16 MS. KHANNA: Good morning. My name is
17 Meena Khanna, and I work in the Division of
18 Engineering, Materials and Chemical Engineering
19 Branch. Basically I will be presenting the first
20 three sections of the Turkey Point license renewal
21 application.

22 I would like to start by just telling you
23 basically the staff and GE that we have got two
24 reviews that we conduct; one is on the systems, and
25 with the system review, what we do is we just try to

1 verify that the applicant has adequately identified
2 all the aging effects, and has adequately identified
3 the aging management programs to manage these aging
4 effects.

5 The second review is of the aging
6 management programs, and Ms. Keim will discuss that
7 later in Section 3.8. She will discuss the process
8 that we actually go through in reviewing the aging
9 management programs.

10 And I will go ahead and start with the
11 common aging management programs. Section 3.1 of the
12 application included a description of the common aging
13 management programs.

14 Again, Ms. Keim will also address the
15 common aging management programs in Section 3.8.
16 However, the three that we reviewed under common aging
17 management programs include the chemistry control
18 program, and the FPL quality assurance program, and
19 the systems and structures monitoring program. We
20 will go into details again in Section 3.8.

21 CHAIRMAN BONACA: Let me try to understand
22 this. This is part of what they missed in the
23 application as existing aging management programs.

24 MS. KHANNA: Exactly.

25 CHAIRMAN BONACA: And you are pulling out

1 these three right now in this presentation.

2 MS. KHANNA: Right. Let me just say that
3 when we call them a common aging management program,
4 that is basically an aging management program that is
5 going to apply to two or more systems or components.

6 CHAIRMAN BONACA: I see.

7 MS. KHANNA: So these three have actually
8 been identified as those aging management programs
9 that will apply --

10 CHAIRMAN BONACA: I understand.

11 MS. KHANNA: And there were no open items
12 that were found with either one of these three common
13 aging management programs. However, there is one
14 confirmatory action item, and that is in regards to
15 the quality assurance program, and that is just a
16 minor SER supplement that is needed and Andrea will
17 discuss that later.

18 Now, let's go to Section 3.2, the reactor
19 coolant system. I would like to acknowledge Alan
20 Hiser. He was actually the lead for the reactor
21 coolant system. I am going to go ahead and present it
22 for him.

23 The components of the reactor coolant
24 systems include the reactor coolant piping, Class 1
25 and non-Class 1 components; the regenerative and

1 excess letdown heat exchangers, pressurizers, reactor
2 vessels, reactor vessel internals, reactor coolant
3 pumps, and steam generators.

4 CHAIRMAN BONACA: Now, are these all
5 existing programs? I don't think so. There are some
6 reactor vessel internal inspections which are new
7 problems, right?

8 MS. KHANNA: These are actually the
9 systems. The aging management programs, they are
10 handled in Section 3.8, and there is a reactor vessel
11 internals inspection there, and that will be covered
12 later.

13 Notes of interest include Florida Power
14 and Lights AMR results were compared to the following
15 topical reports. The first one was WCAP-14574 on
16 pressurizers; and WCAP-14575 on piping; WCAP-14577 on
17 reactor vessel internals.

18 However, the staff noted that the FPL did
19 not incorporate the topical report results by
20 reference. And I would note that I believe there was
21 a question that I believe, Mr. Bonaca, you had asked
22 earlier about the reactor vessel internals WCAP.

23 CHAIRMAN BONACA: Yes.

24 MS. KHANNA: And jus to clear it up, we
25 did have REIs that went out on the reactor vessel

1 internals action items, and the applicant adequately
2 identified them. We are satisfied with all their
3 responses and that was -- and they were noted, all the
4 findings were noted in our response, or in their
5 response.

6 CHAIRMAN BONACA: Well, my question was
7 regarding the pressurizer.

8 MS. KHANNA: Okay. Right.

9 CHAIRMAN BONACA: And there the SER finds
10 at least four of the applicant action items -- well,
11 I mean, the pressurizer, while topical, has maybe 10
12 applicant action items.

13 MS. KHANNA: Right.

14 CHAIRMAN BONACA: And the SER identifies
15 four as being applicable to Florida.

16 MS. KHANNA: Right, to Turkey Point.

17 CHAIRMAN BONACA: To Turkey Point, and I
18 was left searching around for where the others are
19 being discussed in the application. Well, not in the
20 application, but in the SER.

21 MS. KHANNA: In the SER, right.

22 CHAIRMAN BONACA: And where they are
23 discussed is in the REI response on the reactor
24 cooling system.

25 CHAIRMAN BONACA: Well, some of them are

1 considered non-applicable, and I don't understand why
2 they were not applicable in all cases.

3 MS. KHANNA: Well, we have got Alan Hiser
4 here. Alan, would you like to talk on that? We are
5 talking about the pressurizers, the topical report on
6 the pressurizers. There were four action items that
7 were not addressed.

8 MR. AULUCK: There were four addressed and
9 six were not addressed and the question is whether
10 they were applicable at Turkey Point.

11 CHAIRMAN BONACA: Well, I was left with
12 searching around for those that were not addressed,
13 and having to trust the judgment that says these are
14 not applicable.

15 DR. FORD: And with the exact equivalent
16 question for the internals, too. There are 11 action
17 items in the internals program, and that is exactly
18 the same question.

19 CHAIRMAN BONACA: That's right. And some
20 of those in the report for the pressurizer were
21 convincing. Now suddenly they disappear for Turkey
22 Point, and the statement says these are not
23 applicable. So I just don't understand. I couldn't
24 find --

25 MR. HISER: I will have to get you an

1 answer on this. The lead reviewer on that is not here
2 right now.

3 MR. HALE: If I could offer at least from
4 our perspective that it's not that the applicant
5 action items were not applicable. The applicant
6 action items were already addressed in the
7 application, and the reviewer who did the pressurizer
8 review recognized, and only asked us those that
9 apparently weren't covered in the application.

10 But we have addressed all of the applicant
11 action items either in the LRA -- I mean, it wasn't
12 because we had the list. It's just that we had
13 already covered the applicant action item in the aging
14 management review that we had performed.

15 I can give you an example of one. It is
16 Applicant Action Item 3.2.2.1-2, which was covering
17 commitments regarding the boric acid waste
18 surveillance program.

19 Well, we had already covered that in our
20 table, and we had already covered that in Appendix B
21 with the boric acid waste surveillance program. So,
22 in the case of the pressurizer, at least in the
23 interface that we had with the staff reviewer, he
24 recognizes that some of that stuff was already picked
25 up in the application.

1 So he only asked us those REIs, those
2 applicant action items that weren't covered or weren't
3 readily identifiable. Now, in the case of the
4 internals, we got a letter with all of the applicant
5 action items listed, and requested a response from us.

6 CHAIRMAN BONACA: Okay. That is probably
7 the explanation for that. The text was not clear.
8 The text says that during the staff review of the
9 pressurizers, the staff determined that four of the
10 applicant action items summarized in the staff SER and
11 WCAP were applicable to the AMR for Turkey Point, and
12 the staff requested an explanation on this. And
13 that's why the others are not so.

14 MR. HALE: Right. They may have concluded
15 that because it was already in the application.

16 CHAIRMAN BONACA: It is just simply left
17 me with no answers to the others, and the answer may
18 be right in the application. I agree with that, but
19 it wasn't clear.

20 MR. HISER: I believe in the internals
21 topical report that we did list the 11 action items
22 and the specific responses.

23 DR. FORD: Okay. And were the responses
24 to those quantitative, because in that WCAP-14574, the
25 reactor vessel internal one, it is continually

1 referenced to the ASME 11 code as to what the
2 frequency of the inspections would be.

3 It is a beautiful criteria on what an
4 aging management program should specify with data, but
5 in the response to the REIs on Turkey Point were the
6 response quantitative? Do you understand my question?

7 MR. HISER: Yes. I believe in some cases
8 they were, in terms of the inspection program
9 activities. In some areas the details on the programs
10 are still being developed through industry, and MRP
11 programs, and those kinds of activities.

12 So the quantitativeness isn't really there
13 at this point.

14 DR. FORD: Now, are we fairly sure as an
15 industry that we are collecting the relevant data?

16 MR. HISER: We are monitoring everything
17 that is going on with the industry. We have periodic
18 public meetings with the MRP to discuss the status of
19 their program, and what their plans are.

20 At this point the programs are proceeding

21 --

22 DR. FORD: In a timely manner?

23 MR. HISER: Yes, in a timely manner.

24 DR. FORD: Well, it wasn't a statement.

25 It was a question.

1 MR. HISER: Yes. At this point, yes. We
2 are satisfied with the scope, and status, and plans in
3 the program.

4 DR. FORD: And do we know how to define
5 timely in relation to the effect on some risk informed
6 basis, like a delta-LOCA? If we have a failure event
7 occurring, which of the ones out of that list of
8 components are going to give you a real heartache?

9 And are we in the expected time period
10 going to get the data to come up with what renewed
11 frequency should be for inspection?

12 MR. HISER: Well, I think that of the
13 items that are listed there that the main activity is
14 in the reactor vessel internals area, and the industry
15 program timeliness is tied to plants entering the
16 license renewal period. And the plants having
17 programs in place as they enter into that period.

18 MR. ELLIOT: This is Barry Elliot. The
19 reactor vessel's internal program, there are two parts
20 to the program. There is the research part of the
21 program, and then there is the inspection part of the
22 program.

23 The inspection part of the program is a
24 commitment by them to do inspections of limiting
25 locations in the reactor vessel internals, once during

1 the first 10 year interval, and the other unit during
2 the second 10 years of the extra period.

3 So they have to have their research
4 results to meet that schedule, and they will have it
5 to meet that schedule. That is the plan and that is
6 how we have written up the program.

7 DR. FORD: But these in your intervals,
8 Barry, are based on --

9 MR. ELLIOT: Well, you asked whether or
10 not it will be in time. The time needed for the data
11 is in year 41 of the operating cycle of the plant
12 operation. That is the program.

13 They will inspect the first unit in year
14 41 according to whatever the research results are from
15 the research program. The second unit will get
16 inspected in the next 10 years of the operating
17 period.

18 It will use the results of the research
19 program, plus whatever the results are from the first
20 10 year first unit. Now, that is the plan today.

21 When we get research results, and if it
22 shows that there is an immediate problem, then we
23 won't do it in year 41. We might have to do it in
24 2002 or 2003. But that is the current plan.

25 DR. FORD: I can understand the reason,

1 that you have to have a date to go into this.

2 MR. ELLIOT: Right.

3 DR. FORD: You can't just say we will
4 wait.

5 MR. ELLIOT: Right.

6 DR. FORD: You have to draw a line in the
7 stand if you like.

8 MR. ELLIOT: Right.

9 DR. FORD: But what concerns me is that
10 there is surely enough data in the technical community
11 right now to say -- and especially for the older
12 plants with the higher fluence level, that a 10 year
13 period is nowhere adequate enough.

14 MR. ELLIOT: Well, that is going to be the
15 results of the research programs, and to look at all
16 the data, and to come up with an answer for that
17 question. You have to look at everything, and that is
18 one of the issues that I am sure the program will look
19 at.

20 DR. FORD: Obviously we are getting into
21 a great big technical argument of, yes, you do; and,
22 no, you don't, but in terms of delta-LOCA as a
23 parameter to prioritize where you should be putting
24 your money to come up with this data in a timely
25 fashion, have they gone through that sort of analysis?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HISER: I don't think it has been
2 looked at in a risk-informed sort of mode. It has
3 been more of a deterministic mode, where aging
4 mechanisms, and combinations of materials and
5 environments have been identified as potentially
6 requiring additional attention.

7 And the industry programs are looking at
8 the parameters that would be involved and determining
9 when and under what conditions the mechanisms could
10 become important. And then developing inspection
11 tools that would be effective in managing those
12 mechanisms for those materials for these components.

13 DR. FORD: I guess that this goes way
14 beyond Turkey Point, Mario, and specifically it does
15 relate to Lochbaum's assertion that relicensing
16 programs and the data from which they are based are
17 not adequate.

18 CHAIRMAN BONACA: Well, I believe that the
19 examples that Lochbaum made, 8 or 10 were related to
20 active components that wouldn't really even fall in
21 the scope of relicensing if I understand, if I
22 remember that.

23 And again, however, I don't think that
24 license renewal insofar as the process we are
25 implementing there is to review the life cycle

1 management, and the procedures is going to have all
2 the details of what needs to be done in the program
3 right now.

4 What we need to have is a commitment by
5 the licensee that he recognizes the issue, and he has
6 prepared himself to deal with the issue, and that
7 through the corrective action program he has, he has
8 performed those actions that are considered by the
9 requirements to be appropriate.

10 And that will be different when we get
11 there than they are today most likely. I mean, just
12 because we will know about it. Now, I think the only
13 place where we can have some discomfort is where some
14 issues that may not ever be experienced, and then make
15 them up.

16 But again that will have to be dealt with
17 at that time, and will be part of the core licensing
18 interaction within the staff and the NRC, and not
19 necessarily of the license renewal, because that would
20 become part of the license renewal.

21 MR. HISER: And we have tried in
22 particular in the reactor vessel internals area to try
23 to crystal ball some of the issues that may come up,
24 and that we don't think are an issue for 40 years, but
25 could with fluences increasing, and exposure times

1 increasing, they may become important.

2 And right now the data for relevant
3 conditions isn't sufficient to tell us that we
4 definitely would have a problem, or we definitely do
5 not have a problem. So the industry is trying to
6 collect the data that would help them to determine the
7 potential problem, and then propose appropriate
8 management schemes.

9 DR. FORD: I have another question, and I
10 don't know who to ask, but on steam generators, we
11 have been talking about future events. But there have
12 been problems, and I think it was in one of the WCAP
13 documents that was saying that we were safe from many
14 of the cracking problems because we monitor the oxygen
15 and the chloride contents, et cetera.

16 Well, it is not really oxygen that you are
17 interested in. It is corrosion potential, and you can
18 high corrosion potential from copper from condensers
19 on the secondary side, and at Indian Point we did have
20 cracking of the vessel because of copper coming from
21 the condensers.

22 Now, does that come into these programs
23 and into these GE management programs?

24 MS. KHANNA: There is a steam generator
25 integrity program that adequately addresses that.

1 DR. FORD: Then it is just the steam
2 generators that are on this slide then?

3 MR. HISER: Right. Steam generators is
4 one of the components of the RCS. However, there is
5 an aging management program that specifically is
6 called a steam generator integrity program, and that
7 adequately identifies that.

8 DR. FORD: That specific item is watched
9 for copper tube flux within the --

10 MS. KHANNA: Could you guys answer that?

11 MR. HISER: Well, for one thing, when we
12 replaced the steam generators, we replaced all the
13 condenser tubing with titanium. All of our feed water
14 heaters are stainless tube now. So we minimize copper
15 as an additional preventive action.

16 And we do sludge lancing and all that
17 stuff related to ensuring tube integrity is
18 incorporated into the steam generator integrity
19 programming, as well as our current testing of the
20 tubes.

21 And you see that both in your chemistry
22 control program and in the steam generator integrity
23 program.

24 MS. KHANNA: Okay. Great. I will go back
25 to the review. The second note of interest that we

1 noted for the reactor coolant system is that the
2 reactor vessel had penetration nozzle cracking was
3 managed by the reactor vessel had the 600 penetration
4 inspection program.

5 There will be a presentation made on the
6 Ally 600 penetration inspection program. There was an
7 open issue also identified on CRDMs, and that will
8 picked up in a later discussion in Section 3.8. S o
9 basically there were no open items in regards to the
10 reactor core systems. We will go to Section 3.3,
11 engineering safety features. The ESF systems include
12 emergency containment cooling systems, the containment
13 spray, the containment isolation, the safety
14 injection, residual heat removal, emergency
15 containment filtration, and containment post-accident
16 monitoring and control.

17 The staff found that the applicant
18 adequately addressed all the aging effects for each of
19 the components and the systems of the ESF, and also we
20 also found that the aging management programs to be
21 appropriately addressed for each of those aging
22 effects as well.

23 So we also found no aging -- I'm sorry, no
24 open items with the ESF.

25 CHAIRMAN BONACA: The containment

1 monitoring and radiation protection system, that does
2 not have an aging management program for it?

3 MS. KHANNA: Right. There were no aging
4 effects found to require an aging management program.

5 CHAIRMAN BONACA: And could you explain
6 more on that? So there were no aging effects found
7 for that?

8 MS. KHANNA: Right. The applicant didn't
9 identify any aging effects, and we found -- well, what
10 we do is we use the GALL report and we compare the
11 results. And if we found that they had adequately
12 identified the aging effects --

13 CHAIRMAN BONACA: Well, this was a
14 question from John Barton. What you are saying is
15 that it was in scope, but you found no aging effects
16 that would justify a management program?

17 MS. KHANNA: Right, that's correct.

18 CHAIRMAN BONACA: John thought that they
19 were not in scope, and they are in scope. All right.

20 MS. KHANNA: But they were identified as
21 being in scope, and so we went ahead and reviewed it,
22 and it is in scope.

23 CHAIRMAN BONACA: And there was another
24 question here from Mr. Barton regarding the MSIV.
25 There are two different designs for the reserve tanks

1 that are used to operate the MSIVs, and on Unit 4
2 there are reserve tanks that are used or they are
3 simply accumulated that are used.

4 And those are in the scope of license
5 renewal. For Unit 3, there are bottles. I mean,
6 bottles that are used for the safety function.

7 MR. HALE: That's right.

8 CHAIRMAN BONACA: So if I understand it,
9 you do have reserve tanks that are used for normal
10 operation?

11 MR. HALE: The MSIV normal operation is
12 just basically instrument error. What these are, the
13 air accumulators on Unit 4 and the nitrogen bottles on
14 Unit 3, are under certain accident scenarios, if you
15 assume leakage of the actuator, and you have an equal
16 DP, or a no DP across the MSIVs, it could come back
17 open again.

18 So we provided a back up source to
19 instrument error for the MSIVs. Now, with regards to
20 --

21 CHAIRMAN BONACA: Okay. For Unit 4, they
22 are treated different?

23 MR. HALE: They are different. It was
24 kind of a decision that was made for Unit 4 to go with
25 something that didn't need to be replaced

1 periodically. The bottles are monitored for pressure
2 and they are replaced periodically.

3 Whereas, the air accumulators on Unit 4
4 are just an in-line tank. So what was the question?

5 CHAIRMAN BONACA: The question is that you
6 do have the instrument accumulative tanks for Unit 4
7 are in fact subject to an AMR.

8 MR. HALE: Right.

9 CHAIRMAN BONACA: While for Unit 3, you
10 took the position that the bottles are not long term,
11 and they are replaced.

12 MR. HALE: Right. They are replaced on a
13 -- the pressure is monitored, and they are replaced
14 periodically.

15 CHAIRMAN BONACA: And how is it monitored?

16 MR. HALE: Actually, there is tech spec
17 requirements that they be maintained at a certain
18 pressure level, and if it drops below that for
19 whatever reasons -- you know, testing, leakage,
20 whatever it might be -- they are monitored and
21 replaced.

22 So we considered those replaced
23 periodically and as such didn't require an aging
24 management review.

25 CHAIRMAN BONACA: And the monitoring is a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 periodic monitoring with tech specs?

2 MR. HALE: Yes. We are required to
3 maintain a certain pressure.

4 CHAIRMAN BONACA: Okay. All right.

5 DR. ROSEN: When you say periodic
6 monitoring, what do you mean?

7 MR. HALE: Whatever the requirement is,
8 but they are stipulated that we have to maintain a
9 certain amount.

10 DR. ROSEN: Well, does somebody go out and
11 look at these bottles every four hours or something
12 like that?

13 MR. HALE: There is pressure indication.

14 DR. ROSEN: In the control room?

15 CHAIRMAN BONACA: In the control room, no.

16 MS. THOMPSON: I don't know if it is in
17 the control room.

18 MR. HALE: I would have to look at the
19 drawings.

20 MS. THOMPSON: They are monitored
21 relatively frequently, and we are not talking about
22 once every 18 months or something. They are on
23 regular operator rounds.

24 CHAIRMAN BONACA: All right.

25 MR. HALE: The same question was raised in

1 our REIs and we got a response to that as well, which
2 summarizes I think some of the specifics that you are
3 asking for.

4 CHAIRMAN BONACA: All right.

5 MR. AULUCK: Next we will go to the
6 auxiliary systems, and James Davis will cover that.

7 MR. DAVIS: There are 15 systems on the
8 auxiliary systems that we looked at. We thought that
9 the application was very good this time. The best one
10 that I have seen so far.

11 We had a number of REIs, and they were
12 fairly simple. They basically were that the words
13 didn't match the tables, and things like that, and we
14 just cleared those up very quickly. There were no
15 real surprises. So we ended up with no open items.

16 Are there any questions on these systems?
17 If not, on steam and power conversion systems, these
18 included the main steam and turbine generators, and
19 feedwater and blowdown, and the auxiliary feedwater
20 and condensate storage.

21 And there were no show stoppers here.
22 They were just conditional REIs, but they basically
23 were to just clarify the text and the tables again.
24 And there are no open items here.

25 CHAIRMAN BONACA: I would like to go back

1 just a second. I had a question about that there is
2 a discussion in the SER regarding inaccessible
3 locations, the pressurizer, the pressure vessel, and
4 steam generators, and vessel internals.

5 And I would like to have a better
6 understanding of how that is being dealt with in
7 inaccessible locations in the pressurizer, the
8 pressure vessel internals, and steam generators.

9 MR. AULUCK: In the inaccessible areas,
10 they go look at the accessible areas for possible
11 clues, and then follow it up in the inaccessible
12 areas.

13 CHAIRMAN BONACA: Well, assume that you
14 have a clue and it may be something that is in an
15 inaccessible area.

16 MR. HALE: Well, I think we saw quite
17 disparity in how previous applicants have addressed
18 this. We have had some applicants say that there are
19 no inaccessible areas in the power plant, and with the
20 right amount of money or whatever, you can always make
21 something accessible.

22 We took the perspective that with
23 inaccessible areas, if something is not readily
24 visible, and something where you would have to take
25 extraordinary measures in order to see things.

1 Certainly there are observation techniques
2 that you can utilize, such as t.v. cameras on -- you
3 now, remote, very tiny t.v. cameras. In fact, we are
4 going to utilize some of that in our head penetration
5 visual inspection.

6 So I think that the aging management
7 review pretty much stands on its own. The programs
8 that we credit, if we see something, then we would be
9 obligated to go look at these other areas if it was
10 applicable. But in terms of how we define
11 inaccessible --

12 CHAIRMAN BONACA: I wasn't in effect
13 asking about your obligation. Of course, you do have
14 to fill a commitment. I would reach the same judgment
15 that any inaccessible area can be made accessible if
16 you have to, and if you have indications.

17 MR. HALE: Right.

18 CHAIRMAN BONACA: One thing that comes
19 through the application and the SER are some questions
20 regarding looking at operator experience. And there
21 are issues that may prompt you to say that I don't
22 have any problem, but there may be something.

23 You have been looking also at other power
24 plants in the Westinghouse Owners Group, right?

25 MR. HALE: Right. Yes. As part of each

1 one of those GTRs that were mentioned, and not just
2 the ones were submitted, but also the other ones that
3 we used as source information, it was basically an
4 integrated look at all the experience for those
5 particular components on the Westinghouse plants.

6 So we did that, and we also have our
7 sister plants, or our other plants up at St. Lucie.
8 So we have got a broad database to draw on, and we did
9 an extensive review of our operating experience as
10 well.

11 As you have seen, we actually used
12 experience which may have happened at St. Lucie and
13 Turkey Point.

14 CHAIRMAN BONACA: Okay. Thank you.
15 That's all I needed.

16 MR. MUNSON: I am Cliff Munson and I am in
17 the civil engineering group. We reviewed the
18 structures and structural component section. The
19 applicant divided it into two groups. The first group
20 was containment, and then the second group was other
21 structures.

22 And they further divided these two groups
23 into commodities and environments. So they have steel
24 in air, and steel in fluid, concrete, and we looked at
25 the aging effects that were identified by the

1 applicant to make sure that they included all the
2 applicable aging effects.

3 The three aging effects that they
4 identified for the steel and concrete groups were loss
5 of material, cracking, and change of material
6 properties.

7 And for the containment structure, post-
8 tensioning, they also identified loss of pre-stress.
9 For the miscellaneous structure component, they
10 identified loss of seal, as well as loss of material.

11 We didn't have any open items. I have
12 reviewed all of the applications up to date, and this
13 was very easy to follow. We were able to find pretty
14 much everything we looked for, and they had
15 -- I think they thoroughly covered the aging
16 mechanisms that would lead to these aging effects.

17 And I thought it was an excellent job that
18 they did.

19 CHAIRMAN BONACA: I have a question
20 regarding the in-take structure. There is no
21 management, aging management of this structure, and
22 there are a lot of systems or components attached to
23 the structure that in fact do have an aging management
24 program.

25 And I really wondered why -- and also John
