EFERENCES:	
. 1BwOSR 3.3.1.2-1, Rev. 6, Unit 1 Pow Channel Calibration (Computer Calori	
:	
opy of Completed/Ready for review 1BwOSR	3.3.1.2-1.
IDARDS:	
. Perform review of calorimetric data . Determine if adjustment of NIs is ne . Demonstrates the use of good Core Wo	cessary.
DITIONS:	
	S-42 IV.C.NI-05 NI-004

- 1. You are the Unit Supervisor.
- 2. The Unit is at 100% power, steady state.
- 3. Unit 2 is at 100% power.

INITIATING CUES:

1. The Unit NSO has completed the required calorimetric surveillance and has asked for your review.

Note: Hand examinee completed calorimetric D-2 data sheet #1, with the 4 page printout of the calorimetric results from the JPM. (pages 7-10)

.

S-42 (7/3/01) ZD73EXAM

STANDARDS

RECORD START TIME

Note: This JPM is performed by having the examinee review the D-2 Data sheet from the surveillance. The first data sheet is complete through block 12 but has 1 mistake in it. The examinee must locate the mistake to pass the JPM prior to signing block 16, Review Authorization.

- 1. Refer to completed 1BwOSR Review the data sheet for D D completeness/errors for blocks 1 and 2:
 - (CUE: Ensure D-2 Data Sheet #1 is handed to examinee with the printout of the calorimetric data.)
- Date: Today
- Time: 10 minutes ago
- Mwe Gross: Current (1257.0)
- Control Bank Position: Current for C1 (228), C2 (228), D1 (215), D2 (215).
- NSOs Signature.
- 2. Review blocks 3 and 10.

Review blocks 3 and 10 for completeness/errors:

- Initial NIS Drawer Front Panel Meter Power filled in.
- Calculated Calorimetric Power from printout filled in.

S-42 (7/3/01) ZD73EXAM

- *3. Review the Calculated power difference and determines channel N-44 exceeds-28.15 Negetive.
 - (Note:

If examinee discovers the N-44 mistake, and either wants the NSO to complete boxes 13-15 or wants to do it himself, cue the examinee that the data has been taken and hand him D-2 data sheet #2. Go to JPM step 4.

If at any time before the examinee signs the Review Authorization block 16, he discovers he missed the mistake, then treat it like he had discovered the mistake, and provide D-2 data sheet #2, after he states boxes 13-15 need to be filled in.)

STANDARDS

terre a tra

a an constanta

Review the data in block 11 and 12, and determines 1 mistake exists:

- Check absolute difference between data in blocks 3 and 10.
- Determine N-4 absolute difference exceeds 28. 15 Nezative
- Correct block 11 for calculated power difference for N-44. Line-out, date and initial or have the NSO correct/re-do it.
 - Correct block 12 for N-44 to a "YES" box for requiring channel adjustments. Lineout, date and initial or have the NSO correct/re-do it.

N/A

S-42 (7/3/01) ZD73EXAM

- *4. Verify the calculation that determines to what power N-44 must be adjusted.
 - (Note: The examinee will have been given a D-2 data sheet in the previous step, with the appropriate boxes 13-15 numbers filled in. He needs to verify the subtraction and determination of the indicated power the adjustments must result in for N-4.)
 - (CUE: Adjustments to N-4 complete. Hand D-2 data sheet #3 to examinee.)

STANDARDS

DETERMINE the power channel N-447 needs to be adjusted to as follows:

- Ensure the present percent power values are filled in block 13.
- VERIFY the corrected calculated power difference from block 11 in block 14.
- VERIFY/SUBTRACT the power difference from the present indicated power and the value as the Power to adjust the NIS channels to in block 15.
- Direct the NSO to make adjustments to N-44.
- Sign the "Review Authorization", block 16.
- Review the printout and check box 22.a. "YES".

(CUE:) THIS COMPLETES THIS JPM.

SCENARIO 01-1 OVERVIEW

The scenario begins with the plant at 75% power and a ramp up to full power is requested via the turnover. The turnover includes information that MESACs were completed for 1D SGWLC instrumentation on the previous shift and 1A MFP is out of service for breaker cubicle work.

After clearly observable plant response to the requested reactivity change, the controlling channel of S/G Water Level instrumentation for 1D S/G will fail low causing a demand for more feed flow to the 1D S/G. The BOP will diagnose the failure and take manual control of the 1D S/G feed regulating valve. The crew will enter and perform actions of 1BwOA INST-2 Attachment E, "OPERATION WITH A FAILED INSTRUMENT – NARROW RANGE S/G LEVEL CHANNEL FAILURE", to stabilize the plant and trip the bistables for the failed channel. The SRO will investigate Tech Specs. LCO 3.3.1 condition E and LCO 3.3.2 condition D will apply. Maintenance will investigate as requested.

After the bistables are tripped for the failed S/G water level control channel, a failure of the controlling channel of Pzr Level will occur causing letdown to isolate. The crew will respond by diagnosing the failure of the level channel and entering and performing the actions of 1BwOA INST-2 Attachment C, "OPERATION WITH A FAILED INSTRUMENT – PRESSURIZER LEVEL CHANNEL FAILURE". An alternate controlling level channel will be selected, letdown will be restored, and the crew will take actions to restore pressurizer level to the program value. Bistables will be tripped for the failed channel, and Tech Specs will be investigated. LCO 3.3.1 condition K will apply. Maintenance will investigate as requested.

Following the restoration of letdown and bistable tripping, the letdown temperature control valve for the on line letdown heat exchanger will close. Letdown temperature will increase causing a high temperature diversion around the mixed bed demineralizers. Manual control of the temperature controller is available and will be necessary to restore letdown temperature to normal. Annunciator response procedures will be referenced to respond to the failure.

When manual control of the letdown temperature control valve is selected, the 1D S/G PORV controller will cause the 1D S/G PORV to open. RCS Tave will decrease causing control rod motion in the outward direction. The crew will 'investigate the cause of the temperature decrease and diagnose the inadvertent PORV failure. Emergency closure of the PORV will be available from the control room and the PORV will be locally isolated if directed by the crew. The SRO will determine Tech Spec 3.7.4 applies.

A failure open of the 1A Feed Regulating Valve will cause a High-2 SG Level Turbine Trip if the crew does not manually trip the reactor first. A 1A S/G feed line break inside of containment will occur when the 1A FWIV closes requiring a safety injection. 1BwEP-0, "REACTOR TRIP OR SAFETY INJECTION" will be entered. Containment pressure will exceed the Containment Spray actuation setpoint. Manual action will be required to start 1 train of RCFCs and the 1B AFW pump. The 1A AFW pump will fail to start. A diagnosis of a Faulted S/G will cause transition to 1BwEP-2, "FAULTED SG ISOLATION". Further diagnosis will determine 4 faulted S/Gs exist due to failure of all MSIVs to close and a transition to 1BwCA-2.1, "UNCONTROLLED DEPRESSURIZATION OF ALL S/Gs" will be made. Depending on the timing, a transition to 1BwFR Z.1, "RESPONSE TO CONTAINMENT HIGH PRESSURE," will occur after exiting the Reactor Trip/Safety Injection procedure. Manual operator action will be required to throttle

AFW flow to a minimum to the SGs. Local operator action will be required to throttle B Train AFW flow to the faulted 1A S/G due to a failure of the potentiometer and a stuck open isolation valve. Containment Spray may be terminated (depending on the amount of secondary water inventory remaining in the SGs and the RCS temperature) before reaching the LO-2 RWST setpoint for auto swap over to the containment sump and an unnecessary injection of sump water into the RCS. NaOH addition to the CS water will be stopped due to the break being on a secondary system. If the LO-2 RWST level is reached, then the crew will transition to 1BwEP ES-1.3, TRANSFER TO COLD LEG RECIRCULATION and then back to the procedure and step in effect. The crew will proceed to terminate the safety injection in 1BwCA 2.1. Scenario termination is after stopping high head injection flow and re-establishing charging flow.

Critical Tasks

E-0—**F**

Establish the minimum required AFW flow rate to the SGs before transition out of E-0, unless the transition is to FR-H.1, in which case the task must be initiated before RCPs are manually tripped per FR-H.1.

ECA-2.1---A

Control the AFW flow rate to not less than 45 gpm per SG in order to minimize the RCS Cooldown rate before a severe (orange path) challenge develops to the integrity CSF.

SIMULATOR OPERATOR NOTES:

IA/IC Anton Sh Sted. Simulator Setup: Init IC 18, MOC, Xenon equilibrium, steady state. Align switches, "Perform ready for Training" checklist. Insert PRELOAD Events: Place 1A MFP control switch to Pull Out and hang tag. IMF CH11A and CH11C 1A and 1C RCFCs fail to auto shift from high to low speed on SI. IMF FW48B 1B AFW pump fails to auto start, can be manually started. IMF FW43 1A AW pump fails to auto or manually start. IMF MS01A-D All MSIVs fail 100% open, no closure available. IMF FW45E 100 1AF005E potentiometer fails at 100% demand. IOR ZDI1AF013E AUTO 1AF013E stuck open.

Event 1 Power ramp from 75% up to 100%.

As SM acknowledge ramp initiation.

As RP/HP/Chemistry acknowledge sample requirements for power change > 15% in one hour.

Event 2 1D SG Controlling water level channel fails low (1LT-549).

RX19 SDG:

Malf: RX06O, 0 severity, no ramp.

Initiate event after clearly observing reactivity change/response of plant from requested power ramp up or upon lead examiner cue. Role play as U-2 admin and/or extra NSO to accomplish bistable tripping. Acknowledge all info passed to the SM, WEC, and maintenance.

e - 5	SDG: RX19			· · · ·				$\mathcal{L} = \{ \mathcal{L} : \mathcal{L} \in \mathcal{L} : \mathcal{L} \in \mathcal{L} \}$	
	Cabinet door #2	Open		~ 1.82	RF	RX21	OPEN		
\sim	P-14	LB549A	C2-753	BS-1	RF	RX069	TRIP	·	
	LO-2	LB549B	C2-753	BS-2	RF	RX070	TRIP		
	Cabinet door #2	Close			RF	RX21	CLOSE		

Event 3 Controlling PZR level channel fails low (1LT-459).

SDG: RX6

Malf: RX13A, 0 severity, no ramp.

Initiate event after bistables are tripped and tech specs are investigated for event 2, or at lead examiners cue. Role play as U-2 admin and/or extra NSO to accomplish bistable tripping. Acknowledge all info passed to the SM, WEC, and maintenance.

SDG: RX6 Cabinet door #1 Open

RK20 **OPEN** ŔF

Event 4 On line letdown heat exchanger (1A) cooling flow control valve fails closed, (1TCV-130A).

BS-1

SDG: CV2 and CC6

Initiate after bistable is tripped and tech specs are investigated for event 3, or at lead examiners cue. Malf: CV09, 50

Intent is to cause operator to have to take manual control of the TCV-130 controller and restore letdown temperature without having to swap letdown heat exchangers. Manual control via the M/A station is available on this malfunction. Acknowledge all info passed to the SM, WEC, and maintenance. If dispatched as local operator, use first check and report no obvious problems at the valve. Valve appears to operate smoothly from local observation. (An additional simulator manipulation may be necessary as follows: On SDG CC6, may have to close 1CC9452B to reduce CC flow to the 1A letdown Hx, because the malfunction to cause the 1CC130A to close, does NOT fully close the valve. If this is the case, then as Manual Control of the M/A station for 1CC130A/B is taken and demand increased, reopen 1CC9452B to restore cooling flow. The original position of the 1CC9452B valve is ~50% open.)

Event 5 1D SG PORV 1MS018D, fails open.

if asked risk is yellow.

SDG: MS4 Initiate at after letdown temperature is stabilized or at lead examiners cue.

Malf: MS04D, 100, no ramp

If dispatched to the controller box in the AEER, report no obvious problems. If dispatched to locally close 1MS019D, wait 5 minutes, use first check, and then use RF: MS54 CLOSE to close the isolation valve. Report 1MS019D closed when completed. Acknowledge all info passed to the SM, WEC, and maintenance.

Events 6 and 7 1A SG Feed regulating valve (1FW510) fails open with no manual control available causing a feed line break inside containment on 1A feed line when feedwater isolates.

Initiate events 6 and 7 after tech specs are investigated for the 1D SG PORV, or at the lead examiners cue. Action:

Malf: FW09A, 100, 30 second ramp.

SDG: FW8

Malf: FW19A, 2.0 Mlb/hr, when FW009A is full closed.

Trigger: When FWV1FW009A == 0, then IMF FW19A 2

Acknowledge all info passed to SM, WEC, and others regarding reactor trip and SI and procedure transitions. Role play as STA when asked and monitor the Status Trees. Pay particular attention to the Containment Status Tree as the intent of the scenario is reach the Hi-3 setpoint. Actions in EP-0 will ensure CS is going, however if monitoring the Status Trees identifies an Orange path, report it to the US as usage rules apply.

If dispatched as local operators to check/investigate equipment, report as follows for the requested actions:

All running equipment is operating properly.

1A Auxiliary Feed Pump Breaker has an over current flag on phase C. Bus 141, cub 8.

No obvious problems at the high speed breakers for the 1A and 1C RCFCs. Bus 131X Compt 5C (for 1A RCFC) and Compt 3C (for 1C RCFC). Need the floor plugs removed to get to the 1AF013E.

SDG: FW13

Use RF: FW161 to position the hand wheel for 1AF005E as requested. (8 will \sim 45 gpm)

Maintenance will attempt to locally close any/all MSIVs (but will be unsuccessful).

SDG:SIPUse RF:ED55E to energize 1SI8806 at 131X1A:P3,and RF:ED72B to energize 1SI8813 at 132X4A:L3if 1BwEP ES-1.3 is entered.

-- ---

Event Description:		Failure of 1TCV-130A to control temperature / modulates closed.	
Time	Position	Applicant's Actions or Behavior	
,	CUE	Annunciators: 1-9-E2 LTDWN TEMP HIGH	
		Indications: Letdown Hx Outlet temperature decreasing (1TI-130) 1TCV-129 Diverts to VCT	
-	RO	Announces increasing letdown temperature trend and diagnoses failure of 1CC-130A closed.	
		 Dispatches operator to locally check valve and reports status to US. VERIFY High Temperature divert valve diverts letdown flow and reports to US. Takes manual control of 1CC-130 and restores cooling flow. Verifies 1-9-E2 clears. Determines auto control problem and reports to US. Restores letdown flow to VCT when directed by US. 	
	US	Diagnose/Acknowledge failure of 1CC-130A closed.	
		Directs use of BwARs. Directs manual control of 1CC-130 Controller to re-establish proper letdown cooling flow.	
	на на 14 година 14 година	 Determines auto control problem. Dispatches operator to locally check valve and reports status to crew. Contacts Chemistry for Demin Effluent sample. Re-establish letdown flow to VCT. Informs SM of status. Orders WEC to generate AR, CR, and get maintenance involved for repairs. 	
	BOP	Reviews BwARs	
		 Monitors control board indications. o Holds/controls Ramp. o Dispatches operator to locally check valve and reports status to US.

SCENARIO 01-2 OVERVIEW

The scenario begins with the plant at 100% power and a ramp down to 90% in preparation for the TV-GV surveillance due next shift. The turnover includes information that 1A MFP is unavailable due to breaker cubicle work, and MESACs were completed for 1D SGWLC instrumentation on the previous shift.

After clearly observable plant response to the requested reactivity change, the Tcold RTD on Loop 1B will drift high causing inward rod motion. The RO will diagnose the instrument failure and place rod control in manual. The power change may be suspended. The SRO will enter 1BwOA INST-2 Attachment A, "OPERATION WITH A FAILED INSTRUMENT CHANNEL – RCS NARROW RANGE RTD CHANNEL FAILURE", and direct crew actions to defeat the failed channel, restore Tave and automatic rod control, investigate Tech Specs, and trip bistables. LCO 3.3.1 condition E will apply. Maintenance will investigate as requested. When the recovery is complete, the load ramp will recommence if previously suspended.

After the bistables are tripped for the failed RTD, an inadvertent automatic start of the 1A AFW pump will occur due to a slave relay actuation. The addition of colder feedwater to the SGs will cause Tave to decrease and outward rod motion to occur. The BOP will respond by referencing the annunciator response procedures. When the control switch for the 1A AFW pump is placed in PULL OUT to stop the unwanted addition of AFW, the pump will no longer start for the remainder of the scenario. (This failure to start may not be discovered until the major transient.) The SRO will investigate Tech Specs for AFW. LCO 3.7.5 will apply. Maintenance will investigate as requested.

Shortly after the inadvertent start of the 1A AFW pump, the main steam header pressure controller will slowly fail low. This will cause the main feed pumps to slow down, the feed regulating valves to open, and a decrease in all SG water levels. The BOP will diagnose the failure, place main feed pump speed control in manual and increase feed pump speed to restore SG levels and main feed header pressure to the program value. The steam dump controller will no longer respond correctly in the steam pressure mode of operations, but this is inconsequential at power.

After SG levels are stable, the letdown pressure control valve will fail closed causing the letdown relief valve to lift to the PRT. There will be no manual control available and the indication will be that the valve is trying to control letdown pressure at 600 psig. The RO will diagnose this from high letdown pressure and manually isolate letdown. The pressure control valve will be locally isolated and bypassed and letdown flow restored. Excess letdown may be placed on line.

After letdown restoration, breaker 1592 trips causing a loss of 6.9KV Bus 159. No ABT to the UAT will occur, resulting in a loss of the 1D RCP. The Reactor Protection System will sense the loss of RCS flow and generate a reactor trip (OPDT) signal. The Reactor will fail to trip (ATWS), requiring emergency boration because rods will fail to move. The Turbine will fail to trip, necessitating a manual runback of the turbine. The voltage transient will cause feedwater to isolate. The delay in getting the turbine tripped and the loss of feed will most likely result in the generation of Safety Injection and MSIV Isolation signals. The MSIVs will NOT automatically close, but can be manually closed. The SRO will implement 1BwFR S.1, "RESPONSE TO NUCLEAR POWER GENERATION/ ATWS", and the crew will perform Immediate Actions. The 1A AFW pump will NOT start if taken out of PULL OUT. The 1B AFW pump will fail to start. The emergency boration valve will be stuck closed, necessitating an alternate emergency boration source and flow path.

Comments:

The reactor will trip when the steam dumps are taken to off.

A transition from the ATWS procedure to 1BwFR H.1, "LOSS OF SECONDARY HEAT SINK," will be made if the SRO has directed the STA to monitor Critical Safety Function Status Trees and narrow range steam generator levels are all less than 10%. Otherwise, the SRO will transition to 1BwEP-0, "REACTOR TRIP OR SAFETY INJECTION", and diagnose the need to transition the 1BwFR H.1 when AFW flow is unable to be verified.

Upon entering 1BwFR H.1, the loss of SG water levels will require the initiation of Bleed and Feed. The SRO will direct tripping of all RCPs and the initiation of Bleed and Feed. After Bleed and Feed is initiated, the SRO will direct attempts to restore feed flow. Main feed and AFW are not available. When Condensate flow is established, the scenario ends.

Critical Tasks

FR-S.1—A:	Isolate main steam from the main turbine before exceeding 3107 psig RCS pressure.				
FR-S.1—C	Insert negative reactivity into the core by emergency boration.	Insert negative reactivity into the core by emergency boration.			
		va			
FR-H.1—B	Initiate RCS Bleed and Feed before PZR PORVS remain open due to loss of secondary heat sink.	2 19 ⁵ 9 - 2

Event 3 Inadvertent start of 1A AFW pump.

SDG: RP14

MRF RP38 IN

Initiate inadvertent start of 1A AFW pump after tech specs are investigated for the failed RTD in event 2, or at the lead examiners cue.

If dispatched to locally turn off the aux oil pump, use OVERRIDE, to override the 1A AFW pump Aux Lube Oil pump light OFF. IOR ZLO1AF01PAA OFF.

INSERT Malf FW43 to prevent any further starts of the 1A AFW pump. Use Trigger: When ZDI1AF01PA(5) == 1, then IMF FW43.

If sent to locally investigate, the pump looks normal, and there are no abnormal indications at the breaker. If sent to the slave relay, report it is IN. (163) 633)

Acknowledge all info passed to the SM, WEC, and maintenance.

Event 4 Main Steam Header Pressure Controller (1PT-507) fail low over 5 minutes.

SDG: RX22 Malf: RX05, 0, 5 minutes

Initiate malfunction after tech specs are investigated for the inoperable 1A AFW pump, or at the lead examiners cue. Acknowledge all info passed to the SM, WEC, and maintenance.

 Event 5 Letdown pressure control valve (1PT-131) fails closed.

 SDG: CV2

 Malf: CV08, 600. As valve fails, in order to simulate no auto control, also use RF CV01 CLOSE to close the Isolation valve (1CV8408A).

 Initiate malfunction after the feed flows and feed pump speeds are stabilized in manual, or at the lead examiners cue.

 Acknowledge all info passed to the SM, WEC, and maintenance.

 If dispatched to locally isolate and bypass the valve use the following:

 SDG: CV2

 Isolate:
 RF CV01 CLOSE CV8408A (and CV8408B is not modelled).

 Bypass:
 RFCV02 OPEN CV8409

Events 6 and 7 are run together.

Event 6 Loss of Bus 159 and Spurious feedwater isolation.

SDG: ED2A Malf: ED05D Malf: RP09A

Comments:

Scenario 01-2 Draft

Initiate Major Accident sequence after the letdown pressure control valve is bypassed, or at the lead examiners cue. Set up trigger to cause the FWI when the 1592 breaker fails: When YP:MED05D==1, then IMF RP09A.

Event 7 Control Rods fail to move. Auto had speed 1009 & Ensure the trigger to activate the rods fail to move malfunction occurs at the time of the loss of bus 159. When YP:MED05D == 1, then IMF RD06. Ensure the trigger to de-energize 1CV8104 (Bus 132X5:B1) occurs when bus 159 is lost. When YP:MED05D == 1, then MRF ED073B OPEN

Acknowledge the call to locally trip the reactor, but do NOT trip the reactor until the steam dumps are taken to OFF.

If asked to locally trip the turbine at the pedestal, wait until after the steam dumps are taken to OFF, then use RF TC03 TRIP on SDG TC1.

Trigger: When ZDI1HSBYPA(1) == 1, then DMF RP01. Trigger: When ZDI1HSBYPB(1) = 1, the DMF RP02A and RP02B.

Acknowledge the call for the STA to monitor Status Trees. Pay particular attention to Heat Sink (after ATWS). The intent is to get to H.1 and Bleed and Feed..

Acknowledge all info passed to the SM, WEC, and maintenance.

SCENARIO 01-3 OVERVIEW

The scenario begins with the plant at approximately 25% power with orders to ramp up to full power. The turnover includes information that the 1A RH pump is unavailable due to a scheduled work window, 1A MFP is unavailable due to breaker cubicle work, and MESACS were completed for 1D SGWLC instrumentation on the previous shift.

After clearly observable plant response to the requested reactivity change, a Containment Pressure channel will fail high. The BOP and RO will diagnose the failure from annunciators, instrumentation indications, and the bistable light. The SRO will enter 1BwOA INST-2 Attachment J, "OPERATION WITH A FAILED CHANNEL - CONTAINMENT PRESSURE CHANNEL FAILURE," and direct actions to trip the bistable and investigate Tech Specs. LCO 3.3.2 condition E applies. Maintenance will investigate as requested.

After the bistable is tripped for the containment pressure channel, a Power Range Channel will fail high causing inward rod motion. The RO will diagnose the failure from control board indications and alarms and place rod control in manual. The ramp up may be suspended. The SRO will enter 1BwOA INST-1 Attachment A, "NUCLEAR INSTRUMENTATION MALFUNCTION - PR CHANNEL FAILURE," and direct actions to defeat the channel, restore Tave and automatic rod control, trip bistables, and investigate Tech Specs. LCO 3.3.1 conditions D and E apply. Maintenance will investigate as requested. The ramp up may be restarted if suspended earlier.

After the bistables are tripped for the failed NI, 1C RCP seal will begin to leak abnormally. The RO will diagnose the failure from RCP parameters, and the SRO will enter 1BwOA RCP-1, "REACTOR COOLANT PUMP SEAL FAILURE". The crew will determine the seal problem is real, not an instrumentation problem, and commence a shutdown.

記録時代のよう

While preparations are being made to shutdown the unit, a seal water heat exchanger tube leak will occur, causing a decreasing Surge Tank level, and a dilution of the RCS from Component Cooling water entering the flowpath to the CV pumps. The problem will be diagnosed by the BOP from makeup occurring to the CCW surge tank. The SRO will enter 1BwOA PRI-12, "UNCONTROLLED DILUTION", and/or 1BwOA PRI-6," COMPONENT COOLING MALFUNCTION", and direct actions to isolate and bypass the seal water heat exchanger. Control rods will be verified to be above the RIL to satisfy Tech Specs.

After the seal water heat exchanger is bypassed, the 1C RCP seal leak gets worse and exceeds the limit requiring a trip. At the time of the reactor trip, a large break LOCA occurs. The SRO will enter and direct actions of 1BwEP-0, "REACTOR TRIP OR SAFETY INJECTION". Containment pressure will exceed the Containment Spray actuation setpoint. One train of CS will not start, the other train must be manually started due to a slave relay failure. An RCS LOCA will be diagnosed and a transition to 1BwEP-1, "LOSS OF REACTOR OR SECONDARY COOLANT" will be made. If, after Status Tree monitoring is commenced, containment pressure remains above the CS actuation setpoint, a transition to 1BwFR-Z.1, "RESPONSE TO HIGH CONTAINMENT PRESSURE" will be made. A Challenge to the Integrity Status Tree will also be identified, and implementation of 1BwFR-P.1, "RESPONSE TO IMMINENT PTS CONDITION" will result in the performance of just the first step before exiting this procedure. When the LO-2 RWST level is reached, the crew will transition to 1BwEP ES-1.3, "TRANSFER TO COLD LEG RECIRCULATION". A

Comments:

08/21/01 8:53 AM

11 - N

failure of the B Train sump recirculation valve will occur, requiring a transition to 1BwCA-1.1, "LOSS OF EMERGENCY COOLANT RECIRCULATION". The SRO will direct one operator to add make up to the RWST, and direct the other operator to stop the running CS pump. Minimum ECCS flow will be established to the RCS. The scenario is terminated after make-up is established to the RWST.

Critical Tasks

- E-0—E: Manually actuate at least the minimum required compliment of containment cooling equipment before an extreme (red path) challenge develops to the containment critical safety function.
- ECA-1.1—A: Stop ECCS pumps with suctions aligned to the RWST before they cavitate and trip. (applicable when RWST < 7%).

in elements of

ECA-1.1—B: Makeup to the RWST and minimize outflow.

Section 2 Section 1

SIMULATOR OPERATOR NOTES

Simulator Setup:

Init IC____, 25% power, 12 hours after a trip from full power.

Align switches. Perform "Ready for Training" checklist. Place Hotwell Placard to '89'.

Insert PRELOAD Events:

Place 1A MFP control Switch in Pull Out and hang tag.

Place 1A RH pump control switch in Pull Out and hang tag. IMF RH01A 1A RH pump fails to start.

IMF CS01A 1A CS pump fail to start.

MRF RP63 OUT 1B CS pump fails to automatically start.

IMF RH04B 1SI8811B fails to auto open.

IOR ZDI1SI8811B CLOSE override control switch for 1SI8811B to prevent manual open.

Place orange dot on 1CV112 controller (set at 6.0)

Fill out flowchart for 100-3 thru step 44.

To prevent inaccurate sim response to seal water heat exchanger leak, fail the Rad monitors for CC Hx outlet "AS IS". OPR09J

1PR09J.

Scenario	No: 01-3	Event No. 6 and 7		
Event Description:		1C RCP Seal leak worsens requiring Rx Trip, resulting in LBLOCA. Only one CS Train Available, Loss of Emergency Coolant Recirculation.		
Time	Position	Applicant's Actions or Behavior		
	CUE	Increasing #1 Seal leak off beyond 8 gpm.		
		Increasing #1 Seal outlet temperatures and bearing temperatures.		
		Rapid decrease in RCS Pressure to Cnmt pressure.		
		Rapid Decrease in PZR level to zero.		
		Both CS trains fail to Auto start.		
		Recirc Sump Isolation valve fails to open		
	RO/US	Diagnose/announce increasing leakage from 1C RCP #1 Seal.		
	US	Directs a manual reactor trip, then after verifying the reactor trip, orders a trip of the 1C RCP olosure of Enters 1BwEP-0, REACTOR TRIP OR SI, and directs actions:		
		Enters 1BwEP-0, REACTOR TRIP OR SI, and directs actions:		
:		• Gets acknowledgements from RO and BOP		
		Informs SM of plant status, evaluate GSEP.		
	RO	Performs Immediate Actions of 1BwEP-0, REACTOR TRIP OR SI:		
		 Verify Reactor Trip: 		
		Verify Rod Bottom Lights Lit.		
		Verify Reactor Trip and Bypass Breakers are Open.		
		Verify Neutron Flux is Decreasing		
	·	Determine SI Status:		
j - a a	1	o Check any SI First Out Annunciator Lit or o SI Actuated permissive Light Lit or		
		o SI Equipment Automatically Actuated (either SI pump running or 1SI8801A/B open).		
		Manually Actuate SI		
	BOP	Deferred Immediate Actions of 1DwED 0, DEACTOR TRID OR SI		
	DUP	 Performs Immediate Actions of 1BwEP-0, REACTOR TRIP OR SI: Verify Turbine Trip: 		
		 Verify Turbine Trip: All Turbine Throttle Valves Closed. 		
		 All Turbine Governor Valves Closed. All Turbine Governor Valves Closed. 		
		• All rurblie Governor valves Closed.		
		Verify Power to 4KV ESF Buses:		
		• Bus 141 energized		
	1	• Bus 142 energized		

Scenario 01-3 Draft

Fan 0VA03CC Running with Flow Control Damper (0VA024Y) Open and Byp Isol Damper (0VA021Y) Closed. Fan 0VA03CD Running with Flow Control Damper (0VA025Y) Open and Byp Isol Damper (0VA437Y) Closed. Plenum C: Fan 0VA03CE Running with Flow Control Damper (0VA067Y) Open and Byp Isol Damper (0VA052Y) Closed. Fan 0VA03CF Running with Flow Control Damper (0VA072Y) Open and Byp Isol Damper (0VA438Y) Closed. 	
	BOP	 Verify FHB Ventilation Aligned for Emergency Operation: FHB Charcoal Absorbers - One Train Aligned: Train A: Fan 0VA04CA Running 0VA060Y Charcoal Absorber Inlet Isol Damper - Open. 0VA057Y Filter Flow Control Damper - Open. 0VA051Y Charcoal Absorber Bypass Isolation Damper - Closed. Train B: Fan 0VA04CB Running 0VA055Y Charcoal Absorber Inlet Isol Damper - Open. 0VA055Y Charcoal Absorber Bypass Isolation Damper - Closed. 	
	RO	 Check PZR Spray Valves and Porvs: Spray valves (1RY455B and 1RY455C) Closed. Porvs (1RY455A and 1RY456) Closed. 	

.

Scenario		Event No. 6 and 7
Event De	scription:	1C RCP Seal leak worsens requiring Rx Trip, resulting in LBLOCA. Only one CS Train Available, Loss o Emergency Coolant Recirculation.
Time	Position	Applicant's Actions or Behavior
	RO	Maintain RCS Temperature Control and RCP Status:
	KO	 With NO RCPs running – RCS Cold leg temperatures all < 557 and decreasing.
		 Maintains > 500 gpm AF flow until at least one SG is 10% (31% Adverse).
		 Verifies All MSIVs and Bypasses are Closed.
<u> </u>		Reports all RCPs are OFF.
	BOP	Evaluates for faulted SG and ruptured SG:
		Reports NO SG pressure decreasing in an uncontrolled manner.
]	• Reports NO SG completely depressurized.
		• Reports the following have all remained less than Alert Alarm Setpoints:
		• SJAE/Gland Steam Exhaust Gas Radiation (1PR27J)
		SG Blowdown Liquid Radiation (1PR08J)
<u></u>		Main Steam Line Radiation (1TR-AR022 and 1RT-AR023) for all Steam Lines.
	ROBOP	Evaluates if RCS Intact:
		o Cnmt Area radiation has exceeded Alert Alarm Setpoints (1RT-AR014, or 1RT-AR011/012, or 1RT-
		AR020/21).
]	o Cnmt pressure has exceeded 3.4 psig.
		o Cnmt Floor water level has exceeded 5 inches.
	LIC	Discussion PCC is NOT latest and Transitions to 1DurED 1. LOSS OF DEACTOR OR SECONDARY
	US	Diagnoses RCS is NOT Intact, and Transitions to 1BwEP-1, LOSS OF REACTOR OR SECONDARY COOLANT, and directs actions:
* .		 COOLANT, and directs actions: Get acknowledgements from RO and BOP.
		 Informs SM of plant status; evaluates for GSEP.
		 Directs STA to monitor Status Trees.
		Note: Status Tree monitoring will be performed by an instructor who will role play as the STA when
		asked. The Integrity Status Tree and the Containment Status Tree will both be challenged. The
		evaluation for the use of these procedures are found starting on page 32 for the Integrity challenge
<u></u>		(1BwFR-P.1) and page 32 for the Containment challenge (1BwFR-Z.1).

08/21/01 8:53 AM

.

Scenario No: 01-3 Event Description:		Event No. 6 and 7
Event De	escription:	1C RCP Seal leak worsens requiring Rx Trip, resulting in LBLOCA. Only one CS Train Available, Loss of Emergency Coolant Recirculation.
Time	Position	Applicant's Actions or Behavior
	BOP/US	Determines RH Pump should NOT be Stopped:
		 Reset SI: Depress Both SI Reset Pushbuttons. Verify SI Actuated Permissive light NOT LIT. Verify AUTO SI BLOCKED permissive light LIT.
		 Checks RH pump suction aligned to RWST (1RH8812B Open) Checks RCS Pressure < 325 psig.
	BOP	 Performs subsequent actions of 1BwEP-1 as directed: Determines DGs may be stopped: Checks 4KV ESF buses energized. Checks 4KV Non-ESF buses energized. Coordinates with local operator to stop both DGs and place in standby per BwOP DG-12, DIESEL GENERATOR SHUTDOWN.
	ODEW	
· · · · · · · · · · · · · · · · · · ·	CREW	 Initiate Evaluation of Plant Status: Verify Cold Leg Recirculation capability: Power available to 1B RH pump 1SI8811B valve position light lit
" = = =		 Check Aux Bldg Radiation levels NORMAL for plant conditions on RM-11 or HMI: Unit 1 and Unit 2 Aux Bldg Vent Stack (1PR28J, 1PR30J, 2PR28J, 2PR30J) ECCS Pump Cubicles (1PR13J through 1RP18J) Grid 4 Aux Bldg area Radiation.
		Reset Cnmt Isolation Phase A if necessary.
		 Place Hydrogen Monitors in service per BwOP PS-9, POST LOCA CNMT HYDROGEN MONITORING SYSTEM OPERATION. Obtain samples: RCS Activity RCS Boron Concentration Cnmt Atmosphere and Cnmt Sump.
		Chint Aunosphere and Chint Sump.

۶

Scenario No: 01-3	
Event Description:	1C RCP Seal leak worsens requiring Rx Trip, resulting in LBLOCA. Only one CS Train Available, Loss of Emergency Coolant Recirculation.
Time Position	Applicant's Actions or Behavior
BOP/US	 Evaluate plant equipment: At SM discretion, prepare both Hydrogen Recombiners for operation per BwOP OG-10, STARTUP OF A HYDROGEN RECOMBINER. Trip all HD pumps. Shutdown all FW pumps per BwOP FW-3, SHUTDOWN OF A TURBINE DRIVEN MAIN FEEDWATER PUMP. Shutdown all unnecessary CD/CB pumps per BwOP-CD/CB-2, CONDENSATE/CONDENSATE BOOSTER SYSTEM SHUTDOWN. Shutdown all unnecessary CW pumps per BwOP CW-2, CIRCULATING WATER PUMP/SYSTEM SHUTDOWN. Shutdown chiller on Non Operating VC Train by momentarily placing control switch in Trip.
	Note: Depending on the timing, the crew may cycle back to 1BwEP-1 Step 11, to continue evaluating plant status while awaiting the RWST LO-2 setpoint. Reaching the LOW-2 RWST setpoint prior to getting to this step may also occur, necessitating a transition to 1BwEP ES-1.3 at that time, even if the crew is in the middle of one of the 1BwFR procedures.
RO/US	 Determine Transfer to Cold Leg Recirculation is necessary: RCS pressure < 325 psig. 1B RH pump Flow (1FI-619) > 1000 gpm. 1BwEP ES-1.3, TRANSFER TO COLD LEG RECIRCULATION, NOT previously entered. RWST level < 46%.
RO/US	 RCS pressure < 325 psig. 1B RH pump Flow (1FI-619) > 1000 gpm. 1BwEP ES-1.3, TRANSFER TO COLD LEG RECIRCULATION, NOT previously entered.
	 RCS pressure < 325 psig. 1B RH pump Flow (1FI-619) > 1000 gpm. 1BwEP ES-1.3, TRANSFER TO COLD LEG RECIRCULATION, NOT previously entered.

.

	No: 01-3	Event No. 6 and 7
Event Description:		1C RCP Seal leak worsens requiring Rx Trip, resulting in LBLOCA. Only one CS Train Available, Loss Emergency Coolant Recirculation.
Time	Position	Applicant's Actions or Behavior
	ВОР	Check Adequate Cnmt Sump Level:
		CNMT Floor water level at least 8 inches (13 inches Adverse) on 1LI-PC006 or 1LI-PC007.
	BOP	 Align RH Pumps Suction to Cnmt Sumps Determines 1A RH pump is NOT running and Closes 1SI8812A. Determines 1SI8811B did NOT AUTO Open and performs actions of Attachment A as directed. Determines Train A is NOT available. Reports 1SI8811B is Closed and energized, with 1B RH pump running. Attempts to Manually Align 1B RH pump Suction to Cnmt Sump: Place 1B RH pump in Pull Out. Close RH pumps 1B Suction from RWST isol valve (1SI8812B) Place 1B CS pump in Pull Out Close CS pump 1B RWST Suction valve (1CS001B) Open 1B RH pump Cnmt Sump Isol valve Reopen 1CS001B Restart 1B CS pump by taking control switch out of Pull Out, (and if necessary because CS Actuation Signal has been reset with Cnmt Pressure < 20 psig, Manually Actuate CS and Phase E Isolation) Determine at least one Cnmt Sump Recirc Flowpath does NOT exist:
	•	1B RH pump is NOT aligned to Cnmt Sump.
y exily	US	 Diagnose/Announce a Loss of Emergency Coolant Recirculation, and transitions to 1BwCA-1.1, LOSS OI EMERGENCY COOLANT RECIRCULATION, and directs actions: Get acknowledgements from RO and BOP. Informs SM of plant Status, evaluate for GSEP.
	BOP	 Performs actions of 1BwCA-1.1, LOSS OF EMERGENCY COOLANT RECIRCULATION, as directed: Reports Train B Available – 1B RH pump is available, and 1SI8811B is energized. Determines RWST LO-2 Level Alarm (1-6-B7) is Lit. Determines 1SI8811B is NOT open and dispatches operator(s) to open 1SI8811B. Verifies adequate Cnmt Sump level – at least 8 inches (13 inches Adverse) on 1LI-PC006/007. Determine emergency coolant recirculation on at least one train NOT yet restored.

Scenario No: 01-3 Event Description:		Event No. 6 and 7 1C RCP Seal leak worsens requiring Rx Trip, resulting in LBLOCA. Only one CS Train Available, Loss of
		Emergency Coolant Recirculation.
Time	Position	Applicant's Actions or Behavior
		Note: The following Critical Task conditions may present themselves at any time after reaching the LO-3 RWST level.
	BOP CT: CA-1.1 A.	 Stop pumps with suctions aligned to the RWST before they cavitate and/ or Trip: Stop 1A and 1B CV pumps Stop 1A and 1B SI pumps Stop 1B RH pump. Stop 1B CS pump if suction still aligned to RWST (1CS001B still Open, and 1CS009B still closed.)
	RO	 Perform actions of 1BwCA-1.1 LOSS OF EMERGENCY COOLANT RECIRCULATION, as directed: Reset SI (if not previously performed): Depress Both SI Reset Pushbuttons. Verify SI ACTUATED permissive light NOT Lit. Verify AUTO SI BLOCKED permissive light Lit. Reset SI Recirc Sump Isolation valves - 1SI8811A/1CV8110 and 1SI8811B/1CV8111.
	RO CT: CA-1.1 B.	 Add makeup to the RWST as necessary per BwOP SI-13, Filling the RWST: Determine the required blended flow boron concentration to the RWST. Determine the required 4% Boric Acid Flowrate to obtain the desired blended flowrate. Place the Reactor Make-up Control Switch to Stop. Place the Reactor Makeup Mode Selector Switch to Manual. Set the Makeup Control System thumbwheels for Primary Water and Boric Acid to the desired number in accordance with BwOP CV-7.
		 Set the Blend Control Station 1FK110, for Boric Acid to the desired position. Set Blend Control Station 1FK111, for Primary Water to the Desired position. Dispatch operator to verify Close 1CV8553, Boric Acid Blender to HUT. Dispatch operator to Close 1CV8428, BA Blender to CV pumps isolation valve. Open 1CV110B, Boric Acid Blender to CV pumps valve. Dispatch operator to Open 1CV8432, Boric Acid Supply to the RWST. Dispatch operator to Unlock and Open 1CV8434, Boric Acid Supply to RWST. Place Reactor Coolant Makeup Control Switch to Start. Verify/Start 0PW02PA or 0PW02PB, PW Makeup Pump. Verify/Start 1AB03P, Boric Acid Transfer Pump Contact Chemistry to sample the Blended flow to the RWST. Monitor Aux Bldg PR detectors (0REPR025A, B, and C) and RWST level on 1LI930-933 at 1PM06J.

~

SCENARIO 01-4 OVERVIEW

The scenario begins with the unit at 50% power steady state. A report just after turnover confirms 165 gpd tube leakage in 1D S/G. This is an increase from 60 gpd at the beginning of last shift. Steps 1-9 of 1BwOA SEC-8, "STEAM GENERATOR TUBE LEAK" are complete. 1B SI pump will fail to start. 1A MFP is unavailable due to breaker cubicle work, and 1D S/G PORV is isolated due to leakby. MESACs on 1A SGWLC instrumentation were completed last shift.

The SRO will determine the unit must be shutdown within 2 hrs due to exceeding the procedural limit for tube leakage per 1BwOA SEC-8 SGTL, step 10. After clearly observable plant response to the reactivity change for shutting down, the controlling pressurizer pressure channel will fail high causing a PZR PORV to open and stick. The RO will diagnose the pressure channel failure and the PORV sticking open from alarms, meter indications, and decreasing PZR pressure. The RO will attempt to close the failed open PZR PORV, and then close its block valve to stop the pressure decrease. Manual action will also be required to close the PZR spray valves. The SRO will enter and direct actions from 1BwOA INST-2 Attachment B, "PRESSURIZER PRESSURE CHANNEL FAILURE," to select an operable channel, restore pressure, trip bistables and investigate Tech Specs. LCO 3.3.1 conditions E and K, LCO 3.3.2 condition D, LCO 3.3.4 condition A, and LCO 3.4.1 condition A apply for the failed instrument. Tech spec 3.4.11 applies for the Pzr PORV and power will be removed from the block valve. Maintenance will investigate as requested.

After the bistables are tripped for the failed pressure channel, the operating CV pump will trip. The RO will diagnose this failure from the annunciators, pump tripped indications, and a loss of charging flow. The SRO will enter and direct actions from 1BwOA PRI-15, "LOSS NORMAL CHARGING" to verify the tripped pump was not gas bound, start the standby charging pump, and investigate Tech Specs. LCO 3.5.2 condition A and TLCO 3.1.d apply. Maintenance will investigate as requested.

After swapping charging pumps, the Main Feed Header Pressure instrument will drift high causing the SG levels to decrease due to decreasing feed pump speed. The BOP will diagnose the failure from an increasing indication on MCB meter 1PI-508 and level deviation alarms for each SG, and restore main feed pump speed via manual control. The SRO will direct the actions based on the annunciator response procedure. Maintenance will investigate as requested.

After stabilizing feed flows, the automatic voltage regulator (AVR) will increase its output, overexciting the main generator. The BOP will diagnose this failure from main control board indications and alarms. The SRO will direct the BOP to take the regulator to OFF or TEST and reduce voltage to within acceptable limits per the annunciator response procedures. Maintenance will investigate as requested.

Shortly after the generator is stabilized, the tube leak on 1D SG will increase in severity to 500 gpm over 5 minutes. The RO will report decreasing pressurizer level, the BOP will report decreasing feed flow on 1D SG and water level stable or increasing. The MSL rad monitors will indicate increases. The SRO will determine PZR level can NOT be maintained, order a Reactor Trip and SI, and enter and direct response from 1BwEP-0, "REACTOR TRIP OR SAFETY INJECTION". The crew will perform Immediate and subsequent actions, diagnosing a SGTR in 1D S/G, and transition to 1BwEP-3 SGTR. The 1A SI pump will fail to start automatically but can be manually started. When an attempt is made to close the 1D MSIV, it will not close. The use of the MSIV Isolation switch will close all MSIVs. When the RH

Comments:

pumps are stopped, a Main Steam Safety valve on 1D SG will fail open. The crew will diagnose the faulted ruptured steam generator by the decrease in steam generator pressure and transition to 1BwCA-3.1, "SGTR WITH LOSS OF REACTOR COLLANT – SUBCOOLED RECOVERY DESIRED." Initiation of further RCS cooldown will depend on the previous cooldown rate not exceeding 100 degrees F in any 1 hr. The scenario ends after the crew determines if a subcooled recovery is appropriate.

Critical Tasks

- E-0—J: Establish flow from at least one intermediate head (SI) ECCS pump before transition out of E-0.
- E-3—A: Isolate feed water flow into and steam flow out from the ruptured steam generator before a transition to ECA-3.1 occurs.
- ECA-3.1—B: Cooldown the RCS to cold shutdown conditions at the highest rate achievable but less than 100 degrees F per hour in all RCS cold legs.

SIMULATOR OPERATOR NOTES

Simulator Setup:

IC-16, 50% power, MOC, Xenon Equilibrium, steady state.

Align switches. Perform "Ready for Training" checklist.

Insert PRELOAD Events:

Take 1A MFP CS to PTL and hang tag.

Close 1MS019D. RF MS54 CLOSE. Put orange dot on 1D S/G Porv M/A station and Control Switch.

IMF TH03D, #42 gpm (~ 60 gpd tube leak 1D S/G.)

IMF SI12A 1A SI pump fails to Auto Start, can be Manually started.

IOR ZDI1MS001D AUTO (override control switch for 1D MSIV to "AS IS" position forcing closure of ALL MSIVs.)

IMF SIOIB IBSI PUR fuils to auto + MANUElly START.

Event 1 Increase in tube leakage to greater than allowed by tech specs and procedures. SDG:

Malf: TH03D, 0.115 gpm

NOTE: The minor increase in tube leakage in 1D SG is intended to cause the SRO to make a decision to shutdown based on exceeding allowable limits per Tech Specs and the procedure. A phone call from chemistry to the control room is necessary to report sample results <u>confirm</u> an increase in tube leakage to 165 gpd. (150 gpd is the limit.) Initiate the event immediately after turnover or at the lead examiner's cue. Acknowledge all info passed to the SM, WEC, and maintenance.

Event 2 Power reduction.

and the second second

As SM, and Elec Ops acknowledge power reduction.

As Chemistry and RP acknowledge power reduction and requests for samples and RETS actions.

Event 3 Controlling PZR Pressure Channel fails high (2500 psig) causing PZR PORV to open and stick.SDG:RX8Trigger:When PORV 1RY 455 > 0, then IMF TH11A, 100.

Malf: RX21A, 2500

Initiate event after clearly observing reactivity change/response of plant to requested power ramp or at lead examiners cue.

Role play as U-2 admin and/or extra NSO to accomplish bistable tripping. Acknowledge all info passed to the SM, WEC, and maintenance.

SDG: Cabinet door #1 open

RF RX20 OPEN

When requested to remove power from the block valve, 1RY8000A: RF ED058C OPEN.

Event 4 1A CV pump Trip.

SDG:

Malf: CV01A

Initiate event after actions for failed Pzr pressure control instruments and PORV are completed or at the lead examiners cue.

If sent to locally investigate the 1A CV pump and breaker, wait 3 minutes, perform first check, and report no apparent cause at the breaker (bus 141 cub___). If asked about 1A CV pump seal leakoff, report leakoff as "less than when it was running".

If sent to check the 1B CV pump, wait 3 minutes, perform first check, and report "normal operating conditions". If asked about seal leakoff, report "it looks about the same as when 1A CV pump runs". Acknowledge all info passed to the SM, WEC, and maintenance.

Remote Starts or Stops of the Aux Lube Oil pumps can be accomplished by: RF CV76

Event 5 Main Feed Header Pressure Controller (1PT-508) fails high over 3 minutes.

Malf: FW16, 1500 psig, 1.5 minute ramp.

Initiate failure after tech specs are investigated for the CV pump trip, or at lead examiners cue. Acknowledge all info passed to the SM, WEC, and maintenance.

Event 6 Main Generator Field Force – Auto voltage regulator failure, manual control available.

SDG:

Malf: EG03, 100

NOTE: Failure to take prompt action to reduce exciter field current will result in a generator trip reactor trip. Initiate excitation problem after actions are taken to stabilize feed flow and SG levels, or at lead examiners cue. Acknowledge all info passed to the SM, WEC, and maintenance.

Comments:

Event 7 SGTR 1D SG. Leakage increases to 500 gpm over 5 minutes. SDG:

Malf: TH03D, 500 gpm, 5 minute ramp.

Initiate malfunction after actions are taken to manually control main generator exciter field current, or at lead examiners cue.

Acknowledge all info passed to the SM, WEC, and maintenance.

If requested to investigate failure of 1D MSIV report assistance is being called out.

3 minutes after steam is being dumped out of the SG Porvs for the cooldown, call the control room as Security, and report steam is visible coming out of the top of the applicable (1A and 1D; and/or 1B and 1C) MSIV room enclosures.

Event 8 Main Steam Safety Valve fails open SDG: H Malf: MS03Ø, 100 MGO3U, (Ensure the safety valve fails open when the RI Trigger: When 1B RH pump CS is OF	DD H pumps are stop	1		
If asked about steam flow from any MSIV roo opens, but you won't be able to tell specifically 1A and 1D enclosure. If steam is still being bl the 1B and 1C room enclosure.	y that the flow is	from the 1D SG, just that there	e is flow from the top	of the

Comments:

Scenario 01-4 Draft

Scenario	No: 01-4	Event No. 7 and 8
Event De	escription:	1D SG Tube Leak increases to 500 gpm (SGTR). 1A SI pump fails to auto start, 1D MSIV fails to Manual close, and subsequent MS safety opens on 1D SG.
Time	Position	Applicant's Actions or Behavior
	BOP	 Verify FHB Ventilation Aligned for Emergency Operation: FHB Charcoal Absorbers -One Train Aligned: Train A: Fan 0VA04CA Running 0VA060Y Charcoal Absorber Inlet Isol Damper – Open. 0VA057Y Filter Flow Control Damper – Open. 0VA051Y Charcoal Absorber Bypass Isolation Damper – Closed. o Train B: Fan 0VA04CB Running 0VA055Y Charcoal Absorber Inlet Isol Damper – Open. 0VA055Y Charcoal Absorber Inlet Isol Damper – Open. 0VA052Y Filter Flow Control Damper – Open. 0VA052Y Filter Flow Control Damper – Open. 0VA052Y Filter Flow Control Damper – Open.
	RO	Check PZR Spray Valves and Porvs: • Spray valves (1RY455B and 1RY455C) Closed. • Porvs (1RY455A, and 1RY4562 Closed/ States and
	RO	 Maintain RCS Temperature Control: With ANY RCPs running – RCS average temperature STABLE AT OR TRENDING TO 557 Degrees Maintains > 500 gpm AF flow until at least one SG is 10% (31% Adverse).
	RO	 Check RCP Status; Determines RCPs RUNNING. Check If RCPS should be Stopped: ECCS Flow > 100 gpm on 1FI-917 or SI pump Flow > 200 gpm on 1FI-922. RCS Pressure NOT LESS THAN 1425 psig. DOES NOT STOP RCPs.
	BOP	 Check Secondary Pressure Boundaries Intact: NO SG Pressure DECREASING IN AN UNCONTROLLED MANNER. NO SG COMPLETELY DEPRESSURIZED.

Scenario 01-4 Draft

Scenario	No: 01-4	Event No. 7 and 8
Event De	scription:	1D SG Tube Leak increases to 500 gpm (SGTR). 1A SI pump fails to auto start, 1D MSIV fails to Manually close, and subsequent MS safety opens on 1D SG.
Time	Position	Applicant's Actions or Behavior
l · · ·		
	BOP	 Check if SG Tubes are Intact: SJAE/GS Exhaust Gas radiation (1PR27J) NOT LESS THAN ALERT ALARM SETPOINT. SG Blowdown Liquid Radiation (1PR08J) NOT LESS THAN ALERT ALARM SETPOINT. MS Line radiation (1RT-AR022 or 1RT-AR023) NOT LESS THAN ALERT ALRM SETPOINT. Reports any of the above to US.
	US	 Diagnoses/Announces SGTR, Transitions to 1BwEP-3, "SGTR", and directs actions: Gets acknowledgement from RO and BOP. Informs SM of plant status, and evaluates for GSEP. Contacts WEC to have the STA commence monitoring Status Trees.
	RO	 Performs actions of 1BwEP-3, "SGTR" as directed: Check RCP Status: Determines RCPs RUNNING. Check If RCPS should be Stopped: ECCS Flow > 100 gpm on 1FI-917 or SI pump Flow > 200 gpm on 1FI-922. RCS Pressure NOT LESS THAN 1425 psig. DOES NOT STOP RCPs.
1 - 1 <u>- 1</u> - 1-	BOP	 Performs actions of 1BwEP-3, "SGTR", as directed: Identify Ruptured SG fom any of the following means: Unexpected level rise in 1D SG. MS Line Rad 1D MSL/ MSIV room (4AD422/4AD423) NOT NORMAL FOR PLANT CONDITIONS. High Activity from 1D SG sample.
	BOP	Isolate Flow from 1D SG:
	501	 verify 1D SG PORV Controller in AUTO. (SG 1D PORV is Isolated per turnover info) WHEN 1D SG Pressure < 1115 psig, Verify 1D SG PORV (1MS018D) CLOSED. Verify 1D SG Blowdown isolation valves (1SD002C and 1SD002D) CLOSED.
	BOP	Isolate 1D SG Main Steam from at least one other SG:
	СТ: Е-3—А.	 Attempt Closure of 1MS001D (1D MSIV). Report 1D MSIV did not CLOSE. Actuate MSIV Isolation.
		Report ALL MSIVs are CLOSED.

Scenario 01-4 Draft

Scenario	No: 01-4	Event No. 7 and 8
Event D	escription:	1D SG Tube Leak increases to 500 gpm (SGTR). 1A SI pump fails to auto start, 1D MSIV fails to Manually close, and subsequent MS safety opens on 1D SG.
Time	Position	Applicant's Actions or Behavior
-1		
	US	Identifies successful isolation of 1D SG from at least 1 intact SG.
		Directs stabilization of RCS Temperature at 557 degrees F via steaming 1A, 1B, or 1C SGs.
	BOP	Performs subsequent actions of 1BwEP-3, "SGTR", as directed:
	DOI	 Determines 1A, 1B, and 1C SG PORVS are available for RCS COOLDOWN.
		 Determines 1D SG level is > 10% narrow range.
		Verifies 1AF013D and 1AF013H are CLOSED.
		Checks 1D SG Pressure > 320 psig.
	US	Directs actions of 1BwEP-3:
	03	 Determines required CETC temperature by obtaining 1D SG Pressure, Noting Normal Containment
		conditions, and selecting target temperature from table. (1100-1199 psig ≤ 516 deg; 1000-1099 psig ≤
		505 deg; 900-999 psig € 491 deg.)
	RO	Performs actions as directed:Checks PZR Pressure:
		 Checks PZK Pressure: WHEN PZR pressure < 1930, Verifies P-11 LIT, THEN Blocks both trains of Steam Line Isolation
		SI.
ه در	· · · · · · · · · · · ·	
· · · · · · · · · · · · · · · · · · ·	BOP	Performs Actions as directed:
1		Initiates RCS Cooldown at MAXIMUM Rate from 1B SG+
ll i	ા છે.	← Verifies Condenser Available (C-9) LIT. →
1		Places MS Header pressure Controller in Manual at 0% demand.
1		Places Steam Dump Mode Selector Switch in STM PRESS Mode Adjusts MS header pressure controller in manual or auto to initiate cooldown
		 Initiates RCS Cooldown at MAXIMUM Rate from 1A and 1C SGs: IMSO18B, Manually dumps steam from 1A and 1C SG by opening 1MS018A and 1MS018C (SG PORVS)
		Stops Cooldown when Target RCS Temperature reached.
		Maintains average of 10 highest CETCs < target temperature.
		Continued directions of the DCS Continue is initiated with control of the CETC.
	US	Continues directing actions after RCS Cooldown is initiated while awaiting CETCs to reach the required RCS Temperature.

Scenario 01-4 Draft

The following conditions exist on Unit 1: - Unit 1 is in MODE 2, performing a Reactor Startup. All Shutdown Banks are fully withdrawn. - Control Bank A withdrawal has been stopped at 50 steps. - Source Range Counts are STABLE. - SDM is inadequate per the COLR. What action is required? RESTORE SDM within 15 minutes.	
All Shutdown Banks are fully withdrawn. - Control Bank A withdrawal has been stopped at 50 steps. - Source Range Counts are STABLE. - SDM is inadequate per the COLR. What action is required?	
RESTORE SDM within 15 minutes.	
RESTORE SDM within 1 hour.	
INITIATE Boration within 15 Minutes.	
INITIATE Boration within 1 hour.	l

Question Topic RADIOLOGICAL CONTROLS

Given the following information for a rad worker qualified operator:

- Age

25 yrs. 3800 mrem TEDE , Total Lifetime exposure - Current Year exposure 800 mrem TEDE

A Site Area Emergency has been declared due to a LOCA Outside Containment with limited makeup to the RWST available.

The above operator volunteers to make an emergency entry into the penetration area to attempt to isolate the leak.

This action would result in a significant reduction in offsite dose.

The individual has all the required approvals.

What is the MAXIMUM exposure the operator may receive while performing this action?

1200 mrem TEDE.	
4200 mrem TEDE.	
24200 mrem TEDE.	
25000 mrem TEDE.

	Question Topic RCS
۰,	/ith the Reactor at 100% power on Unit 2,
	Which ONE of the following will REDUCE RCS Subcooling?
	Turn ON ALL Pressurizer Heaters.
	Derived Pressurizer PORV.
	DECREASE Reactor power.
	CLOSE Pressurizer Sprays.
	Answer b Exam Level B Cognitive Level Memory Facility: Braidwood ExamDate: 10/29/01
	Tier: Plant Systems RO Group 2 SRO Group 2
	002 Reactor Coolant System
	K5. Knowledge of the operational implications of the following concepts as they apply to the Reactor Coolant System:
	K5.09 Relationship of pressure and temperature for water at saturation and subcooling conditions 3.7 4.2
•	Any action that would decrease pressure or increase temperature at constant pressure will decrease subcooling. A. Incorrect, pressure will rise slightly until sprays compensate, subcooling will remain the same. B. Correct, an open Pzr Porv will rapidly decrease pressure and subcooling, heaters will not keep up. C Incorrect, reducing power reduces Tave, and initially increases pressure. D. Incorrect, pressure will increase, increasing subcooling.

Question Topic REACTOR PROTECTION SYSTEM

During MODE 1 operations on Unit 1, the following maintenance needs to be accomplished: The transmitter for Presurizer Pressure Channel, 1PT-457 needs to be calibrated and the entire channel must be placed in "TEST". A work package has been prepared and reviewed.

Tripping the bistables for this channel will result in various trip status lights being lit.

How many bistable switches are tripped when this channel is taken to test, and how many status lights are lit because of tripping these bistables?

5 bistable switches are tripped, and 4 status lights are lit.

5 bistable switches are tripped, and 5 status lights are lit.

6 bistable switches are tripped, and 5 status lights are lit.

6 bistable switches are tripped, and 6 status lights are lit.

Question Topic CONTAINMENT PURGE SYSTEM

The detector for 1RT-AR011, Containment Fuel Handling Incident Train A rad monitor, fails causing the output to go HIGH.

/hich ONE of the following would AUTOMATICALLY occur due to this failure?

CLOSES 1VQ005C, Containment Mini-Flow Purge Exhaust Isolation.

STARTS 0VA04CB, Fuel Handling Building Charcoal Booster Fan.

STARTS 0VA04CA, Fuel Handling Building Charcoal Booster Fan.

CLOSES 1VQ003, Containment Post-LOCA Purge Exhaust Isolation.

Question Topic PROCESS RADIATION MONITORING

The following conditions exist on unit 2:

- 100% Reactor power.

The "0" CC Heat Exchanger is in service with the 2A Component Cooling pump running.

- The In-service Letdown Heat Exchanger (2A) has developed a tube leak.

- All other systems are functioning NORMALLY.

Which ONE of the following predicts the response of the Component Cooling System to these conditions?

When 0RE-PR009 reaches the HIGH Alarm setpoint, BOTH Units CC SURGE TANK Vent valves (1/2CC017) will CLOSE.

When 0RE-PR009 reaches the HIGH Alarm setpoint, ONLY Unit 2 CC SURGE TANK Vent valve (2CC017) will CLOSE.

When Unit 2 CC Surge Tank Level DECREASES to 50%, AUTO Makeup will occur from the Primary Water System.

When Unit 2 CC Surge Tank Level INCREASES to 60%, Unit 2 CC SURGE TANK Vent valve (2CC017) will CLOSE.

Answer a Exam Level B Cognitive Level	Comprehension Facili	ty: Braidwood	ExamDate:	10/29/01				
Tier: Plant Systems	RO Group 2	RO Group 2	5					
073 Process Radiation Monitoring Sys	stem	4						
A1. Ability to predict and/or monitor changes	in parameters associated	with operating th	ne Process Rad					
System controls including:		and the second	<u> 1968 - An Antonio - 1999 - 19</u>	<u></u>				
A1.01 Radiation levels			· · · · · · · · · · · · · · · · · · ·	3.2 3.5				
Answer Answer A. Correct. Both vent valves isolate on the Common hx outlet high rad signal, no matter which unit the common hx is aligned to. B. Incorrect, Both would isolate. C. Incorrect, Tank level will increase, not decrease at the given conditons. Decreasing to 50% would cause makeup from WM first, not PW. D. Incorrect, Tank Level is not an input to valve closure logic.

Question Topic Small Break LOCA	
Given the following Unit 1 conditions:	7
- A small break LOCA is in progress.	
SI has actuated. ————————————————————————————————————	
Which ONE of the following is the reason for maintaining a secondary heat sink?	
To ensure removal of RCS heat if any RCPs are still running.	
RCS pressure may remain so high that cooling from injection flow alone is inadequate.	
Reflux boiling is the primary means of heat removal prior to voiding in the hot legs.	
To provide an alternate means of RCS pressure control.	
Answer b Exam Level B Cognitive Level Memory Facility: Braidwood ExamDate: 10/29/0	11
Tier: Emergency and Abnormal Plant Evolutions R0 Group 2 SR0 Group 2	
009 Small Break LOCA	
EK2. Knowledge of the interrelations between Small Break LOCA and the following:	
EK2.03 S/Gs 3.0 3.0	3
Explanation of A. Incorrect, RCPs are not necessary to transfer heat to the SGs. B. Correct, heat removal via the SGs will	7
Answer enable RCS depressurization to allow greater injection flow from SI and CV pumps. C. Incorrect, reflux	
boiling occurs after voiding in the hot legs. D. Incorrect, RCS pressure control is via Heaters/Sprays or Pzr. Porvs, or Aux spray.

Question Topic RCP MALFUNCTIONS LOSS OF FLOW	
Given the following Unit 2 Conditions:	
- Unit 2 is in Mode 3, at NOT and NOP. 1B RCP Trips.	
What happened to loop flow and core flow as a result of the RCP trip?	
With THREE RCPs running, the active loops TOTAL flow is	
3/4 of the value for FOUR RCPs, and flow through the core is 3/4 of the value for FOUR RCPs.	
3/4 of the value for FOUR RCPs, and flow through the core is LESS THAN 3/4 of the value for FOUR RCPs.	
GREATER THAN 3/4 of the value for FOUR RCPs, and flow through the core is LESS THAN 3/4 of the value for FOUR RCPs.	
LESS than 3/4 of the value for FOUR RCPs, and flow through the core is LESS THAN 3/4 of the value for FOUR RCPs.	
Answer C Exam Level B Cognitive Level Comprehension Facility: Braidwood ExamDate: 10/29/01	
Tier: Emergency and Abnormal Plant Evolutions RO Group 1 SRO Group 1	
017 Reactor Coolant Pump Malfunctions (Loss of RC Flow)	
AA1. Ability to operate and / or monitor the following as they apply to Reactor Coolant Pump Malfunctions (Loss of RC Flow):	
AA1.12 Reactor coolant loop flow meters	
Dianation of C. Correct. Stopping one of four running RCPs, reduces the head which the remaining running pumps must operate against. This increases individual pump flows. Summing each running pump's flow yields greater than 3/4 of what four pumps can individually produce. However, due to backflow in the idle loop, some additional flow bypasses the core, reducing core flow by more than 1/4.	ģĹ

Question Topic PZR PRESSURE	CONTROL	
-----------------------------	---------	--

The following conditons exist on Unit 1:

-	50%	Reactor	power.
---	-----	---------	--------

PZR Pressure control is in automatic

- One set of Backup heaters is in "ON".

- Actual Pzr Pressure is 2250 psia.

The Pzr Pressure Master Controller malfunctions and the SETPOINT drifts to 2100 psia over a 10 minute period.

Which ONE of the following describes the INITIAL automatic responses of the control elements of the Pzr Pressure Control System as a result of this failure?

Spray valves throttle open and variable heaters go to minimum current.

Spray valves throttle closed and variable heaters go to maximum current.

PORV 1RY455A opens, Spray valves throttle open, variable heaters go to minimum current.

PORV 1RY456 opens, Spray valves throttle open, variable heaters go to minimum current.

Answer a	Exam Level B Cognitive Level Application	Facility: Braidwood	ExamDate:	10/29/01

Question Topic SGTR	
The following indications were obs the Unit:	served during a Steam Generator Tube Rupture just prior to tripping
Charging flow 140 gpm. - Letdown flow 75 gpm. - PZR Level steady DECREASE of - Reactor and Turbine power cons	stant.
What is the approximate primary to 2010 1280 gpm.	
▶ 480 gpm.	
128 gpm.	
65 gpm.	
Answer b Exam Level B Cognitive Tier: Emergency and Abnormal Plant Evolution Emergency and Abnormal Plant Evolution 038 Steam Generator Tube Rup	volutions RO Group 2 SRO Group 2
	he following as they apply to Steam Generator Tube Rupture:
EA2.13 Magnitude of rupture	
Answer Charging/letdown mismato 6 Incorrect. 1280 gpm is pla if 140 charging flow has 12	Pzr Level, a 10% decrease over 3 minutes is 3.33% per minute, or 427 gpm. The ch of 65 gpm - 12 gpm seal return flow is added to this to total 480 gpm. A. ausible if a 10% decrease is taken at 128 gal/%. C. Incorrect. 128 gpm is plausible 2 gpm seal return subtracted from it. D. Incorrect. 65 gpm is plausible if 140 win flow subtracted from it.

Question Topic LOSS OF NUCLEAR SERVICE WATER

An extended loss of all AC power has occurred and the crew is placing equipment in PULL OUT to inhibit automatic loading of the AC Emergency Buses per the Attachment for Recovery from an Extended LOSS OF ALL AC POWER procedure.

Which pump Control switches will be left in normal after trip (NAT), and why?

One charging pump on either train, to provide RCP sealing cooling.

Dire charging pump on either train to provide RCS inventory makeup.

One essential service water pump on either train to provide emergency diesel generator cooling.

One essential service water pump on either train to provide charging pump lube oil cooling.

તે કે બેંધ જે છે.

198

AK3. Knowledge of the reasons for the following responses as they apply to Loss of Nuclear Service Water:

AK3.03 Guidance actions contained in EOP for Loss of nuclear service water

Explanation of A. Incorrect, because initiating seal cooling after seal overheating will further damage the seals. B. Answer Incorrect, at this point in the procedure, limited electrical sources are being made available. Loading of these sources is controlled manually by defeating the sequencer. C. Correct, restoring a DG is the most likely source of power. Leaving the SX pump available for auto start is appropriate. D. Incorrect, although a plausible distractor due to recent modifications to ensure a loss of SX does not result in a core damage 201 States of t sequence. (PSA). 35-6-6 2.3

Question Topic SI TERMINATON
Which ONE of the following describes the action the operator should take upon determining pressure in the 1A Steam Generator (unisolated) is deceasing UNCONTROLLABLY while in 1BwEP ES-1.1 "SI TERMINATION"?
Shut all MSIVs, SG PORVS, and ISOLATE Main Feedwater, Auxiliary Feedwater, Sampling and Blowdown Lines.
Initiate Operator Action Summary (OAS) and transition to 1BwEP-2, FAULTED STEAM GENERATOR ISOLATION.
Initiate OPERATOR ACTION SUMMARY (OAS) and transition to 1BwEP-1 LOSS OF REACTOR OR SECONDARY COOLANT.
Verify all Steam Generator PORVs and steam dumps are shut, then shut all MSIVs.
Answer b Exam Level R Cognitive Level Comprehension Facility: Braidwood ExamDate: 10/29/01
Tier: Emergency and Abnormal Plant Evolutions RO Group 2 SRO Group 1
E02 SI Termination
EA2. Ability to determine and interpret the following as they apply to SI Termination:
EA2.2 Adherence to appropriate procedures and operation within the limitations in the facility's license and amendments. 3.5 4.0
Explanation of B. Correct. OAS clearly states go to EP-2 for conditions given. C. Incorrect. EP-1 is entered only if SI is re- Answer initiated. A. and D. Incorrect. Shuttting valves and isolating FW and MS are directed within EP-2.

Question Topic NATURAL CIRCULATION WITH STEAM VOID IN VESSEL WITH/WITHOUT RVLIS

A Reactor Trip from 100% power and a Loss of Offsite Power occurred 1 hour ago. The following conditions exist:

1BwEP-ES-0.3, NATURAL CIRCULATION COOLDOWN

WITH STEAM VOID IN VESSEL (WITH RVLIS) is in progress.

- All NON-ESF buses are still DE-ENERGIZED.

- PZR Level is stable at 50%.
- Letdown is established.

1.5

- Charging is in MANUAL Control.
- Pressurizer Pressure indicates 800 psig.
- Pressure control is via the Aux Spray Valve.
- CETCs indicate 520 degrees F.
- RVLIS indicates 81% Plenum level.

The Aux spray valve inadvertently sticks OPEN causing a DECREASE in RCS pressure.

E10 Natural Circulation with Steam Void in Vessel with/without RVLIS

EK2. Knowledge of the interrelations between Natural Circulation with Steam Void in Vessel with/without RVLIS and the following:

EK2.2	Facility's heat removal systems, including primary coolant, emergency coolant, the decay heat
	removal systems, and relations between the proper operation of these systems to the operation of
	the facility.

Explanation of Answer B. Correct. With charging in manual, the excessive spray will decrease RCS Pressure. No NON ESF power means no vessel head cooling from CRDM fans. A decrease in RCS pressure will cause void growth at the given conditons so RVLIS decreases. No additional heat is removed from the RCS, so with charging in Manual, and voids increasing, pzr level increases.

Question Topic LOSS OF EMERGENCY COOLANT RECIRCULATION	
The following conditions exist on Unit 1:	
 A loss of coolant accident has occurred. RWST Level is 35% and DECREASING. 1BwCA-1.1, LOSS OF EMERGENCY COOLANT RECIRCULATION is in progress. 1B RH pump has TRIPPED on overcurrent. Attempts are being made to establish Cold Leg Recirculation capability. SI has been RESET. The NSO is questioning the ECCS valve alignment. 	
being MANUALLY OPENED?	
ISI8812A, Train A RWST to RH Suction valve is OPEN.	
ISI8812A, Train A RWST to RH Suction valve is CLOSED.	
ICS001A, Train A RWST to CS Suction valve is CLOSED.	
ICS009A, Train A Containment Recirc Sump to CS Suction valve is OPEN.]
Answer: a Exam Level B Cognitive Level Memory Facility: Braidwood ExamDate: 10/29	2/01
Tier: Emergency and Abnormal Plant Evolutions R0 Group 2 SR0 Group 2	
E11 Loss of Emergency Coolant Recirculation	
EA1. Ability to operate and / or monitor the following as they apply to Loss of Emergency Coolant Recirculation:	
EA1.1 Components, and functions of control and safety systems, including instrumentation, signals, 3.9 interlocks, failure modes, and automatic and manual features. 3.9	1.0
Explanation of A Correct. SI8812A must be closed to manually open SI8811A. The CS009 must be closed to open CS00 and SI8811 must be open to open CS009. But there is no interlock for the CS009 to open the SI8811.	1,
