1. PURPOSE

1.1 Objective

Provide instructions for operation of the Unit 3 reactor coolant post accident sampling system for RCS/RSS sample acquisition during Station Emergency Response Organization (SERO) activation when high radioactivity levels, due to an accident, may preclude the normal (conventional) sampling method.

This procedure satisfies requirements listed in Unit 3 Technical Specification 6.8.4 d.

1.2 Discussion

The time required to collect and analyze samples should be 3 hours or less from the time the ADTS makes the decision to obtain a sample using PASS, except for chloride, which is 24 hours. Gross activity is the sum of liquid and gaseous isotopic activity.

A potential exists for a reactor coolant to service water leak in the PASS sample cooler during sampling. This requires 3SWP*RE60A to be in operation to allow Operations to detect the leak. If a leak is detected, 3SSP-V41, sample cooler SCL3 inlet isolation valve, 3SWP*V839, PA sample cooler SCL3 service water inlet, and 3SWP*V842, PA sample cooler SCL3 service water outlet, are closed to isolate the leak.

If conditions arise that will not allow Sections 4.1 through 4.12 to be completed, the procedure user will be directed to Section 4.20, "Restoration from PASS Sample Acquisition," to return the system to normal.

Attachment 7 contains a simplified drawing of the reactor coolant post accident sampling system.

1.3 Applicability

This procedure is applicable during SERO activation when in-plant radioactivity levels are too high to permit reactor coolant sampling via the normal (conventional) method.

For RCS sample, when RCS pressure is greater than 255 psia.

For RSS sample, when RSS is in operation (restricted to MODE 4, 5, 6 and 0 during non-accident conditions).

Circle the appropriate sample bottle dilution corresponding to the dilution(s) required during performance of step. The sample mass is determined by multiplying the degas liquid sample mass (M_{dl}) by the applicable correction for the sample dilution that is being counted.

1. PURPOSE

1.1 Objective

Provide instructions for operation of the Unit 3 containment air post accident sample system for containment air sample acquisition during Station Emergency Response Organization (SERO) activation when high radioactivity levels, due to an accident, may preclude the normal (conventional) sampling method.

This procedure satisfies requirements identified in Unit 3 Technical Specifications 6.8.1, 6.8.4 d, 6.8.4.e and the Millstone Nuclear Power Station Emergency Plan.

This procedure was developed using the reactor technical manual for the containment air PASS (Ref.6.2) and other documents identified herein.

1.2 Discussion

The time required to collect and analyze samples should be 3 hours or less from the time the ADTS makes the decision to obtain a sample using PASS.

If conditions arise that will not allow Sections 4.1 through 4.4 to be completed, the procedure user will be directed to Section 4.8, "Restoration from PASS Sample Acquisition," to return the system to normal.

Attachment 4 contains a simplified drawing of the containment air post accident sample system.

1.3 Applicability

This procedure is applicable during SERO activation when in-plant radioactivity levels are too high to permit containment air sampling via the normal (conventional) method.

1.4 Frequency

Performance of this procedure may be repeated periodically during SERO activation.

1. PURPOSE

1.1 Objective

Provide instructions for sample acquisition and analysis from the Unit 3 ventilation system during Station Emergency Response Organization (SERO) activation when high radioactivity levels, due to an accident, may preclude the normal (conventional) sampling method.

This procedure partially satisfies the requirements listed in Unit 3 Technical Specification 6.8.4 d.

1.2 Discussion

The time required to collect and analyze samples should be 3 hours or less from the time the ADTS makes the decision to obtain a sample using PASS.

Sections 4.1, 4.2, and 4.3 are distinct sections that may be performed independently of each other. Section 4.4 is completed following completion of Sections 4.1, 4.2, or 4.3.

Sections 4.5, 4.6, 4.7, 4.8, and 4.9 are distinct sections that may be performed independently of each other. Section 4.10 is completed following completion of Sections 4.5, 4.6, 4.7, 4.8, or 4.9.

1.3 Applicability

This procedure is applicable during SERO activation when in-plant radioactivity levels are too high to permit ventilation sampling via the normal (conventional) method.

1.4 Frequency

Performance of this procedure may be repeated periodically during SERO activation, when requested by the MRDA or the AMRDA.

3. PRECAUTIONS

- 3.1 The sample system particulate filters and iodine cartridges may be highly radioactive resulting in high radiation levels in the vicinity of the ventilation monitor. If radiation levels are greater than 1 R/hr, notify the MRDA or the AMRDA and wait for instructions.
- 3.2 Health Physics should be consulted to determine whether to transport the sample in a sample bucket with lid or in the shielded transport container. The decision should be made taking the following into consideration:
- Gas or particulate channel reading (where available)
 - Sample dose rate
 - Sample location dose rates
 - Availability of elevator (None available for 3HVQ-RE49)
 - Difficulty in moving shielded transport container versus sample bucket
