portant motors to list it he file of the plant. A review of failure data from other plants via the Equipment Partomance Information change (EPN) has 27 motor failures at various planta due to over-greasing or power cable problems. The Reschor Coolant mig motors. Circ Vater Pump Motors, and the Main Generator, as well as the EDGs had some activities to avaluate and for urbish these large electrical mechanis. A failure of one of these machines will have a significant negative conomic resource. A number of other motors on the which are important to plant reliability are not included in a refurbishment or dictice maintenance program. Examples of these motors include Condensate Pump motors. Turbine Plant Cooling Water Pump tors, Stator Cooling Water Pump motors, Component Cooling Water Pump motors. Mexup Pump motors, etc. Again a loss of e of these 4160 VAC motors could result in a significant economic loss. Resolution of this issue will be pursued under project 99-1016 and Modification 99-01. There are common misconceptions on site reliated to the plant's 40 year design life. During plant design, relatively few sponents were formally evaluated to determine their expected life. Only Class 1 systems received a faitgue analysis to verify the space of components used and the design life. Some components such as the turbines, received as marding. Some fait design specifications of site reliated to the plant's 40 year is addition to typically referenced codes and andrads. Some fait design specifications description of a long year plant life. Some components such as not included to a serve andrads, some faits and the component over 40 years). Because this specifications is the provential indentity and andrads. Some faited to service life, there was no mechanism to evaluate or certify this condition (other than the OEM's signam), sitionally, yendon assume contain maintenance activities will be performed on the component ourbing the standards. Some earlier to such as repacking greased bearlings every quarter. he 38 EPIX r	v iy yea ra. ventive maintenance activity. The 4160 VAC breakers and the Auxiliary Boiler are typical examples of the preventive intenance root cause or action to prevent reoccurrence. The inadequate preventive maintenance includes the tack of a PM, PM ructions not detailed enough, or PM frequency is not high enough. These specific causes were eveny distributed and a trend s not appear. It should be noted that there were two cases in which a plant power reduction was the result of inadequate rentive maintenance. In one case the cause was tack of details in the PM which resulted in improper reassembly. The second e was an oversight on the need for a preventive maintenance activity to clean control system fluid filters. Additionally there was plant trip (Manual trip during SFRCS testing due to SP7B solenoid in October 1998) where a preventive maintenance activity eriodically replace the solenoids may have prevented the plant trip. These failures were addressed as common cause thanisms and the corrective action is complete. It is impossible for any PM program to prevent all failures. Based upon a review dustry data submitted to EPIX, Davis-Besse percentage of failures due to inadequate preventive maintenance is within stry norms. self-assessment investigated the use of the INPO databases for assistance in failure investigation. This area of the easement was investigated by the use of a questionnaire for the plant engineers. The various industry data bases more ched 68 times by those who responded. Reviews identified that some engineers conduct query the data bases more enty than others with a range from 13 per year to as little as once per year. in the - CLORED ST MARK 1.1.1.1.1 1009-1947 NO Page 7 of e (na fili de la composition de la comp 1114 then an Amhradae PM Template Exist? -- The PM template is a documented mainteriance strategy for a particular ent type that lists significant failure modes, possible indications of degradation, and recommended condition-based or time pd PMa Develop System/Component Long Range Maintenance Strategy - Establish the optimal maintenance methods for each 4.2 potential failure and define the long-term frequency for condition-based maintenance, planned refurbishment, and replacement. Long term strategy for component types such as MOVs and breakers should be included in each applicable system strategy for consistency. Summary of weaknesses based on industry comparison Lack of component engineers and associated component programs. Lack of a method to record and trend as-found equipment condition. Lack of an effective prioritization system. Lack of dedicated equipment reliability resources. Lack of PM templates. Lack of system/component long-range maintenance strategies. Lack of PM program focus. **Remedial** Actions Remedial actions for the specific events were covered under the individual PCAQRs/CRs. 1. Perform system health review to identify equipment problems and isolutions / schedule. Eshelman Complete 2. Review, reprioritize and reschedule equipment maintenance activities. Eshelman Complete 3. Review OEs, industry experience for components to identify vulnerabilities, and submit work items to preclude problems. Eshelman Complete 4. Revise Boric Acid Corrosion Control program based on benchmarking to schieve industry best practice. Eshelman Complete 5. Identify current equipment problems or concerns. Eshelman Complete 2 6. Compare 1998 problems and initiatives to current problems and initiatives to identify areas not covered. Eshelman 1/27/00 2/10/00 7. Address / prioritize the equipment / areas not covered. Eshelman 8, Identify any programmatic and/or drganizational changes required to more aggressively deal with equipment issues. Eshelman / Rogers / Coakley 3/1/00 9. Develop and obtain agreement from site management on the goal of the PM program (i.e. prevent all equipment failures, or prevent equipment failures which result in plant shutdowns, forced outages, etc.) 3/1/00 Eshelman Ø Continued
