1:00 p.m.

CHAIRMAN BONACA: This meeting will now come to order. This is a Joint Meeting of the ACRS Subcommittees on Reliability and PRA and Plant Operations.

I'm Mario Bonaca, Chairman of this Joint Meeting.

The purpose of this meeting is to discuss staff progress related to risk in forming the reactor oversight program and the agency's pilot program to assess the adequacy and trends associated with safety system and availability using the performance indicator PI approach.

Dr. August Cronenberg is the cognizant ACRS staff engineer for this meeting, while Mrs. Maggalean Weston is the designated federal official.

Rules for participation in today's meeting have been announced as part of the notice of this meeting previously published in the *Federal Register* of May 8, 2002.

A transcript of this meeting is being kept and the open portions of this transcript will be made available as stated in the *Federal Register* notice.

It is requested that the speakers first

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 identify themselves and speak with sufficient clarity
2 and volume so that they can be readily heard.

3 We have received no written comments or
4 requests for time to make oral statements from members
5 of the public.

6 We will now proceed with the meeting, and
7 I call upon Mr. Baranowsky of RES to begin.

8 MR. SATORIUS: My name is Mark Satorius.
9 I just have a couple of words. I'm a Chief of the
10 Performance Assessment Section in the Inspection
11 Program Branch of NRR.

12 We're very pleased to be here to address
13 the Subcommittee today and talk about the performance
14 indicator pilot program that we intend on beginning
15 later this summer.

16 And with me is Mr. John Thompson, who is
17 a member of my staff, who will give an outline on some
18 of the background and go forward with some of the
19 details of the pilot program as well as Hossein
20 Hamzehee who is here from the Office of Research, and
21 he'll go into more depth on some of the details of how
22 the pilots program is actually going to work.

23 And I think, Pat, you did have something
24 that you wanted to mention?

25 MR. BARANOWSKY: Yes. I just wanted to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 mention that we have briefed this Subcommittee and the
2 full Committee several times in the past about the
3 programs that we have underway in the Operating
4 Experience Risk Assessment Branch that involved the
5 collection of data and the analysis of data that
6 relates to risk analysis. And what we're going to be
7 doing today is discussing two projects that the Office
8 of Research has been heavily involved in supporting
9 NRR and a lot of the technical basis for the work that
10 we're presenting here is founded on work that we have
11 done, as I said, over the last several years.

12 So I just wanted to give that as a piece
13 of background. It includes not only the databases, but
14 the system and component reliability studies of some
15 aspects of the action sequence precursor program and
16 in particular some use of the SPAR models. And I
17 think you'll see that a few places.

18 So having said that, I'd like to just turn
19 it over, I guess, to John Thompson to get started on
20 what the first issue is about.

21 MR. THOMPSON: Thank you, Pat.

22 Good afternoon, members of the
23 Subcommittee. Can you hear me?

24 I'm going to be talking today about an
25 overview of a pilot program to develop a replacement

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 performance indicator for the mitigation systems,
2 safety system unavailability.

3 We've been in the revised oversight
4 process for about 2 years now and we've observed some
5 problems with the current SSU indicator and has led us
6 to develop a working group to address some of these
7 issues. We are here today to brief you on status of
8 where we are in a pilot program to replace this
9 indicator, and hopefully your knowledge level will
10 come up and understand where we're trying to go and
11 what we're trying to do for the near future with this
12 pilot program.

13 To see the background for this program,
14 SECY 99-007 addressed the need to further refine the
15 use of the performance indicators by developing risk
16 based performance indicators and taking steps in that
17 direction.

18 During the first 2 years of the ROP staff
19 and industry, like I said, identified problems with
20 the current indicator and make several interim changes
21 as well as trying to address the need for the longer
22 term. We formed a working group and have met
23 regularly since the spring of 2001 to discuss these
24 issues with industry and with members of NEI and with
25 the staff.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: SSU is safety system
2 unavailability?

3 MR. THOMPSON: Correct.

4 We made a formal decision --

5 MR. APOSTOLAKIS: Which was really safety
6 train, not system. The way it was defined it was a
7 train.

8 MR. THOMPSON: But the indicator gives us
9 system indication.

10 MR. APOSTOLAKIS: I thought it was a
11 train?

12 MR. BARANOWSKY: I think you're right,
13 George. It was a train level indication that was meant
14 to be a surrogate for the system's performance. It was
15 never put together into a --

16 MR. APOSTOLAKIS: A system.

17 MR. BARANOWSKY: A system type thing. But
18 the threshold for performance were based on
19 understanding of the implementations of that train in
20 a risk model, if you will. That's all we originally
21 did.

22 MR. APOSTOLAKIS: But you didn't know in
23 a particular case whether the system was a one out of
24 two or one out of three

25 MR. BARANOWSKY: Yes. We've had a lot of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 problems, and those are some of the things we're going
2 to try and correct with the methodology we're
3 proposing here.

4 MR. APOSTOLAKIS: And also the
5 unavailability was only the maintenance, really. I
6 mean, how long was it out? It didn't include human
7 error or error -- probability of failure to start,
8 right? It was just that --

9 MR. BARANOWSKY: I think it included some
10 of those things, but the way it included it was
11 somewhat problematic, and we're going to try and go
12 over that also.

13 MR. APOSTOLAKIS: Okay. All right.

14 MR. THOMPSON: Going hand-in-hand with
15 this effort was the development of the risk based
16 performance indicators, and you were briefed on that
17 in 2001. And that'll be part of Hossein's presentation
18 following mine.

19 And this pilot is recognized as an
20 evolutionary step toward enhanced PI development.

21 MR. APOSTOLAKIS: So what your heading
22 calls mitigating system is what your main body says
23 safety system? It's the same thing?

24 MR. THOMPSON: Yes.

25 MR. APOSTOLAKIS: Okay. If they were

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 considering it, it would MSU?

2 MR. THOMPSON: Yes, it's the cornerstone
3 title that we borrowed from, and to give it a
4 different title than the current indicator.

5 MR. APOSTOLAKIS: All right. So it's the
6 same thing?

7 MR. THOMPSON: Yes.

8 MR. APOSTOLAKIS: Good.

9 CHAIRMAN BONACA: Now, I'm sorry. The
10 heading said "Mitigating System"?

11 MR. THOMPSON: Yes.

12 MR. APOSTOLAKIS: But inside you see the
13 second bullet says "with current SUU"?

14 MR. THOMPSON: Yes.

15 MR. APOSTOLAKIS: That's safety system
16 unavailability, but it's mitigating system.

17 CHAIRMAN BONACA: Okay. So it is the same
18 thing?

19 MR. THOMPSON: Yes, we gave it a different
20 title to denote that it's a different indicator with
21 different systems and stuff.

22 MR. APOSTOLAKIS: So your new indicator
23 will be mitigating system?

24 MR. THOMPSON: Yes, that's the title of
25 it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. BARANOWSKY: And it's going to be a
2 system level indicator, whereas the other one was more
3 of a train level indicator --

4 MR. APOSTOLAKIS: Good. Good.

5 MR. BARANOWSKY: -- with some implications
6 for a system.

7 MR. APOSTOLAKIS: Very good.

8 CHAIRMAN BONACA: But, you know, one could
9 contend that a trip function is a separate system. I
10 mean, yet you're counting that as an initiator. Isn't
11 it confusing, I mean, to --

12 MR. APOSTOLAKIS: I wonder whether -- I'm
13 sorry, I don't want to interrupt.

14 CHAIRMAN BONACA: No, I just was trying to
15 understanding.

16 MR. APOSTOLAKIS: Is a high safety
17 injection system a mitigating system?

18 MR. THOMPSON: Yes.

19 MR. APOSTOLAKIS: I thought it was a
20 safety system.

21 MR. SATORIUS: But it's in the mitigating
22 cornerstone of the ROP.

23 MR. THOMPSON: Yes.

24 MR. APOSTOLAKIS: Right.

25 MR. SATORIUS: It's considered because it

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 mitigates the effect of an accident, so it's in the
2 mitigating portion of the cornerstone of the ROP.

3 MR. APOSTOLAKIS: Well, in other contexts
4 prevention and mitigation; prevention is everything
5 before core melt and mitigation and everything after
6 core melt. Now your point of reference is the
7 initiating event.

8 MR. BARANOWSKY: Agreed. From a risk
9 analyst point of view that's the same way I talk, too.
10 But the way the direct oversight process has been set
11 up, mitigating systems are the preventive ones. And
12 we're not going to try and go back and change 99007.

13 CHAIRMAN BONACA: That was because -- I
14 mean before PRA. But before we believed that there
15 could be a core damage, I mean --

16 MR. APOSTOLAKIS: Remember, 007 has a
17 license to kill.

18 CHAIRMAN BONACA: Exactly.

19 MR. APOSTOLAKIS: So we can't go back--

20 CHAIRMAN BONACA: With the old terminology
21 of the FSAR. Okay.

22 MR. ROSEN: But we don't need a license
23 here.

24 MR. BARANOWSKY: By the way, the names are
25 subject to change if they aren't pleasing in some way.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: Well, it's just in
2 different context we use different names. I mean, you
3 know, the standard thing about prevention and
4 mitigation refers to core melt. You guys refer to the
5 initiating event and you're mitigating the initiating
6 event. It's a good usage of English.

7 CHAIRMAN BONACA: I'm only saying that
8 before PRA became of age, that was the definition they
9 were using for the FSAR.

10 MR. WALLIS: Mitigating the accident,
11 George.

12 CHAIRMAN BONACA: Mitigating was
13 mitigating an initiator --

14 MR. APOSTOLAKIS: Not the initial event.

15 MR. WALLIS: Now you've got accident.

16 MR. APOSTOLAKIS: Well, but --

17 MR. WALLIS: ECCS mitigates the accident.

18 MR. THOMPSON: That's right.

19 MR. APOSTOLAKIS: But what is the
20 accident, that's the question.

21 MR. WALLIS: Accident's already underway.

22 MR. APOSTOLAKIS: But it has not reached
23 core melt.

24 MR. WALLIS: That's right.

25 MR. SHACK: The mitigating systems work,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it may not.

2 MR. THOMPSON: We just wanted to have a
3 slide to go over some of the known problems that we've
4 been trying to deal with with the current indicator.
5 The first is that the risk insights are not accounted
6 for in the current indicator because it uses design-
7 basis function instead of PRA or unit functions.

8 At that thresholds developed or the SSU
9 were not plant-specific nor were they risk informed
10 thresholds. The new --

11 MR. APOSTOLAKIS: They were not? They
12 were. They were not the right thresholds, but they
13 were --

14 MR. HAMZEHEE: Were not plant specific.

15 MR. APOSTOLAKIS: Right. And now you guys
16 are saying they should have been plant specific?

17 MR. HAMZEHEE: That's right. As we go
18 along with this presentation, we say --

19 MR. THOMPSON: We are moving in that
20 direction.

21 MR. WALLIS: We're trying to agree with an
22 ACRS point. They should be more plant specific.

23 MR. APOSTOLAKIS: Several centuries ago.

24 MR. WALLIS: Exactly. Well, we've finally
25 caught up.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: See, that answers my
2 earlier question. We do have an impact after a few
3 years.

4 MR. ROSEN: It takes a while.

5 MR. APOSTOLAKIS: They're mitigating it.

6 MR. ROSEN: Now, it's going to be plant
7 specific. Does that mean that a plant that has three
8 trains of safety systems versus a plant that has two
9 trains will get some more credit?

10 MR. HAMZEHEE: That's correct, yes. And
11 when we get to the technical aspects of it, you see
12 that, yes.

13 MR. ROSEN: I think I'm done here. I think
14 I'm done here.

15 MR. KRESS: Mission accomplished.

16 MR. APOSTOLAKIS: I have complained from
17 day one.

18 MR. THOMPSON: Actually, I don't want to
19 leave you with the impression that the thresholds are
20 plant specific. They are standard thresholds but the
21 margin to the thresholds are plant specific.

22 MR. BARANOWSKY: The risk thresholds are
23 standard. Just like REG Guide 1.174 has what you might
24 call thresholds of regulatory acceptance, the
25 thresholds of risk that are associated with the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 performance of these systems are the same. But the
2 performance within any given system can change
3 depending on the --

4 MR. APOSTOLAKIS: How much margin you
5 have?

6 MR. BARANOWSKY: Right.

7 MR. THOMPSON: The level of redundancy or
8 the risk associated with that system.

9 MR. APOSTOLAKIS: You'll explain though,
10 probably.

11 MR. BARANOWSKY: And he's going to explain
12 it all if we get there.

13 MR. APOSTOLAKIS: So now I see this thing
14 that it was inside NRC, risk manage, does it replace
15 risk informed?

16 MR. THOMPSON: Yes.

17 MR. APOSTOLAKIS: And the Commission has
18 agreed to that?

19 MR. THOMPSON: I don't know that.

20 MR. BARANOWSKY: This is also news to me.
21 I'm hoping to get some definition other than from
22 inside NRC.

23 MR. APOSTOLAKIS: There was something
24 inside NRC. You guys are changing it already.

25 MR. HAMZEHEE: Well, we're proactive.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: I'm not sure risk manage
2 is a good idea.

3 CHAIRMAN BONACA: And before we change
4 everything, you know --

5 MR. APOSTOLAKIS: At least we can discuss
6 it a little bit.

7 MR. THOMPSON: Certainly.

8 MR. APOSTOLAKIS: We've been talking about
9 risk informed initiative now for what? Five or six
10 years? The least you can do is ask the Commission
11 whether they agree with the change. Okay. I know
12 that one person wants that, according to inside NRC,
13 but I think it's a good idea, as Pat said, not to get
14 our marching orders from inside NRC.

15 MR. BARANOWSKY: Well, anyhow, I do think
16 it's important to note that we do have five points
17 that we're trying to correct in at least skipping some
18 of the terminology problems here. One of them I think
19 was that second one, was a pretty important one.

20 So why don't you go on, John?

21 MR. THOMPSON: Yes. The demand and demand
22 failures are not properly accounted for by the current
23 indicator either. It's kind of a mix, a hodgepodge
24 that doesn't match well. And the new indicator, the
25 new pilot more properly accounts for those instances.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And the other big issue with the current
2 indicator was that use of fault exposure hours can
3 over estimate the significance and then result in a PI
4 that can no longer measure further degradation of
5 performance because the indicator's already yellow or
6 red and smaller increments of degradation is not
7 measured.

8 MR. APOSTOLAKIS: So you're going to tell
9 us later why these are valued points?

10 MR. THOMPSON: Yes.

11 MR. APOSTOLAKIS: Because it's not clear
12 to me what you mean by this?

13 MR. THOMPSON: That's correct.

14 MR. APOSTOLAKIS: And the first bullet is
15 unclear, too.

16 MR. THOMPSON: Yes, all of that will be
17 cleared up later.

18 And then the last issue is that cascading
19 of support system unavailability to the monitored
20 system overstates the actual unavailability of the
21 monitored system which end up measuring is not only
22 the availability of the monitored system, but the
23 availability of the support system that maintains that
24 system. And it kind of defeats what you're trying to
25 measure. The new pilot corrects that by monitoring

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 separately the support system.

2 MR. APOSTOLAKIS: So you're becoming more
3 PRA oriented?

4 MR. THOMPSON: This is definitely a step
5 in that direction.

6 MR. APOSTOLAKIS: Yes.

7 Another question. I mean, PRA's have been
8 distinguishing between support systems an front line
9 system now for 25 years. I don't understand why we
10 have to stop -- anyway, go ahead.

11 This should be -- the whole thing should
12 be PRA based.

13 MR. BARANOWSKY: Well, remember, this is--
14 we're trying to bring what we learned from the risk
15 based performance indicator work into this project;
16 just the things that we tested out and believe work.
17 And so you're seeing a lot of risk concepts here
18 today.

19 MR. APOSTOLAKIS: Okay.

20 MR. BARANOWSKY: Yes.

21 MR. ROSEN: The objectives of this program
22 simply stated was that we wanted to create a better
23 indicator and a more accurate one of performance that
24 adds value and solves the known problems that I just
25 over without also adding undue burden both to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 inspectors that got to oversee this PI as well as
2 industry which has to implement it.

3 We want to calculate in this pilot the
4 revised unavailability -- unreliability values.

5 MR. APOSTOLAKIS: Now you're mentioning
6 unreliability for the first time. That's not part of
7 your five bullets? Are you adding it as a PI

8 MR. BARANOWSKY: Yes.

9 MR. APOSTOLAKIS: So the previous five was
10 corrections to something that existed?

11 MR. THOMPSON: Yes.

12 MR. APOSTOLAKIS: But this will be added
13 as a sixth?

14 MR. ROSEN: You note that we mentioned
15 unreliability in one of our letters, George.

16 MR. APOSTOLAKIS: Oh, yes.

17 CHAIRMAN BONACA: That was already part of
18 the Phase-1, right? Phase-1 development?

19 MR. THOMPSON: Yes, that's one of the
20 objectives of this new PI is to calculate both and to
21 compare the results from that to the existing PI data
22 and to ascertain whether or not the differences
23 observed in the changes address our concerns and suits
24 the needs of the revised oversight --

25 MR. ROSEN: That implies you're going to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 do that retrospectively? You're going to go back?

2 MR. THOMPSON: We're going to do both.

3 MR. ROSEN: And calculate all this stuff?

4 MR. THOMPSON: We're doing both.

5 MR. ROSEN: And compare it to what you got
6 -- what you have from -- the existing SSU PI data?

7 How you could to do that when they haven't captured --
8 many places haven't captured that data respective, you
9 know?

10 MR. THOMPSON: Well, we're going back to
11 look at the pre-ROP data and run that data through the
12 mechanics of this new PI and then look at it, see how
13 the SDP looked at it.

14 We're also going to look at the last two
15 years of data through tabletops exercises. And then
16 we'll look at it as the actual data comes in through
17 in the pilot.

18 MR. ROSEN: And then in answer to my
19 question, how you going to get the manuscript --

20 MR. HAMZEHEE: Well, Steve, I think there
21 are two parts of your question. One is as part of the
22 RBPI we looked at some previous data to see if this
23 concept worked. And we looked at 44 plants, and I'll
24 talk about them in more detail and demonstrated that
25 these are reasonable and they do provide adequate

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 performance indication.

2 The other thing that John is talking about
3 is insights learned and the improvements we want to
4 make the existing PI. So these are mainly for the
5 future PI. But to make sure that they do work, we are
6 going to do a visual validation of going and looking
7 at some, whatever data we can get for the on demand
8 failures and a number of demand basically based on
9 EPICS, that is the only available database in the
10 industry. And in order to see how these things work
11 and what kind of results we get.

12 But the main objective is not to be
13 retroactive and try to regenerate the past 5 or 10
14 years of performance.

15 MR. ROSEN: You think EPICS has captured
16 enough demand data to do that?

17 MR. HAMZEHEE: For a validation purpose,
18 yes. And we have a section in phase I RBPI report
19 NUREG 1753 that shows that. But for the future in
20 order for these PIs to be fully implemented, then one
21 of the conditions is for the industry to report
22 accurate reasonable data to support this performance
23 indicator.

24 MR. ROSEN: Yes, I would just put some
25 measure of grain of salt on the past EPICS data.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: That's correct.

2 MR. ROSEN: Once the staff puts this in
3 place, then you as a regulatory requirement, then you
4 can have more confidence.

5 MR. HAMZEHEE: That's correct. And as
6 part of this pilot program industry is going to work
7 with the NRC staff to provide the actual data for some
8 time period so that we can go through all these "what
9 if" questions and try to validate the results.

10 So you're right. In the past we did not
11 have enough information on the on demand failures.

12 CHAIRMAN BONACA: Yes, and that's good
13 just as a baseline for us. Two years ago commenced
14 our work that was being done and two recommendations
15 were made. One was that we work with the industry to
16 improve the ethics to the point where there will be
17 consistent reporting, otherwise --

18 MR. ROSEN: That's correct.

19 MR. HAMZEHEE: And the other one was to
20 provide some -- to work towards a common definition of
21 unavailability and reliability with the industry so
22 that we're comparing apples and oranges there.

23 MR. ROSEN: Yes.

24 MR. HAMZEHEE: And it would be worthwhile
25 for us to understand if any progress has been made on

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 those two issues.

2 MR. BARANOWSKY: Now, for sure we have had
3 some progress on the EPICS thing, except I want to
4 point out that not all plants are embracing the EPIC
5 system, so they're not necessarily providing complete
6 data. But a lot are and we've worked pretty closely
7 with INPO in their working groups. And that involves
8 the technical folks from the plants that are providing
9 this information.

10 So even though it maybe has on a few
11 places some errors on the order of 10 to 20 percent on
12 counting demands, that's probably good enough to get
13 an idea. Because even if the demands are off 10 or 20
14 percent, we're in the ball park. Now, a few plants
15 might be off by 50 percent, but most of them are based
16 on what we can understand providing the bulk of the
17 data that's been requested. And we think we've come
18 together on the unavailability unreliability
19 definitions through this project, I believe, and
20 Hossein will cover that in a few minutes.

21 CHAIRMAN BONACA: Good.

22 MR. WALLIS: Are you going to tell us what
23 the first bullet means? Are you going to tell us
24 that? I mean, I have no idea what a better indicator
25 performance is, and I don't know how you can tell when

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it's good and when it's better. And more accurate
2 means nothing to me. I mean, if number of SCRAMs is--
3 if I measure SCRAMs to 2 significant figures, is it
4 better than 4 significant or 1 significant figures, or
5 something. Accurate isn't a good word.

6 MR. HAMZEHEE: Yes, we are going to talk
7 about this. This is for him to set the ground for us
8 to know what is our --

9 MR. WALLIS: And having value, I have no
10 idea what your value is so I don't know how to add it.

11 MR. BARANOWSKY: Okay. I think he's
12 saying that this will provide a method that fixes some
13 of the problems that we've have in the past where
14 there were approximation that resulted in many so
15 called frequently asked questions where because of the
16 lack of rigor in the development of the PI from a
17 methodological point of view, we went into more and
18 more permutations on how to deal with those slight
19 deficiencies. And what we're trying to do is get away
20 from that, have something that has more rigor up front
21 so we don't have to come up with special cases on how
22 to deal this to make it sort of fit like what we would
23 expect if we had a more rigorous formulation for the
24 indicator.

25 MR. THOMPSON: And not only that, a lot of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 these cases ended with a conclusion that the indicator
2 was not a good way to do this. And we would --

3 MR. WALLIS: I think you need to start
4 with a definition of what an indicator should do.
5 What it's purpose is, how you measure one being better
6 than another in terms of what it does. Then we can
7 tell whether the new one is better than the old one.

8 MR. THOMPSON: Well, I think this new
9 indicator is going to do something different than what
10 the old one was trying to do. It's trying to
11 accurately capture the unavailability and
12 unreliability which was not necessarily the purpose of
13 the original indicator.

14 MR. BARANOWSKY: Yes, I guess what we
15 haven't done is sat here and other than identifying
16 those five points on the prior viewgraph, gone through
17 the methodology things in the current indicator that
18 are problematic. And I guess we're more focusing on
19 what's in the one that we're proposing. But if I step
20 back a bit, just the fact that we didn't have demands
21 and failures in the prior indicator, it was missing
22 something. Just the fact that there was a single
23 model with a single threshold for every plant, we knew
24 that was a problem.

25 So we've identified a number of things

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that we know are flawed in the current indicator and
2 what he's trying to say is we're going to make
3 progress in removing those things. And if those are
4 flaws and we fix them, then we know this is a better
5 indicator.

6 MR. WALLIS: Yes, I think you're
7 proceeding by solving problems which have been
8 recognized.

9 MR. BARANOWSKY: Right.

10 MR. THOMPSON: Exactly.

11 MR. BARANOWSKY: That's our approach.

12 MR. THOMPSON: That's right.

13 Another objective of the pilot is to
14 minimize the differences and increase the consistency
15 where we can between this pilot, the maintenance rule,
16 PRA and the SDP. And as I go this, you'll see where
17 we're trying to address those things.

18 We also want to exercise the methodology,
19 the actual reporting, the mechanics as licensees would
20 really do it if we went to full implementation with
21 this PI such that the data will come in, we'll
22 actually see the data as it would be for full
23 implementation.

24 And then we want to identify after the
25 pilot any unintended consequences that might result

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and assess their impact, if any.

2 Now, we do have a list of questions,
3 predetermined questions that we want answered during
4 the course of the pilot. These probably aren't all
5 inclusive. They were just some of the ones that the
6 working group has come up with.

7 And the first one is one we just went over
8 in the last slide, is this a better indicator of risk
9 than using the SDP which we're forced to do through
10 the frequently asked question resolution such that the
11 staff may need only rely on the PI indication for the
12 risk significance and not do the SDP. That is a big
13 issue with industry right now. That is something they
14 want, and they think and the working group believes
15 that if the indicator works as we designed it, we may
16 be able to achieve that.

17 MR. APOSTOLAKIS: To achieve what?

18 MR. THOMPSON: To be able to use the
19 outcome or the color characterization from the PI as
20 the appropriate risk characterization.

21 MR. APOSTOLAKIS: This touches on
22 something I think that's much bigger, which is -- I
23 mean, it's not clear to me that the PI should actually
24 deal with risk. One of the major comments we made in
25 our last letter, I think, was that the PI by itself as

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 a measure of risk is not very minimal. That's why the
2 red threshold was so bad. Because you had to go
3 through 23 SCAMS to see a significant change in risk.

4 And as many of my colleagues here have
5 been saying, we are looking at the PIs to marshal our
6 resources. Now when you get an early indication that
7 something's going wrong, and we're going to send more
8 NRC inspectors or we're going to look more carefully
9 and so on. But this is not really related to risk.

10 So it seems to me that this kind of
11 approach has to be resolved because you may be going
12 down the same path as the previous PIs. See, the
13 problem there was that in order to see a change of 10^{-3}
14 or 10^{-4} -- not 10^{-3} ; 10^{-4} or 10^{-5} in the CDF because of one PI,
15 you have to change the PI so much that it was
16 unrealistic. And we know that accidents don't happen
17 that way. In accidents you have usually a combination
18 of events. Right? It's not one thing that you have
19 too many SCRAMs. The accident is really that you have
20 one SCRAM and you have other things that are failing.

21 So I'm not sure that trying to pursue the
22 PIs as better indicators of risk is a good idea.

23 MR. BARANOWSKY: Let me clarify a couple
24 of things on that. In other words, there's another
25 point maybe.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: No, go ahead.

2 MR. BARANOWSKY: It is a conditional
3 measure of the risk, which is basically what I think
4 you were pointing out, George. Holding other things
5 constant.

6 In terms of whether some of the indicators
7 require many failures, if you will, or incidents to
8 occur before the indicator trips a threshold, I think
9 that's a measure of the risk significance of the
10 functions that we're trying to monitor performance on.
11 And maybe we're not monitoring the right performance
12 or maybe we need to monitor things differently.

13 The MSPI indicator is meant to provide an
14 accumulation of unavailability/unreliability and what
15 the implications are with regard to performance as it
16 relates to how risk is changing if that performance
17 declines.

18 The SDP looks at individual instances such
19 as something failed or something was out of service,
20 and that unavailable contributes to an amount of risk,
21 such as a risk meter might look at it. I don't know
22 of any risk meter, for instance, that has a change in
23 the failure rate or demand failure probability as a
24 function of time every time one has a failure you
25 update. I don't think they do that. That's what this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 indicator does.

2 So it accumulates information on a
3 performance of whatever system or function we're
4 looking at instead of looking at individual points.

5 MR. APOSTOLAKIS: I understand that. But
6 I think the notion that everything in the -- should be
7 tied to risk is questionable.

8 For a long time I was advocating -- not
9 advocating as it should be, but I was working on the
10 assumption that it was. And some of my colleagues here
11 said no, that's not the purpose of this. Whether I
12 have three SCRAMs in a year or not tells me something
13 else. It doesn't really tell me much about risk, but
14 it tells me that I should be going there and looking
15 and that something is not proper, you know. That's
16 very different from tying it to risk.

17 MR. SHACK: Yes. I mean, are the PIs
18 measuring the safety status of the plant or are they
19 measuring the performance? And I think, you know, you
20 could argue that looking at one of these PIs, yes, I
21 can tolerate a very large variation before that in
22 itself is a measure of an unsafe condition. However,
23 as an indicator of the performance of the licensee,
24 you might have -- you know, the risk informed
25 indicator I think is a reasonable thing. I think the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 thing that we're getting at is how do you set the
2 threshold. And setting the thresholds on a delta CDF
3 we argued led to problems because you were isolating
4 something. And you're really not trying to measure
5 the plant safety status, you're trying to measure
6 performance.

7 MR. APOSTOLAKIS: Right. And performance
8 is in the sense that this fellow deviates too much
9 from the industry.

10 MR. SHACK: And as an indicator of
11 everything else that he's doing. I mean, we're
12 looking at one thing.

13 MR. APOSTOLAKIS: Right.

14 MR. SHACK: And it's indicator of how he's
15 performing overall because we're not measuring
16 everything that's related to the plant.

17 MR. BARANOWSKY: Yes. Well basically what
18 we've done, of course, in this whole oversight process
19 is aggregated some things. The cornerstones themselves
20 are disaggregation. I mean, we could have just put
21 down plant safety status and put containment barriers,
22 mitigating systems and initiating events all into one
23 thing; plant safety status. But then you've got a
24 problem with figuring out well when the safety status
25 is bad, how do you know what to go look at.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 So there was a judgment call that was
2 made. And we're not trying to revisit that issue
3 today, even though I think I understand what the
4 nature of the concern is because in fact in the risk
5 based performance indicator report we did talk about
6 an integrated indicator. That would be essentially at
7 the plant level --

8 MR. APOSTOLAKIS: Oh, all right. Yes.

9 MR. BARANOWSKY: But I don't think we're
10 ready to go there yet.

11 MR. APOSTOLAKIS: I like that.

12 MR. BARANOWSKY: We're not ready to go
13 there yet.

14 MR. APOSTOLAKIS: I know.

15 MR. BARANOWSKY: We have to take some
16 steps, and this is the first step. If this step works
17 and it looks like it makes sense to address the issues
18 of plat status versus monitoring performance, then I
19 think there's probably something we can work on.

20 MR. APOSTOLAKIS: The ideal situation
21 would be to have PC model where I can input the
22 findings and get the delta CDF. Isn't that what --

23 MR. HAMZEHEE: We already have that.

24 MR. THOMPSON: Yes, we call that PRA.

25 MR. BARANOWSKY: Yes, we call that a PRA,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 right?

2 MR. BARANOWSKY: Right. And we're having
3 enough trouble changing things like 5046, Appendix J
4 and everything else so if we attack that --

5 MR. APOSTOLAKIS: It runs already, though-
6 -

7 MR. BARANOWSKY: -- none of you will be a
8 member of this committee by the time we end up coming
9 with a new indicator.

10 MR. APOSTOLAKIS: Because the findings are
11 not always PRA.

12 MR. HAMZEHEE: And all the plants have
13 that already and they do it for internal purposes.
14 And I think Steve had it as his --

15 MR. APOSTOLAKIS: No, but a lot of the
16 findings in the inspections require additional
17 processing.

18 MR. BARANOWSKY: You're going to see a lot
19 of use of PRA in this that you haven't seen before as
20 far as I can tell. And I think we're just going --

21 MR. APOSTOLAKIS: Let me take one point,
22 and I did try last time we were writing the letter but
23 it was pretty much -- I think the way the action
24 matrix is put together causes a lot of
25 misunderstandings and leads you the wrong path.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Because it tries to -- it has two different purposes,
2 really.

3 One purpose is to look at performance and
4 the other is to look at risk. And I think the
5 attitude so far has been risk. Let's try to make
6 everything risk related. And, you know, sometimes
7 that leads to an unrealistic result. But that's
8 something to think about with other guys, not you.

9 MR. BARANOWSKY: There has to be a nexus
10 between performance and risk or else we can't --

11 MR. APOSTOLAKIS: At some point.

12 MR. BARANOWSKY: -- set the performance
13 targets in any rational way.

14 MR. SIEBER: Well, I sort of disagree with
15 that to some extent. If you look at thresholds, the
16 ones that seem to be outrageous are the ones
17 associated with initiating events. And perhaps that's
18 because initiating events are designed, there's a
19 design in the plant to cope with them. And so on that
20 basis initiating events like reactor SCRAMs for
21 example are better off being performance based than
22 risk based. But perhaps mitigating systems might have
23 some value in being risk based.

24 And so I would tread carefully in this
25 area. But the way I see it, I see applications for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 both performance basing and risk basing in the PI.

2 MR. APOSTOLAKIS: Sure. Sure. But right
3 now I think most people look at the action matrix and
4 they really think in terms of risk.

5 MR. SIEBER: Risk.

6 MR. APOSTOLAKIS: Except some members of
7 this committee.

8 MR. SIEBER: That's right.

9 MR. KRESS: And I think it's very
10 difficult to take an individual performance indicator
11 and convert that into risk. I know if it's a
12 mitigating system, you can plug in the change in
13 unreliability -- in the PRA. But that's not what
14 we're after here, I don't think.

15 That as an indicator of what things --
16 other things may go wrong, and you don't know what
17 those other things are and you don't know how to input
18 those into the PRA at the same time.

19 So I think we make a mistake in actually
20 saying selecting a delta CDF due to this
21 unavailability to represent our threshold. Because I
22 don't think we have a way to establish that threshold
23 that way. I don't think you have any basis for
24 choosing. You could probably arbitrarily choose it,
25 but I don't know how you would do it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE, N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: The problem I think
2 comes back to what I said earlier. Accidents don't
3 occur because of a single thing.

4 MR. SIEBER: That's true.

5 MR. KRESS: Yes, that's exactly right.

6 MR. APOSTOLAKIS: It will not be the
7 unavailability of something. It will not be an
8 initiating event, it will be a combination of some
9 hardware or some human error, or some of this and some
10 of that, and all of a sudden you have a problem.

11 MR. BARANOWSKY: Could I just point out --

12 MR. APOSTOLAKIS: That is difficult to
13 capture, though. It's very difficult.

14 MR. BARANOWSKY: We're talking about not
15 one performance indicator for one system or component.
16 We're talking about performance indicators that cover
17 several systems and components. So the issue of --

18 MR. KRESS: But that's my whole problem is
19 you don't have a way to conglomerate those together at
20 the same time.

21 MR. BARANOWSKY: Well, actually, we do
22 have a way and that's through the PRA.

23 MR. APOSTOLAKIS: So great. Let's wait
24 until we see how you do it.

25 MR. BARANOWSKY: If we can get --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. KRESS: You don't have a way to set
2 the threshold.

3 MR. BARANOWSKY: Yes we do.

4 MR. APOSTOLAKIS: That's the way to do it.

5 MR. KRESS: Well, okay. I'll wait.

6 MR. APOSTOLAKIS: But I think the first
7 bullet, though, I mean really at this time it seems to
8 argue for the SDP, because the SDP is --

9 MR. BARANOWSKY: The SDP is looking at
10 single incidents.

11 MR. APOSTOLAKIS: Well, it's not done
12 correctly?

13 MR. BARANOWSKY: What?

14 MR. APOSTOLAKIS: We also recommended that
15 if they find three things, they should do one SDP for
16 the three things, not separately.

17 MR. HAMZEHEE: Or should they be looking
18 at them at the same time.

19 MR. BARANOWSKY: Oh, no. If they find
20 three things and you want to know the risk
21 significance, then you've clearly you've got to have
22 an integrated model.

23 MR. APOSTOLAKIS: Exactly.

24 MR. BARANOWSKY: But if you want to know
25 about performance, how has performance changed, do you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 go every single time there is a failure or an
2 unavailability if you do -- equivalent, do an ASP
3 analysis to the SDP.

4 MR. APOSTOLAKIS: I agree with you. And
5 I think the action matrix --

6 MR. BARANOWSKY: I mean, if that's true,
7 then what's the role of reliability and unavailability
8 in the PRA itself?

9 MR. APOSTOLAKIS: Yes. I think you're a
10 little ahead of the ROP. You are ahead of the ROP.
11 Because I really think the action matrix should make
12 that very explicit that performance and safety, you
13 know, they overlap a lot, sure. But there may also be
14 different objectives.

15 MR. BARANOWSKY: There is a bunch of
16 simplifications in the reactor oversight process
17 framework. Okay. We knew they were there when we put
18 them, and what we're trying to do is slowly but surely
19 improve on those.

20 We can't just overhaul everything at once.
21 So we're going to take them on --

22 MR. APOSTOLAKIS: Well, let's see what you
23 have solved already. I mean, we've never been there.

24 MR. BARANOWSKY: Based on one of the
25 thorniest issues.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: The way we're going,
2 we'll never get there.

3 MR. HAMZEHEE: We're on page 3, I think.

4 MR. KRESS: What did you say?

5 MR. HAMZEHEE: We're still on page 3 and
6 we have 20 some pages.

7 MR. APOSTOLAKIS: Can you use, I mean with
8 the permission of the Chairman, your judge on this,
9 keep the motherhood statements.

10 CHAIRMAN BONACA: Yes.

11 MR. THOMPSON: Let's go to the next
12 viewgraph.

13 MR. BARANOWSKY: And I'll turn it over to
14 you.

15 MR. THOMPSON: All right. This is an
16 overview of the workings of the pilot.

17 The MSPI comprises the four existing
18 systems currently monitored by the SSU PI, plus we're
19 adding in the support cooling system as monitored
20 systems for the pilot. That really means the central
21 service water or its equivalent and the component
22 cooling water or its equivalent for the boilers.

23 It's a 12 quarter rolling average like the
24 current PI, but we're going to monitor and calculate
25 the unavailability and unreliability in relative terms

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of a new unit that we're calling delta CDF index. I
2 know it doesn't say index here, but we've come up with
3 an equivalency to a conditional CDF.

4 MR. BARANOWSKY: And that's because of the
5 issue of Dr. Kress and Dr. Apostolakis raised about it
6 being an incomplete measure of the risk.

7 MR. THOMPSON: Yes. The PI incorporates
8 plant specific models and uses data to calculate the
9 index. And Hossein will go over that in detail with
10 his slides.

11 The thresholds were developed using the
12 standard risk insights and are defined as 1E-6 for the
13 green/white, 1E-5 for white/yellow and 1E-4 for
14 yellow/red with the units of CDF Index.

15 MR. APOSTOLAKIS: So they are risk
16 related?

17 MR. THOMPSON: Yes, and not plant specific
18 thresholds.

19 One of the big differences, too, is that
20 discovered conditions that prevent fulfillment of the
21 safety function of the monitored system will be
22 specifically accounted for in the unreliability
23 portion of the PI. All right.

24 MR. LEITCH: I think I missed a subtlety
25 here. You said it, but CDF index as compared to delta

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CDF? I'm not sure I understand the difference.

2 MR. THOMPSON: As Pat said, it's because
3 it's a conditional look at what we're trying to
4 monitor and not a broader look like what the SDP would
5 do.

6 MR. ROSEN: Another way to say that I
7 think, Graham, is that if you really wanted to
8 calculate delta CDF, you have to use the plant model,
9 the PRA model and calculate the whole CDF. Here
10 they're just looking at a couple of systems. It
11 doesn't take into account the interrelationships
12 between all of the plant's components and the
13 different initiating events.

14 MR. BARANOWSKY: And we're only looking at
15 level one, so we don't have other factors.

16 MR. ROSEN: And you're not looking at
17 shutdown risk.

18 MR. THOMPSON: Or operator recovery, or
19 anything like that.

20 MR. ROSEN: So it's an index, it's just
21 not the whole deal. Ultimately the right way to do
22 this is to use the plant PRAs.

23 MR. SATORIUS: Right.

24 MR. ROSEN: But they're just taking -- you
25 know, before they could just crawl, now they're

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 standing up and trying to walk. And then ultimately
2 something else will happen.

3 I would like to ask a question about the
4 last bullet on that slide. "Discovered conditions
5 that prevent the fulfillment of the safety function"
6 now are counted in the unavailability. They're
7 considered in the unavailability index. That is, you
8 go back to the last time you knew it worked and
9 usually take half of that time.

10 MR. SATORIUS: Right. The fault exposure.

11 MR. ROSEN: The fault exposure time and
12 the unavailability. And now what does this mean?
13 That it's being accounted for in the unreliability PI;
14 I don't get it.

15 MR. THOMPSON: Let me take a first stab.

16 The problem with what we're doing now is
17 while true that the PI as we have now was designed to
18 do that, it's the so called T over 2 issue and the PI
19 is not measuring that no longer. We're using the SDP.
20 We're taking those instances because the PI can over
21 estimate the significance of that issue and having it
22 monitored using the SDP.

23 So the PIs really not accounting for those
24 things no longer, especially with the interim fix that
25 we use with the 99-02 Rev. 2.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: Now, the unreliability
2 will be over a period of time, right?
3 Unavailabilities at the given time? So this will
4 include the operator intervention to stop the system
5 if it doesn't stop?

6 MR. ROSEN: I think we're getting --

7 MR. THOMPSON: I think you'd better try
8 that answer.

9 MR. BARANOWSKY: No, it's really simple.
10 If the condition was such that had you tried to
11 initiate a start of the piece of equipment, it
12 wouldn't have functioned. It would have failed on
13 demand. So we call it a failure on demand. And since
14 we're looking at performance over a long period of
15 time, we just take that as one failure, one demand and
16 we put it in with the others that have occurred. And
17 we compute an unreliability for failure on demand.
18 Whereas before we were looking at it as a single
19 incident by itself without looking at any other prior
20 history and just saying how significant is that
21 condition.

22 MR. APOSTOLAKIS: So unreliability is not
23 used in the sense of a PRA. Unreliability is the
24 failure to start on demand?

25 MR. BARANOWSKY: That's what this would

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 be. Let's say turbine driven pump, somebody walked by
2 the turbine driven pump and found that some valves
3 were in the wrong position --

4 MR. APOSTOLAKIS: But you guys are
5 producing these other reports that are very good that
6 are looking at the operating experience and you're
7 calculating unreliability as the probability of the
8 system not working over a period of time.

9 MR. BARANOWSKY: Well, we do it both ways.
10 We look at the probability that it will not operate
11 when called upon, at start up in order words, and the
12 probability that it will not continue to operate to
13 fulfill its safety mission.

14 MR. APOSTOLAKIS: Right.

15 MR. BARANOWSKY: That's all included in
16 this indicator now.

17 MR. APOSTOLAKIS: But the probability of
18 not starting any continuing to operate --

19 MR. BARANOWSKY: Yes.

20 MR. APOSTOLAKIS: -- is the unreliability.

21 MR. BARANOWSKY: That's right. And that's
22 exactly the way we're defining it.

23 MR. APOSTOLAKIS: Not just the probability
24 of failure to start?

25 MR. BARANOWSKY: If we get there, I think

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 you're going to see it.

2 MR. APOSTOLAKIS: All right.

3 MR. ROSEN: You may not get there, but
4 you'll have fun on the way.

5 MR. HAMZEHEE: And I think, George, the
6 way we're doing it now is we are very consistent with
7 the PRA approach. So it's nothing --

8 MR. APOSTOLAKIS: Then your earlier answer
9 was not exactly right. But that's fine.

10 MR. ROSEN: Okay. So you're solving the
11 PI with two problems you think by doing it this way?

12 MR. APOSTOLAKIS: Correct. Fixing a
13 terminology problem.

14 MR. ROSEN: So you discover a component --
15 it's easy. I mean, you have to do a monthly test or
16 something, you go do the test and it doesn't work,
17 doesn't start. Okay. That's a failure on demand.
18 And that's the only way you count that. You don't say,
19 mmm, we tested this last week and it worked, it passed
20 the test, so it can't have been out more than a week.
21 Now what did we do during this week? Oh, it must have
22 been when we repacked this valves yesterday afternoon.

23 MR. APOSTOLAKIS: Right.

24 MR. ROSEN: Now it turns out it doesn't
25 work because this valve doesn't stroke. We repacked

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the valve. Oh, yes, we asked the guy who repacked
2 whether he knew how to do it. It turns out he was
3 unqualified.

4 We've got a lot of problems here, but we
5 think the time that that valve was made inoperatable,
6 when that step was taken, was really when that -- it
7 would have worked up until that time. So if you have
8 that, you can say fault exposure hours. In that case,
9 it's just a day.

10 All right. And then you add that into
11 unavailability. Now you're saying we're not going to
12 do that. We're just going to say, okay, it didn't
13 work, bang. We've got one failure on demand. Forget
14 all the unavailability, we're going to consider that
15 it's available throughout that whole time up until
16 this test. Is that right?

17 MR. BARANOWSKY: That's right.

18 MR. HAMZEHEE: That's correct.

19 MR. ROSEN: Don't you lose something, is
20 my point? Don't you lose some real unavailability by
21 doing that? Now before you might have been over
22 estimating -- you might have been overestimating
23 unavailability if you're using the T over 2 algorithm.
24 Might have been. You might also have been under-
25 estimating. That's why we use T over 2 because we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 didn't when in some cases you would over estimate it,
2 some cases you under estimate; on the average you'd
3 hit it right on the nose.

4 MR. BARANOWSKY: No.

5 MR. ROSEN: Now this new way, you're
6 almost certainly going to estimate unavailability.

7 MR. BARANOWSKY: No, I disagree with you
8 on that.

9 MR. ROSEN: Almost there's no question
10 that you're going to under estimate unavailability.
11 Because the only case in which you are not going to
12 under estimate unavailability is the case where it
13 just failed. It would have worked a microsecond, an
14 epsilon in time before we did this test it would have
15 worked, but now it won't.

16 MR. BARANOWSKY: There's going to be some
17 cases where you over and under estimate it and the
18 assumption is that it's basically a constant failure
19 rate process. You'll under estimate by about a factor
20 of 2.

21 If you assume that the inspection occurs
22 at the end of the test interval. The inspection
23 occurs randomly within the interval, then the T over
24 2 approximation is correct.

25 What this solves, though, is the issue of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 taking a potential single failure for something that
2 only has a limited number of demands in, say, a year
3 in which if you take only, say, one failure in one
4 year and a limited number of demands in one year; then
5 you know that for any given one year period of time
6 you're going to have things like perfectly reliable,
7 perfectly reliable, highly unreliable, then back to
8 perfectly reliable again.

9 The approach that Hossein is going to talk
10 about is how we are going to bring in Bayesian
11 statistics to account for this high increase or zero
12 situation which is basically a sparse statistics
13 issue.

14 MR. SIEBER: Do you take into account post
15 maintenance testing since maintenance generates a lot
16 of the future failures to start?

17 MR. HAMZEHEE: Yes. As part of the
18 unavailability.

19 MR. SIEBER: Right.

20 MR. HAMZEHEE: That's correct, yes. They
21 are all unaccounted for.

22 MR. APOSTOLAKIS: Well, we should wait and
23 see until --

24 MR. ROSEN: I'm still not convinced that
25 you're not going to lose unavailability. You're

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 measuring unavailability and unreliability separately
2 now, right?

3 MR. APOSTOLAKIS: That's correct.

4 MR. ROSEN: That's a wonderful, wonderful
5 thing to do. It's very good you moved in that
6 direction. But now that you've changed the algorithm
7 for how you account for the unreliability, you're
8 going to lose real unavailability hours. You're not
9 going to account for times that the machines were
10 really unavailable by doing it this way.

11 MR. THOMPSON: But there's another issue.
12 You don't want to double count. You don't want to take
13 a demand failure and take the unavailability. That's
14 like double counting.

15 MR. ROSEN: No, it isn't.

16 MR. APOSTOLAKIS: Let's raise the issue
17 when we see the actual --

18 MR. BARANOWSKY: I mean there's a definite
19 -- there's an equivalence with a constant failure rate
20 assumption between a failure on demand in the T over
21 2 situation. It's a very simple mathematical formula
22 and we're trying to account for it here.

23 MR. APOSTOLAKIS: And it depends very much
24 on what value for lambda you use.

25 MR. BARANOWSKY: It has to be a small

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 value of lambda and it has to be a constant failure
2 rate process.

3 MR. THOMPSON: Next slide.

4 MR. APOSTOLAKIS: Yes, let's move on.

5 MR. THOMPSON: As of today this is the
6 list of plants that have volunteered to participate in
7 the pilot. We've tried to --

8 MR. APOSTOLAKIS: Next time you should
9 have the plants that are not participating and show
10 them this time.

11 MR. THOMPSON: We tried to get a good
12 random representation, but it was voluntary so these
13 are the ones that we ended up with.

14 MR. APOSTOLAKIS: So what does 1/2 mean?
15 Both units one and two?

16 MR. THOMPSON: Yes. Units one and two.

17 The next slide shows the monitored systems
18 in the pilot. The first four are identical to the
19 systems currently measured by the SSUPI. The last
20 line of each of the Bs and Ps are the support system
21 that is the additional system that the PI is going to
22 monitor.

23 MR. APOSTOLAKIS: What are the support
24 systems?

25 MR. THOMPSON: Like under B column the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 support system cooling, which is essential service
2 water plus the building closed cooling water and the
3 turbine building.

4 MR. APOSTOLAKIS: I don't see any of those
5 here. Is there?

6 MR. THOMPSON: The last line.

7 MR. APOSTOLAKIS: Oh, down at the bottom.

8 MR. HAMZEHEE: The very last line.

9 MR. THOMPSON: Any questions? Okay. Next
10 slide.

11 MR. APOSTOLAKIS: Actually, support system
12 cooling is wrong English, isn't it? You're not
13 cooling the support systems, are you?

14 MR. HAMZEHEE: That's true, we're not.

15 MR. THOMPSON: True. It's the support --

16 MR. APOSTOLAKIS: Well, like all the
17 component cooling water system, right?

18 MR. THOMPSON: The support cooling --

19 MR. ROSEN: But you have a very high
20 standard. You want the staff to speak English.

21 MR. BARANOWSKY: We just factor in here
22 English is our second language, you know.

23 MR. ROSEN: I didn't think we have any
24 such expectation.

25 MR. THOMPSON: The next slide is to give

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 you the definitions of unavailability and
2 unreliability as we're defining them for the pilot.

3 The MSPI unavailability is the sum of the
4 planned and unplanned maintenance reported by train,
5 corrective unavailability. It's not all
6 unavailability. I wanted to make that point.

7 MR. BARANOWSKY: We're going to show
8 equations for all this.

9 MR. APOSTOLAKIS: Wait a minute. This is
10 the MSPI train unavailability, correct?

11 MR. THOMPSON: That's correct.

12 MR. APOSTOLAKIS: Yes, with the word
13 "train" in front of unavailability?

14 MR. THOMPSON: Well, it says reported by
15 train

16 MR. APOSTOLAKIS: Well, it says MSPI --
17 MSPI train unavailability.

18 MR. HAMZEHEE: George, but I think if you
19 wait until we go through the algorithm, you realize
20 these are system --

21 MR. APOSTOLAKIS: I understand that.

22 He took away the microphone.

23 MR. THOMPSON: The next bullet is the
24 train unavailability is the ratio of hours that the
25 train was unavailable to perform its risk-significant

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 function or functions as defined in the PRA, the plant
2 specific PRA, due to planned or corrective maintenance
3 or testing during the previous 12 quarters with
4 reactor critical, by the way, which is the current
5 definition of the SSUPI to the ratio to the number of
6 critical hours that the train was required to be
7 available.

8 MR. ROSEN: Now wait a minute. Now you
9 told RHR was one of the MSPI indicators you're going
10 to look at.

11 MR. THOMPSON: Yes, it is.

12 MR. ROSEN: Well, how often is RHR needed
13 when the plant is critical?

14 MR. HAMZEHEE: The RHR for at power
15 functions, there are so many functions as you know for
16 RHR. What we're talking about here are those
17 functions that are required during at power mode.

18 MR. THOMPSON: Okay. Right.

19 MR. BARANOWSKY: And some plants use RHR
20 in power.

21 MR. HAMZEHEE: Well, for a mitigating
22 purpose, yes, under --

23 MR. ROSEN: No, it's not all plants, but
24 some do.

25 MR. HAMZEHEE: That's correct, yes

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: So there should have
2 been a third bullet there saying that the train
3 unavailability will be put together somehow to get the
4 MSPI unavailability. Okay. Okay.

5 MR. THOMPSON: Yes. For unreliability the
6 MSPI unreliability is a measure of the demand failure
7 probability.

8 MR. APOSTOLAKIS: So it's both. Good.

9 MR. THOMPSON: Yes. Of the monitored
10 system and the failure probability during a mission
11 time.

12 MR. APOSTOLAKIS: Yes. Okay.

13 MR. THOMPSON: And that the component
14 unreliability is the failure on demand probability
15 that the system would not perform its risk-significant
16 function when called upon during the previous 12
17 quarters.

18 Now all of this Hossein will go over in a
19 little more detail with his presentation.

20 Now our schedule, which has turned out to
21 be an ambitious one, at the end of next month we have
22 prepared a workshop for the pilot participants, both
23 for the licensees and for the inspectors that will
24 partake in the pilot, a three day workshop.

25 MR. APOSTOLAKIS: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. THOMPSON: We will go over the details
2 and bring everybody up to speed.

3 August 1 is the start of the pilot and we
4 plan to come back to the ACRS and brief you on the
5 pilot progress in two or three months.

6 MR. APOSTOLAKIS: See, that's confusing to
7 me. Every bullet is a noun, public workshops, start
8 of MSPI pilot. So brief there I thought it referred to
9 a brief subcommittee. You mean to brief or briefing
10 the ACRS. It's not that you're declaring the
11 Subcommittee --

12 MR. ROSEN: We have to deal with this all
13 the time. You only have to deal with it during this
14 meeting.

15 MR. APOSTOLAKIS: So briefing the ACRS
16 Subcommittee.

17 MR. THOMPSON: It would require two lines
18 and two slides otherwise.

19 MR. APOSTOLAKIS: Okay.

20 MR. THOMPSON: In February the pilot ends
21 and we start the analysis period.

22 MR. APOSTOLAKIS: So what do you expect to
23 learn from the pilot?

24 MR. THOMPSON: That we solved the
25 problems.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: Certainly those guys are
2 not going to tell you anything about the theoretical
3 basis of this. They will probably tell you that that
4 it was difficult to get the data you thought you were
5 going to get. I mean, have you thought about it?

6 MR. THOMPSON: Yes.

7 MR. APOSTOLAKIS: What is the value of the
8 pilot?

9 MR. HAMZEHEE: Yes, there are pilot
10 objectives. I think if you go over the objectives of
11 your pilot program --

12 MR. APOSTOLAKIS: There will be a slide on
13 that? Fine.

14 MR. BARANOWSKY: We gave those to you
15 earlier.

16 MR. APOSTOLAKIS: Oh, you did?

17 MR. THOMPSON: It was I think the third
18 slide.

19 MR. HAMZEHEE: There's a slide on the
20 objective of the pilot program.

21 MR. APOSTOLAKIS: The third slide.

22 MR. BARANOWSKY: I mean, a major thing is
23 this is a new and somewhat more complex way of doing
24 the calculation using a plant specific PRA, if you
25 will. And so we've got a lot of technicalities that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 we have to go over.

2 MR. APOSTOLAKIS: Yes, these are not
3 really objectives I had in mind. I mean --

4 MR. BARANOWSKY: Well, we want to
5 determine how difficult this is to do in order to get
6 consistent results.

7 MR. APOSTOLAKIS: Right.

8 MR. BARANOWSKY: Because while the
9 industry is doing their thing --

10 MR. APOSTOLAKIS: It's the doing of it?

11 MR. BARANOWSKY: -- the staff is going to
12 be doing their thing as a check.

13 MR. APOSTOLAKIS: But let's not over
14 estimate the value of the pilots. They will tell you
15 how difficult it is.

16 MR. BARANOWSKY: Yes.

17 MR. APOSTOLAKIS: Or of it's impossible,
18 or whether it's impossible to do what you want to do.
19 But they will never tell you or question the
20 theoretical basis of what you're doing.

21 MR. BARANOWSKY: No. During the pilot
22 we're also going to do what we are calling "table top
23 studies," issues that are raised in this meeting or by
24 other stakeholders that are related to methodology.
25 And what would happen if you treated it this way or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that way. We're going to run a bunch of case studies
2 on them. But we want to get the industry into trying
3 to collect the data and exercise the basic method,
4 even though it might change a little bit. There's
5 some technicalities and what Hossein's going to show
6 you that we're going to have some questions on and we
7 may want to try other ways.

8 But we know that collecting the data and
9 getting everyone to compute in a consistent way the
10 same thing is a little bit of a problem.

11 MR. APOSTOLAKIS: Right. So what in July
12 of 2003?

13 MR. THOMPSON: We'll collect the results
14 and roll them up into a RIS and communicate that to
15 the members of the public.

16 MR. ROSEN: What's a RIS?

17 MR. APOSTOLAKIS: What's a RIS?

18 MR. THOMPSON: Regulatory information
19 summary. It's kind of like an information notice.

20 MR. SATORIUS: That's the vehicle that we
21 report to the public and our other stakeholders. And
22 it's also the pilot, whether we consider it a success,
23 whether it met the pre-agreed upon success criteria
24 and attributes.

25 MR. THOMPSON: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN BONACA: Now let me understand
2 now. You wrote, you know, a NUREG in which you had
3 Phase-1 development of the RBPIs and you're really
4 testing some of these RBPIs that you have in that
5 Phase-1 development, right?

6 MR. HAMZEHEE: Which were customized for
7 the ROP, yes.

8 CHAIRMAN BONACA: That's right.

9 MR. HAMZEHEE: That's correct.

10 CHAIRMAN BONACA: No decision has been
11 made on the part of NRR yet whether to use them in the
12 ROP or not?

13 MR. SATORIUS: That's correct. That's the
14 purpose of the pilot.

15 CHAIRMAN BONACA: Okay. The pilot really
16 is to either --

17 MR. SATORIUS: We'll test what we believe
18 will be a working system. And, as George had
19 mentioned, it will exercise the mechanics of reporting
20 the data for licensees to be able to go out and
21 collect the data.

22 CHAIRMAN BONACA: You're doing that?

23 MR. SATORIUS: And for us to check that
24 the algorithms are actually working and, as Pat had
25 mentioned, to do a table top exercises to validate or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to verify that it's doing what --

2 CHAIRMAN BONACA: With some sensitivity to
3 the changes you made. I mean, some of them may not be
4 significant.

5 MR. SATORIUS: That's correct, some of
6 them may not be.

7 CHAIRMAN BONACA: They may not be, you
8 know, worth the time that -- the collection on the
9 part of the licensees. Okay. I understand.

10 MR. SATORIUS: I think, Hossein, you're
11 ready to start on the technical discussion.

12 MR. APOSTOLAKIS: Do we want to take a
13 break?

14 CHAIRMAN BONACA: No. We have scheduled
15 a break at 2:30. Let's go on.

16 MR. HAMZEHEE: Okay. I am Hossein
17 Hamzehee in research NRC. And I think the purpose of
18 this presentation is mainly to provide the technical
19 aspects of this new approach of mitigating system
20 performance index. And as part of this presentation
21 I will first talk about the major insights from our
22 Phase-1 RBPI study and then I will go in a little more
23 detail into the technical aspects of the approach.
24 And then at the end we'll summarize the conclusion.

25 And just to make sure that I can finish

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 this, I'm going to try to be very focused so that I
2 can get to the meat of this presentation. And then
3 I'll be more than happy to answer any easy questions.

4 MR. APOSTOLAKIS: What about the difficult
5 ones?

6 MR. HAMZEHEE: Now first, let's talk about
7 the insights from the Phase-1 risked-based performance
8 indicator study.

9 As you may have all seen in the report,
10 this study really demonstrated that there are enough
11 planned risk-significant differences among different
12 plants in the industry that would make it necessary to
13 develop some kind of plan specific thresholds for
14 unavailability and unreliability performance
15 indicators. And the main reason, as we all know, is
16 because many of these plants even though they may be
17 Westinghouse, BNW, PWRs, they all have significant
18 design features and operating characteristics. And
19 during this Phase-1 study that was demonstrated.

20 And the way MSPI will work is this
21 algorithm will account for those plant specific
22 features.

23 And then we also found that this
24 unavailability and unreliability indicators that were
25 treated separately in the RBPI study were found to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 provide objective and risk informed indication of
2 plant performance. Again, they were all mainly risk
3 informed. And they also provide broader risk
4 coverage, mainly because they had more systems and
5 they had unreliability in addition to unavailability.

6 And as I mentioned earlier, the approach
7 that was described in the Phase-1 report was tested by
8 evaluating plant specific data for 44 nuclear plants
9 over a three year time period, which was basically
10 from '97 to '99 and reused our available SPAR model.
11 And I'm assuming we all know what SPAR models are.
12 And we use EPICS for unreliability information and
13 ROPPI for unavailability information.

14 MR. WALLIS: I don't understand this. How
15 would you know if they were not objective? They have
16 to be risk informed because that's what they're based
17 upon, aren't they?

18 MR. HAMZEHEE: That's correct.

19 MR. WALLIS: Well, how would you know that
20 they were not risk informed? You're reaching a
21 conclusion that you discovered that they were risk
22 informed.

23 MR. HAMZEHEE: No. Because if you read the
24 report, at the beginning we set some criteria that
25 would be based on risk.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. WALLIS: Oh, so you have a criteria to
2 determine whether they were risk informed or not?

3 MR. HAMZEHEE: Exactly. We defined up
4 front before we started the study.

5 MR. WALLIS: Okay.

6 MR. HAMZEHEE: We said all right how can
7 we develop objective risk informed indicators. So we
8 went ahead and defined the criteria.

9 MR. WALLIS: Okay.

10 MR. HAMZEHEE: And then we developed the
11 approach and we would go back and look at those
12 criteria to make sure that --

13 MR. WALLIS: So you found that they did
14 what they were intended to do?

15 MR. HAMZEHEE: That's exactly correct.

16 MR. WALLIS: Okay. Good.

17 MR. HAMZEHEE: Yes, sir.

18 MR. WALLIS: Thank you.

19 MR. HAMZEHEE: We also realized as part of
20 this that support systems are very important. And we
21 looked at the significance of those support systems.
22 And CCW and service water system or their equivalent
23 were found to be some of the most risk significant
24 support systems. But we also realized that they were
25 difficult to develop PIs for mainly because of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 variation of designs among the industry. And they
2 were so plant specific that it would not be easy to
3 develop PI generically. So with that in mind, when we
4 started this pilot program as part of preparation, we
5 worked with the industry and we have come up with some
6 approach that would be used to developed performance
7 indicators for those two support systems or their
8 equivalent.

9 And the last bullet talks about the fact
10 that in order to have a good estimation of component
11 unreliability we used Bayesian update approach. And it
12 was found to minimize the likelihood of false-positive
13 and false-negative indications. And as you may all
14 know, because of the monitoring period it is very
15 difficult based on statistics, scarcity of data, the
16 nature of these PIs to develop a PI in a time frame
17 that could give you 100 percent accuracy. So you
18 always have to deal with some false-positive and
19 false-negative probabilities.

20 MR. APOSTOLAKIS: I don't understand that.
21 What's a false-negative?

22 MR. HAMZEHEE: False-negative, I have one
23 slide on this one. But false-negative means if you
24 shows a performance indicator that would indicate the
25 performance is green when in reality it's non-green.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 It's either yellow or red, or what; that's called
2 false-negative. And false-positive means if your
3 performance indicator indicates red, yellow or white
4 where in reality it's at the baseline or green
5 performance.

6 MR. WALLIS: How do you know what the
7 reality is? You're measuring something other than the
8 performance indicator which is more real?

9 MR. HAMZEHEE: Well, there are two parts.
10 One is based on -- for instance, you look at the
11 statistics of the information because you're always
12 dealing with numbers and then probabilities. And you
13 estimate. And then you go back and see based on this
14 estimation. And then availability among these
15 estimations. What is the likelihood that you are
16 within your 90 percentile, 95 percentile of actual
17 performance and what's the probability that if your
18 performance is green, you're going to demonstrate non-
19 green performance.

20 So it's basically looking at data and
21 statistics.

22 MR. WALLIS: I thought green was defined
23 by the output from the performance indicator and there
24 was no other measure of it to compare it with.

25 MR. HAMZEHEE: That's correct

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. WALLIS: Absolute measure --

2 MR. BARANOWSKY: Remember, the performance
3 indicators, the current ones and even these are going
4 to basically have a mean value. And the mean value
5 allows for some probability, of course, that you're
6 over or under predicting what the performance is.

7 And so he took the statistical
8 characteristics associated with the probability
9 distributions as to whether or not they were --

10 MR. WALLIS: I thought that whatever came
11 out of the process was the measure of meanness.

12 MR. BARANOWSKY: No.

13 MR. WALLIS: And there's no other measure
14 of that.

15 MR. BARANOWSKY: No. It's like you said,
16 if you're coming up X number of things and Y is your
17 threshold, you just ask if you're going over that
18 threshold.

19 Here what we're saying is instead of
20 counting X number of things, we're computing
21 perimeters and we're having an uncertainty on those
22 perimeters and that uncertainty expressed in terms of
23 a distribution was used to derive the probability that
24 we had a false-positive or a false-negative outcome.

25 MR. WALLIS: That's correct, yes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. BARANOWSKY: And then we varied a
2 number of things associated with the distribution in
3 some assumptions, the time period that we looked at to
4 come up with the smallest possible range of both
5 false-positive and false-negative in which we balance
6 them out.

7 If you just use the mean, you know like
8 about half the time you're going to be over or under
9 estimating whether or not you passed that threshold.

10 MR. APOSTOLAKIS: Another way of putting
11 it, if I see a failure, is that a random failure or is
12 it really a real thing that shows a trend?

13 MR. HAMZEHEE: That's exactly right, yes.

14 MR. APOSTOLAKIS: I mean, I may be wrong.
15 They don't have another indication.

16 MR. WALLIS: I still don't understand.

17 MR. HAMZEHEE: And we have a section in
18 the appendix in RBPI if you would like later on, look
19 at it and let us know. We'll be --

20 MR. WALLIS: I guess what you're saying is
21 if you used a more sophisticated measure which
22 included uncertainty, then you might reach a different
23 conclusion. But if you've already chosen to use the
24 mean as your measure, then that's it.

25 MR. BARANOWSKY: That's correct. Suppose

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 we want to have 95 percent confidence, that would be
2 different than the mean, obviously, different point in
3 the distribution.

4 MR. APOSTOLAKIS: If I flip a coin ten
5 times and I get ten heads, one logical conclusion
6 would be that it's not a fair point. But I may be
7 wrong. It may still be fair and I just witnessed a
8 rare event. All ten trials resulted in heads. That's
9 what they're addressing.

10 MR. WALLIS: I don't know. It seems to me
11 if you have three strikes, you're out, and that's it.
12 And you define the rules --

13 MR. APOSTOLAKIS: If I see ten heads in
14 ten tries, I can either conclude it was not a fair
15 coin, it was biased toward heads, or it was fair but
16 I witnessed something that's extremely rare. Because
17 it's allowed in a fair coin to have ten heads in ten
18 trials. But the probability is so low so that
19 essentially that's the problem they're addressing.

20 MR. HAMZEHEE: That's correct.

21 MR. APOSTOLAKIS: It's not that they have
22 a different piece of information because the real coin
23 will do this. Because that's all they have.

24 MR. BARANOWSKY: This is a big issue with
25 the industry. They don't want to have the chance of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 false-positives.

2 MR. APOSTOLAKIS: This is standard in
3 quality control. I mean, what I see; is that a random
4 weird occurrence or is it something that shows a
5 trend? For example, coming from an earlier
6 discussion, is Bayesian an aleatory thing that is
7 unusual or rare or does it show a trend of some sort.

8 CHAIRMAN BONACA: Well, after we have
9 three or four of those, we will make a decision.

10 MR. APOSTOLAKIS: Okay. Hossein?

11 MR. HAMZEHEE: And again, another
12 challenging part that would add to this is the
13 monitoring period. Of course, if you have 20 years of
14 monitoring period, then these indications become more
15 and more accurate. But when you narrow down the
16 monitoring period, then you need to understand what
17 are the probability of these false indications.

18 MR. ROSEN: Move faster.

19 MR. HAMZEHEE: You want to go faster? I
20 can. All right.

21 Now let's just put --

22 MR. ROSEN: It's not your fault you're
23 going slowly, it's George Apostolakis' fault.

24 MR. HAMZEHEE: Thank you, Steve.

25 Now quickly let's go over some concepts

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 before we get into the equations so you're all
2 familiar with what we're talking about.

3 Again, the mitigating system performance
4 index monitors the risk impact of changes in
5 performance of selected mitigating systems. And this
6 impact is based on change in core damage frequency.

7 And then as was already mentioned earlier,
8 the MSPI includes Level-1, internal events for at-
9 power mode. And this is consistent with the current
10 ROP performance indicators.

11 And again, as was mentioned earlier, the
12 MSPI for a given system consists of two elements,
13 unreliability and unavailability. And the MSPI is the
14 sum of the changes in a simplified CDF evaluation that
15 shortly I'll show you how from changes in the system
16 unavailability and system unreliability relative to a
17 baseline values. And again soon I'll tell you what
18 those baseline values are.

19 MR. ROSEN: Now it's my fault.

20 MR. HAMZEHEE: That's okay, please.

21 MR. ROSEN: Why do you sum them, a simple
22 sum? Is that mathematically correct?

23 MR. HAMZEHEE: Yes. Because in a right
24 format, yes. Because in reality a piece of equipment
25 could not -- could be unable to perform its function

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE, N.W.
WASHINGTON, D.C. 20005-3701

1 either due to unavailability. It's unavailable
2 because they're doing some maintenance activities on
3 it or because they tried to start it and it failed to
4 start. So either one of those is going to add to the
5 probability that that piece of equipment is unable to
6 perform its function. So you have to --

7 MR. APOSTOLAKIS: Well, in theory you
8 should subtract the probability --

9 MR. HAMZEHEE: That's correct.

10 MR. BARANOWSKY: And also we've done some
11 checking. It's linear approximations that we're
12 making in order to make this a fairly simple equation
13 to work with. And we're testing it with full blown
14 models to see how much potential error is being
15 introduced.

16 MR. WALLIS: Well, you might get numbers
17 bigger than one.

18 MR. BARANOWSKY: I doubt it.

19 MR. HAMZEHEE: You're going to be very,
20 very surprised if you get anything even close to one.

21 MR. APOSTOLAKIS: The only place where you
22 have to do this is in seismic analysis where the
23 probabilities of failure are fairly high. So you have
24 to --

25 MR. HAMZEHEE: Conditional probability

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 given you have a seismic.

2 MR. APOSTOLAKIS: You have to subtract the
3 probable. But here it's -- go ahead.

4 MR. HAMZEHEE: Well, you're my teacher.

5 MR. APOSTOLAKIS: Go ahead.

6 MR. HAMZEHEE: All right. The next one,
7 the other concepts, again, the risk impact of --

8 MR. APOSTOLAKIS: Where's the equation.
9 I'm looking --

10 MR. HAMZEHEE: The risk impact of these
11 changes on plant performance are estimated using
12 plant-specific performance data and a Fussell-Vesely
13 importance measure. And I assume you know what
14 Fussell-Vesely importance measure is. If not, we'll
15 go over it.

16 And again, I think this is very important
17 to realize that those aspects of the MSPI that are not
18 -- that those aspects of safety performance that are
19 not covered by MSPI will be evaluated through our
20 normal inspection and significant examination process.
21 Because this MSPIs don't cover all performance areas.

22 And some example are, for instance, common
23 cause failures, concurrent failures of more than one
24 component in a system, passive components that are --

25 MR. APOSTOLAKIS: Passive components?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: Passive components --

2 MR. ROSEN: We had a discussion this
3 morning that BRA doesn't cover passive components.

4 MR. HAMZEHEE: Next time, yes. And then
5 the other -- and these are the typical things that are
6 not included in the MSPI and it will be covered by a
7 SDP and inspection.

8 MR. WALLIS: There's also passive
9 management.

10 MR. APOSTOLAKIS: Yes, I think cultural
11 issues are not covered. And Fussell I think is double
12 L.

13 MR. HAMZEHEE: That's correct, yes.

14 Now the next one is the scope of MSPI. Let
15 me quickly go over the scope.

16 For unreliability calculations
17 calculations only active components within a system
18 are included in the performance indicators. And we
19 all know what active components are. A good example
20 is a normally closed valve that has to open on demand
21 to allow flow through a system. We call that an active
22 component.

23 And all pumps and diesels in the monitored
24 systems are considered as active components even if
25 they're normally running because of their

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 significance.

2 Active failures of check valves are not
3 included in the MSPIS and they'll be covered under
4 inspections and SDP.

5 MR. APOSTOLAKIS: Why is that? Why aren't
6 they included?

7 MR. HAMZEHEE: Check valves?

8 MR. APOSTOLAKIS: Yes.

9 MR. HAMZEHEE: Well, because --

10 MR. APOSTOLAKIS: If the valve is close,
11 is suppose to open?

12 MR. HAMZEHEE: Yes.

13 MR. APOSTOLAKIS: Then why not?

14 MR. HAMZEHEE: There are a few reasons.
15 That was one of the issues that in the last year we
16 reviewed and analyzed and discussed with the industry
17 and the conclusion was not to include them; (1) is
18 because the risk-significant failure of the check
19 valves are not failure to open, but rather a failure
20 to prevent reverse leakage from high pressure to low
21 pressure systems.

22 MR. APOSTOLAKIS: Oh. So essentially what
23 you're saying it's a passive system?

24 MR. HAMZEHEE: Exactly. And it doesn't
25 happen often. But if it does, then the consequence

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 could be severe and we evaluate it through SDP
2 inspection. So that's important because --

3 MR. APOSTOLAKIS: Active failures. No,
4 this is --

5 MR. HAMZEHEE: If it has to open on
6 demand, this is active failure mode. Because in a --

7 MR. APOSTOLAKIS: No, no, no, no. If it
8 has to open and it doesn't open, that's an active
9 failure and that should be included.

10 MR. HAMZEHEE: That's correct. And what I
11 am saying --

12 MR. APOSTOLAKIS: But if it fails to
13 remain closed --

14 MR. HAMZEHEE: That's correct.

15 MR. APOSTOLAKIS: -- then it's passive.

16 MR. HAMZEHEE: That's correct. Exactly.

17 MR. APOSTOLAKIS: You shouldn't be using
18 the word active?

19 MR. HAMZEHEE: No. What this bullet is
20 saying is that the active failure mode of a check
21 valve, which is failure to open on demand, is not
22 included in the MSPI intentionally.

23 MR. APOSTOLAKIS: But it should be
24 included.

25 MR. HAMZEHEE: I understand. You know, I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 understand. But as I said, the decision was not to
2 include that because the failure probability of a
3 check valve to open on demand is very low. So we said
4 since it does not happen often and it's not risk-
5 significant, we included it in the inspection and SDP
6 so it's not forgotten. It's treated in a different
7 place.

8 MR. BARANOWSKY: Let me also point out
9 that the likelihood of seeing one of these valves fail
10 to open is small and that's why we said we would only
11 rarely have to look at it. So we would use a
12 different tool instead of collecting data, data, data
13 that we're never going to get any pay off from.

14 Now we're going to study this a little bit
15 further during the pilot, okay. But the idea is to
16 keep the number of components that we have to collect
17 data to a manageable set. And you're going to see
18 that we're going to have to collect really a lot of
19 information, and so that's what the decision was here.

20 These are the things that show up rarely.
21 And if they show up rarely, let's treat them with some
22 tool that's good for treating rare events.

23 MR. APOSTOLAKIS: But the baseline
24 inspection program will inspect these check valves how
25 often?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. SATORIUS: Typically these would be as
2 a result of a failure to open and there would be an
3 event. So there would be event follow up and then --

4 MR. APOSTOLAKIS: Oh. So it's not
5 something that will be done routinely?

6 MR. SATORIUS: Not necessarily. There are
7 -- back there to help me here, but there are specific
8 inspections that we do where we can select
9 surveillances that are either performed or maintenance
10 activities. So that there is an opportunity within
11 the inspection program to routinely take a look at
12 these components. But typically we see a failure here
13 and we react to that using an event follow up type of
14 an inspection.

15 MR. APOSTOLAKIS: Because if it's done
16 routinely, I mean essentially what you're saying is
17 the probability of failure is so low that we'll
18 inspect it every time. Now come on. The inspection
19 is not risk informed. But if what Mark said is what's
20 happening, then it's okay.

21 MR. SIEBER: Generally when a check valve
22 fails to open, and in 40 years I've never seen that,
23 that what it would do would be reduce the performance
24 of the system. But where you do see check valve
25 failures is in failures to close. They may come off

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the pins or get caught in there.

2 MR. HAMZEHEE: That's correct. That's
3 exactly --

4 MR. SIEBER: And generally -- and that is
5 tested in surveillance tests.

6 MR. HAMZEHEE: That's correct.

7 MR. SIEBER: It's the Appendix V tests and
8 so forth.

9 MR. HAMZEHEE: It's also covered under the
10 maintenance rule.

11 MR. SIEBER: That's right. And it's not
12 a mitigating system function either.

13 MR. APOSTOLAKIS: This is philosophical.
14 If something is so rare that it can't be in the PI,
15 then it would be logically inconsistent to say I will
16 move it to the inspection program and inspect it every
17 time.

18 MR. SATORIUS: We're not saying that,
19 George.

20 MR. HAMZEHEE: We're not saying that.
21 We're saying it's fairly impassive --

22 MR. APOSTOLAKIS: Somehow the inspection
23 has to be risk informed, too.

24 MR. SIEBER: If it fails to open, you're
25 going to get a system failure.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: That's correct.

2 MR. SATORIUS: Exactly, and then you would
3 have an event and you would do event follow up and use
4 the inspection program.

5 MR. SIEBER: And that would be
6 unreliability instance, too, that would count against
7 a system.

8 MR. HAMZEHEE: That's correct, yes.

9 MR. APOSTOLAKIS: So what does the last
10 bullet mean?

11 MR. HAMZEHEE: And the last bullet is --
12 let me just give you an example. For instance, let's
13 say you have a high pressure safety injection system
14 in a PWR which has two trains, train A and train B.
15 Sometimes in train A it had more than one flow path
16 from discharge of a pump. So you may have two fully
17 redundant parallel flow path from discharge of train
18 A.

19 We're saying that those two valves, even
20 if they're active components because of the failure of
21 both valves at the same time has a very low
22 probability. We're not going to include it in the
23 MSPI, but rather we do exactly what we said like the
24 check valve.

25 MR. APOSTOLAKIS: Which brings up another

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 issue. What does it mean to include it? I mean,
2 you're looking at the whole train, aren't you?

3 MR. HAMZEHEE: No, and we show you what we
4 -- we were going to tell you soon what is the scope of
5 a system.

6 MR. APOSTOLAKIS: Oh.

7 MR. HAMZEHEE: Because usually what we are
8 going to do is we are going to look at a full system
9 and within that system we are going to highlight the
10 active components. And based on the preliminary
11 studies that we have done, a typical system train has
12 a pump and between one to three valves. That's the
13 scope of a given train.

14 MR. APOSTOLAKIS: Okay.

15 MR. HAMZEHEE: And then it's talking about
16 component boundaries that are consistent with PRAs and
17 then the SDP will be used for the performance areas
18 that are also MSPI. We already talked about those
19 areas.

20 Now, should I get into equations, Mario,
21 or you want to take a break?

22 CHAIRMAN BONACA: Is it a good time,
23 because you have still quite a bit of --

24 MR. HAMZEHEE: That's correct.

25 CHAIRMAN BONACA: -- material to go

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 through, right?

2 So let's take a break now. And let's get-

3 -

4 MR. SIEBER: This requires more thinking.

5 CHAIRMAN BONACA: So that in the meantime,
6 George can review all this upcoming algorithms. Let's
7 get back here at 20 minutes of 3:00.

8 (Whereupon, at 2:23 p.m. off the record
9 until 2:39 p.m.)

10 MR. HAMZEHEE: Should I go ahead?

11 CHAIRMAN BONACA: Yes, please.

12 MR. HAMZEHEE: All right. So the next one
13 is talking about equations. And the equation number
14 one mainly says that the mitigating system performance
15 index for a system is the summation of unavailability
16 index and unreliability index.

17 MR. APOSTOLAKIS: I don't understand why
18 it says changes in train unavailability. You're not
19 calculating changes, you're calculating the actual
20 unavailability, aren't you?

21 MR. HAMZEHEE: Yes, but it says system
22 unavailability index due to changes in train
23 unavailability.

24 MR. APOSTOLAKIS: Yes.

25 MR. HAMZEHEE: In other words, you're

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 going to have a baseline unavailability and then based
2 on that baseline you measure the changes.

3 MR. APOSTOLAKIS: Why? How.

4 MR. HAMZEHEE: Will you let me go through
5 the equations, George, at the end of it if you don't
6 understand it, then I'll try to explain it.

7 MR. APOSTOLAKIS: All right.

8 MR. KRESS: Equation three is a fractional
9 change in unavailability.

10 MR. HAMZEHEE: If you guys don't mind, let
11 me just quick run through the equations quickly and
12 then I'll be more than happy to stop.

13 So it's UAI, which is the system
14 unavailability index due to changes in train
15 unavailability and URI system unreliability index due
16 to changes in component unreliability. And you see
17 one is train, one is component and we'll explain why.

18 Now, let's see how we find UAI. UAI is
19 the summation of the UAI_T , which UAI_T is
20 unavailability index for train T and the summation is
21 over the number of trains in the system. So for the
22 two train system, it's one T, 1 plus T2.

23 I'm sorry, Steve.

24 MR. ROSEN: I said it's victory.

25 MR. HAMZEHEE: And then UAI sub t is equal

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to DCF_p and equation. Fussell-Vesely, sub UA_p divided
2 by $USRP$; the whole thing multiplied by that USR_p minus
3 UR_{BLT} . And let me explain.

4 MR. KRESS: That's essentially a plant
5 specific change in CDF?

6 MR. HAMZEHEE: Exactly. You got it.
7 That's exactly what it is.

8 And let me quickly go over the terms and
9 then I explain a little more.

10 CDF_p is plant specific internal events at
11 power core damage frequencies that is going to be
12 obtained from licensees.

13 Fussell-Vesely --

14 MR. APOSTOLAKIS: The mean value, right?

15 MR. HAMZEHEE: Yes. Right now we're merely
16 talking about mean values.

17 And $FVUSRP$ is the train specific Fussell-
18 Vesely value for unavailability based on plant
19 specific PRA. So if you have four different planned
20 PRAs with four different design characteristics, most
21 likely you're going to have four different Fussell-
22 Vesely. And each represents a different plant.

23 And then $USRP$ is the value of
24 unavailability for train 2 T from plant specific PRAs.
25 In other words, you're going to go to that system and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 ask licensee what they have used for that train in
2 their PRA models for that system. And that's what we
3 use. And then later on we talk about how NRC is
4 going to validate or confirm, make sure those are the
5 right numbers.

6 MR. KRESS: Then the question I might have
7 there is that may be what they used in their PRA, but
8 what was their normal value? Do they have a standard
9 value that might be different from what was used?

10 MR. HAMZEHEE: Yes. I'm going to talk
11 about them. Yes. You're right. There's going to be
12 some variations, some differences. We'll talk about
13 it.

14 MR. ROSEN: When you say you're going to
15 go ask them what they used, do you mean in their last
16 model update?

17 MR. HAMZEHEE: In their most recent
18 updated PRA, yes.

19 MR. ROSEN: Because it changes over time.

20 MR. HAMZEHEE: That's correct.

21 MR. KRESS: But you used plant specific
22 data?

23 MR. HAMZEHEE: That's correct.

24 MR. ROSEN: Because we're basing an update
25 here.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: That's exactly right. But
2 then we also have to define some frequency at which
3 you can do those. Otherwise, you don't want to change
4 these everyday, but you're right.

5 MR. ROSEN: No. But a update frequency,
6 it's a function of -- it's in our license.

7 MR. HAMZEHEE: That's right.

8 MR. ROSEN: Because at South Texas it's
9 part of the exemption.

10 MR. HAMZEHEE: That's right.

11 MR. ROSEN: So now what you're saying is
12 we will be using that number during a cycle? Okay.
13 Well, that'll work.

14 MR. HAMZEHEE: And right now I think I'm
15 going to focus on how technically we're going to
16 calculate these. But then later on as part of pilot
17 with NRR we have to define how often and why, and how
18 we're going to --

19 MR. ROSEN: That's right. South Texas is
20 in the pilot, so you'll get some feedback on how that
21 works in a plant with an exemption.

22 MR. HAMZEHEE: Exactly.

23 MR. SATORIUS: But we understand that
24 there are reasons for licensee to change their PRA as
25 they may modify the plant, as they make changes to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 plant. It's a reasonable thing for them to do. And
2 we're mindful of that.

3 MR. ROSEN: Change the model as well as
4 change the data.

5 MR. HAMZEHEE: Exactly.

6 MR. KRESS: Now your summation, is that
7 the summation over the four trains --

8 MR. HAMZEHEE: If you have a South Texas
9 three train system, then that's train A plus B, plus
10 C. For Comanche two train system, it's only two of
11 them.

12 MR. KRESS: Okay. But you don't sum it
13 over systems?

14 MR. HAMZEHEE: No. This is a system. This
15 is MSPI, which is mitigating system performance index
16 for a given system.

17 MR. KRESS: A specific system?

18 MR. HAMZEHEE: In other words, we're going
19 to have one for HPI, one for 00 feed water, one for
20 RHR.

21 MR. KRESS: And the way you'd summate
22 those would be in your --

23 MR. HAMZEHEE: Within the system.

24 MR. KRESS: -- multiple performance
25 indicators in your matrix?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: That's correct, yes.

2 MR. KRESS: You'd have a sort of a
3 summation?

4 MR. ROSEN: But RHR is only for RHR
5 systems that are used for an at power function?

6 MR. HAMZEHEE: Correct.

7 MR. ROSEN: So plants that use their RHR
8 only for shut down, only in shut down modes --

9 MR. HAMZEHEE: Those functions are not.

10 MR. ROSEN: -- they will not have an MSPI
11 for shut down or for RHR?

12 MR. SATORIUS: It should be the same way
13 it is right now, Steve. Because we're making no
14 change to RHR and how it's viewed between the way that
15 unavailability is measured today and the way
16 unavailability will be measured under the pilot.

17 MR. ROSEN: I thought you said RHR was in
18 the pilot?

19 MR. SATORIUS: It's in this pilot. It's
20 also in the PIs that we're gathering unavailability
21 data for today.

22 MR. ROSEN: All right. Then why are we
23 measuring RHR?

24 MR. HAMZEHEE: Tom, would you like to ask
25 something?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. ROSEN: Is there some RHR function at
2 power?

3 MR. BARANOWSKY: No. Are we talking about
4 low pressure safety injection?

5 MR. HAMZEHEE: I think Tom Houghton is
6 here from NEI.

7 MR. HOUGHTON: Let me try to help. The
8 two functions of RHR that we're thinking about are the
9 accident mitigation function, okay, which we would
10 include for RHR while at power because it's needed
11 immediately upon initiation of the accident.

12 MR. ROSEN: That's the low pressure
13 coolant injection mode of RHR.

14 MR. HOUGHTON: Right. That's exactly
15 right.

16 And the shut down cooling mode we would
17 not include as a function of RHR.

18 MR. ROSEN: Now I'm trying to remember in
19 the South Texas design the low pressure coolant
20 injection. South Texas has a separate and completely
21 independent low pressure coolant injection system.

22 MR. SATORIUS: Steve, I would bet you, and
23 I don't know for sure, I can find out that South Texas
24 is providing that low pressure safety injection system
25 of unavailability today. Because that function, that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 system provides that high volume, low pressure --

2 MR. ROSEN: And labeled paren RHR which
3 it's not?

4 MR. SATORIUS: Right.

5 MR. ROSEN: Because the RHR system at
6 South Texas is a very different plant, remember, but
7 it's inside containment -- totally motor's inside
8 containment, it's used only for shutdown. So, you
9 know, what we have is separate LPCI.

10 MR. SATORIUS: Yes, you do.

11 MR. ROSEN: Which functions in the mode
12 that other plants or two loop plants typically use
13 their RHR for. So I think your point, Mark, is that
14 South Texas is reporting performance of LPCI in lieu
15 of RHR?

16 MR. HOUGHTON: Yes.

17 MR. ROSEN: Because functionally they're
18 equivalent.

19 MR. HAMZEHEE: I'm confident that that's
20 what they're reporting. I can double check that, and
21 will.

22 MR. ROSEN: I think that's the right
23 answer.

24 MR. APOSTOLAKIS: Can we go back to the
25 equations so I can understand it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. WALLIS: Could we go back to the
2 equations and explain to someone stupid like me what's
3 going on here.

4 MR. HAMZEHEE: Yes.

5 MR. WALLIS: What you seem to be doing is
6 trying to get a measure of of the effect on CDF of
7 system unavailability and unreliability.

8 MR. HAMZEHEE: That's exactly right, yes.

9 MR. WALLIS: And you never said that. And
10 so the units of this MSPIR are delta CDF?

11 MR. HAMZEHEE: Correct.

12 MR. WALLIS: And the rest of it I can sort
13 of believe what you're doing. Why don't you just
14 calculate all the CDF directly?

15 MR. HAMZEHEE: Well, that's what it is.

16 MR. WALLIS: This is a very round about
17 way of doing it.

18 MR. BARANOWSKY: No, no, no. That's not
19 answering your question. Your question is answered by
20 this: The full blown, you know, fault tree models all
21 linked together and everything are going to be fairly
22 large. This is just a couple of simple --

23 MR. WALLIS: Well, doesn't Fussell-Vesely
24 do that for you?

25 MR. BARANOWSKY: Well, the Fussell-Vesely

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 incorporates all that modeling in a simple perimeter
2 so we can just work with some simple --

3 MR. KRESS: It's almost a precalculation--

4 MR. BARANOWSKY: Right. So do the
5 calculation and then only when you change your model
6 do you go back and mess with this.

7 MR. WALLIS: Yes.

8 MR. HAMZEHEE: Now let me then go over the
9 rest of them. I think at the end it may be more
10 clear.

11 The USRP then is the actual unavailability
12 of train T during the previous 12 quarters. And that
13 is what we're going to measure as part of this MSPI
14 for that system.

15 MR. APOSTOLAKIS: So let's see now, if I
16 multiple CDF_p time the parenthesis, what do I get?

17 MR. HAMZEHEE: Well, if you get CDF times
18 Fussell-Vesely, then Fussell-Vesely tells you that
19 that multiplication gives you the change in CDF do to
20 that system. And then you multiply that by the --

21 MR. APOSTOLAKIS: No, no. Fussell-Vesely
22 is the ratio of the minimal that contain that train,
23 right?

24 MR. HAMZEHEE: Yes, it is --

25 MR. APOSTOLAKIS: Divided by the CDF.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: Exactly.

2 MR. APOSTOLAKIS: So you multiply it by
3 the CDF and you --

4 MR. HAMZEHEE: So you get the ultimate
5 CDF.

6 MR. BARANOWSKY: No, that's like saying
7 what fraction of the CDF was due to this.

8 MR. APOSTOLAKIS: Right. Due to this --

9 MR. BARANOWSKY: Right.

10 MR. APOSTOLAKIS: So now I have a fraction
11 of the CDF that's due to this train. Not the faction,
12 I don't have the fraction -- I have the --

13 MR. BARANOWSKY: A portion of the CDF.

14 MR. APOSTOLAKIS: It's not even a portion.

15 MR. HAMZEHEE: No, no, no. You are taking
16 CDF, you multiply it by Fussell-Vesely. Fussell-
17 Vesely is the change in CDF. You're saying that
18 what's the CDF if a piece of equipment or that system
19 is perfect minus the CDF for the base case.

20 Oh, I'm sorry, base case minus if that
21 system is perfect. So you get a delta CDF that you
22 divided by the base case CDF. That's the fraction --
23 the condition of Fussell-Vesely. So when you divide
24 it by CDF, up front you multiplied it by CDF. So the
25 result of those first two terms are the change in CDF.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 That if --

2 MR. APOSTOLAKIS: If the system is always
3 good.

4 MR. HAMZEHEE: It's perfect, yes.

5 Now, this is means -- the maximum
6 contribution that a system can have on CDF.

7 MR. APOSTOLAKIS: Right.

8 MR. HAMZEHEE: Right. Okay. Now hold
9 that portion.

10 MR. APOSTOLAKIS: Divide by UAB.

11 MR. HAMZEHEE: Yes.

12 MR. APOSTOLAKIS: And what do I get now?

13 MR. HAMZEHEE: Now, hold that portion now.

14 The second term is the USRT minus $USRB_{BLT}$ divided USRP.

15 MR. APOSTOLAKIS: But before I go, are the
16 UAs that be divided --

17 MR. HAMZEHEE: Exactly, it doesn't matter.
18 Yes.

19 MR. SHACK: Well, he'd be better off to
20 write it that way.

21 MR. APOSTOLAKIS: Yes, you'd better write
22 it that way.

23 MR. KRESS: He just have to --

24 MR. SHACK: You see what I'm saying?

25 MR. HAMZEHEE: Yes. But it was just

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 easier when I was using WordPerfect.

2 MR. KRESS: Yes, that's right. WordPerfect
3 don't let you do it.

4 MR. APOSTOLAKIS: So logically then the
5 UAB should be dividing the last parenthesis?

6 MR. HAMZEHEE: That's correct. So have
7 you a fraction dimension that's times change in CDF
8 which is going to give you change in CDF --

9 MR. APOSTOLAKIS: Now what was the last
10 parenthesis dividing UAB, what does that --

11 MR. HAMZEHEE: Okay. Now let's go over
12 that. The first term USRT is the actual
13 unavailability of train T during the previous 12
14 quarters. That is the actual measure of
15 unavailability as John defined what those things are
16 for planned and unplanned unavailability minus the
17 USR_{BLT} which is the baseline unavailability value for
18 train T. And in a couple of pages I explain what the
19 baseline unavailability is.

20 Quickly just to make sure you understand,
21 the baseline is something that is based on the
22 industry average over some period of time.

23 MR. APOSTOLAKIS: Is that the one that was
24 used in calculating in CDF?

25 MR. HAMZEHEE: No. Not the baseline.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. KRESS: No. That's just sort of an
2 industry -- that's the old industry average that you
3 want to see did not depart too far from.

4 MR. HAMZEHEE: That's exactly right.

5 MR. APOSTOLAKIS: And why do I bring the
6 industry average --

7 MR. HAMZEHEE: Because now if you look at
8 the USRP, that's the unavailability of the train based
9 on plant specific PRA. So that term with Fussell-
10 Vesely plant specific PRA are going to be in terms of
11 the same perimeters.

12 MR. APOSTOLAKIS: Wait a minute. The CDF
13 that you have there, CDF_p .

14 MR. HAMZEHEE: Yes.

15 MR. APOSTOLAKIS: Is the plant specific
16 internally events PSA?

17 MR. HAMZEHEE: Correct.

18 MR. APOSTOLAKIS: And then you bring the
19 industry average there for some reason in the last
20 parenthesis.

21 MR. KRESS: It's like your quality control
22 concept.

23 MR. WALLIS: Yes, I don't understand that.

24 MR. HAMZEHEE: Well, yes. Because what
25 we're trying to do here is that we have the plant

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 specific CDF, plant specific Fussell-Vesely, plant
2 specific USRP which is going to be under dominator.
3 And then you look at the delta.

4 Now the delta is the actual performance
5 minus something that is a baseline performance. You
6 have to have some baseline --

7 MR. SHACK: Why did you choose UA_p instead
8 of --

9 MR. APOSTOLAKIS: That's right.

10 MR. HAMZEHEE: We tried that and I'll give
11 you the answer. We've done a lot of work. We didn't
12 just use this equation.

13 The reason for that is when we use UA_p for
14 the minus, then the results when you compare it to the
15 actual using the full scope PRA don't compare. You get
16 a much closer approximation when you use this
17 equation.

18 MR. APOSTOLAKIS: Well, what do you mean
19 that they don't compare? I don't understand that.

20 MR. HAMZEHEE: In other words, if you
21 use--

22 MR. BARANOWSKY: No. I know what he's
23 saying. He's saying remember this is an
24 approximation. And first of all what's not clear I
25 think to this Committee is why we're using a baseline

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to start off with.

2 The baseline is the same situation that
3 was used when the original performance indicators were
4 instituted. We have to identify what is an acceptable
5 level of performance to measure departures from.

6 MR. HAMZEHEE: Right.

7 MR. BARANOWSKY: So the baseline is
8 measured against what the performance was in the '95
9 to '97 time frame consistent with what was known at
10 the current PIs as documented in 99-007 SECY. So we
11 didn't want to deviate from that philosophy. So we
12 have a baseline of if you're at this baseline, you're
13 okay.

14 Now the reason for using the Ap in the
15 denominator is since this is a linear approximation,
16 we wanted to agree as best as possible over the
17 realistic range with the full model. We ran the full
18 model and we found out that when we used the value
19 that was in the PRA for the unavailability in this
20 equation, it gave us a better agreement for that
21 linear approximation over the range of values that
22 were realistic to be expected in terms of deviations
23 from the baseline.

24 MR. WALLIS: I thought the whole idea was
25 to be plant specific.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. BARANOWSKY: It is plant specific.

2 MR. WALLIS: Now you're bringing in a
3 baseline which is an average of all the other plants
4 and it's not plant specific.

5 MR. KRESS: That's the acceptance
6 criteria.

7 MR. BARANOWSKY: The acceptance criteria
8 is that -- I mean, it would be very hard for us to
9 pick a baseline -- I mean, that's the right to do it
10 is to pick a baseline for every single plant that
11 matches up with where they were in '95 to '97. But
12 going back and getting that information seemed to be
13 outside of what we were able to do. And this is
14 practical and I think people are satisfied.

15 MR. KRESS: Yes, George, this is not your
16 concept of plant specific acceptance criteria at all.

17 MR. APOSTOLAKIS: No, wait, wait, wait.
18 Well, I could see something like this: I have an
19 industry wide average which is a baseline and then I
20 have this plant. For this plant I have a plant
21 specific CDF, right? I can work backwards now and say
22 this plant deviates from the industry average by this
23 much; it's higher, say, by this much. And then I will
24 use that as part of my acceptance criteria for the
25 actual deviation. But I would not use the deviation

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in equation three, the actual performance.

2 In other words, derive the acceptance
3 criterion first and then you look at the actual
4 performance and somehow you adjust it to the plant
5 specific situation.

6 Let's take the situation where this
7 particular plant is extremely redundant, okay? So the
8 UA_t calculated using the baseline and the nominal that
9 they use at the plant gives me --

10 MR. SHACK: The UA_t is real.

11 MR. APOSTOLAKIS: Yes.

12 MR. SHACK: The UA_t is real.

13 MR. APOSTOLAKIS: UA_t is real, but I would
14 not be using UA_t in equation three.

15 MR. SHACK: I sure will.

16 MR. APOSTOLAKIS: No, no, no, no. One way
17 of developing the acceptance criteria, if you want to
18 compare with the baseline, is to say because this
19 plant is so redundant, I will allow the actual
20 performance to deviate more from the nominal
21 performance. Because I'm already low. But that's not
22 what they're doing unless it's built into it, and I
23 don't see.

24 MR. SHACK: I think it is. It's saying
25 that they're measuring their performance versus the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 industry performance and this guy's extremely
2 redundant. He can let his unavailabilities go up and
3 he doesn't get penalized as much.

4 MR. BARANOWSKY: That's correct.

5 MR. SHACK: So that if he's worse than
6 average, he's going to have to --

7 MR. APOSTOLAKIS: Well, if that idea is
8 built into this, and it's not clear to me right now --

9 MR. KRESS: It seems possible to me that
10 UA_t minus UA_{BLT} could be a negative number.

11 MR. BARANOWSKY: That's right. Yes, it
12 can. That in essence says the risk associated with
13 unavailability for the time period of interest is
14 declined. That's possible. Performance improved, if
15 you will.

16 MR. KRESS: No, I maintain that --

17 MR. APOSTOLAKIS: No, the performance is
18 not improved.

19 MR. KRESS: I maintain the UA_t could be a
20 decrease in performance and still have a negative
21 number there.

22 MR. BARANOWSKY: A decrease in
23 performance.

24 MR. KRESS: For that plant.

25 MR. SHACK: If he's good enough and he

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 could even decrease his performance if he's good
2 enough.

3 MR. APOSTOLAKIS: There are two points of
4 reference, Pat. One is the industry average and one
5 is the nominal unavailability of the train of this
6 plant.

7 MR. BARANOWSKY: That's the p value.

8 MR. APOSTOLAKIS: Yes, let's not go there
9 now.

10 MR. BARANOWSKY: Right.

11 MR. APOSTOLAKIS: You can be measuring
12 deterioration with respect to the industry average.

13 MR. BARANOWSKY: That's right.

14 MR. APOSTOLAKIS: Or with respect to the
15 nominal of the plant.

16 MR. BARANOWSKY: Oh, that's true. That's
17 true.

18 MR. APOSTOLAKIS: Now, what is three
19 doing? Compared to what?

20 MR. BARANOWSKY: Okay. Here's the other
21 reason for doing it this way.

22 MR. APOSTOLAKIS: I may be deteriorating
23 with respect to --

24 MR. BARANOWSKY: The other reason for
25 doing it is the current value, UA_p , is changing in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 time. Not quite rapidly as UA_t .

2 Now, the idea was instead of saying well
3 let's just look at how things deviate from some
4 current performance, which means every time you make
5 an improvement you then have a little ratchet look at
6 this thing instead of saying what's the baseline upon
7 which I want to measure your performance change from
8 so that there's some acceptance criteria that doesn't
9 change forever. That's what it is.

10 MR. ROSEN: So this is to avoid the
11 ratchet?

12 MR. BARANOWSKY: This is to avoid
13 ratcheting.

14 MR. ROSEN: Self-ratcheting?

15 MR. BARANOWSKY: That's right. You would
16 be self-ratcheting every time you updated your model.

17 MR. ROSEN: Let's take a plant that is
18 updating his model routinely and its performance is
19 gradually improving. And then over time at one point
20 it no longer improves. It's been improving for five
21 years and now they have a bad quarter or a bad half a
22 year.

23 MR. BARANOWSKY: Right.

24 MR. ROSEN: Now their performance
25 indicator is going to go --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: That's exactly right.
2 They'll be penalized --

3 MR. ROSEN: Even though they've been
4 improving for six years and they're below the industry
5 average?

6 MR. APOSTOLAKIS: Let's understand first
7 of all what three does. Not what it should be doing,
8 what it does.

9 You remember the way the threshold for the
10 industry was set, it was the 95th percentile of the
11 plant-to-plant variability curve. They put 103 units
12 unavailability and said 95 percentile. Right? That
13 was the threshold.

14 MR. BARANOWSKY: Yes.

15 MR. APOSTOLAKIS: Okay. It does not say
16 automatically that the thing in parenthesis is
17 negative for 95 percent of the plants.

18 MR. KRESS: That's what I would have
19 thought.

20 MR. HAMZEHEE: No. Not really.

21 MR. APOSTOLAKIS: Why not?

22 MR. BARANOWSKY: Because the UA -- the
23 baseline UA has nothing to do with a 95 percentile
24 point.

25 MR. APOSTOLAKIS: No. But that's what --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. BARANOWSKY: This is a different
2 number.

3 MR. HAMZEHEE: This is a different number.

4 MR. APOSTOLAKIS: This is not the
5 threshold that was set at the time?

6 MR. BARANOWSKY: These numbers are derived
7 from different information because the whole
8 formulation is different.

9 MR. APOSTOLAKIS: But I thought you said
10 that you wanted to maintain that 007 approach?

11 MR. BARANOWSKY: No. What we wanted to
12 maintain was the fact that we're baselining it to the
13 '95 to '97 time period. But this unavailability
14 definition is different than the one that was used in
15 the 007 unavailability definition. Therefore, the
16 number's different.

17 MR. SHACK: You said it was an industry
18 average, right?

19 MR. BARANOWSKY: This is an industry
20 average. What we were looking for before was the
21 deviation from the 95 percentile measurement. This is
22 what's the deviation from an acceptable baseline
23 performance that gives me a delta CDF index of some
24 value.

25 MR. WALLIS: What's the baseline

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 unavailability value for a train T which is unique to
2 a given plant?

3 MR. BARANOWSKY: What we said was we
4 didn't have that --

5 MR. WALLIS: Never happen?

6 MR. BARANOWSKY: Well, that's not such an
7 easy thing for us to go and get.

8 MR. HAMZEHEE: Did you say what's the
9 value for UA_t ?

10 MR. WALLIS: How do you get an average,
11 the industry average for a particular train which is
12 unique to a given plant. That's a certain plant that
13 has different design.

14 MR. HAMZEHEE: Remember, though, I think
15 we talk about in a couple of pages. But that specific
16 curve is the summation of unplanned and planned
17 unavailabilities. Okay. And then the planned version
18 of it is plant specific baseline.

19 In other words, because plant A and plant
20 B have different maintenance practices; some do more
21 PMs, some do less PMs. So the plant portion of it is
22 plant specific and the unplant portion we are going
23 to use a three year average based on industry
24 information.

25 MR. APOSTOLAKIS: Plant specific or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 industry?

2 MR. HAMZEHEE: No. There are two terms for
3 that UA baseline. One is a plant unavailability which
4 is based on preventive maintenance, surveillance
5 testing. Those are going to be plant specific values.

6 This other portion of the unavailable are
7 due to unplant maintenance activities such as
8 corrective maintenance. Those corrective maintenance
9 consistent with PRAs are going to be average of the
10 industry. And we picked '95 to '97 based on what Pat
11 explained.

12 MR. APOSTOLAKIS: But why? I mean, I
13 don't understand that. Why is some part plant
14 specific --

15 MR. HAMZEHEE: Well, because the answer is
16 because for the plant maintenance activities they are
17 very plant specific. Every plant has a different PM
18 program, different --

19 MR. APOSTOLAKIS: But the unplanned
20 presumably are correlated with the planned ones.

21 MR. HAMZEHEE: That's not true. Now --

22 MR. APOSTOLAKIS: That's not true?

23 MR. HAMZEHEE: Well, there's some
24 relationship --

25 MR. APOSTOLAKIS: It's not true for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 preventive maintenance. I expect not to have many
2 unplanned --

3 MR. HAMZEHEE: Right, there's some
4 relationship. But the unplanned portion is based on
5 some failure; either random failures or some dependent
6 failures based on your maintenance activities.

7 MR. APOSTOLAKIS: Right. So you're going
8 to penalize this guy who has an excellent PM program
9 because some other guy doesn't do that and has a lot
10 of unplanned SCRAMs. I mean, that's very arbitrary,
11 isn't it?

12 MR. HAMZEHEE: I don't think so.

13 MR. KRESS: You have sparse data on the
14 unplanned.

15 MR. BARANOWSKY: I don't understand what's
16 going on here, to be honest with you. All I can tell
17 you is this is a measure of the change in CDF that's
18 associated with departures from a baseline value of
19 unavailability that's determined to be acceptable.
20 Okay. That's all this is, nothing more.

21 MR. APOSTOLAKIS: Okay.

22 MR. BARANOWSKY: And if we had not used
23 this formula that you see here, you would have seen
24 the full blown PRA model with all the Bayesian
25 expressions and you would have still seen delta UA--
