

1 MR. SHACK: Pat, let's just pick it a
2 different way. Why didn't you pick a baseline that
3 was the plant's average for '95, '97 and it would
4 never change?

5 MR. BARANOWSKY: Because it's a sparse
6 data.

7 MR. KRESS: Because it's sparse data that
8 you don't have.

9 MR. BARANOWSKY: If you only take that
10 many years, some plants are -- even though
11 statistically are going to have a high number and some
12 are going to be low because they were going into
13 outages or not in outages --

14 MR. KRESS: Exactly.

15 MR. BARANOWSKY: So we needed to take more
16 data.

17 MR. KRESS: And then they did the best
18 they could with that --

19 MR. BARANOWSKY: Right.

20 MR. KRESS: -- by using the planned for
21 plant specific.

22 MR. BARANOWSKY: Exactly.

23 MR. KRESS: And they knew that wasn't all
24 of it, and they got the rest of it --

25 MR. APOSTOLAKIS: But let me change the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 statement. Instead of using the '95, '96, '97 data,
2 use the number that the utility used in calculating
3 the CDF. Because that number included all these
4 considerations.

5 MR. KRESS: That might be another choice.

6 MR. APOSTOLAKIS: And that could serve as
7 the baseline.

8 MR. SHACK: You say UA_p 2000 and then that
9 would be fixed forever.

10 MR. APOSTOLAKIS: Whatever.

11 MR. BARANOWSKY: Well, as it turns out,
12 this a mute discussion because the numbers are about
13 the same whether you use the '95 to '97 or the '99 to
14 2001, as Hossein is going to tell you. Okay.

15 We only did the '95 to '97 to be
16 consistent with the philosophy that was espoused in
17 99-007.

18 MR. APOSTOLAKIS: You know, this is a
19 discussion that at least on the Committee we've had
20 several times in the last two or three years. It
21 comes back to the fundamental objective of this ROP.
22 In quality control in manufacturing, forget about
23 reactors for a moment, the whole idea of quality
24 control is to measure deviations that could be
25 unacceptable from the expected performance of this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 machine. I don't care that there other 10,000
2 machines in the world. My machine. Okay?

3 Now, we come to reactors. If we bring
4 this philosophy over to ROP, then we would be saying
5 I want to know whether San Onofre has deviated from
6 San Onofre's expected performance as reflected in the
7 PRA.

8 The 007 said no, we're not going to do
9 that. We're going to look at San Onofre and say is
10 San Onofre deviating from the industry average.
11 Different approach.

12 MR. BARANOWSKY: Well, George, I think --

13 MR. APOSTOLAKIS: Different approach. And
14 that's what you're trying to --

15 MR. BARANOWSKY: George, wait a minute.
16 No, not exactly. I'm not sure I think I agree with
17 you.

18 If I'm making parts for airplanes in four
19 different factories on machines and I have a
20 specification for what's acceptable, I apply a QA that
21 includes deviations from the specification to those
22 four different machines. I don't have a different
23 deviation spec for each machine. So I'm not sure I
24 agree with your --

25 MR. APOSTOLAKIS: No, but your machines in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 manufacturing are identical. Here you have different
2 device.

3 MR. BARANOWSKY: They're never
4 identifiable, just like all these --

5 MR. APOSTOLAKIS: No, no. Here you have
6 different designs here. I mean, the curves in 007
7 show that.

8 MR. BARANOWSKY: I think the principle I
9 espouse is correct.

10 MR. APOSTOLAKIS: The fundamental question
11 is do I want to know how much South Texas deviated
12 from South Texas' performance or do I want to know how
13 much Texas deviated in the industry average?

14 MR. HAMZEHEE: And I think Steve made a
15 good point.

16 MR. SHACK: No, you want to know how much
17 South Texas deviated from acceptable performance.

18 MR. HAMZEHEE: That's exactly the point.

19 MR. SHACK: The question is how do you
20 determine acceptance performance.

21 MR. HAMZEHEE: That's exactly the point.

22 MR. APOSTOLAKIS: Well, it's stating the
23 same question a different way.

24 MR. SHACK: No, it's a different question.

25 MR. APOSTOLAKIS: Okay. If acceptable is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 with respect to -- is acceptable performance with
2 respect to industry average. Because acceptable is
3 also the fact that I have licensed it. That was
4 acceptable independently of industry average. I
5 licensed South Texas. So if I licensed it and I do
6 the PRA, the PRA tells me that this is what the NRC
7 licensed. And then acceptable for me --

8 MR. KRESS: George, let's look at UA_p for
9 a moment; that's the unavailability that's in the PRA.
10 Now supposedly they try to keep that updated in a
11 basin sense.

12 MR. APOSTOLAKIS: Sure.

13 MR. KRESS: Because they want to use plant
14 specific data and say well I didn't know what to use
15 when I first started my PRA for this, but I'm going to
16 adjust it as I go along.

17 UA_{BLT}, it's almost the same thing, which is
18 what you're asking for it to be. It's almost the same
19 thing because they're using the plant specific planned
20 maintenance and are saying "Well, I still don't have
21 enough plant specific data to add to that to make it
22 the total, which I would put in for my UA_p anyway. So
23 they're trying to get those two to approach the same
24 thing, like you're talking about, but they have to use
25 industry wide data because they don't have enough

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 plant specific data to do it.

2 I think it's probably a pretty good way to
3 do it.

4 MR. SHACK: I mean, the plant is free to
5 make UA_p get better and better every day. I mean
6 that's their choice.

7 The NRC says there's some level of
8 unavailability below which we will not let you go.
9 And those are different numbers. Well, they are
10 approximating it here but the performance that they
11 had in '95 to '97.

12 MR. HAMZEHEE: That's correct, yes.
13 That's correct.

14 MR. APOSTOLAKIS: What is the level of
15 unavailability? I don't understand that. I see the
16 difference.

17 MR. ROSEN: It's not exactly what you
18 said, Bill. The level of unavailability below which
19 you may not go is defined by your tech specs. And it
20 is a level well above --

21 MR. SHACK: No. This is a level by which
22 we think your performance is unacceptable. It's not
23 legally unacceptable, but it's a level below we will
24 start coming and looking --

25 MR. ROSEN: It will change your color of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 one of your --

2 MR. SHACK: That's right. This is a level
3 that if you go beyond it we will change the color of
4 one of your indicators. You will get management
5 attention. If you don't think that gets a lot of
6 attention, you're wrong. It does.

7 MR. APOSTOLAKIS: Let's talk talk about
8 UA_p minus UA_{BLT} divided by UA_p . What is that?

9 MR. HAMZEHEE: That tells you that based
10 on your actual performance or actual unavailability
11 during a 12 quarters time frame what fraction of that
12 unavailability was changed or increased with respect
13 to baseline. In other words, UA_t minus UA_{BLT} divided
14 by UA_p gives you the fraction of change in your
15 unavailability.

16 MR. APOSTOLAKIS: But why do I divide by
17 UA_p ? That's not in the numerator.

18 MR. HAMZEHEE: No, no, no. If you look at
19 the equation and I am moving USRP to the last term,
20 make it easier.

21 MR. APOSTOLAKIS: Right. Right.

22 MR. HAMZEHEE: And if you look at that,
23 you see that you get a fraction.

24 MR. APOSTOLAKIS: But usually to get a
25 fraction of deviation from something, you subtract the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 actual performance from the something and then the
2 something is in the denominator, too.

3 MR. HAMZEHEE: That's correct.

4 MR. APOSTOLAKIS: Instead you're dividing
5 by something else.

6 MR. SHACK: But he's got to get the U_{Ap}
7 out of there because he's built that into the delta
8 CDF and he's going to compute from CDF times Fussell-
9 Vesely.

10 MR. BARANOWSKY: Right. In order to make
11 this agree with the PRA model we have to use that
12 value. This is an approximation. We could have
13 written 18 pages of fault trees here. Okay. And
14 probably would have gotten away with it. But instead
15 we took something simple and said assume this stuff in
16 the brackets is 18 pages of fault trees. All right?
17 And we changed only one perimeter, the UA, and we've
18 compared it to baseline and we did the delta
19 calculation. That's it.

20 MR. SHACK: Now, if I was writing this
21 equation, I would write parenthesis CDF star FV
22 divided by U_{Ap} . And that's really the CDF DUA and
23 then I would have delta U multiplying --

24 MR. HAMZEHEE: And we have some backup
25 information in our Appendix F that does have all those

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 derivation and how we got to this point. We just
2 didn't want to bore you with those things. But if you
3 like, we can give you the information after the
4 meeting.

5 MR. ROSEN: You don't know our problems.

6 MR. BARANOWSKY: Well, could I suggest
7 that we're also looking at just to see if there are
8 some other better approximations. And it's not, you
9 know, closed book necessarily. But I think this is
10 the way we want to go. And we can come back to this
11 at another meeting and let's get some --

12 MR. KRESS: George might have been happy
13 if you would have had UA_{BLT} in the denominator. Would
14 that be just as bad or good --

15 MR. HAMZEHEE: Yes, we tried that.

16 MR. KRESS: You tried that?

17 MR. HAMZEHEE: And I tell you why we got
18 erroneous results. The problem we're having is your
19 Fussell-Vesely is based on your plant specific PRA.
20 And if the USRP is not, then you divide them by each
21 other, you get different contributions.

22 MR. KRESS: But the plant specific UA_p
23 should have been something like a UA_{BLT}

24 MR. SHACK: It shouldn't be very
25 different.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. KRESS: It shouldn't have been very
2 different.

3 MR. HAMZEHEE: That's correct, yes.

4 MR. SHACK: This seems like the correct
5 first order --

6 MR. KRESS: Yes.

7 MR. HAMZEHEE: That's correct.

8 MR. KRESS: It's a very good first order
9 approximation.

10 MR. APOSTOLAKIS: CDF times FV by itself
11 is the change -- the maximum change in CDF I can get
12 if I assume the component is always good.

13 MR. HAMZEHEE: That's correct.

14 MR. APOSTOLAKIS: Without dividing by
15 anything?

16 MR. HAMZEHEE: That's correct.

17 MR. ROSEN: It's like the inverse of --

18 MR. APOSTOLAKIS: So now I want to somehow
19 take a fraction of that and consider it acceptable in
20 my plant?

21 MR. HAMZEHEE: Yes.

22 MR. APOSTOLAKIS: So I will multiple by
23 some fraction.

24 MR. HAMZEHEE: By fraction of change in
25 your unavailability.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: Right. But you see
2 that's the problem, that it's not a fraction of change
3 if I subtract UA_{BLT} and divide by UA_p .

4 MR. KRESS: It's an approximation, though.

5 MR. APOSTOLAKIS: To what?

6 MR. KRESS: It's an approximation to that
7 fraction you --

8 MR. APOSTOLAKIS: Well, why don't I divide
9 by UA_{BLT} then?

10 MR. HAMZEHEE: If you are mathematically
11 want to have an exact equation, you're right, it
12 should be $USRT$ minus -- BLT divided by UL_{BLT} or $USRT$
13 minus $USRP$ divided by $USRP$. That mathematically the
14 exactly term. But when we did the validation and
15 compared these with the actual full scope PRAs, this
16 equation would give us the best approximation.

17 MR. APOSTOLAKIS: So you have the actual
18 -- the exacting somewhere?

19 MR. HAMZEHEE: Yes. Well, we use the full
20 scope from all those and then we run them this
21 equation to see if you get acceptable results. You
22 know, you want to make sure what you get here is
23 somehow close to what you may get if you use your full
24 scope PRA.

25 MR. KRESS: Now you want to get what you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 would have gotten if the full scope PRA had been
2 corrected to have the right value of UA, which would
3 have been in my mind a UA_{BLT} .

4 MR. HAMZEHEE: That's correct.

5 MR. KRESS: But I maintain that UA_p is
6 close enough.

7 MR. HAMZEHEE: That's correct.

8 MR. KRESS: It just makes a good
9 approximation.

10 You know, I'm not surprised. Because the
11 full scope's formula has a UA_p in it which probably
12 isn't an updated UA_{BLT} at all. So I'm not surprised
13 that this gives you better approximation to what you
14 get by the PRA. It may not be a better approximation
15 to the delta CDF.

16 MR. HAMZEHEE: But we also had the utility
17 folks at our pilot plants -- there are how many, Tom?
18 Ten some plants that are working with us.

19 A few of them went back and validated this
20 through using their own updated PRA models. And they
21 also came out with --

22 MR. KRESS: So they had the updated UA_p ?

23 MR. HAMZEHEE: That's right. They used
24 theirs and they ran it through their models to see
25 what kind of approximation we get. And they all came

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 out with positive indications.

2 So this is a joint effort with the
3 industry. WE're not doing this in isolation.

4 MR. KRESS: Yes, I think this is a pretty
5 good approximation myself.

6 MR. APOSTOLAKIS: To what?

7 CHAIRMAN BONACA: We need to move on.

8 MR. APOSTOLAKIS: It's not clear to me
9 what we're approximating.

10 MR. KRESS: You're approximating the delta
11 CDF due to the departure of the unavailability from a
12 baseline level.

13 MR. HAMZEHEE: That's correct.

14 MR. KRESS: In fact, the delta CDF you get
15 may be negative.

16 MR. HAMZEHEE: That's correct.

17 MR. KRESS: Even though you've decreased
18 performance.

19 MR. WALLIS: That's why the word "change"
20 is misleading. You say index due to changes in train.
21 You can have an equation three with a positive or
22 negative value without changing anything.

23 MR. KRESS: That's right.

24 MR. WALLIS: So the word change is a bit
25 misleading here. It's really really the deviation of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 train unavailability from some rather arbitrary chosen
2 baseline.

3 MR. KRESS: It's a difference in your CDF
4 from some baseline CDF.

5 MR. WALLIS: Right. It's very different
6 from the idea of a change.

7 MR. APOSTOLAKIS: Yes, it's not a change.

8 MR. WALLIS: Not a change in anything.

9 MR. FORD: Reality it's a second
10 difference, isn't it? It's a change of a change.
11 It's a change in delta CDF. It's defining what you get
12 by multiplying CDF times Fussell-Vesely, doesn't that
13 give you delta CDF?

14 MR. APOSTOLAKIS: Right. Delta CDF.

15 MR. FORD: And then you're multiplying by
16 this on another change ratio --

17 MR. APOSTOLAKIS: Because they want to
18 normalize it to something else. That's really what
19 they're doing in their second difference. Their
20 second fraction. And my problem is that the
21 denominator seems to be different from what you have
22 in the numerator and you say it's an approximation.
23 And I don't know what it approximates.

24 MR. BARANOWSKY: Dale Rasmuson has a
25 comment.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. RASMUSON: The first part there, if
2 you take CDF_p times Fussell-Vesely divided by UA_p is--
3 if you work it out, is just really the Bernbaum
4 importance measure. That's what it comes down to.

5 MR. HAMZEHEE: That's another way of
6 presenting it.

7 MR. WALLIS: That doesn't help me at all.

8 MR. HAMZEHEE: I know. That's why it's
9 presented like this.

10 MR. WALLIS: Doesn't the DCFD -- isn't
11 that what it is?

12 MR. APOSTOLAKIS: Well, why do we let the
13 man finish.

14 MR. RASMUSON: You know, the Bernbaum
15 importance measure is just the partial derivative of
16 the basic event in question with respect to the core
17 damage frequency.

18 MR. WALLIS: Using the UA?

19 MR. RASMUSON: Right.

20 MR. WALLIS: It would be simpler if we
21 started with that.

22 MR. RASMUSON: Right. I mean, that's what
23 it's equivalent to.

24 MR. WALLIS: I think what we're all arguing
25 about is what you multiple it by to get anything that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 means anything.

2 MR. SHACK: -- CDF DU, then the delta
3 they've chosen is the right one. It's the actual
4 version what you find acceptable.

5 MR. APOSTOLAKIS: Why do you say DU? All
6 I see is UA_p which is the value of unavailability.
7 It's not the DU.

8 MR. SHACK: He's arguing that that does in
9 fact give you DCDF DU.

10 MR. APOSTOLAKIS: No. I don't see why. I
11 mean it's just the value of unavailability.

12 MR. SHACK: The delta.

13 MR. APOSTOLAKIS: UA_p in the denominator
14 is not a delta. It's the unavailability itself.

15 MR. WALLIS: You're looking at the
16 significance as far as CDF is concerned of the plant
17 deviating from some baseline.

18 MR. APOSTOLAKIS: I think we said earlier
19 is the more appropriate.

20 CHAIRMAN BONACA: We have been stuck on
21 this equation for 40 minutes flat. And I think we
22 need to make some progress.

23 MR. APOSTOLAKIS: Now let's to equation
24 two.

25 CHAIRMAN BONACA: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: Let's go to equation
2 two.

3 CHAIRMAN BONACA: The next 40 minutes,
4 yes.

5 MR. APOSTOLAKIS: If I have one of the
6 four system, the four trains --

7 MR. HAMZEHEE: Yes.

8 MR. APOSTOLAKIS: Then my UAI will be
9 worse than if I -- in a plant where I have two trains.
10 I don't understand why.

11 MR. HAMZEHEE: No. But remember if you
12 have four train system, then you have four Fussell-
13 Vesely values.

14 MR. APOSTOLAKIS: Lower.

15 MR. HAMZEHEE: Exactly. You got it.

16 MR. APOSTOLAKIS: But I still don't
17 understand why UAI is a sum.

18 MR. ROSEN: Say the rest of that sentence.
19 You have a four train system, you have four Fussell-
20 Vesely values and?

21 MR. HAMZEHEE: You're going to have four
22 different values for Fussell-Vesely. And when you use
23 equation three to add four terms, using equation three
24 then the equation three because of the Fussell-Vesely
25 is going to be much smaller quantity because of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 importance of one train for the four train system is
2 going to give much lower Fussell-Vesely value. So it
3 does very nicely put together the PRA model into a
4 four train system by having those terms multiplied and
5 added together.

6 MR. APOSTOLAKIS: Well, let's look at
7 equation two now.

8 Why is the system unavailability index due
9 to changes in train unavailability, the sum of the
10 unavailability and this is for the trains? Because
11 the system unavailability is not the simple product or
12 the simple sum of train unavailability. There is
13 coupling there because of the testing schemes. So I
14 don't understand why it's the sum.

15 And the word "change" just throws me off
16 everywhere I see it. It is what Dr. Wallis said, that
17 these are changes not in performance, they're changes
18 with respect -- differences actually from some
19 baseline performance?

20 MR. HAMZEHEE: Yes, I think --

21 MR. APOSTOLAKIS: So these are differences
22 from the baseline?

23 MR. HAMZEHEE: That's correct.

24 MR. APOSTOLAKIS: Not changes due to
25 random --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: Well, that's what it said,
2 changes in train unavailability relative to the
3 baseline value. That's the more accurate -- well,
4 you're right. I'm just adding that. It means
5 relative to the baseline value. That's what it means.

6 Now, we didn't write everything here
7 because the intention was not for this to be a
8 textbook.

9 MR. APOSTOLAKIS: No. The problem of
10 saying is that you're dealing with collecting data.

11 MR. HAMZEHEE: Yes, sir.

12 MR. APOSTOLAKIS: And changes there mean
13 that the data collect now should tell me that I
14 deviate from what was happening before. But that's not
15 what you mean. You mean from some baseline.

16 MR. HAMZEHEE: Relative to a baseline
17 value. That's what these --

18 MR. APOSTOLAKIS: Anyway, why is equation
19 two true?

20 MR. HAMZEHEE: Because the way -- you're
21 right. Now, you look at the system from a reliability
22 perspective, what you said is very true. But the way
23 we look at the PRA models and we wanted to evaluate
24 the contribution of a system unavailability on total
25 CDF, in reality what we do is we go to that system

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 components and trains and change their perimeters from
2 a nominal value to some changed value at the same
3 time.

4 Once we make those changes, then we go
5 back and requantify the CDF to get a revised CDF.

6 So the way we're doing it here is in a
7 sense doing the same thing. You're saying if the
8 unavailability of train changes by X percent or by X
9 hours and B by Y hours, you go back in reality when
10 you do the full scope evaluation of those changes by
11 changing the system train A increasing or decreasing
12 it by some value. At the same time you go use the
13 train B increase or decrease unavailability. And then
14 you requality your core damage frequency.

15 MR. APOSTOLAKIS: So what's this? This
16 sub.

17 MR. HAMZEHEE: Yes.

18 MR. APOSTOLAKIS: It doesn't say --

19 MR. HAMZEHEE: But the way we have
20 formulated the equations, you sum it but using
21 equation three gives you exactly what you do in
22 reality when you try to measure the impact of a change
23 in a system performance on CDF.

24 CHAIRMAN BONACA: Let me just say this.
25 Okay. This is not the proper approach to go about

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 this equations. I mean, clearly maybe the best thing
2 to do is to give you a chance to go back and write --
3 all this discussion in writing, maybe 3, 4, 5 pages,
4 so that we can review it and then we much better can
5 understand. Because I think we're getting back to the
6 same definitions.

7 I wrote down deviation availability from
8 the baseline about half an hour ago and now the same
9 point is being made again. I mean, so otherwise we're
10 going in circles.

11 MR. KRESS: It wasn't exactly the same
12 point. But owing to the comment to George that the
13 summation -- George. George is not listening.

14 MR. APOSTOLAKIS: I have to listen. I
15 think he's complaining. I'm sorry.

16 MR. KRESS: The reason the summation is
17 all right is because this is an index, it's not a real
18 thing. It's an index.

19 MR. APOSTOLAKIS: I don't understand that.
20 I mean, the system consists of two trains. They
21 probably listed performance of the trains is not
22 independent. They're not independent because they
23 have coupled them by the way I do tests.

24 MR. KRESS: I don't care. I just want an
25 index that tells me there's something different than

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 what I used to have.

2 MR. APOSTOLAKIS: But it has to have some
3 basis --

4 MR. BARANOWSKY: It has a basis, but I
5 think that we're not going to solve it here, as Dr.
6 Bonaca said.

7 MR. APOSTOLAKIS: Absolutely.

8 MR. BARANOWSKY: I suggest that we do
9 produce a document that you can look at.

10 MR. APOSTOLAKIS: Yes, good.

11 MR. BARANOWSKY: Which I think we have to
12 do anyhow.

13 MR. APOSTOLAKIS: Are we here in this next
14 week as well?

15 CHAIRMAN BONACA: No.

16 MR. HAMZEHEE: It may be the short version
17 of this presentation to full Committee next week.

18 CHAIRMAN BONACA: I don't want to see any
19 equations next week.

20 MR. HAMZEHEE: No, no. Just text, you're
21 right.

22 MR. BARANOWSKY: Because we're coming back
23 to this Committee --

24 CHAIRMAN BONACA: In fact, I heard before
25 the plan is to have a couple of more updates before we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 have a product that we would comment on. So that --

2 MR. APOSTOLAKIS: A two or three pager
3 explaining the basis of these equation. And when you
4 say approximation, explaining what you're
5 approximating would go a long way towards --

6 CHAIRMAN BONACA: Well, most of all, I
7 mean they've made an effort to explore different
8 possibilities. They did that. And I think if you can
9 describe that and explain to us why you made the
10 choice you made.

11 MR. ROSEN: In your white paper how a
12 system with three trains in a system with two trains
13 gets -- how the system with three trains gets credit
14 for the --

15 MR. HAMZEHEE: Yes. All right.

16 MR. ROSEN: You know, with some arrows so
17 the stupid ones like me can understand to see how
18 you're dividing it out.

19 MR. APOSTOLAKIS: Another thing I would
20 appreciate is if I do consecutive testing of the
21 trains or I do staggered test, would that make any
22 difference anywhere here. Don't answer now.

23 MR. HAMZEHEE: All right. All right. We
24 will provide some backup documentation and background,
25 and then we'll give it to you.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. BARANOWSKY: We now we have something
2 to do for the next time we get together.

3 MR. WALLIS: But I disagree with Pat's
4 suggestion that the next presentation have no
5 equation. I mean, these are such simple equations
6 that we ought to understand.

7 MR. BARANOWSKY: At the full Committee?
8 That's next week.

9 MR. WALLIS: Yes, based on what you're
10 doing.

11 MR. BARANOWSKY: Well, we're not going to
12 have a white paper put together by next week.

13 MR. WALLIS: But there's nothing
14 complicated.

15 MR. BARANOWSKY: I agree with you. It's
16 not a problem, it's just that --

17 CHAIRMAN BONACA: Wait a minute. They can
18 state what the meaning of the equation is. Okay. But,
19 you know, we shouldn't be there taking it apart and
20 questioning every single step. There is no time for
21 doing that. I mean simply we have to have a better
22 understanding before we get to Committee.

23 MR. APOSTOLAKIS: If we have your letter
24 next week, then it's okay.

25 MR. HAMZEHEE: And I think the idea was to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 provide some concept and give you background
2 information, you read them and come back to us if you
3 have more questions. There are some background
4 information, yes.

5 MR. ROSEN: But they're the same
6 equations?

7 MR. HAMZEHEE: We are not going to go over
8 any detail, but let me just spend a few minutes and
9 tell you what the next page equations are if you don't
10 ask me any questions.

11 The next one is very similar to
12 unavailability index, but this is not for
13 unreliability. The only difference is the other one
14 was done at the train level, this is done at the
15 component level for active components within a system.

16 MR. APOSTOLAKIS: Now why on earth is the
17 same here, this is Bayesian-updated component
18 unreliability for previous 12 quarters and the
19 previous one you don't say Bayesian-update?

20 MR. HAMZEHEE: It's a very good question.
21 But, George, you realize that in any PRAs for
22 unavailability we always use exact numbers for
23 unreliability, we use Bayesian-update.

24 MR. APOSTOLAKIS: Why don't we use
25 Bayesian for unavailability?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: Because unavailability you
2 have more data and more information, the uncertainty
3 is lower than if you use the unreliability that is
4 very scare and you don't have as much events.

5 MR. APOSTOLAKIS: So you are taking the
6 approach now that use Bayesian when I have lot of
7 uncertainties. That doesn't make sense. I mean, you
8 can use it all the time.

9 MR. HAMZEHEE: Is that done in PRAs?

10 MR. APOSTOLAKIS: Not some PRAs, not all
11 PRAs.

12 MR. HAMZEHEE: The majority of the PRAs
13 they don't do Bayesian on unavailability.

14 MR. APOSTOLAKIS: This is not a democracy.
15 We are not voting here. Okay. Most PRAs don't do
16 uncertainty analysis. That doesn't mean they're
17 right. Okay?

18 MR. HAMZEHEE: All right.

19 Now, that's the concept. Do you want me
20 to spend anymore time or are you happy with just what
21 I said?

22 MR. APOSTOLAKIS: I don't want to spend
23 anymore time, but that doesn't mean we're happy.
24 Don't draw conclusions.

25 MR. KRESS: I'd like to hear about

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 equation five.

2 MR. APOSTOLAKIS: Oh boy.

3 MR. HAMZEHEE: Okay. Equation five now
4 for unreliability you see that you have that URBC
5 which is the actual unreliability that is going to
6 measure for any period, in this case 12 quarters.

7 Now, to calculate that if you remember
8 John's definition the unreliability, the way we define
9 it to make sure that the combination of unavailability
10 and unreliability is complete, we define it as a
11 failure of the component to function on demand or
12 given that it is started successfully on demand, it
13 continues operating for the mission time. So this is
14 what that equation is.

15 And the PD give you the probability of the
16 components failing to function on demand. And the
17 second term gives you the probability that it's going
18 to fail during the mission time. And the T_m is the
19 mission time, which usually is about 24 hours, in some
20 cases different.

21 MR. KRESS: Well, really the question was
22 why wasn't that by the -- and you answered it it's the
23 mission time.

24 MR. HAMZEHEE: That's correct. Not a
25 fault exposure time. That's correct.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: Now, the failure on
2 demand probability. Isn't that one of the views of
3 before?

4 MR. HAMZEHEE: No. None of these things
5 were used in the previous page. Those were all
6 unavailabilities only, which were the direct
7 calculation of unavailable hours divided by the number
8 of hours that the reactor was critical.

9 MR. APOSTOLAKIS: So it's only
10 unavailability due to some reason that --

11 MR. HAMZEHEE: Planned and unplanned
12 maintenance.

13 MR. APOSTOLAKIS: Okay. So it then
14 includes that plus something else?

15 MR. HAMZEHEE: That's correct.

16 MR. APOSTOLAKIS: And that something else
17 is what?

18 MR. HAMZEHEE: No. PD does not include
19 unavailability. It only includes on demand time.

20 MR. APOSTOLAKIS: On demand. On demand.

21 MR. HAMZEHEE: Remember we said that up
22 front the big equation was that the mitigating system
23 performance index has two terms. Unreliability index
24 plus unavailability index. The unavailability index
25 had all those planned and unplanned maintenance

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 activities that would make the equipment unavailable.

2 The second term is what you see here, the
3 unreliability index.

4 MR. APOSTOLAKIS: So if there is a -- I
5 mean PD would be something -- you could put the zero
6 for many cases?

7 MR. HAMZEHEE: No, it won't. Because you
8 use Bayesian-update. It can never be zero.

9 MR. APOSTOLAKIS: Physically. Look at it
10 physically.

11 MR. HAMZEHEE: Physically, yes, it could
12 be zero actually for many quarters, yes. Yes. And
13 that's why we use Bayesian, because you don't want to
14 use zero when it comes to probability.

15 MR. APOSTOLAKIS: No, no, no, no. That's
16 okay.

17 MR. BARANOWSKY: Well, if it's more than
18 that, I think the issue about using a Bayesian-update
19 has to do with sparse statistics of where you only
20 have a few numbers of demands and then you have a
21 failure.

22 If you take a piece of equipment that
23 normally, say, doesn't fail but once every 600 demands
24 and you only have then demands per year. Okay? Now
25 every once in a while there'll be a failure, but if

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 you look at only a three year period with 30 demands,
2 it's going to look like your performance was pretty
3 bad. But, let's face it; you have to have a way of
4 judging whether or not that's an outlier or not. And
5 so this allows us to do that, which is exactly the way
6 the PRAs are done.

7 MR. APOSTOLAKIS: PD represents failure
8 modes.

9 MR. HAMZEHEE: Component failure on demand
10 probability based on --

11 MR. APOSTOLAKIS: Failure modes that are
12 there because you are trying to start the thing?

13 MR. HAMZEHEE: That's correct, right. Or
14 open a valve or close a valve.

15 MR. APOSTOLAKIS: Well, start. Do
16 something.

17 MR. HAMZEHEE: Possibly start or it's
18 failure to run.

19 MR. APOSTOLAKIS: It's available in the
20 previous equation.

21 MR. HAMZEHEE: That's correct.

22 MR. APOSTOLAKIS: But it doesn't start
23 because there's some extra stresses or some --

24 MR. HAMZEHEE: Yes. As Pat said, very
25 consistent with PRAs. That's the best way of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 approximating equipment on reliability or
2 unavailability. We're not presenting anything new
3 here.

4 MR. ROSEN: And this is the solution for
5 the T over 2 problem?

6 MR. HAMZEHEE: That's exactly right.
7 That's why don't you need T over 2 and it gives you a
8 better approximation of equipment unreliability.

9 MR. WALLIS: Now, I have to say this. I'm
10 very happy that you're giving us equations, but I have
11 great difficulty getting the dimensionality right. N
12 and A seem to be numbers. And T is hours?

13 MR. HAMZEHEE: Yes.

14 MR. WALLIS: And P cannot be numbers and
15 hours and be compatible --

16 MR. HAMZEHEE: Yes. Let me just give you
17 a quick explanation. The whole thing has to be
18 dimensioned. The PD you agree that's dimension,
19 right?

20 MR. WALLIS: Well, everything is dimension
21 except this mission time, which is in hours.

22 MR. HAMZEHEE: Yes. But lambda is barely
23 a rate per hour.

24 MR. WALLIS: Well, then T is in units of
25 hours.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: Correct. Mission time is in
2 hours.

3 Are you looking at (5b) or are you looking
4 at (5)?

5 MR. APOSTOLAKIS: 3 and B are not the same
6 units.

7 MR. BRANCH:

8 MR. HAMZEHEE: Yes. Now let's go back.
9 A and B are the perimeters of the industry priors.

10 MR. APOSTOLAKIS: They're numbers.

11 MR. HAMZEHEE: B is hours also. These are
12 not the same As and Bs from (5a) to (5b).

13 MR. APOSTOLAKIS: Then B is not compatible
14 with A.

15 MR. BARANOWSKY: B is in hours.

16 MR. HAMZEHEE: Let me explain it.

17 MR. APOSTOLAKIS: Please do.

18 MR. HAMZEHEE: For the simplification of
19 it, (5a) and (5b) are two different equations. As and
20 Bs in (5a) are different from As and Bs in (5b).

21 MR. APOSTOLAKIS: Then these?

22 MR. HAMZEHEE: Correct. Just for
23 simplicity I used the same nomenclatures.

24 MR. APOSTOLAKIS: Okay. With two
25 different calculations.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: Exactly.

2 MR. WALLIS: You're going to make it clear
3 when you go do it next time?

4 MR. HAMZEHEE: Yes.

5 CHAIRMAN BONACA: I think it would be
6 important again for these equations to understand what
7 the purpose was in the index. But you tried, because
8 clearly this is an approximation, as you're saying,
9 but you try. You try different things and why you
10 chose -- you rejected most of them and you chose the
11 product that you had. And I think we'll have it in
12 writing, I think it will be easier to evaluate for
13 discussion at that time. We need to look at it again.

14 MR. KRESS: I personally think you're on
15 the right track here.

16 MR. HAMZEHEE: Thank you.

17 MR. KRESS: And don't have these problems
18 that the other guys have.

19 The one thing that I see that I worry
20 about is I don't want to know the technical basis of
21 the one times 2 to the minus 6, the thresholds. You
22 know, I understand you've taken a one times 2 to the
23 minus 4 and dropped off two orders of magnitude. This
24 is sort of arbitrary thing to me. And I would like a
25 little more explanation of that at some point.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. BARANOWSKY: Okay. But in a nutshell,
2 that came from what we did in 99-007.

3 MR. KRESS: Yes, I know. I didn't like it
4 then either.

5 MR. BARANOWSKY: And it's supposed to be
6 consistent with reg guide 1.174.

7 MR. KRESS: Yes, and I didn't like that
8 either.

9 MR. BARANOWSKY: Well then you won't like
10 our explanation.

11 MR. SHACK: If you read the Brunwick
12 letter, you'll see why?

13 MR. RANSOM: Just one quick question.

14 MR. BARANOWSKY: Yes, sir.

15 MR. RANSOM: On the URBLC that you use
16 here, is that also an industry average?

17 MR. HAMZEHEE: That is the same concept.
18 It's baseline value based on industry average for some
19 period of time. Same logic, same concept.

20 MR. ROSEN: I was wondering if you were
21 hungry when you did this, because you've orders of
22 magnitude _{BLT}s. I'll have one order of that.

23 MR. BARANOWSKY: I'm going to suggest that
24 we probably don't need to go over the rest of the
25 viewgraphs. Because we've covered the issued i them,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 you know, the thresholds, baselines and all that other
2 kind of thing. So instead of plowing through it,
3 we've got the record. It's replete with stuff for us
4 to look at and take into consideration.

5 CHAIRMAN BONACA: Would you just go
6 through the final page.

7 MR. HAMZEHEE: Do you want to go over
8 conclusions?

9 CHAIRMAN BONACA: Yes, just the
10 conclusions.

11 MR. HAMZEHEE: All right.

12 MR. APOSTOLAKIS: Well, do you want to say
13 anything about technical areas currently under
14 evaluation? Well, say something that we haven't said
15 before.

16 MR. HAMZEHEE: You want to go on the one
17 page before the last page?

18 MR. APOSTOLAKIS: What?

19 MR. HAMZEHEE: He said they wanted --

20 MR. APOSTOLAKIS: Well, there is technical
21 areas under evaluation, I'd like to hear about the
22 thresholds. Second to last page.

23 MR. HAMZEHEE: Again, these are the areas
24 that we're currently working with the industry to
25 further refine and improve. And one thing they try to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 determine the acceptable of level of false-
2 positive/false-negative indication. And the following
3 is the example. And what the first one means is the
4 probability of calling in performance indicator Y when
5 it's actually the baseline performance.

6 And the second one is calling something
7 green when it's either white or yellow and calling
8 something green when it's yellow or red. And I don't
9 even want to go over more discussion. We talked about
10 this more earlier.

11 And then the next one is issues, again, as
12 you all raised questions and concerns or mainly
13 questions. We want to again go back during the pilot
14 and revisit the baseline values for these index--
15 indices. So we're still trying to come up -- you
16 know, make sure that these values are the best values
17 to use.

18 And the third bullet talks about the fact
19 that as part of this pilot program we also want to
20 have some independent calculations of these perimeters
21 and indices using the SPAR models versus the
22 licensee's PRAs.

23 And last but not least is to evaluate any
24 potential differences that we may get using these
25 indices versus using the SDP process.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 These are the current areas that we're
2 working on.

3 And the last page are just summary of the
4 conclusion. I think based on what we've done and all
5 the work that we've done in the last year or so and
6 using a lot of insights from RBPI, we believe that
7 this MSPI approach is based on risk insights and it
8 does account for plant-specific design and operating
9 characteristics through the use of plant-specific data
10 and risk models.

11 And again, those are the things that we
12 think it does.

13 MR. APOSTOLAKIS: Wait a minute. If you go
14 back to your -- oh, remember the studies that you guys
15 do, the reliability studies?

16 MR. HAMZEHEE: Yes.

17 MR. APOSTOLAKIS: They do not define under
18 reliability as your equation five. You include the
19 human intervention. Here you don't, huh?

20 MR. BARANOWSKY: We put recovery in there.
21 That's correct.

22 MR. APOSTOLAKIS: You will put recovery in
23 there?

24 MR. BARANOWSKY: No, no. We do put
25 recovery --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: In those --

2 MR. BARANOWSKY: But there are rules in
3 the data collection for when to include recovery and
4 not include recovery. I mean, there's a definitions
5 document, there's going to be documents this thick.

6 MR. APOSTOLAKIS: I remember. But are you
7 going to do the same thing here?-

8 MR. BARANOWSKY: It's going to have a
9 procedure for crediting recovery that's consistent
10 with some guidelines that we're putting in.

11 MR. APOSTOLAKIS: So it will not be just
12 lambda T_m . It would be plus other things.

13 MR. BARANOWSKY: The data will be adjusted
14 so that those with recovery are treated differently.

15 MR. APOSTOLAKIS: Okay.

16 MR. HAMZEHEE: And that's actually how we
17 get some of the As and Bs.

18 MR. APOSTOLAKIS: Okay.

19 MR. HAMZEHEE: We apply some recovery so
20 we adjusted failure rate.

21 MR. APOSTOLAKIS: Oh, through the failure
22 rate?

23 MR. HAMZEHEE: Yes. Because some are
24 recoverable, some were not using the NUREG reports
25 that we have generated. So we're consist in that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 area.

2 Now, let's quickly go over the first
3 bullet and look those sub-bullets.

4 Use of Fussell-Vesely importance measures
5 does account for plant-specific features. That's the
6 beauty about it.

7 Treatment of demand failures in
8 unreliability indicators, that's no more fault
9 exposure time.

10 Use of Bayesian update for unreliability
11 indicators because in the short period of time you have
12 less data points, so Bayesian gives a better
13 approximation of equipment unreliability and it uses
14 risk-significant functions rather than design-basis
15 functions, MSPI.

16 And then, again, having PI for support
17 systems mainly for the cooling water, such as service
18 water and CCW.

19 And then I think --

20 MR. APOSTOLAKIS: The English is correct
21 here.

22 MR. HAMZEHEE: I'm sorry?

23 MR. APOSTOLAKIS: The English is correct
24 here.

25 MR. HAMZEHEE: Oh, good, I'm glad.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Well, the second bullet MSPI approach
2 allows -- now, that's why some of you were saying well
3 one may be negative, one may be positive. But another
4 good aspect of this approach is that you can balance
5 between component reliability and component
6 unavailability. So that the plant that is doing a lot
7 of PMs is going to have higher unavailability, but
8 hopefully he has low on reliability. So they're going
9 to balance each other in a very logical fashion and
10 it's also consistent with the maintenance rule.

11 MR. APOSTOLAKIS: Again --

12 MR. HAMZEHEE: Uh-oh.

13 MR. APOSTOLAKIS: If I do PM on one train,
14 don't I make sure the other train is good?

15 MR. HAMZEHEE: Definitely, by tech specs.

16 MR. APOSTOLAKIS: Right.

17 MR. HAMZEHEE: So?

18 MR. APOSTOLAKIS: So somehow you're
19 penalizing those people. You say, you know, your
20 unavailability is very high because you're doing a lot
21 of PM. I mean --

22 MR. HAMZEHEE: But at the train level or
23 the component level, not the system level.

24 MR. APOSTOLAKIS: AT the train level, yes.
25 And you're penalizing them for that?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: No. And you have a high
2 unavailability, but remember you sum them up. The
3 other terms which is unreliability is going to go
4 down. So you balance between unreliability and
5 unavailability.

6 MR. ROSEN: As long as you do good
7 maintenance.

8 MR. HAMZEHEE: Exactly. Now, if you do a
9 lot of maintenance but you're doing the wrong thing,
10 then both are going to go up. Then that's a good
11 indication, too.

12 MR. APOSTOLAKIS: But isn't there some
13 situations where if one thing is down, one train is
14 down, then people actually take extra measures and
15 make sure the other train is up.

16 MR. HAMZEHEE: That's correct, yes.

17 MR. ROSEN: What we do is start the other
18 train --

19 MR. APOSTOLAKIS: There's absolutely no--

20 MR. ROSEN: Start the other train first.
21 No, you don't take it out of service to check that,
22 you start it. You put it in test.

23 MR. APOSTOLAKIS: Yes, and there is no
24 credit for that.

25 MR. ROSEN: You start it and run it and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 make sure it's okay, shut it back down. And now you
2 take the other train and you're going to do
3 maintenance out.

4 MR. APOSTOLAKIS: And so why am I going to
5 be penalized for that maintenance?

6 MR. HAMZEHEE: We are not penalizing.
7 Maybe either I did not state it clearly or something.
8 The way these are consistent with PRA models, when you
9 look at the PRA model you never allow for simultaneous
10 either maintenance or test on more than one train at
11 the same time. And you know better that even if you
12 do at the end, you go back and zero out those -- that
13 have two trains out due to maintenance or testing.

14 The same thing is done here. We don't
15 penalize them. We use the same PRA model, the same
16 approach, but given that one train is unavailable,
17 that's what we're counting. The other train, the
18 models don't allow to be unavailable. So there is no
19 mismatch or no penalizing --

20 MR. APOSTOLAKIS: But your approach I
21 argue doesn't include the fact that the other train is
22 available.

23 MR. HAMZEHEE: Oh, it does.

24 MR. APOSTOLAKIS: No, it doesn't. In FV
25 only. In FV.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMZEHEE: Yes, that's because it's
2 not allowed to be unavailable.

3 MR. APOSTOLAKIS: It doesn't matter it's
4 not allowed. In FV it --

5 MR. HAMZEHEE: It does. In FV it does
6 account for it.

7 MR. APOSTOLAKIS: All right.

8 Now, in the bullet here, the before last,
9 the limitations. What is the biggest limitation of
10 what you're doing?

11 MR. HAMZEHEE: Oh, I'm sorry. Which one
12 are you?

13 MR. APOSTOLAKIS: The --

14 MR. HAMZEHEE: Well, remember the
15 limitations, for instance, is one is we do not include
16 concurrent failure of multiple components.

17 MR. APOSTOLAKIS: Okay. So that's the
18 biggest one?

19 MR. HAMZEHEE: Sure.

20 MR. APOSTOLAKIS: Good.

21 MR. HAMZEHEE: One is we don't look at
22 common cause failures. Now, they don't happen often
23 but --

24 MR. APOSTOLAKIS: No, you answered the
25 question I wanted. You know, there was an expected

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 performance and you met it.

2 MR. HAMZEHEE: And the last one --

3 MR. APOSTOLAKIS: That's to be a joke, per
4 se.

5 MR. HAMZEHEE: I don't know what is joke
6 and what's not anymore. Sorry.

7 MR. ROSEN: Now we've achieved --

8 MR. APOSTOLAKIS: See, I don't base your
9 expected performance on the NRC staff average. Would
10 you like me to?

11 MR. HAMZEHEE: Well, no comment.

12 And the last one is that it we believe
13 based on all the work we've done that it provides
14 appropriate risk categorization of performance
15 degradations that are covered by --

16 MR. APOSTOLAKIS: Okay. When you write
17 the white paper, when you say approximation, would you
18 please tell me what the exact thing is. Don't assume
19 I know, okay?

20 MR. ROSEN: You have been subjected to the
21 average level of abuse that we normally subject NRC
22 staffers to. But --

23 MR. APOSTOLAKIS: No. This group is --

24 MR. ROSEN: Maybe you need more. Maybe one
25 star. The average level times a star.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But I would like to say that --

2 MR. HAMZEHEE: Yes, sir.

3 MR. ROSEN: -- this is very good work.

4 MR. HAMZEHEE: Thank you.

5 MR. ROSEN: And it's very much in the
6 right direction and solves many of the problems that
7 I have had of the discriminatory treatment of plants
8 that exists in the current mitigating system.

9 MR. APOSTOLAKIS: What's beyond means
10 though for --

11 MR. HAMZEHEE: And thank you.

12 MR. APOSTOLAKIS: -- why for 2 or 3 years
13 now people have been telling me that plant specific is
14 not the way to go and now all of a sudden it is the
15 way to go?

16 MR. HAMZEHEE: We are learning.

17 MR. BARANOWSKY: George, I don't know
18 whose been telling you that, but remember we're trying
19 to factor in some of the latest things that we did in
20 the risk-based PI program and from what we learned
21 from doing all those studies. And we think we've got
22 enough basis to go forward with this kind of thing on
23 a plant specific basis.

24 MR. RANSOM: And one thing I don't
25 understand is why this is tied to the industry trend,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 you know, rather than being an absolute measure of
2 whether the plant is improved or not.

3 I mean, the industry is presumably a value
4 that will float and could either get worse or better.
5 And the measure now is relative to that rather than to
6 where the plant is actually operating.

7 MR. HAMZEHEE: Well, again, maybe I did
8 not explain it clearly. But once we defined the
9 baseline, we're not planning to change that. The
10 baseline we're planning to keep it constant. Because
11 as Pat said, we at some point in time basically
12 between '95 to '97 we agreed that the industry
13 performance was acceptable. So if everybody agreed and
14 we used the industry average for that period, then
15 that's going to be fixed. You don't change it anymore.

16 MR. RANSOM: Oh, okay.

17 MR. HAMZEHEE: That's the acceptable level
18 of performance.

19 MR. RANSOM: That's not changing with
20 time.

21 MR. HAMZEHEE: That's right. No, no, no.
22 And I did not explain that. I apologize.

23 MR. APOSTOLAKIS: I don't know what it
24 means that the industry performance was acceptable
25 when there is some plants that have CDFs higher than

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 10-4. Why is that acceptable? It's just that legally
2 we can't do anything about it. That's unacceptable.

3 MR. BARANOWSKY: They did not pose undue
4 risk and the Commission said that's okay.

5 MR. APOSTOLAKIS: Right. So now it's
6 undue risk and I can go from 10^{-3} all the way to 10^{-7} .
7 And we're saying this is nice and acceptable.

8 MR. LEITCH: Have you considered the
9 treatment of --

10 MR. APOSTOLAKIS: We have a goal of 10^{-4}
11 and yet being above the goal by an order of magnitude
12 is fine.

13 MR. ROSEN: Because it's an average goal
14 for the whole fleet.

15 MR. HAMZEHEE: That's right. We're not
16 taking one plant --

17 MR. APOSTOLAKIS: On the average,
18 everybody's an average person.

19 MR. LEITCH: In the treatment of shared
20 systems, for example, a diesel that's shared between
21 two units.

22 MR. HAMZEHEE: Yes. And we are -- actually
23 that's a good point. We have talked about this
24 several times during our public meeting with the
25 industry. There are some criteria that we define in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 9902, the NEI document that said if you follow and
2 omit certain criteria, those shared equipment like a
3 diesel for 2 units per plant can be credited into the
4 PR if they're credited in the PRAs, we do allow their
5 operation and that is built into the Fussell-Vesely.
6 So that's a very good point. Those plants are going to
7 have ore flexibility with the diesel generator
8 reliability.

9 MR. LEITCH: All right. In a PWR, for
10 example, where you're looking at HIPSI RCIC, RHR in an
11 HIPSI mode perhaps and diesels and cooling water
12 systems. Are we talking about 12 indicators? In
13 other words, there would be six for each one of those
14 things for unavailability and six for unreliability?
15 In other words, are we developing a whole family of
16 indicators here or all this data somehow assimilated
17 into one indicator?

18 MR. HAMZEHEE: Well, no, the one
19 unreliability and unavailability are going to be
20 combining to one. So you're going to have one PI for
21 the system. That includes unreliability contribution
22 and unavailability contribution of the system, for the
23 given system.

24 Now talking about the cooling system, as
25 you mentioned there are variations of them. And if

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 you remember, we mentioned that was one of the
2 difficulties that we encountered during the RBPI
3 Phase-1 study. And now as part of this effort with
4 the industry we are planning to combine all the
5 cooling water such as service waters, CCW or their
6 equivalent into one or two PIs. So you're not going
7 to have more than maybe two PIs.

8 MR. LEITCH: So for example to go back to
9 HIPSI just to make sure I understand, there would be
10 one HIPSI PI?

11 MR. HAMZEHEE: In this PI, correct.

12 MR. LEITCH: That would reflect both
13 unavailability and unreliability?

14 MR. HAMZEHEE: Correct. So in other
15 words, we estimated if we have six systems on the
16 average that we monitoring, we're estimating that we
17 have anywhere from 4 to 6 PIs.

18 Am I right?

19 MR. SATORIUS: Yes, that's correct.

20 MR. LEITCH: But then in order to -- I
21 mean, it's quite a different problem whether it's
22 unavailability or unreliability. They're different
23 actions the utility would take to solve those
24 problems.

25 MR. HAMZEHEE: Sure.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. LEITCH: They're different areas the
2 regulator may want to look at. So you have to go back
3 another level. In other words, if that indicator is
4 going off, you need to look back one level further
5 down the chain, so to speak.

6 MR. HAMZEHEE: Exactly.

7 MR. LEITCH: To say is this unreliability
8 problem or an unavailability.

9 MR. SATORIUS: Absolutely. And that would
10 be part of the inspection program. Because if this PI
11 would cause a system to change colors from green to
12 white.

13 MR. LEITCH: Right.

14 MR. SATORIUS: Then the action matrix
15 would indicate that there would be a supplemental
16 inspection that would take place. And that
17 supplemental inspection would be charged to do just
18 what you've indicated.

19 MR. ROSEN: But there's no question,
20 Graham, that the utilities will monitor this not at
21 the indicator level. They're monitor at the
22 unreliability and the unavailability.

23 MR. LEITCH: Yes, they already are.

24 MR. ROSEN: Yes.

25 MR. LEITCH: And what I'm saying is if you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 just looked at the indicator that you're producing, it
2 wouldn't be intuitively obvious what the problem was.
3 I mean, you would know it was our problem, but --

4 MR. HAMZEHEE: But the beauty about it is
5 that if you look at the equations, you can easily go
6 back and find out where they come from.

7 MR. LEITCH: Right.

8 MR. HAMZEHEE: So you can look at the
9 contributions and do your root cause analysis all the
10 way down to the component level. Because that's how
11 these things are built up.

12 MR. LEITCH: Yes.

13 MR. HAMZEHEE: So that would allow you to
14 go back and look at the root cause of the problems.

15 MR. LEITCH: Okay. Another question I had
16 was do you now have or do you plan to assess as part
17 of the pilot what is the level of effort on the part
18 of the utility to collect all this data?

19 MR. SATORIUS: You know, Mr. Houghton
20 whose available with NEI might be in a position to
21 speak for industry on that.

22 The question, Tom, was are we mindful of
23 and is the pilot going to investigate the level of
24 effort that licensees are going to have to expend in
25 order to capture this data. And the answer to that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 is, yes, we've gotten very good feedback. WE have a
2 working group that's been formed for approximately a
3 year and it consists of members of industry as well as
4 NEI. And we are reminded monthly that the level of
5 effort that is going to be involved with collecting
6 this data.

7 CHAIRMAN BONACA: And there was an issue
8 that was raised, in fact, by the industry that, you
9 know, if you increase the number of performance
10 indicators are you going to take back something from
11 the inspection program.

12 MR. APOSTOLAKIS: They need some sort of
13 guidance. If you increase the number of performance
14 indicators, what else are you decreasing?

15 MR. SATORIUS: Well, and I think it's our
16 view, it's the staff's view that this creation of
17 adding reliability and unavailability -- because at
18 one point in time we were looking are reliability and
19 an unavailability PI so that industry was, quite
20 frankly, balking because they were looking at going
21 from 4 PIs to a dozen, as many as a dozen. And there
22 was reluctance. And I think it was quite an
23 innovative fix to come up with this addition to where
24 you come up with really not increasing the actual PI
25 burden significantly on industry.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: Okay. This is not part
2 of the oversight process yet, right? This is still
3 research?

4 MR. SATORIUS: Oh, yes, this is a pilot.
5 And during the pilot program, George, which we would
6 intend to be about six months in length or longer,
7 depending upon the other PIs and the other program
8 would continue in parallel such that the pilot plants
9 would be burdened to not only continue to report the
10 information required by the current PI, but also to go
11 outside of that and gather this additional
12 information.

13 MR. APOSTOLAKIS: Okay. Now, one of your
14 objectives -- changing the subject a little bit -- was
15 to do -- let's see, to minimize to the extent
16 practicable the differences and increase the
17 consistency between this approach, the maintenance
18 rule, the PRA and the SDP.

19 Now, the maintenance rule, as far as I
20 know, doesn't use any industry averages, does it?

21 MR. HAMZEHEE: Mark, correct me if I'm
22 wrong. And, John, you guys know better.

23 I think here what we meant was the data
24 collection, some of the definitions --

25 MR. APOSTOLAKIS: But the maintenance rule

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 doesn't use industry averages. And I wonder why this
2 agency does one thing with industry averages and
3 another thing with plant specific numbers.

4 MR. HAMZEHEE: Here it's talking about the
5 industry average. It's talking about the areas that
6 are common to both.

7 MR. APOSTOLAKIS: Isn't it plant specific?

8 MR. HAMZEHEE: No, I understand. I am
9 saying what this bullet covers is those areas that are
10 common to the maintenance rule, to SDP and to ROP.

11 MR. APOSTOLAKIS: But let's go beyond the
12 bullet.

13 MR. SATORIUS: Let me give it a try.
14 Right now licensees are required or because of the
15 maintenance rule are required to collect data and
16 monitor the performance of systems.

17 MR. APOSTOLAKIS: Right.

18 MR. SATORIUS: And one of the pushes by
19 industry was to the extent that's practicable that we
20 make the data that they go out and collect for the
21 maintenance rule be similar or the same as the data
22 that they would collect for this PI, that the data
23 that they would collect for WANO, for the data they
24 would collect for INPO -- so it lessens the burden.

25 MR. APOSTOLAKIS: It goes beyond the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 bullet. Why in the maintenance rule we are happy with
2 the number, the baseline number -- used in its PRA and
3 in this context we are -- in the maintenance rule we
4 asked the utilities tell us what you want to put for
5 this train or this system. The utilities looked at
6 their plant specific PRA. They massaged it a little
7 bit according to more recent information and they said
8 X. We didn't ask them to go to the industry average
9 and do something and give us X star.

10 So all of a sudden we're saying we have a
11 major rule that everybody's hailing as being great
12 because it's risk informed, but is plant specific and
13 now we're doing this which in addition to being plant
14 specific evokes something that's called industry
15 average performance. And the philosophy here it seems
16 to be inconsistent and I'm wondering why.

17 Now, maybe it's not your job to do that.

18 MR. HAMZEHEE: You're right, it's not.

19 MR. SHACK: But he argues that that's only
20 a surrogate for the data that he needs.

21 MR. APOSTOLAKIS: No. He says

22 MR. SHACK: I mean we've had more
23 arguments here this afternoon. But I mean one of the
24 arguments was they tried to make -- that industry
25 average they talk about is part plant specific and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 industry average.

2 MR. APOSTOLAKIS: But why --

3 MR. SHACK: They made it as plant specific
4 as they could, they just didn't have enough data to do
5 the whole --

6 MR. APOSTOLAKIS: And why did they have
7 enough in the maintenance rule? I don't understand
8 that.

9 MR. BARANOWSKY: George, we're --

10 MR. APOSTOLAKIS: We're not talking about
11 regulation here. It's the maintenance rule. Oh,
12 those Americans are doing this -- and all of a sudden
13 there is another major rule that says no, we're going
14 to do it different this time. The rest of the world
15 doesn't do that.

16 MR. BARANOWSKY: Yes, I know. There are
17 differences in the way the maintenance rule does some
18 calculations of things. They're rigorously controlled
19 then the reactor oversight process in terms of any
20 standards, so the comparability between plants and the
21 identification of when plants on a consistent basis
22 exceed an unacceptable or a point in which we should
23 engage them more, let's say, would be inconsistent.
24 And so what we're trying to do here is identify ways
25 to get that consistency.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 We've made a number of impacts on I think
2 the maintenance rule, including especially the way
3 unavailability information is collected and how
4 unavailability is defined which was a significant
5 challenge for us, okay.

6 MR. ROSEN: A significant area for the
7 industry.

8 MR. BARANOWSKY: Yes. And I guess I'm a
9 little concerned that we're not hearing that we've
10 made a lot of progress here, and we don't have
11 perfection but we do have a lot of progress.

12 Okay. So let's identify the few things
13 that we've got to still work on, we'll be glad to work
14 on them.

15 MR. APOSTOLAKIS: No. You're
16 misunderstanding my comment. I'm not saying you
17 didn't progress. What I'm saying is that as an agency
18 we seem to be happy using one philosophical approach
19 in one major piece of regulation, the maintenance
20 rule, which is consistent with my example earlier of
21 the machines, the quality control.

22 We told them for your plant tell me what
23 this unavailability should be, but then make sure you
24 meet it. And the industry says fine, we'll do that.
25 So that was plant specific. There was no question of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 industry average. South Texas didn't give a damn of
2 what the other plants were doing. They said this is
3 us.

4 Now we are coming with this other major
5 piece of regulation and we're saying well, you know,
6 it's nice to know what you guys are doing, but we
7 really want you to compare with some industry average.

8 And I'm having a problem with this
9 different philosophical approach to two major pieces
10 of regulation.

11 MR. ROSEN: It's an accommodation. I
12 think they've said that they even had sparse data, so
13 they just did what they could.

14 MR. SATORIUS: And, George, I don't think
15 -- I can't speak authoritatively on the maintenance
16 rule, and I think we're a little bit light on that, so
17 we might want to have to get back to you on that just
18 because --

19 MR. APOSTOLAKIS: And maybe we should be
20 asking different people, you know.

21 MR. SATORIUS: That's just it. And I'm
22 thinking maybe we ask some maintenance rule people to
23 be with us when we discuss this with the full
24 Committee in case there's a short discussion on that.

25 CHAIRMAN BONACA: If I understand it, you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 have two more presentations to go through today?

2 MR. SATORIUS: Yes.

3 CHAIRMAN BONACA: That's on the industry
4 trends program. And we have an hour left. So, I
5 mean, we intend to cover this ground?

6 MR. APOSTOLAKIS: I thought we were just
7 discussing now.

8 CHAIRMAN BONACA: Well, you go into
9 discussion and the discussion is over.

10 MR. SHACK: Trending time.

11 CHAIRMAN BONACA: How long?

12 MR. SATORIUS: WE need to change two
13 people and can start in 30 seconds.

14 CHAIRMAN BONACA: Okay. Do you want to
15 take a break before we do that? Let's take a ten
16 minute break. But then that means that you have ten
17 less minutes.

18 MR. SATORIUS: We can talk quickly. This
19 is an update on the trends.

20 (Whereupon, at 4:01 p.m. off the record
21 until 4:12 p.m.)

22 CHAIRMAN BONACA: With that, let's --

23 MR. KRESS: It's the reasonable men are
24 left.

25 CHAIRMAN BONACA: We have two

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 presentations to go through.

2 I would like to ask members when you ask
3 questions to make sure we don't talk simultaneously
4 because our transcriber has pointed out that it makes
5 it very challenging for her to distinguish who said
6 what.

7 With that, this is about industry trends
8 program.

9 MR. BOYCE: Thank you. Yes. Good
10 afternoon. I'm Tom Boyce of the Inspection Program
11 Branch of NRR. And I'm going to present the industry
12 trends portion of this briefing.

13 Before I get started, after looking at the
14 dynamics that occurred and the level of questioning
15 over the last three hours I had two thoughts. The
16 first is I'm glad my colleagues went first and the
17 second is, given we only have 50 minutes left and it
18 was an average level of abuse, we won't lower the
19 average too much if you under perform in this last
20 hour.

21 I would like to set a framework, a mindset
22 for you. We're no longer at the plant specific
23 threshold level. What we're trying to do is take all
24 the indicators that we have at the plant level,
25 aggregate them into an industry average. And that was

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 alluded to earlier, but it's not an industry average
2 like we talked about in terms of this equation. It's
3 an overall level of performance that may or may not be
4 directly related to the baseline values you saw here.
5 And I'll get into that in a moment, but I wanted to
6 just -- it's easy to lose sync between a plant
7 specific indicator and a plant specific threshold
8 versus an industry indicator and an industry
9 threshold.

10 So with that also I'll be followed by Dale
11 Rasmuson of Research, and he'll talk more about
12 threshold development right after I talk about an
13 overview of the industry trends program.

14 This is what I'll be talking about. I will
15 skip going over each bullet. Just let you know it
16 follows the normal path of introduction and conclusion
17 at the end.

18 As background, improving industry trends
19 contributed to the decision to revise the reactor
20 oversight process. This is about 1998/1999 time frame
21 and simultaneous the NRC's strategic plan was revised.
22 And in that revision was included a performance goal
23 measure of no statistically significant adverse
24 industry trends in safety performance. The NRC is
25 required to report to Congress on the state of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 achieving that measure every year, and we do it as
2 part of the NRC's Performance and Accountability
3 Report.

4 Responsibility for this particular
5 performance goal measure shifted from Research to NRR
6 in late calendar year 2000. Subsequently NRR
7 developed a formal ITP in early 2001. And we
8 initially used existing indicators from the former
9 Office of AEOD, their PI program, and we also are
10 using the Accident Sequence Precursors, which I think
11 you've been briefed on several times.

12 We've provided two reports to the
13 Commission. I think you've also gotten copies of
14 those. They're SECY papers; one in June of 2001, one
15 in April of this year.

16 Bottom line, we have identified no adverse
17 industry trends to date.

18 And if I haven't said so, ITP is industry
19 trends program. Sorry if I omitted that.

20 MR. LEITCH: Have you identified any
21 positive industry trends?

22 MR. BOYCE: Each of the indicators that we
23 have monitored has shown improving trends. But we
24 have not -- as a negative agency, we haven't gone out
25 of our way to say these are all positive trends.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 We've just said that we've had no adverse trends.

2 MR. APOSTOLAKIS: As a negative agency?

3 MR. LEITCH: But aren't the positive
4 trends statistically significant. But what I'm saying
5 is are they statistically significant, the positive
6 trends?

7 MR. BOYCE: Yes, they are actually. The
8 improvements are statistically significant, and if
9 you've got the SECY papers, each of the AU DPIs, and
10 I believe there are 7 of them, have all shown
11 improving trends and they've all been statistically
12 significant. In addition, the ASP program, and we use
13 the total counts of ASP events, well that's almost
14 statistically significant through FY 2001. I think
15 the P value is like .08 and a statistically
16 significant P value, I think, is .05.

17 MR. LEITCH: So I guess I'm just trying to
18 develop a feel then. If the industry performance had
19 declined as much as it has improved in the past. Are
20 you saying it's something -- there is an adverse trend
21 then?

22 MR. APOSTOLAKIS: Right.

23 MR. BOYCE: Yes, I would. Let me -- a
24 picture is worth a thousand words, and actually when
25 we get to Dale's presentation he'll be talking about--

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 he has some graphs and will be able to illustrate this
2 point I think more clearly with automatic SCRAMs while
3 critical.

4 MR. LEITCH: Yes. Okay.

5 CHAIRMAN BONACA: But you use certain
6 number of years of performance, I mean to develop a
7 trend?

8 MR. BOYCE: That's correct. Jumping to a
9 little bit about what Dale's going to get into, we had
10 to respond to the performance goal measure very
11 quickly, and that's why we used the existing
12 performance indicators. What we decided to do was go
13 back to as long as we had what we felt was good data
14 and had confidence in the data. That year turned out
15 to be 1998 for the AEOD indicators. I believe the ASP
16 program is going back to 1993.

17 As far as those two main purposes of the
18 industry trends program, the first is to provide a
19 means to confirm that the nuclear industry is
20 maintaining the safety performance of operating
21 reactors. And the second is by clearly communicating
22 industry performance, we believe we will enhance
23 stakeholder confidence in the efficacy of the NRC's
24 processes.

25 The industry trends program actually

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 complements existing NRC processes. AS I've described
2 earlier, the reactor oversight process takes a look at
3 safety of plants on a plant specific basis. What
4 we're doing is aggregating the data and trying to look
5 for the big picture. Are we missing anything by
6 focusing on each of the 103 operating units out there.

7 While we're looking at the big picture if
8 we do discover an adverse trend in any of our
9 indicators, we would respond and take a response in
10 accordance with our existing processes for addressing
11 generic issues. Those process are the generic
12 communications process and the generic safety issues
13 process.

14 This slide shows how we communicate with
15 stakeholders, and it's in a variety of ways. We've
16 been briefing our ongoing development efforts to an
17 NRC industry working group that looks at the reactor
18 oversight process, and those have been periodic,
19 perhaps quarterly type of briefs.

20 We published the industry indicators on
21 the NRC's website.

22 There's an annual review of the industry
23 trends program and results at the agency action review
24 meeting, and we provide annual reports to the
25 Commission in those two SECY papers so far that I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 alluded to on an earlier slide.

2 We also provide an annual report to
3 Congress and the graphs of the industry indicators
4 were included in the most recent report to Congress.
5 And these industry indicators are also presented at
6 various conferences with industry. The most example
7 is the Regulatory Information Conference this past
8 March.

9 This slide depicts some of the concepts
10 that we used when we developed the ITP. We tried to
11 adopt a hierarchal approach. I had alluded to earlier
12 that we used a qualified set of indicators in
13 reporting to Congress. And the reason we use that term
14 is, actually we ran into a situation where we had just
15 a multiplicity of potential indicators for use in the
16 program. And so the hard part was identifying what
17 was the correct level of reporting and what indicators
18 acted as, if I could use the term, macroscopic type of
19 indicators that would give us good insights across the
20 spectrum and were not so detailed that we might be
21 missing something.

22 If we do find a problem in those
23 macroscopic indicators, we would use all the other
24 multiple indicators that we think are subordinate to
25 investigate why we got an up-tic in the more

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 macroscopic indicator. And I'll try and show you this
2 on the next slide a little bit more what I'm talking
3 about.

4 WE did use these existing programs. And
5 what we're trying to do is flush out these -- I say
6 these existing indicators. We're trying to flush out
7 these existing indicators and make them give us
8 insights in all the cornerstones of safety. Right now
9 we have seven cornerstones of safety. Much of the
10 previous discussion this afternoon focused on the
11 initiating events and mitigating system's
12 cornerstones. We are also trying to develop industry
13 level indicators for the other cornerstones such as
14 occupational radiation exposure, public radiation
15 exposure, physical protection and that sort of thing.

16 WE're trying to flush that out by deriving
17 these indicators from the information that was
18 submitted for the plant specific reactor oversight
19 process, performance indicators. And we've also
20 tasked research to update some of the studies that,
21 again, were alluded to earlier this afternoon such as
22 initiating events and reliability studies.

23 This slide is intended just to illustrate
24 the concept of hierarchy of potential indicators.
25 What we're trying to get to is representative industry

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 risk here. But where we are is in terms of our
2 thinking is right here. And three hours of discussion
3 this afternoon focused on right here in plant level
4 risk. And the challenge is to aggregate 103 units into
5 something that's representative of industry risk
6 without causing a distortion of the indicator.

7 If there is a problem up here, we can go
8 down and break the indicators into their constituent
9 parts right here. An example might be for initiating
10 events we have reactor SCRAMS. Well, if you have up-
11 tic in reactor SCRAMS, you got to take a look at the
12 cause. Do you have an up-tic due to automatic SCRAMS,
13 do you have an up-tic due to manual SCRAMS. Is the
14 cause due to loss of off site power, or is it due to
15 instrument air issues, is it due to steam generator
16 tube ruptures. You get into that. And so the
17 question becomes do you want to track all these
18 subordinate initiating events or can you stay with
19 that one roll up indicator of SCRAMS. So, that's what
20 this is intended to illustrate.

21 And if you got any questions on this, I
22 borrowed it from Pat. So I'm going to make Pat answer
23 the question.

24 MR. WALLIS: Well, I guess someone's going
25 to ask eventually how the things that we worried about

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 recently fit into this pattern? The Sumner and
2 Davis-Besse Is that human error or where does that fit
3 into the --

4 MR. BARANOWSKY: Those would normally show
5 up -- there's actually one more thing that's not shown
6 here, and that's the accident sequence precursor
7 program, which is another slightly different way of
8 trying to capture performance information. And we
9 would sum it through those. Because those things
10 aren't in the PRA models, they're hard to account for.
11 So we have --

12 MR. LEITCH: But those are the things
13 which obviously we worried about most in the recent
14 times.

15 MR. BARANOWSKY: Right. That's why the
16 ASP program exists and why we have things there.

17 MR. APOSTOLAKIS: The ASP is not an
18 indicator.

19 MR. BARANOWSKY: What's that?

20 MR. APOSTOLAKIS: I mean this -- I thought
21 you were using indicators to do this trending.

22 MR. BARANOWSKY: No. ASP --

23 MR. APOSTOLAKIS: ASP doesn't use
24 indicators.

25 MR. BARANOWSKY: It's an industry

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 indicator and it's been reported to the Commission for
2 several years.

3 MR. BOYCE: Yes, the total counts of ASP
4 events. The total counts of ASP events can be trended
5 from year-to-year, and that's the index that we're
6 using.

7 MR. APOSTOLAKIS: Well, yes, they could.

8 MR. BARANOWSKY: And not only that, I mean
9 it's the total counts where we can look at trends.
10 And I don't know, Dale, if you have something on that
11 in here. But we're looking at what's the right way to
12 present ASP information to show what safety
13 implications are, whether they're getting better or
14 worse. And we're going to see some interesting things
15 going on with ASP when we add some of these new events
16 in.

17 MR. WALLIS: It's not just counts, it's
18 the severity.

19 MR. BARANOWSKY: Yes, the severity's
20 important.

21 MR. APOSTOLAKIS: But if I wanted to
22 understand whether human performance at U.S. nuclear
23 plants is improving or deteriorating, or doing
24 anything I really have no way of learning that, do I?

25 MR. BARANOWSKY: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. BOYCE: Yes, not through the industry
2 trends program.

3 MR. BARANOWSKY: That's correct.

4 MR. BOYCE: And the same question applies
5 to the reactor oversight process, because that's one
6 of the cross cutting issues.

7 MR. APOSTOLAKIS: Sure, they will be asked
8 the same question, don't worry.

9 MR. BARANOWSKY: Right.

10 MR. BOYCE: And the answer I believe is
11 that we expect that human performance errors would
12 manifest themselves in performance issues, such as
13 reactor SCRAMs or in the case of maintenance, lower
14 reliabilities and higher unavailabilities.

15 MR. APOSTOLAKIS: Yes. And at least I hope
16 that this expectation will be revised. Because, you
17 know, in the case of Davis-Besse, yes, it would have
18 been revealed in a medium size LOCA. That doesn't
19 help me at all.

20 MR. BARANOWSKY: Well, it was revealed
21 through the identification of the degradation at the
22 plant.

23 MR. APOSTOLAKIS: Sure.

24 MR. BARANOWSKY: And, you know, clearly
25 there's some relationship to human performance there.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 So, any of these things that occur, common
2 cause failure or whatever, you can go and see whether
3 there's a human element involved. And if you get a few
4 hits on these things, that tells you, Ops, that's an
5 area to focus on. And I think that's one of the things
6 that's been going on in the oversight process.

7 MR. SATORIUS: Yes, that's right.

8 MR. KRESS: An ASP then is one that would
9 have a conditional CDF of 10^{-3} .

10 MR. BARANOWSKY: Six.

11 MR. APOSTOLAKIS: Six.

12 MR. BARANOWSKY: Or greater. Or greater.

13 MR. KRESS: There is no CDF of 10^{-6} .

14 MR. APOSTOLAKIS: Is somebody doing the
15 Davis-Besse thing, the ASP, or you've not yet --

16 MR. BARANOWSKY: No, it's in the
17 preliminary stages, but we're working with NRR because
18 it's so complicated I think we're just going to work
19 together on it for now.

20 MR. ROSEN: Isn't it true in principle
21 that that second level down on your diagram, plant
22 risk; plant 1 plus 2 all the way up to N, if everybody
23 had a good PRA done to the same standards and that was
24 updated, couldn't you just sum all those and divide by
25 the total number of plants?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: Or just look at the 103
2 units.

3 MR. BOYCE: Probably.

4 MR. BARANOWSKY: We could do that if we
5 were able to trust -- the reason we disaggregate it,
6 we don't think we have enough trust in these
7 individual models to just take that one number. So
8 we're looking at some of the individual subelements
9 and it's a judgment call as to how many elements you
10 look at.

11 But, you're right. In the future one could
12 in theory have highly qualified PRAs and you could
13 track just performance at the risk level. And when
14 there was a problem, then you'd disaggregate the thing
15 down to get at the root cause in terms of areas of the
16 plant or issues.

17 MR. WALLIS: The cracked pipes aren't in
18 PRAs, are they?

19 MR. BARANOWSKY: Well, those are some of
20 the reasons why we have other things.

21 MR. WALLIS: Yes.

22 CHAIRMAN BONACA: But you would pick up
23 that one, for example, significant events. You're
24 plugged into significant events as a function of here.
25 So that would pick up, for example, there is Besse

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 under that, wouldn't you? Or would you have to go
2 necessarily only to the precursor --

3 MR. BOYCE: I would think those would be
4 counted under both. There is slightly different
5 criteria that NRR uses for the significant events
6 program and the ASP program. I would expect they'd be
7 counted in both areas.

8 CHAIRMAN BONACA: Yes, some of the
9 indicators like equipment forced outages, forced
10 outage rate; these are pretty insightful. Average
11 exposure to plant.

12 MR. BARANOWSKY: Well, I think we're going
13 to look at making some changes. The old AEOD
14 indicators are in there because they're well developed
15 and understood. We're working on a number of things
16 that maybe have a better nexus to safety and risk.
17 And in the future when they're proven, I think Tom may
18 mention something about that, that might replace them.

19 MR. BOYCE: That's right. What Pat's said
20 is correct. We are working to be more risk informed
21 in as many cornerstones as we can. Those are
22 primarily the reactor safety cornerstones, initiating
23 events, mitigating systems and barrier integrity.

24 MR. APOSTOLAKIS: One of the things that
25 really concerns me is that as you said earlier, we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 have a number of ways of looking at performance. We
2 have your program. We have the ROPs, we have the ASP,
3 we have -- you know -- and that's fine. I agree that
4 we should have a multi-pronged approach.

5 The thing that really bothers me is that
6 all of these programs are hardware oriented. And the
7 industry operating experience is telling us that's not
8 where the problems are. Now, again, that's a question
9 that's bigger than you, than your issues here.

10 MR. SIEBER: AEOD had some indicators that
11 had human performance factors in them where they did
12 the percentage comparison to causes.

13 MR. BOYCE: Yes.

14 MR. SIEBER: But those are not being done
15 anymore, right?

16 MR. BOYCE: Right. That's correct.

17 MR. BARANOWSKY: I think the approach
18 we're taking now is if it impacts a functions
19 availability, then we go down and dig down into
20 causes. It's just too expensive to have all the
21 causes tally and ready to go for any possible number
22 of things. It's a lot more practical to look at
23 safety functions. If the functions are okay, you don't
24 have to dig down. If they're not okay, then you dig
25 down and find out what's going on.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN BONACA: Yes, the only thing is
2 that, I mean again the performance of active
3 components that the utility has focused on for 20
4 years may not be the best hook on human reliability.

5 MR. BOYCE: That's right.

6 CHAIRMAN BONACA: And, you know, for
7 example certainly, I mean issues that -- decisions
8 during outages may cause latent effects because you
9 have a comforter between, you know, the economics and
10 safety issues. I mean, and you have those kind of
11 competition, and time. I mean, we've seen it in the
12 root cause evaluation of Davis-Besse.

13 Those things, I mean right now they're not
14 being --

15 MR. BARANOWSKY: But they're going to
16 manifest themselves in terms of availability of
17 equipment or reliability of equipment.

18 And one that I have a concern about is
19 operator performance in an accident situation where we
20 really have nothing more than the training and the
21 simulators.

22 MR. APOSTOLAKIS: That's true, Pat. But
23 if you look at Davis-Besse, I mean you can't really
24 say, "Okay, I would catch it if the vessel were
25 breached." I mean, that's too late. Something like

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that you can't afford to say I will wait until I see
2 the impact on the hardware.

3 MR. BARANOWSKY: Well, I think when we see
4 something like Davis-Besse we go through lessons
5 learned, and we ask ourselves what is it about our
6 inspection program or indicators that suggests we
7 should make some changes.

8 MR. APOSTOLAKIS: But I think you will
9 never make the right changes as long as you are
10 forbidden from getting into cultural issues and
11 organizational issues.

12 MR. BARANOWSKY: Well, I think you can
13 inspect that stuff. For instance, if we weren't
14 looking at how licensees were inspecting their heads
15 and other passive components and we spending a whole
16 lot of time worrying about the reliability of diesel
17 generators where we have good data --

18 MR. APOSTOLAKIS: Right.

19 MR. BARANOWSKY: -- maybe what we should
20 be doing is inspecting those softer areas where the
21 human element is important and I can't get a good
22 indicator or quantification that changes in time line.

23 MR. APOSTOLAKIS: Yes, I agree.

24 MR. ROSEN: Let me tell you the last
25 things I'm worried about, are diesel generator

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 performance and operator performance during
2 transients. What I'm worried about mostly is human
3 performance other than operator performance.

4 MR. APOSTOLAKIS: Me, too.

5 MR. ROSEN: Meaning the maintenance
6 people, engineering people, managers, supervisors and
7 executive.

8 CHAIRMAN BONACA: And, you know, it's
9 interesting, you know, if you look at the root cause
10 for Davis-Besse where you have -- you read the guys
11 did go and cleaned up and then they stopped cleaning
12 when the schedule said that's it, that's the time you
13 got, so they didn't complete the activities because
14 time was up. And, you know, now from the root causes
15 it's hard to understand if there was a real contention
16 there. If somebody said oh we should be doing more,
17 an somebody said no you're not going to do more. Or
18 if you simply everybody was in lock-step doing that.
19 There are many opportunities there.

20 But this is really typical in outages.
21 And you know one concern I've always had is right now
22 there has been the race of the industry to have
23 shorter and shorter outages. Okay. And I think that
24 those kind of pressure to have shorter outages are
25 going to put some pressure on some critical activity

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and decisions there. Because that's what you got.

2 MR. BOYCE: I can only add one more thing
3 that will not be a disagreement with what you said,
4 but we did attempt to take a look at whether there was
5 commonality in some of the events that we were seeing.
6 And so in the first SECY paper that we did we took a
7 look at issues that were what were called greater than
8 green and we tried to look at some of the factors like
9 what was going on at the time. Was it at power, was
10 it shutdown, what systems were involved and what the
11 apparent cause was. And as you know, we do follow up
12 inspections every time you cross that green white
13 threshold. So we had some data that we could go look
14 at.

15 And we concluded, and all the results are
16 in there, that was not sufficient commonality to be
17 able to draw any conclusions or have any reasonable
18 indicators that would tell you anything in advance.

19 Anyway, I'm not going just make that
20 statement, but I'm not going to disagree with your
21 premise.

22 CHAIRMAN BONACA: And I'm not saying it is
23 an easy thing to do I'm only saying that somehow we
24 have to get there.

25 MR. APOSTOLAKIS: I think there is one

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 area where we are reluctant to get into because it's
2 not thermal hydraulic structure or mechanics, or
3 reactor physics, and that's the soft area
4 organization, cultural. We keep getting those
5 messages from the plants that that's where the
6 problems are and we're not getting into that for some
7 reason.

8 Now you might say, "Well, gee, tell me
9 what to do." I don't know what we should do. That's
10 why there's an Office of Research. But, you know, we
11 need to spend money doing more work on performance
12 indicators that deal with hardware, because that's
13 where we know what to do.

14 But this is a really different subject.
15 I mean we should --

16 MR. ROSEN: Yes, we are going to move on.

17 MR. BOYCE: All right. This lays out in
18 detail the process for industry trends. And
19 essentially what we're trying to do is use statistical
20 techniques to identify the adverse trends using
21 indicators that have been qualified for use. And what
22 this does is is you just fit a trend line to it to
23 whatever the indicator is and in general, based on
24 what we've had so far, if the trend line is pointing
25 down or is flat, you do not have an adverse trend. If

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the trend line is going up, you have an adverse trend
2 in general.

3 We've also got a statistical technique
4 where we look for one year deviations from the norm,
5 and it's called prediction limits. And I don't want
6 to get bogged down into it. But recognizing that we
7 started in 1988, it would take a significant trend to
8 give us an adverse trend, and that's why we used the
9 prediction limit method is to look for that short term
10 trend. We're not calling that an adverse industry
11 trend, we're calling it we exceeded the prediction
12 limit and we will investigate it. It's a bit of a
13 nuance, but I wanted to point it out.

14 If we identify an adverse trend, the next
15 step is to evaluate the underlying issues and their
16 safety significance. And then based on that safety
17 significance, take the appropriate agency response in
18 accordance with our existing processes.

19 And finally, there's an annual review by
20 the senior managers of the agency at the agency action
21 review meeting.

22 Just to give you snapshot of the results
23 of the program today, as I said there's no
24 statistically significant adverse trends identified in
25 fiscal year 2001.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 In looking at the indicators that we're
2 deriving from the ROP data given that the ROP started
3 in April of 2000, we did not have sufficient data to
4 do long term trending. However, an inspection of the
5 data that's been submitted so far, and there's 18 of
6 those indicators, didn't reveal any significant
7 issues.

8 In the most recent SECY paper you'll see
9 examples of initiating event indicators that the
10 Office of Research has developed. Those are
11 essentially an update of the initiating events
12 indicators in NUREG 5750. We took a look at those,
13 and again those statistically significant adverse
14 trends were identified.

15 MR. APOSTOLAKIS: I think the issue of
16 statistical significance, it is meaningful it seems to
17 me to talk about statistically significant trends when
18 you talk about indicators that are a fairly low level
19 if I take, you know, what you showed earlier about
20 risk. This is core damage and I'm way down there.
21 Again, statistically significant trends make sense.

22 I wouldn't apply this criteria to core
23 damage. I'm not going to say, "Look, I only had one
24 core damage event last year out of 103 plants, that's
25 not statistically significant, right?" The higher I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 go the notion of statistically significant becomes
2 less valued, it seems to me.

3 MR. BARANOWSKY: Yes, but the NRC has some
4 performance standards that say that's unacceptable.

5 MR. APOSTOLAKIS: For low level
6 indicators.

7 MR. BARANOWSKY: No, for like core damage
8 frequency. We don't say if we get a statistically
9 significant one. No, we say none is the accepted
10 performance level.

11 MR. APOSTOLAKIS: But you're right.

12 My question is let's say next year nothing
13 else changes and the only piece of information in 2002
14 is Davis-Besse. Are we going to still conclude that
15 the NRC says that there is flat -- or the indicators
16 show that there are flat or improving trendliness,
17 trend lines, and this and that? In other words, is
18 that an outline there that doesn't effect any of our
19 conclusions?

20 MR. BOYCE: Well, the ASP program does in
21 fact, there's actually two outputs in the ASP program.

22 MR. APOSTOLAKIS: But that --

23 MR. BOYCE: Actually, there's a second
24 performance goal measure that uses the ASP program.

25 And it's in the strategic plan. And it says no more

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 than one event that exceeds 10^{-3} delta CDF. So
2 there's a -- okay. So that's an example of a
3 threshold base criteria.

4 We're looking at a trending base criteria.
5 The ASP program would pick that up because it --

6 MR. APOSTOLAKIS: But not this program?

7 MR. BOYCE: Well, that's correct.

8 MR. APOSTOLAKIS: Because this relies on
9 AEOD?

10 MR. BOYCE: Because the index that we're
11 using for ASP counts total number of ASP events. So
12 this program would not pick up that significant event.

13 MR. APOSTOLAKIS: So I wonder whether we
14 could still claim next year that the industry's
15 performance is improving? If I have one ASP event, as
16 10^{-2} .

17 MR. BARANOWSKY: Well, you have to be
18 careful about talking about the industry versus a
19 single licensee that's had a problem. I mean, that's
20 part of the assessment that I believe you would do,
21 Tom. If some one or two events occur, you want to
22 know is this an industry problem or a one plant? You
23 know, just because one kid's chewing gum, we don't
24 make the whole class stay after school.

25 MR. APOSTOLAKIS: That's true. But, I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 mean, you know the caution should be both ways. One
2 is to generalize and say, gee, this is an industry
3 problem. But also I think you should be cautioned not
4 to say this is an isolated event too quickly.

5 So let's do it both ways.

6 MR. BARANOWSKY: Well, I mean, that part
7 of their assessment will be whether or not we have
8 weaknesses in the way we either inspect our licensees,
9 implement program. And if it's generic, we'd have to
10 say we have a generic issue that was identified.

11 MR. WALLIS: Well, the generic issue would
12 probably be symptoms which because for various reasons
13 which you can go to at Davis were ignored.

14 MR. BARANOWSKY: Yes.

15 MR. WALLIS: And other places where
16 symptoms are being ignored, maybe because they're not
17 in the PRA or something.

18 MR. APOSTOLAKIS: They are not in whatever
19 we're doing.

20 MR. SIEBER: Well, one of the interesting
21 things with performance indicators is as soon as you
22 establish them, people manage them.

23 MR. BOYCE: Yes. Right.

24 MR. SIEBER: And other things were thrown
25 off that your performance indicators --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. ROSEN: George, I think we'll get to
2 this discussion on Saturday I think when we talk about
3 our response to Davis-Besse. In particular, I want to
4 be sure I address the culture issue and how we use
5 Davis-Besse as an example of where we don't want to
6 go.

7 MR. APOSTOLAKIS: Exactly.

8 MR. ROSEN: And why the regulatory system
9 needs to do something to respond to those culture
10 issues which I think is at the root of the Davis-
11 Besse. And then we define that as corrective action,
12 system failures and a lot of other kinds of failures.

13 CHAIRMAN BONACA: Well, it's interesting.
14 I mean, there -- criteria that were used there. Like,
15 for example, the pressure was -- on the flanges. The
16 pressure was simply through the start. So therefore,
17 how many flanges can you fix in these many hours, and
18 the answer was --

19 MR. ROSEN: Rather than the opposite
20 approach, which is to shut the plant down until you
21 fix all the flanges, clean the head up completely,
22 make sure you have no degradation and restore the
23 initial design basis.

24 CHAIRMAN BONACA: For the prospective of
25 a regulator, however, the question then comes should

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it be an option left to the corrective action program
2 or should it be a requirement that if you have leakage
3 from the head or from somewhere in the primary system
4 you're going to fix it before you start.

5 If you have that, you're helping the
6 technician whose doing the work up there who doesn't
7 have to stop and question whether or not he should go
8 beyond the point.

9 So the issue is broader. There are things
10 that really help facilitate the process if you take
11 the decision away from the hands of some intermediate
12 management or management.

13 MR. ROSEN: I don't want to be here three
14 years from now with another plant, XYZ plant, that's
15 had a serious incident, maybe even an accident, whose
16 root cause was the same kind of safety culture
17 deficiencies that happened at Davis-Besse.

18 MR. APOSTOLAKIS: Yes, of course.

19 MR. ROSEN: And that we didn't do
20 something different. That we just saw Davis-Besse,
21 knew what the root cause was and safety culture and
22 said "Okay, we'll just keep doing the same regulatory
23 stuff we have now."

24 CHAIRMAN BONACA: Exactly. Exactly.

25 MR. ROSEN: Because what that is is an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 embodiment of the commonest definition of insanity,
2 right? Doing the same thing over and over and
3 expecting different results.

4 MR. APOSTOLAKIS: I'm with you. I'm with
5 you.

6 MR. BOYCE: Let me press on.

7 CHAIRMAN BONACA: Yes, let's press on.

8 MR. BOYCE: One of the problems that we
9 identified early on was with the indicators that we've
10 looked at so far, given that we started in 1988, the
11 indicators all have like an expedient type of
12 curve. And it appears, just visually, that they might
13 be approaching an -- and if you get to that point, it
14 would be very easy, particularly if we shortened the
15 period of time that we were looking at, to get just
16 almost like a random up-tic in the indicator. And by
17 our process we would then start reporting events to
18 Congress that may or may not have safety significance.

19 So what we are attempting to do is
20 establish thresholds for reporting and thresholds for
21 monitoring and actions so that -- an example would be
22 SCRAMs. In 1988 we were on the order of about 3
23 SCRAMs per plant per year. The most recent or Fiscal
24 Year 2001 we were at .85 SCRAMs per plant per year. So
25 if we go up to 1 SCRAM per plant per year, is that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 much less safe or are we maintaining safety at one
2 SCRAM per year. And that's the philosophical issue
3 you face.

4 And so we are trying to have a rational
5 basis to establish thresholds where we would monitor
6 what's going on below the threshold so that we
7 wouldn't ignore an emerging problem, but at the same
8 time we would only be reporting issues of safety
9 significance to the appropriate stakeholders.

10 All right. So that's the problem. The
11 Commission helped us out with an SRM directing us to
12 develop risk informed thresholds as soon as
13 practicable. We've asked Research to help us out with
14 that for the appropriate cornerstones and indicators.
15 We're going to take on the other cornerstones, NRR is,
16 for like occupational radiation exposure, physical
17 security, etcetera.

18 We'll engage the appropriate stakeholders
19 including this body as we develop them.

20 The near term indicators that are concern
21 we think are the ROP indicators because we think they
22 will have in excess of 4 years worth of data which we
23 have somewhat arbitrarily said are our threshold for
24 starting to use these indicators.

25 The nuance here is to start the ROP in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 April of 2000. We asked licensees to submit
2 historical data, but that data was best estimate type
3 of data, so we're taking a hard look at that data and
4 seeing if we can use it. And so that looks like the
5 near term issue.

6 If we get these thresholds, we would then
7 move we think towards a different performance measure,
8 one that was more oriented towards crossing thresholds
9 such as the ASP program rather than the totally based
10 on trends in the indicators.

11 And with that, I'll turn it over to Dale
12 Rasmuson whose got some ideas on developing
13 thresholds.

14 MR. RASMUSON: I will try to move fast
15 here, just pick out some selected slides. I did
16 colored ones because I know George likes colored
17 slides.

18 We wanted to share with you our thoughts.
19 We've just started on this process --

20 MR. APOSTOLAKIS: You guys are taking
21 abuse, but you are giving it out, too, you know.

22 MR. RASMUSON: Oh. Okay.

23 MR. APOSTOLAKIS: Give and take.

24 MR. RASMUSON: We wanted to explain some
25 of the technical approaches we've identified for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 generating information for thresholds and to receive
2 any ideas or suggestions that you may have as a body.

3 One of the points I want to make is the
4 second bullet here, is that industry thresholds differ
5 from plant-specific thresholds. And to illustrate
6 that, for instance, we'll stay with the unplanned
7 SCRAMs. In the ROP process, the green/white threshold
8 is 3 SCRAMs. When I look at the performance on an
9 industry basis, we're down at about .6 SCRAMs per
10 plant for average for automatic SCRAMs. And when I
11 get a trend in this type of fashion here, if I were
12 going to use three, I'm clear up here. To set a -- I
13 would probably think that I would be down here for the
14 industry in some sense.

15 And so those are the types of things that
16 we're working and focusing on.

17 MR. APOSTOLAKIS: Now, have you read the
18 ACRS letter on the reactor oversight process of last
19 October?

20 MR. RASMUSON: I have not.

21 MR. APOSTOLAKIS: You should, because we
22 have attacked this threshold.

23 MR. RASMUSON: Right.

24 MR. APOSTOLAKIS: We don't like it at all.

25 MR. RASMUSON: Yes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. APOSTOLAKIS: There's no sympathy
2 here, you know. Three means nothing.

3 MR. RASMUSON: Right. Right. And all I'm
4 trying to do is use that for an example here. Three
5 may be meaningful for a plant, but for the industry
6 average when we're taking industry behavior, we tend
7 to -- you get average behavior and so forth. And so
8 the threshold probably ought to --

9 MR. APOSTOLAKIS: And what we said in that
10 letter is that even for a plant --

11 MR. RASMUSON: Right.

12 MR. WALLIS: Well, just the average is 95
13 percent. And that's more significant than the
14 average, and that's always way below one or it's
15 around one.

16 MR. RASMUSON: I don't know. I haven't
17 looked at --

18 MR. WALLIS: I mean, I thought you had it
19 on your picture there.

20 MR. RASMUSON: Well, that was a prediction
21 -- right. And I don't know whether I would use that
22 value or not. We're looking at two types of
23 thresholds, one an action threshold and an early
24 warning threshold.

25 The action threshold would be sort of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 one that would be used for reporting to stakeholders.
2 The early warning one would be used as a tool for
3 helping us in the industry here to monitor performance
4 and to take some action as we start to see some upturn
5 in the process.

6 MR. APOSTOLAKIS: Now, why can't the
7 reactor revised oversight process do that? Early
8 warning? Marshaling my resources and then have
9 something else that says "Boy, am I in trouble."

10 MR. SATORIUS: I would argue that that's
11 exactly what the ROP does, George.

12 MR. APOSTOLAKIS: It doesn't do that.
13 We'll see that. The action matrix doesn't say things
14 like that. It may be doing it --

15 MR. SATORIUS: With the green/white
16 thresholds and the white/yellow thresholds, and the
17 inspection findings manifest themselves into colors
18 that force -- or produces more inspections and further
19 review by the staff, I would say it does exactly that.
20 A measured approach.

21 MR. APOSTOLAKIS: If you move the
22 thresholds--

23 MR. SATORIUS: It's a graded approach.

24 MR. SIEBER: You can have an increasing
25 industry trend and not change colors on anything at

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 any specific plant. But something's going on and I
2 think that's part of regulation to figure out why is
3 this uptake occurring.

4 MR. SATORIUS: Tom, you want to answer
5 that?

6 MR. BOYCE: Yes, that's the point of the
7 ITP is to catch those sorts of things.

8 MR. SIEBER: And outcomes that would be --
9 or something like that that it says we've looked at
10 this and analyzed it and here's steps that the
11 industry ought to take.

12 MR. BOYCE: Right. And we would follow up
13 with inspections if appropriate.

14 MR. SIEBER: Right. So there's a
15 difference to me, anyway, between the ROP and an
16 industry wide effort.

17 MR. APOSTOLAKIS: We'll come back to that.

18 MR. BOYCE: I have every confidence you
19 will at some point.

20 MR. RASMUSON: Okay. Threshold
21 characteristics. Here thresholds should have a
22 rational basis, they should be practical, they should
23 be conceptually simple, they should be consistent with
24 the existing regulatory framework and they should
25 reflect risk, safety and regulatory perspectives.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Those are sort of the criteria that we're working
2 towards.

3 Our protocol that we're proposing to use
4 for this is to develop risk and statistical
5 information related to the trends for input to an
6 expert panel, provide associated safety and regulatory
7 information to the expert panel, and then the expert
8 panel would set the thresholds based on the inputs.

9 Inputs for the expert panel would be some
10 of the things, we could start with the values set for
11 the ROP indicators. We'll look at values from the
12 risk based performance indicator report, those if
13 they're applicable. Other risk insights. We'll look
14 at the current industry performance, the trends,
15 estimate some of the characteristics from that using
16 various statistical methods such as prediction
17 intervals, Bayesian predictive distributions and
18 different things like that can help us to give some
19 insights.

20 Using these we will select some values and
21 that. We'll evaluate the risk implications of some of
22 these things is applicable using some selected SPAR
23 models to just give some idea of what the risk is on
24 these. And then suggest the values to the panel.

25 Technical approaches we're looking at are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 prediction limits, Bayesian predictive distributions,
2 percentiles from industry distributions, insights from
3 PRAs, rate-of-change of the trend, expert panel input,
4 modification of current ROP thresholds.

5 There, for instance, some people have
6 suggested that we take a percentage of, say, the
7 green/white threshold and use that for an industry
8 trend threshold.

9 Integrated risk measure concept being
10 developed in the enhanced PIs that was talked about
11 today. That's an idea that we may use for some of
12 these, but we'll see how that develops and comes
13 along, and that. That may be applicable for rolling up
14 some of the indicators like initiating events or
15 something. Or a combination of all of those.

16 Technical questions that we are
17 considering are how many years should be included in
18 a trend. For instance, if we look at this one here,
19 certainly this trend right here is certainly driven by
20 the early years. If we take something in a shorter
21 interval, that model changes and the prediction
22 interval changes there.

23 MR. WALLIS: With all of these things fit
24 a very simple expediential --

25 MR. RASMUSON: This particular model here

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 is strictly a linear one. This is an expediential
2 model here.

3 MR. WALLIS: Yes.

4 MR. APOSTOLAKIS: So if they look at the
5 last 6, 7 years, they really have a horizontal line,
6 don't they?

7 MR. RASMUSON: They have a horizontal
8 line. And so that's one of the questions that we're
9 interested in looking at there.

10 What level is appropriate for reporting to
11 Congress.

12 What level is reported for the agency
13 action to an adverse trend or the start of one.

14 How should some of the PIs be grouped. We
15 have initiating events, should we group all of those
16 into one over -- say super indicator or something and
17 use that for reporting to Congress and then maybe
18 trend some of the other things that maybe don't occur
19 as frequently, such as steam generator tube ruptures.
20 Certainly we can have information from looking at some
21 of these lower level initiating events or
22 characteristics that can help us an agency.

23 How does the safety goal influence setting
24 thresholds or should it?

25 And should the concepts in Reg. Guide

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 1.174 be used in setting thresholds, if they're
2 applicable.

3 Those are some of the questions that we're
4 kicking around right now and moving forward on. And
5 so those are the types of things that we're doing.

6 MR. BARANOWSKY: So it's early and we've
7 just really started this, but there's a lot of
8 questions that we've raised and we're going to be
9 soliciting information. And I think the expert panel
10 approach is something that we wanted to mention here.

11 MR. WALLIS: One thing that will keep you
12 alive is if you have a requirement that every year you
13 introduce one new PI and discharge one old one.
14 Because existence of PIs themselves conditions the
15 sort of behavior in management of a plant to some
16 extent, which means that something else may be
17 forgotten. So if you force every year to bring in a
18 new PI, you have to think about what's important that
19 you haven't been trending.

20 MR. KRESS: You've got to have four years
21 for a good trend, so by then it's --

22 MR. WALLIS: Yes.

23 MR. SHACK: I missed, what was the time
24 frame for this? I mean, when do you plan to have at
25 least a preliminary version of this in place?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. BOYCE: Well, of course, the AEOD
2 indicators and the ASP program are ongoing.
3 Personally I'd like to do it sooner rather than later
4 because I think it's just a question of when we get an
5 up-tic that we'll be explaining to Congress and having
6 to fully understand the safety significance, which
7 isn't easy when you're just dealing with numbers being
8 submitted.

9 And so I'm asking research to go as
10 rapidly as possible. I think it's going to take maybe
11 to the end of FY 03 before we're able to do it.

12 MR. SHACK: It's that kind of time frame
13 you're talking about?

14 MR. BOYCE: Yes.

15 CHAIRMAN BONACA: This was actually on the
16 line of -- you know, when you come up next week it
17 would be interesting to have a time line for -- you
18 know, you mentioned before, Pat, that you were
19 planning to have a couple of more updates to us as you
20 get progress going.

21 MR. BARANOWSKY: Yes. Yes, we were going
22 to put together some tentative dates on what would
23 happen with that. But our plan is to come back here
24 at least a few times before to change this up.

25 MR. APOSTOLAKIS: Actually, I was about to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 recommend that once you have, you know, a couple of
2 ideas as to how to proceed on each of the questions,
3 it would be a good idea to have a Subcommittee
4 meeting. I mean, if you are interested in getting our
5 feedback. Because if you get it after you invest a
6 year and a half into it, it's kind of late.

7 MR. BARANOWSKY: Okay. I think we want to
8 look at some concepts, try some things out showing you
9 what it looks like. And then show you what it looks
10 like and solve, and you tell us what other problems we
11 missed.

12 MR. APOSTOLAKIS: So you're going to show
13 us the approximations?

14 MR. BARANOWSKY: Yes.

15 MR. SATORIUS: We could probably have some
16 of those dates, Pat, I think put together for the
17 Committee briefing next week, don't you think?

18 MR. BARANOWSKY: I think so.

19 MR. SATORIUS: Okay.

20 MR. RANSOM: IS there anything to be
21 learned from other maturing industries, you know, in
22 terms of what could be expected? I mean, because
23 there are obviously reflecting learning curves that go
24 with time and I think there is quite a bit of
25 information available, isn't there? My idea would be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 you never can set zero as the goal, so there's got to
2 be some realistic expectation on where these things
3 can go.

4 MR. BARANOWSKY: But there's two things
5 that happen. It's true that people manage the
6 indicators. I mean, that's a well known thing.

7 And the second thing is lessons that were
8 learned long ago that caused people to fix things tend
9 to be forgotten after a period of time when they don't
10 appear to be important anymore. So those kind of
11 things have to show up.

12 But managing the indicators is an issue
13 for sure.

14 MR. APOSTOLAKIS: Does the airline
15 industry have anything like this?

16 MR. SATORIUS: Or the railroad industry?
17 I mean, that's probably --

18 MR. BOYCE: I don't think we've taken a
19 really hard look at that. You know, some of this,
20 again we're only a year and a half into this program.
21 Some of it is you got to be able to be consistent with
22 like WANO indicators, which worldwide plants --
23 everybody contributes to that system. And so if we
24 come up with new ideas, it's got -- we're trying to
25 work within the worldwide framework. And INPO has got

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 its ideas. And so we're trying to work so far within
2 that sort of existing framework. But I think there
3 might be some value in doing a compare and contrast.

4 MR. WALLIS: I'm not being factious about
5 bringing in new indicators. It seems to me that after
6 a while there may be so few unplanned SCRAMs it
7 doesn't mean anything, it makes no sense anymore. And
8 something else is going to be much more significant
9 and you ought to look at it.

10 MR. RASMUSON: For example, I mean this is
11 sort of the yearly distribution of unplanned SCRAMs.
12 And starting over here you can see how it's quite flat
13 and here that it's tightened up.

14 Another way of looking at that is to look
15 -- just plot it by year. This is the total number of
16 plants. This one right here is plants with two or
17 more SCRAM. This one is with one SCRAM only, and this
18 is with no SCRAMs. And you can see how the industry
19 has improved in that.

20 I mean, just looking at some of these
21 things you sort of see as you get in and cut the data
22 a little bit different, you sort of see that, hey, you
23 know, the industry has learned some things. And maybe
24 we ought to replace this one. I don't know.

25 MR. SATORIUS: From a historical

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 perspective, we choose SCRAMS and unplanned power
2 changes because our history had taught us from
3 monitoring these plants in the past that typically
4 plants that are changing power often or are SCRAMing
5 often have other problems, whether it be maintenance,
6 whether it be operational. But they were good
7 indicators of plants that were having problems.

8 MR. ROSEN: Did Davis Besse change power
9 often?

10 MR. SATORIUS: I don't know.

11 MR. APOSTOLAKIS: See, that's why Graham's
12 point becomes irrelevant now. Because now we have to
13 look for a new indicator.

14 MR. BOYCE: Yes. I would just add -- I
15 mean, I think that's an intriguing thought. I would
16 just add that at least as we're bringing on 18 ROP
17 indicators on line at the industry level. And so
18 those are still relatively new. So, you know, at
19 least for a couple of years I think we're bringing in
20 new stuff.

21 MR. APOSTOLAKIS: I think there is no
22 question that for the indicators on which we have
23 focused in the past the trends are the right ones. So
24 what we're saying now with the new incident is, you
25 know, do we have a complete set. Is there something

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that we're leaving out.

2 MR. WALLIS: And are there some other
3 possible indicators for which the trends are bad?

4 MR. APOSTOLAKIS: Yes. Exactly. Exactly.

5 MR. BOYCE: And then the other point I was
6 going to add, remember this is a voluntary program for
7 the ROP PIs to submit data. And we don't have
8 unlimited access to unlimited data.

9 MR. APOSTOLAKIS: Yes.

10 MR. BOYCE: And so anything we do, you
11 know, we're relying on existing sources because it's
12 hard to justify just for the sake of data asking
13 licensees to collect and submit it. And so we're
14 reviewing LERs as one of our sources of data. We're
15 trying to leverage the ROP PIs, and we're trying to
16 also go to the EPICs IMPO realm.

17 But all I'm doing is telling you some of
18 the problems that we're facing. I think your idea is
19 intriguing in trying to change them.

20 MR. WALLIS: I think the licensees
21 themselves should be sources of PIs. It doesn't have
22 to be something you know about. I mean, if they
23 observe themselves that something else is a better
24 indication of the state of their plant, they ought to
25 be willing to upgrade it to a PI eventually.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN BONACA: And they trend a lot of
2 things and you can really see what's going on.

3 MR. ROSEN: Open corrective maintenance
4 items that don't require an outage to correct. That's
5 just a measure of what they're not getting to, even
6 though they could. I mean, there's a whole lot of
7 different things that licensees watch that are not in
8 this program.

9 MR. SATORIUS: I'll add, too, that we
10 provided a paper to the Commission I think in the
11 January time frame where we had gave some historical
12 perspectives and also acknowledged that we've worked
13 with some of our international colleagues and looked
14 at some of the performance indicators that some of our
15 international colleagues are tracking. And they look
16 at things, Steve, similar to what you had noted
17 yourself that are outside of the scope of what we're
18 looking at. And we're mindful of those and are aware
19 of those, and work with NEI and industry on developing
20 different looks and different PIs.

21 MR. KRESS: I think your threshold idea is
22 good because you don't want to be reporting things
23 that aren't statistically significant trends.

24 I think the words "statistically
25 significant" ought to be a strong input into your

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 thinking on thresholds, which implies to me you need
2 a distribution of the trends and use standard
3 statistical measures of what's a significant change in
4 a distribution.

5 I'm very skeptical of trying to tie it to
6 risk at all for these things. I think you're going to
7 have the same problem we had with the plant specific
8 ones.

9 I think safety goals would be useless to
10 you here. I can't see any way you can factor them
11 into your thinking at all.

12 So, I would think in terms of statistical
13 significance based on actual data and get a threshold
14 that is from your thinking there that says this thing
15 is beyond what we expect for the random variations and
16 it wouldn't necessarily risk significant at all, but
17 it's an indicator of statistical change in the
18 industry's distribution.

19 MR. BARANOWSKY: One of the other things
20 that we were thinking about doing, you know with the
21 SCRAMs right now we have like, say three is the ROP
22 number. But not all SCRAMs are equally important.
23 And the three is based on them having about the same
24 importance. So look at this list of initiating events.

25 You have a wide variation in the safety

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 significance of these things. The indicator might
2 somehow take into account and you may end up coming
3 with a different type of indicator that drops it down
4 a notch to catch the most risk significant ones, and
5 that's the kind of thinking we're trying to do.

6 MR. APOSTOLAKIS: Right.

7 MR. BARANOWSKY: Which changes the
8 indicator, as you were saying, from a simple a beans
9 to something else, although it's in essence trying to
10 count the same thing.

11 MR. APOSTOLAKIS: I think our letter on
12 the ROP, though, is relevant. So maybe you should
13 consult it. In October, was it?

14 CHAIRMAN BONACA: So how much time do we
15 have allowed for doing this ACRS meeting?

16 MR. CRONENBERG: An hour and a half I
17 believe.

18 CHAIRMAN BONACA: One hour and a half. So
19 clearly you would want to take -- well, handle this
20 equation. I don't know what the agreement was. I
21 mean, if you bring them up, there have to be a way to
22 deal with them. We don't --

23 INTERVIEWER: Yes, sir, we understand our
24 challenge.

25 MR. KRESS: You know, everybody's here but

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 two members. And I don't think you'll get the same
2 question on those. We've already -- so I think you'll
3 be all right with it.

4 MR. BARANOWSKY: I mean, this was an
5 information briefing, both of them, by the way.
6 Because we have quite a bit of work to do as we go on
7 the road. So --

8 CHAIRMAN BONACA: So we will expect a
9 letter.

10 Any other questions of this program? That
11 was an interesting update, and I appreciate it
12 personally.

13 If not, the meeting is adjourned.

14 (Whereupon, at 5:10 p.m. the meeting was
15 adjourned.)

CERTIFICATE

This is to certify that the attached proceedings before the United States Nuclear Regulatory Commission in the matter of:

Name of Proceeding: Advisory Committee on
Reactor Safeguards
Subcommittees on Reliability
and Probabalistic Risk
Assessment and Plant
Operations

Docket Number: N/A

Location: Rockville, Maryland

were held as herein appears, and that this is the original transcript thereof for the file of the United States Nuclear Regulatory Commission taken by me and, thereafter reduced to typewriting by me or under the direction of the court reporting company, and that the transcript is a true and accurate record of the foregoing proceedings.

ADVISORY COMMITTEE ON REACTOR SAFEGUARDS
 SUBCOMMITTEES ON RELIABILITY & PROBABILISTIC RISK ASSESSMENT and PLANT
 OPERATIONS: *DEVELOPMENT OF RELIABILITY/AVAILABILITY PERFORMANCE
 INDICATORS & THE INDUSTRY TRENDS PROGRAM*
 MAY 30, 2002
 ROCKVILLE, MARYLAND

- PROPOSED AGENDA -

<u>TOPIC</u>	<u>PRESENTER</u>	<u>TIME</u>	
I. ACRS Introduction	Bonaca/Sieber ACRS	5 min	1:00 - 1:05 pm
II. NRC Staff Presentation		2:25 hr	1:05 - 3:30 pm.
Introduction - overview & meeting objectives	P. Baranowsky, RES	10 min	1:05 - 1:15 pm
ROP Pilot for MSPI - description & objectives - scope & schedule - measures of success	M. Satorius, NRR J. Thompson, NRR	30 min	1:15 - 1:45 pm
MSPI Technical discussion - algorithms for MSPIs - Fussel-Vesely approach - data and data treatment - studies and opens issues	H. Hamzehee, RES	45 min	1:45 - 2:30 pm
..... BREAK		15 min	2:30 - 2:45 pm
Industry Trends Program (ITP) - description, process, results	T. Boyce, NRR	15 min	2:45 - 3:00 pm
Industry Trends Program (ITP) - policy & philosophy - scope of data and indicators - technical approaches - statistical methods - related methods	D. Rasmuson, RES	30 min	3:00 - 3:30 pm
III. Committee Discussion		30 min	3:30 - 5:00 pm

Development of Thresholds for Industry Trends

Dale M. Rasmuson
Division of Risk Analysis and Applications
Office of Nuclear Regulatory Research
U.S. Nuclear Regulatory Commission

May 30, 2002

Purpose of Presentation

- To share with the ACRS our thoughts about threshold characteristics
- To explain the technical approaches we have identified to establish thresholds
- To receive any ideas or suggestions that we should consider in the threshold development

May 30, 2002

Industry Trend Thresholds

2

Industry Trends

- The particular trends are the following:
 - Initiating Events
 - Common-Cause Failures
 - Accident Sequence Precursors
 - System Performance
 - Reactor Oversight Process PIs
 - Fire Events
 - Component Performance

May 30, 2002

Industry Trend Thresholds

3

Industry Trend Thresholds

- RES is developing industry trend thresholds for use in a risk-informed regulatory framework.
- Industry thresholds differ from plant-specific thresholds.

May 30, 2002

Industry Trend Thresholds

4

Plant-Specific Thresholds versus Industry Thresholds

- Combining plant-specific thresholds may not be meaningful for industry thresholds
 - Unplanned scram green/white threshold = 3 unplanned scrams per reactor
 - This implies an industry threshold of 300 unplanned scrams per year based on 100 reactors
- Industry thresholds must consider the industry performance as well as other factors
 - Industry unplanned scram average is about 0.6 scrams per reactor per year.

May 30, 2002

Industry Trend Thresholds

5

Kinds of Thresholds

- Action Threshold
 - Used to measure industry performance, similar to thresholds used in ROP process
- Early-Warning Threshold
 - Used to alert NRC to a change in industry trends that may indicate a change in industry safety performance

May 30, 2002

Industry Trend Thresholds

6

Threshold Characteristics

- Thresholds should have a rational basis that is well documented.
- Thresholds should be practical, that is, possible to determine and compare from data or other means with modest effort.
- Thresholds should be conceptually simple.
- Thresholds should be consistent with the existing regulatory framework.
- Thresholds should reflect risk (including associated uncertainties), safety, and regulatory perspectives.

May 30, 2002

Industry Trend Thresholds

7

Protocol for Setting Thresholds

- Develop risk and statistical information related to trends for input to an expert panel
- Provide associated safety and regulatory information for expert panel
- Expert panel sets thresholds based upon input and expert judgment

May 30, 2002

Industry Trend Thresholds

8

Inputs for Expert Panel

- Start with values for the ROP indicators, values from risk-based performance indicator report, and/or risk insights from PRAs
- Assess current industry performance (e.g., trend, average)
- Estimate trend statistical characteristics (e.g., prediction intervals, Bayesian predictive distribution)
- Using these inputs pick a feasible value for the threshold
- Evaluate the threshold's risk implications using selected SPAR models, if appropriate
- Suggest threshold values based on principles from the threshold characteristics

May 30, 2002

Industry Trend Thresholds

9

Technical Approaches to Estimating Trend Thresholds

- Prediction Limits
- Bayesian Predictive Distribution
- Percentiles from Industry Distributions
- Insights from PRAs
- Rate-of-Change of Trend
- Expert Panel Input
- Modification of Current ROP PI Thresholds
- Combine Plant-specific Thresholds
- Integrated risk measure concept being developed for the enhanced PIs
- Combination of the above

May 30, 2002

Industry Trend Thresholds

10

Technical Questions

- How many years should be included in the estimation of a trend?
- What level is appropriate for reporting to Congress?
- What level is appropriate for agency action to an adverse trend?
- Should some of the PIs be grouped?
- How does the safety goal influence setting thresholds?
- Should concepts in Reg. Guide 1.174 be used in setting thresholds?

May 30, 2002

Industry Trend Thresholds

11

REVISED OVERSIGHT PROCESS PERFORMANCE INDICATOR PILOT PROGRAM

MITIGATING SYSTEM PERFORMANCE INDEX

PRESENTATION TO ACRS SUBCOMMITTEE ON PRA

**John Thompson (415-1011)
Office of Nuclear Reactor Regulation
Hossein G. Hamzehee (415-6228)
Office of Nuclear Regulatory Research**

May 30, 2002

REVISED OVERSIGHT PROCESS PERFORMANCE INDICATOR PILOT
MITIGATING SYSTEM PERFORMANCE INDEX

BACKGROUND

- **SECY 99-007 ADDRESSED THE NEED TO FURTHER REFINE USE OF PIs BY DEVELOPING RBPIs**
- **DURING THE FIRST TWO YEARS OF INITIAL ROP IMPLEMENTATION, STAFF AND INDUSTRY IDENTIFIED PROBLEMS WITH CURRENT SSU PI AND MADE SEVERAL CHANGES**
- **SSU PI PROBLEMS DISCUSSED AT REGULAR SSU PI WORKING GROUP MEETING IN SPRING, 2001**
- **DECISION MADE TO FORM A SPECIAL SSU WORKING GROUP TO ADDRESS A POTENTIAL PI REPLACEMENT FOR THE SSU PI**
- **ACRS BRIEFED IN 2001 ON STAFF EFFORTS TO DEVELOP RBPIs**
- **MSPI PILOT IS AN EVOLUTIONARY STEP TOWARDS ENHANCED PI DEVELOPMENT**

PROBLEMS WITH CURRENT SSU PI

- RISK INSIGHTS ARE NOT ACCOUNTED FOR WITH USE OF DESIGN-BASIS FUNCTIONS
- SSU PI THRESHOLDS NOT PLANT-SPECIFIC OR RISK MANAGED
- DEMANDS AND DEMAND FAILURES NOT PROPERLY ACCOUNTED FOR
- USE OF FAULT EXPOSURE HOURS CAN OVER ESTIMATE THE SIGNIFICANCE AND RESULT IN A PI THAT CAN NO LONGER MEASURE FURTHER DEGRADATION OF PERFORMANCE
- CASCADING OF SUPPORT SYSTEM UNAVAILABILITY TO THE MONITORED SYSTEM UNAVAILABILITY OVERSTATES THE ACTUAL UNAVAILABILITY OF THE MONITORED SYSTEM

OBJECTIVES OF THE MSPI PILOT PROGRAM

- TO CREATE A BETTER AND MORE ACCURATE INDICATOR OF PERFORMANCE THAT ADDS MORE VALUE AND SOLVES THE KNOWN PROBLEMS WITHOUT ADDING UNDUE BURDEN
- TO CALCULATE THE REVISED UNAVAILABILITY AND UNRELIABILITY PI VALUES AND TO COMPARE THE RESULTS TO THE EXISTING SSU PI DATA TO ASCERTAIN WHETHER THE PROPOSED CHANGES ADDRESS THE EXISTING CONCERNS AND SUIT THE NEEDS OF THE ROP
- TO MINIMIZE TO THE EXTENT PRACTICABLE THE DIFFERENCES AND INCREASE THE CONSISTENCY BETWEEN THE MSPI, MAINTENANCE RULE, PRA, AND SDP
- TO EXERCISE THE MSPI DATA REPORTING MECHANICS AND CALCULATIONAL METHODOLOGY
- TO IDENTIFY ANY UNINTENDED CONSEQUENCES AND ASSESS THE IMPACT

QUESTIONS TO BE RESOLVED DURING THE PILOT

- Is the MSPI an equivalent or better indicator of risk than using the SDP such that the staff need only to rely on the MSPI for the risk significance characterization?
- Is the MSPI methodology more consistent with the maintenance rule and other risk assessment policies?
- Can the NRC inspect and verify the pilot MSPI without major problems?
- Can pilot licensees implement the MSPI with no major problems by the end of the pilot period?
- Do pilot participants believe the guidance is clear and easy to implement?
- What is the change in staff/licensee PI data collection/reporting resource burden?
- If it is an increase in burden, do the benefits (solves the known problems) justify the increase resource expenditure?
- Are there any unintended consequences, and if so, are they acceptable ?

OVERVIEW OF THE MSPI

- MSPI IS COMPRISED OF THE 4 EXISTING SSU PI SYSTEMS PLUS THEIR SUPPORT COOLING SYSTEMS AS MONITORED SYSTEMS
- THE MSPI IS A 12 QUARTER ROLLING AVERAGE OF THE UNAVAILABILITY AND THE UNRELIABILITY OF A MONITORED SYSTEM, CALCULATED IN RELATIVE TERMS OF Δ CDF.
- MSPI INCORPORATES PLANT-SPECIFIC MODELS AND USES DATA TO CALCULATE CDF index.
- MSPI THRESHOLDS WERE DEVELOPED USING STANDARD RISK INSIGHTS AND ARE DEFINED AT 1E-6 (GREEN/WHITE); 1E-5 (WHITE/YELLOW), AND 1E-4 (YELLOW/RED) CDF_{INDEX}
- DISCOVERED CONDITIONS THAT PREVENT FULFILLMENT OF THE SAFETY FUNCTION WILL BE ACCOUNTED FOR IN THE UNRELIABILITY PIs

PLANTS PARTICIPATING IN THE PILOT MSPI

Region I

Limerick 1/2
Millstone 2/3
Hope Creek
Salem1/2

Region II

Surry 1/2

Region III

Braidwood 1/2

Region IV

Cooper
Palo Verde 1/2/3
San Onofre 2/3
South Texas 1/2

LIST OF MSPI MONITORED SYSTEMS

BWRs

HPCI/HPCS (high pressure core injection/spray)
RCIC (reactor core isolation cooling)
RHR (residual heat removal)
EDGs (Emergency AC Power)
Support System Cooling (ESW + RBCCW + TBCCW)

PWRs

HPSI (high pressure safety injection)
AFW (auxillary feedwater or equivalent)
RHR (residual heat removal)
EDGs (emergency AC power)
Support System Cooling (ESW + CCW)(or equivalent)

MSPI UNAVAILABILITY

- MSPI UNAVAILABILITY IS THE SUM OF THE PLANNED AND UNPLANNED (CORRECTIVE) UNAVAILABILITY, REPORTED BY TRAIN
- MSPI TRAIN UNAVAILABILITY IS THE RATIO OF HOURS THAT THE TRAIN WAS UNAVAILABLE TO PERFORM ITS RISK-SIGNIFICANT FUNCTION(S) (DUE TO PLANNED/CORRECTIVE MAINTENANCE OR TESTING DURING THE PREVIOUS 12 QUARTERS WITH THE REACTOR CRITICAL) TO THE NUMBER OF CRITICAL HOURS THAT THE TRAIN WAS REQUIRED TO BE AVAILABLE

MSPI UNRELIABILITY

- MSPI UNRELIABILITY IS A MEASURE OF THE DEMAND FAILURE PROBABILITY OF THE MONITORED SYSTEM AND FAILURE PROBABILITY DURING A MISSION TIME.
- MSPI COMPONENT UNRELIABILITY IS THE FAILURE ON DEMAND PROBABILITY THAT THE SYSTEM WOULD NOT PERFORM ITS RISK-SIGNIFICANT FUNCTION(S) WHEN CALLED UPON DURING THE PREVIOUS 12 QUARTERS

IMPLEMENTATION SCHEDULE

JULY 23-25, 2002	PUBLIC WORKSHOP TO PREPARE FOR LAUNCH OF THE MSPI PILOT
AUGUST 1, 2002	START OF MSPI PILOT
NOVEMBER, 2002	BRIEF ACRS SUBCOMMITTEE ON PILOT PROGRESS
FEBRUARY, 2003	MSPI PILOT DATA COLLECTION ENDS. START OF THE ANALYSIS PERIOD TO ANALYZE COLLECTED DATA
MARCH, 2003	BRIEF ACRS SUBCOMMITTEE ON PILOT PROGRESS
JULY, 2003	END OF PILOT. RIS TO COMMUNICATE PILOT RESULTS

MSPI Technical Discussion

- **The purpose of this presentation is to describe the technical aspects of the Mitigating System Performance Index (MSPI).**
- **This presentation will include:**
 - **Summary of insights from Phase-1 RBPI study**
 - **Technical aspects of MSPI approach**
 - **Conclusions**

MSPI Technical Discussion

Insights From Phase-1 RBPI Study:

- There were enough risk-significant differences among different plants that necessitated the development of plant-specific thresholds for unavailability and unreliability PIs.
 - MSPI accounts for plant-specific differences
- Unavailability and unreliability indicators were found to provide objective and risk-informed indications of plant performance. They also provide broader risk coverage.
 - They were tested by evaluating plant-specific data for 44 plants over three-year period (1997-1999).

MSPI Technical Discussion

Insights From Phase-1 RBPI Study (cont'd):

- Performance indicators for CCW and SSW (or their equivalent) support systems were found to be difficult to develop due to the wide variation of plant-specific design features.
 - Based on the technical analyses performed by NRC/industry, an approach has been developed for the pilot.
- Use of Bayesian update for estimating component unreliability was found to minimize the likelihood of false-positive/false-negative indications.

Technical Aspects of MSPI Approach

Concepts:

- **Mitigating System Performance Index monitors risk impact (i.e., change in CDF) of changes in performance of selected mitigating systems.**
- **MSPI includes Level-I, internal events for at-power mode, which is consistent with the scope of the current ROP PIs.**
- **MSPI consist of two elements, system unavailability and system unreliability. MSPI is the sum of changes in a simplified CDF evaluation resulting from changes in system unavailability and system unreliability relative to baseline values.**
 - **Baseline values are based on SECY-99-007 concepts.**

Technical Aspects of MSPI Approach

Concepts (cont'd):

- The risk impact of changes in mitigating system performance on plant-specific CDF is estimated using plant-specific performance data and Fussel-Vesely importance measure.
- Those aspects of mitigating system performance that are not covered by MSPI will be evaluated through inspection/SDP. Examples are:
 - CCFs
 - Concurrent failures of multiple components
 - Passive components outside the scope of MSPI
 - Demand failures not capable of being discovered during normal surveillance tests.

MSPI Technical Discussion

Scope of MSPI:

- For unreliability calculations, only active components within a system are included in the performance indicator.
 - Active components are those components within a system that are required to change state upon demand in order for the system to perform its risk-significant functions; e.g., normally closed valve that must open on demand to allow flow through the system.
 - All pumps and diesels in the monitored systems are considered as active components.
 - Active failures of check valves are excluded from performance indicators and will be included in the inspection program.
 - Redundant valves within a train are not included in the performance indicators. PRA success criteria are used to identify those valves.

MSPI Technical Discussion

Scope of MSPI (cont'd):

- **Component boundaries are generally consistent with those used in PRAs.**
 - **For example, the motor-driven pump boundary includes pump body, motor/actuator, lubrication system cooling components of pump seals, breaker, and its associated local control circuit.**

- **SDP will be used for performance areas outside the scope of MSPI:**
 - **CCFs**
 - **Concurrent failures of multiple components**
 - **Passive components**
 - **Demand failures not capable of being discovered during normal surveillance tests.**

MSPI Technical Discussion

Equations:

MSPI for each monitored system is calculated as follows:

$$\text{MSPI} = \text{UAI} + \text{URI} \quad (1)$$

UAI: system unavailability index due to changes in train unavailability

URI: system unreliability index due to changes in component unreliability

System Unavailability Index (UAI):

$$\text{UAI} = \sum \text{UAI}_t \quad (2)$$

Where: the summation is over the number of trains in the system.

UAI_t is unavailability index for train t

$$\text{UAI}_t = \text{CDF}_P (\text{FV}_{\text{UAP}} / \text{UA}_P) (\text{UA}_t - \text{UA}_{\text{BLt}}) \quad (3)$$

CDF_P : plant-specific, internal events, at-power Core Damage Frequency

FV_{UAP} : train-specific Fussel-Vesely value for unavailability based on plant-specific PRA

UA_P : value of unavailability for train t from plant-specific PRA

UA_t : actual unavailability of train t during previous 12 quarters

UA_{BLt} : baseline unavailability value for train t

MSPI Technical Discussion

Equations (cont'd):

System Unreliability Index (URI):

$$\mathbf{URI = CDF_P \sum [(FV_{URC} / UR_{PC})(UR_{BC} - UR_{BLC})]} \quad \mathbf{(4)}$$

Where the summation is over the number of active components in the system

- CDF_P: plant-specific internal events, at power, Core Damage Frequency
FV_{URC}: component Fussel-Vesely value for unreliability based on plant-specific PRA
UR_{PC}: value of component unreliability from plant-specific PRA
UR_{BC}: Bayesian-updated component unreliability for previous 12 quarters
UR_{BLC}: baseline unreliability value for each active component in the monitored system

UR_{BC} (Component unreliability) is calculated as follows:

$$\mathbf{UR_{BC} = P_D + \lambda T_m} \quad \mathbf{(5)}$$

- P_D: component failure on demand probability based on data for previous 12 quarters
λ: component failure rate (per hr) for failure to run based on data for previous 12 quarters
T_m: mission time for the component based on plant-specific PRA assumptions

$$\mathbf{P_D = (N_d + a) / (D + a + b)} \quad \mathbf{(5a)}$$

$$\mathbf{\lambda = (N_r + a) / (T_r + b)} \quad \mathbf{(5b)}$$

MSPI Technical Discussion

Equations (cont'd):

N_d : total number of failures on demand during the previous 12 quarters
D: total number of demands during the previous 12 quarters
 N_r : total number of failures to run during the previous 12 quarters
 T_r : total number of run hours during the previous 12 quarters
a, b: parameters of industry priors derived from industry experience

MSPI Technical Discussion

Key Data Elements:

- **Baseline unavailability data:**
 - **Planned unavailability values are based on actual plant-specific values from 1999 through 2001.**
 - **Unplanned unavailability values are based on ROP PI data from 1999 through 2001.**
 - **Initial study indicated that these values are consistent with 1995-1997 data, and they will be validated during the pilot.**

- **Baseline unreliability values are based on component/system reliability studies**
 - **NUREG/CR-5500**
 - **Generally cover performance data from 1987 through 1995**
 - **These values will be updated when reliability studies through 1997 become available.**

MSPI Technical Discussion

Key Data Elements (cont'd):

- **Constrained, non-informative priors based on the mean of the industry performance were used for component unreliability calculations.**
 - **These priors minimize likelihood of false-positive/false-negative indications.**

MSPI Technical Discussion

Technical Areas Currently Under Evaluation:

- **Acceptable level of false-positive/false-negative indication.**
 - **P(W/baseline)**
 - **P(G/W-Y)**
 - **P(G/Y-R)**
- **Issues related to data that were used to set baseline unavailability and unreliability values.**
- **Independent calculations using SPAR models versus licensees PRA models.**
- **Evaluations of potential differences between MSPI and SDP results.**

MSPI Technical Discussion

Conclusions:

- The MSPI approach is based on risk insights. It accounts for plant-specific design/operating characteristics through the use of available risk models and data.
 - Use of F-V importance measures to account for plant-specific features.
 - Treatment of demand failures in unreliability indicators.
 - Use of Bayesian update for unreliability indicators.
 - Use of risk-significant functions rather than design-basis functions.
 - Use of a new indicator for cooling water support systems.
- The MSPI approach allows for balancing between component unreliability and unavailability consistent with the Maintenance Rule.
- The MSPI provides more objective indication of plant performance, and will provide broader risk coverage.
- The limitations of MSPI have clearly been identified, and will be covered through inspections/SDP.
- The MSPI provides appropriate risk-categorization of performance degradations that are covered by PIs.

**ACRS BRIEFING ON
INDUSTRY TRENDS PROGRAM (ITP)**

May 30, 2002

Introduction

- Background
- Purposes and Role of ITP
- Communications
- Concepts and Approach
- Process for Industry Trends
- FY 2001 Results
- Threshold Development

Background

- Improving industry trends contributed to decision to revise ROP
- Strategic Plan performance goal measure of “No statistically significant adverse industry trends in safety performance” - annual report to Congress as part of NRC’s Performance and Accountability Report
- Responsibility assigned to NRR from RES in late 2000
- NRR developed formal ITP in 2001
 - Initially used indicators from former AEOD PI and Accident Sequence Precursor (ASP) programs
 - Reports in SECY-01-0111 (6/2001) and SECY-02-0058 (4/2002)
- No adverse industry trends identified to date

Purposes and Role of ITP

- Purposes:
 - (1) Provide a means to confirm that the nuclear industry is maintaining the safety performance of operating reactors
 - (2) By clearly communicating industry performance, enhance stakeholder confidence in the efficacy of the NRC's processes

- Complements existing NRC processes:
 - (1) Plant-specific oversight by ROP
 - (2) Processes for addressing generic issues (i.e., generic communications process in NRR and generic safety issues process in RES)

Communications

- Ongoing development efforts briefed to NRC/industry working group on ROP
- Industry indicators published on NRC web site
- Annual review at AARM and report to Commission
- Annual report to Congress in NRC Performance and Accountability Report
- Conferences with Industry

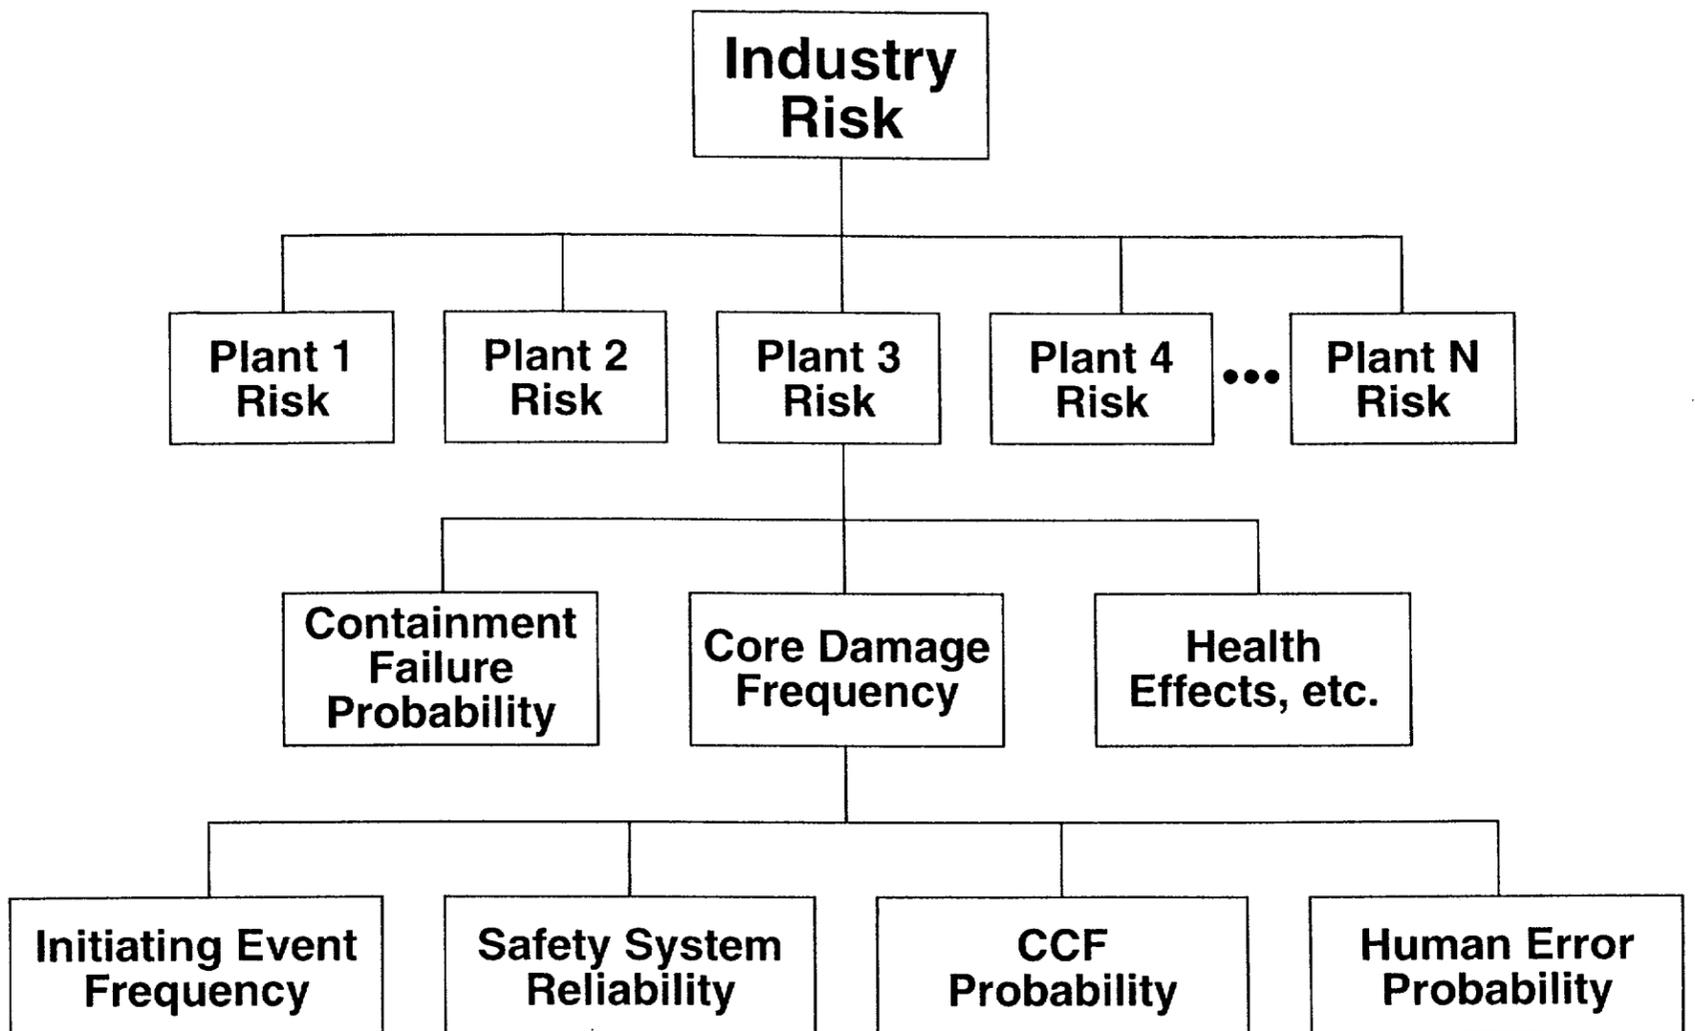

Concepts and Approach

- Hierarchal approach to use of industry indicators
 - Qualified set of indicators used for reporting to Congress
 - Indicators may be “decomposed” into multiple indicators to investigate any trends

- Used existing programs for initial set of indicators
 - ex-AEOD indicators
 - ASP program

- Developing additional industry indicators for each cornerstone of safety
 - PIs derived from plant-level PIs in ROP
 - PIs from operating experience data (initiating events and reliability PIs)

A DECOMPOSITION OF REACTOR RISK

Process for Industry Trends

- Identify any statistically significant adverse trends in industry indicators
 - Statistically significant fit of a trendline to each indicator
 - Improving or flat trendlines = no adverse trend => done
 - Degrading trendlines = adverse => report to Congress & initiate evaluation
 - In addition, to investigate short-term variations before they become trends, single data point above prediction limit => initiate evaluation

- Evaluate underlying issues and assess safety significance
 - Decompose indicators and look for outliers
 - If appropriate, review of LERs and inspection reports

- Agency response IAW existing NRC processes for generic issues
 - Early engagement with industry and assessment of issues
 - Responses could include industry initiatives and requests for information
 - NRC may conduct generic safety inspections

- Review at AARM

FY 2001 Results

- No statistically significant adverse industry trends in safety performance identified in FY 2001
 - Ex-AEOD indicators show flat or improving trendlines
 - ASP program shows overall improving trends and no significant precursors (SECY-02-0041)
- Insufficient data (<4 years) on ROP indicators for long term trending in FY 2001 (however, no issues identified by inspection of short term data)
- Industry indicators for initiating events developed; no statistically significant adverse trends identified

Threshold Development

- SRM in August 2001 directed staff to develop risk-informed thresholds for industry indicators “as soon as practicable”
 - NRR tasked RES to develop risk-informed thresholds for initiating events, mitigating systems, and ASP
 - NRR to develop thresholds for other cornerstones of safety
 - Stakeholders, including ACRS, will be engaged as thresholds are developed over next 1-2 years
- ROP indicators may have long term data (>4 years) in FY 2002; NRR evaluating efficacy of early “best estimate” data and may qualify for use in FY 2003
- Threshold development may allow changes to performance goal measure so that agency response based on thresholds vice trends
