ABSTRACT:

This document assesses the environmental impacts that may result from alternatives for the disposition of U.S.-origin weapons-usable highly enriched uranium (HEU) that has been or may be declared surplus to national defense or defense-related program needs. In addition to the No Action Alternative, it assesses four alternatives that would eliminate the weapons-usability of HEU by blending it with depleted uranium, natural uranium, or low-enriched uranium (LEU) to create LEU, either as commercial reactor fuel feedstock or as low-level radioactive waste. The potential blending sites are DOE's Y-12 Plant at the Oak Ridge Reservation in Oak Ridge, Tennessee; DOE's Savannah River Site in Aiken, South Carolina; the Babcock & Wilcox Naval Nuclear Fuel Division Facility in Lynchburg, Virginia; and the Nuclear Fuel Services Fuel Fabrication Plant in Erwin, Tennessee. Evaluations of impacts at the potential blending sites on site infrastructure, water resources, air quality and noise, socioeconomic resources, waste management, public and occupational health, and environmental justice are included in the assessment. The intersite transportation of nuclear and hazardous materials is also assessed. The Preferred Alternative is blending down as much of the surplus HEU to LEU as possible while gradually selling the commercially usable LEU for use as reactor fuel. DOE plans to continue this over an approximate 15- to 20-year period, with continued storage of the HEU until blend down is completed.

PUBLIC INVOLVEMENT:

The Department of Energy issued a HEU Draft EIS on October 27, 1996, and held a formal public comment period on the HEU Draft EIS through January 12, 1996. In preparing the HEU Final EIS, DOE considered comments received via mail, fax, electronic bulletin board (Internet), and transcribed from messages recorded by telephone. In addition, comments and concerns were recorded by notetakers during interactive public hearings held in Knoxville, Tennessee, on November 14, 1995, and Augusta, Georgia, on November 16, 1995. These comments were also considered during preparation of the HEU Final EIS. Comments received and DOE's responses to those comments are found in Volume II of the EIS.

Chapter 1

Issue Bins

1.1 INTRODUCTION

In October 1995, the Department of Energy (DOE) published the *Disposition of Surplus Highly Enriched Uranium Draft Environmental Impact Statement* (HEU EIS). This HEU EIS analyzed the environmental impacts of alternatives for the disposition of U.S.-origin highly enriched uranium (HEU) that has been or may be declared surplus to national defense or national defense-related program needs by the President. The 78-day public comment period for the HEU Draft EIS began on October 27, 1995, and ended on January 12, 1996. However, comments were accepted as late as January 30, 1996.

During the comment period, public meetings were held in Knoxville, TN, on November 14, 1995, and Augusta, GA, on November 16, 1995. Two meetings were held at each location, one in the afternoon and one in the evening. In addition, the public was encouraged to provide comments via mail, fax, electronic bulletin board (Internet), and telephone (toll-free 800-number).

Attendance at each meeting, together with the number of comments recorded and comments received by other means during the comment period, is presented in Table 1.1-1. Attendance numbers are based on the number of participants who completed and returned registration forms but may not include all of those participants present at the meetings. Comments that were received over the telephone were transcribed. Comments submitted via electronic bulletin board were downloaded. All comments received by mail, fax, electronic bulletin board, and telephone were stamped with the date the comment document was received. A total of 72 organizations and 125 individuals submitted comment documents for consideration.

1.2 ORGANIZATION

The *Comment Analysis and Response Document* has been organized into the following sections:

Table 1.1-1. Document and Comment Submission Overview

Method of Submission	Documents Received	Comments
Public Meetings		
<i>Knoxville, TN</i>	101	131
Total attendance-101		
<i>Augusta, GA</i>	33	89
Total attendance-33		
Hand-in at public meeting	3	4
Other		
Mail-in	69	169
Fax	30	123
Telephone	76	160
Electronic Bulletin Board	8	12
Total	320	688

Note: Comments from public meetings are recorded whereas comments from other submissions are identified.

- Chapter 1 describes the comment analysis and response process and lists the issue bins.
- Chapter 2 presents the changes made in the HEU Draft EIS as a result of the public comments received.
- Chapter 3 contains documents received during the public comment period showing the comments identified, comments recorded at the public meetings, and responses to all comments.

Tables are provided at the end of this chapter to assist commentators and other readers in locating comments regarding the HEU Draft EIS. Once comments were identified, they were categorized by issue (for example, emergency response or environmental compliance) and assigned to an issue bin. (An issue bin is the term used for a general topic under which to identify comments for proper response.) Table 1.2-1 lists the issue category and

corresponding issue bin numbers. The majority of comments were responded to on a one-to-one basis; however, comments that were similar in content were grouped together and one response addressing that group was provided. Each comment, whether an individual comment or a group of comments, was assigned a five-digit number, starting with the appropriate issue bin number (example: 10.024, 10 being the issue bin number and 024 being the 24th comment in that bin).

Table 1.2-2 identifies the individuals who attended the public meetings and how to locate the comments and responses from those meetings. Commentors interested in locating their comment document and seeing how their comments were binned can use Table 1.2-3. This table lists the individuals, agencies, companies, organizations, and special interest groups who submitted comment documents. Commentors are listed alphabetically by last name or organization name, along with the corresponding page number on which the actual comment document appears. Also listed in this table are the issue numbers assigned to the comments found within each comment document.

As discussed in Section 1.1, comments were received by mail, fax, electronic bulletin board, or telephone in addition to the comments recorded in the public meetings. In some instances, duplicate comments were received from a single commentor. Many individual phone calls were received to support the phone campaign. The scan of only one telephone call transcription representative of the campaign is reproduced in Chapter 3. All individuals who participated in this campaign are referred to the page upon which the scan for the representative transcription is reproduced.

The issue bins identified previously are listed by number in Table 1.2-4. This table provides the number of the issue bin under which comments received on the HEU Draft EIS were grouped, followed by the specific comment number and the page number(s) where the comment(s) can be found. Multiple page numbers indicate several comments on the same issue. Using the appropriate issue number, commentors can use this table to see if their comment was grouped with other comments and how many were grouped together.

Table 1.2-1. Issue Bins

Issue Category	Issue Bin Number	Content
Purpose and Need for Action/Scope	1	Highly enriched uranium disposition process
	2	Surplus disposition and its process
	3	Nonproliferation objectives
	4	Economic objectives

Chapter 2

Changes in Environmental Impact Statement as a Result of Public Comments

During the 78-day public comment period, DOE received a total of 688 written or recorded comments (Table 1.1-1) on the HEU Draft EIS. All comments were considered and responses prepared. There were several major issues that emerged from public comments on the HEU Draft EIS. Some of these comments necessitated changes in the HEU Draft EIS, which were incorporated into the HEU Final EIS. The major comments received and changes made in response to these comments are summarized below.

There was, among those who submitted comments, overwhelming support for the fundamental objective of transforming surplus HEU to a non-weapons-usable form by blending it down to low-enriched uranium (LEU) (for either fuel or waste). A few commentators, however, argued that surplus HEU should be retained in its present form for possible future use, either in weapons or breeder reactors.

There was substantial opposition to commercial use of surplus HEU in the form of nuclear reactor fuel. The commentators holding this view indicated that such use would increase proliferation risk by creating commercial spent nuclear fuel, which results in the generation of Pu. These commentators generally supported blending surplus HEU to LEU for disposal as waste instead of blending for commercial use.

Some commentators from the uranium fuel cycle industry expressed substantial concern that the entry of LEU fuel derived from surplus HEU from both Russian and U.S. weapons programs would severely depress uranium prices and lead to the closure of U.S. uranium mines, conversion plants, or enrichment plants. There were other comments, however, from several electric utilities that operate nuclear plants and from one uranium supplier indicating that reactor fuel derived from surplus HEU (Russian and U.S.) would enter the market at

a time when worldwide production is expected to fall considerably short of demand and prices are expected to be rising substantially, which, in fact, has occurred over the course of completing the HEU Final EIS. These commentators felt that the likely impact of market sales of LEU fuel derived from surplus HEU would be to moderate sharp price escalation.

Several commentators argued that DOE should have evaluated in the HEU Draft EIS blending some or all of the surplus HEU to either 19- or 4-percent LEU and storing it until some later, undefined time. They argued that blending surplus HEU to below 20-percent enrichment and storing it indefinitely would have considerable nonproliferation advantages since it would not generate spent nuclear fuel, which contains Pu, while preserving its economic or beneficial use options.

Many commentators also argued that DOE should have developed a formal economic analysis evaluating the cost of each alternative, as well as benefits anticipated from the sale of LEU fuel derived from surplus HEU in the commercial market. They indicated, in general, that without a comparative cost analysis between various alternatives and the Preferred Alternative, it would not be possible to fully weigh the environmental risks and socioeconomic impacts of the Preferred Alternative against the risks and benefits that could be achieved by implementing other alternatives.

Many commentators expressed support for or opposition to the use of particular facilities for surplus HEU disposition actions. Similarly, several commentators indicated either support or opposition to the Preferred Alternative and/or expressed their Preferred Alternative. A few commentators expressed concern regarding the projected worker latent cancer fatality consequences for facility accidents.

In response to comments received on the HEU Draft EIS, as well as other changes in circumstances and knowledge, the HEU Final EIS has been modified in the following respects:

- The discussion of potential impacts to the uranium mining and nuclear fuel cycle industries (Section 4.8) has been revised to reflect enactment (in April 1996) of the *U.S. Enrichment Corporation (USEC) Privatization Act* (Public Law [P.L.] 104-134), and to better reflect cumulative impacts in light of the U.S.-Russian agreement to purchase Russian HEU blended down to LEU. The HEU Final EIS recognizes the possibility that the market may be able to support only one U.S. enrichment plant after the year 2000 (as projected in the *Environmental Assessment for the Purchase of Russian Low Enriched Uranium Derived from the Dismantlement of Nuclear Weapons in the Countries of the Former Soviet Union* [USEC EA]) when Russian shipments of LEU derived from HEU are scheduled to triple. However, decisions regarding the continued operation of the enrichment plants would be made by USEC or its successor and would be based on the prevailing market conditions.
- Revisions were made in Chapters 1 and 2 of Volume I of the HEU Final EIS to modify the discussion of the rates of disposition actions that could result in commercial sales of LEU to better reflect the composition of the surplus inventory, the time required for DOE to make HEU available for disposition, and the new legislative requirement (in the *USEC Privatization Act*) to avoid adverse material impacts on the domestic uranium mining, conversion, or enrichment industries. As a result of the Secretary of Energy's *Openness Initiative* announcement of February 6, 1996, Figure 1.3-1 was included in Volume I of the HEU Final EIS to provide the forms, locations, and quantities of surplus HEU in the United States.
- In response to several comments, a qualitative discussion has been added in Section 2.1.3 of Volume I of the HEU Final EIS regarding the option of blending surplus HEU to 19-percent LEU and storing it. As explained in Section 2.1.3, DOE does not consider this option reasonable because it would delay beneficial re-use of the material; delay recovery of the economic value of the material; add storage costs; reduce net revenues in the near term; not meet all aspects of the purpose and need of the proposed action; and be practically applicable without additional construction to only a small portion (20 metric tons [t] or approximately 40 t if a solidification facility is proposed and constructed at or near Savannah River Site [SRS]) of the current surplus inventory.
- The assessment of impacts to noninvolved workers and the public from accidental releases (radiological) was revised to improve realism in the calculation of doses and the results were incorporated into Chapters 2 and 4 of Volume I of the HEU Final EIS. Accidental radiological releases of uranium were remodeled using the MELCOR Accident Consequence Code System (MACCS) computer code with more detailed site-specific information to better estimate noninvolved worker (and public) cancer fatalities at each candidate site. The results revealed substantial reductions in projected cancer fatalities for all the blending alternatives at each site. DOE believes that these results reflect more realistic consequences since MACCS offers better capabilities in terms of modeling accident conditions and uses detailed site-specific information.

- Volume I of the HEU Final EIS has been modified to reflect the fact that SRS has effectively lost the ability to do metal blending and currently lacks the ability to solidify and crystalize material at the 4-percent enrichment level. SRS is now assessed only for uranyl nitrate hexahydrate (UNH) blending, and the fact that other arrangements must be made for oxidation of commercial material is reflected.
- Several changes have been made to the cumulative impacts section (Section 4.6 of Volume I) to reflect changes in the status of other projects and their associated *National Environmental Policy Act* (NEPA) documents (for example, Oak Ridge Reservation [ORR] was not selected as part of the Preferred Alternative in the *Tritium Supply and Recycling Programmatic Environmental Impact Statement* and Record of Decision [ROD]).
- Based on comments received, Section 4.4 of Volume I has been revised to include a discussion and comparison of risks associated with materials handling and transportation for all blending processes at the Y-12 Plant. Section 4.4 has also been revised to include an assessment of impacts for potential transportation of surplus HEU currently located at SRS and Portsmouth directly to blending sites instead of sending it to the Y-12 Plant for interim storage.
- The geology and soils sections for all of the candidate blending sites have been augmented to address a comment requesting a discussion of past earthquakes and potential impacts to facilities that could result from future seismic activity.
- A separate Floodplain Assessment (and Proposed Statement of Findings) has been added to the HEU Final EIS (Section 4.13 of Volume I) pursuant to 10 CFR Part 1022. This assessment is based, in large part, on information that was presented in the water resources sections of the HEU Draft EIS. The discussion of potential flooding at the NFS site has been expanded in response to comments.
- Numerous other minor technical and editorial changes have been made to the document.

Some DOE policy positions have remained unchanged between the HEU Draft and Final EISs notwithstanding comments that counseled a different approach. These comments were associated with keeping surplus HEU in its present form for possible future use, perceived nonproliferation concerns due to plutonium (Pu) in spent nuclear fuel generated as a result of using LEU fuel derived from surplus HEU in commercial reactors, and the request for economic cost/benefit analysis of alternatives in the HEU Draft EIS. (A cost analysis of the alternatives has been prepared and is available for public review.) The unchanged policy positions are explained in detail in Section 1.5.4 of Volume I of the HEU Final EIS.

Chapter 3

Comment Documents and Responses

This chapter presents all documents submitted to DOE on the HEU Draft EIS, comments recorded in public meetings and identified from documents, and DOE's response to each comment. Comments that were identical or similar in nature were grouped together to develop a single response. The responses developed for each group were then repeated in this section for each comment in that group.

I'm calling from Lynchburg, Virginia, and I don't see here that there's going to be a public workshop in Lynchburg, considering that's one of the two places is one of the two facilities among the candidate sites for this proposed disposition of surplus HEU. I would like to have something local rather than have to take my time to go out to Knoxville, Tennessee, to attend a workshop. I think that would be fair, and I think it's right and that's what I would like to see. I like my phone call returned please. My name is Peter Alexander, and my number is 804-845-0145. Thank you.

32.001

32.001: The Department of Energy welcomes your comments on the HEU Draft EIS. DOE must work within the constraints imposed by available funding and resources. Because DOE is trying to reduce the costs of complying with NEPA, and due to the geographical proximity of three of the four candidate sites identified in the HEU EIS, DOE determined that two public meetings (Knoxville, TN and Augusta, GA) would be appropriate for this program.

Transcription:

I'm calling on January 12th, 1996 to express our organization's concern about the Department of Energy's Environmental Impact Statement on the disposition of surplus highly enriched uranium. A major problem with the current Draft HEU EIS is that it selects the maximum commercial use option as the favored option. That is, the HEU EIS recommends that 85% of the uranium be down blended to the level of nuclear reactor fuel. This would result in tens of thousands of tons of spent nuclear fuel containing plutonium and highly enriched uranium, both usable for nuclear weapons after reprocessing, but the President's 1993 Nonproliferation and Export Control Policy Statement requires that nonproliferation be a higher priority in determining how to deal with surplus special materials. The creation of weapons-usable materials as an end result of a process motivated by commercial gain from the sale of reactor grade uranium relegates nonproliferation goals to a lower priority. Even without the President's 1993 policy statement, we think it foolish to create more weapons-usable materials when there is another option, that is down blending HEU to less than 1% and disposing of it as low-level waste so that it can't be used in weapons. Nonproliferation should be our major priority.

03.017

Finally, we recommend that the HEU EIS at least begin to deal with the issue of international controls on all nuclear materials in order to lessen weapons proliferation and to better assure environmental protection. The United States should take the lead in assuring that all materials usable for nuclear weapons be controlled by the international community securely and permanently.

03.020

Sincerely yours,
Thomas M. Rauch,
Director, Disarmament and Rocky Flats Program
American Friends Service Committee,
1664 Lafayette Street
Denver, Colorado 80218.
Our phone number is area code (303) 832-4789. Thank you for the opportunity to comment.

03.017: The Department of Energy does not agree that commercial use of LEU fuel derived from surplus HEU increases the proliferation potential. DOE considers alternatives 2 through 5, which represent blending different portions of the surplus HEU to waste or fuel, as roughly equivalent in terms of proliferation potential and much more proliferation resistant than the HEU in its present form. That is, LEU at both 4- and 0.9-percent enrichment and spent fuel are all considered to have low proliferation potential because both enrichment of uranium and reprocessing of spent fuel to separate Pu are difficult and costly. Although fuel derived from U.S. surplus HEU and sold abroad could conceivably be reprocessed in some countries to separate Pu for commercial (non-military) use in mixed oxide fuel, that LEU fuel derived from surplus HEU would simply replace other fuel, so no incremental Pu will be created as a result of this program.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to International Atomic Energy Agency (IAEA) controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky Flats sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

RE: Draft Environmental Impact Statement (EIS) for disposition of Surplus Highly Enriched Uranium, October 1995.

The Atomic Trades and Labor Council, representing sixteen international unions at the Oak Ridge Y-12 and X-10 plants, would like you to please consider the following comments when making final decisions on the disposition of surplus Highly Enriched Uranium (HEU).

We support the Department of Energy's proposal to blend-down surplus of HEU to Low Enriched Uranium (LEU). The Department of Energy's preferred alternative, (Alternative 5, Variation c) is one that we could support. However, we would prefer Alternative 5, Variation d as our first choice and then Alternative 5, Variations a and e respectively. The blending-down of surplus HEU using any variation of Alternative 5 would allow the United States a means to recover some investments from the Cold War efforts.

10.003

We do not favor Variation b of Alternatives 4 or 5. We feel it would be a terrible disservice to the workers at the Y-12 Plant to send this peacetime mission to the commercial sites and displace Y-12 Defense Program workers.

We feel that the Y-12 Plant and the Oak Ridge Reservation (ORR) should be considered at the top of the list for all processes used to blend HEU. The many advantages that the Y-12 Plant and the ORR have to offer are as follows:

The Y-12 Plant already has facilities that can be utilized for many of the blending operations being considered;

10.008

State-of-the-art systems for treatment and disposal of waste streams generated during blending operations;

More professional, technical, and craft experience and expertise in the safe handling of HEU than any other site;

10.003: Comment noted.

10.008: The Y-12 Plant is one of the four alternative sites evaluated in the HEU EIS as having the capability to provide uranium blending processes. To be in compliance with NEPA, the HEU EIS must assess the environmental impacts of the proposed action and alternatives at all potential candidate sites without favoring one over another and provide this information to the decisionmaker.

ATOMIC TRADES AND LABOR COUNCIL, OAK RIDGE, TN
PAGE 2 OF 2

HEU would not have to be shipped off site to be processed since most HEU is already stored at the Y-12 site.

The Y-12 Plant capabilities to blend-down HEU using two processes at the same time, HEU to LEU as metal and HEU to LEU as Uranyl Nitrate Hexahydrate

The community population surrounding the Y-12 Plant and the ORR, has a thorough knowledge of and interest in technologies and processes related to HEU. Also, confidence and trust in the facilities and expertise associated with the already current missions which have been ongoing for over 50 years.

Also, the Department of Energy could utilize the experience and capable work force from the Cold War effort who's job is now in jeopardy because of the downscaling of Defense Program.

We also feel the Y-12 Plant or the ORR should be considered as the ideal location for the new uranium hexafluoride blending operation because of the previously listed advantages.

Thank you for your time and consideration of these comments.

Sincerely,

Carl R. Scarborough
President, Atomic Trades and Labor Council

** The following is the text of the Author's Comment.

I find that the analyses presented in the Public and Occupational Health sections of the draft HEU EIS are alarming and question the validity of data used and presented in previous DOE NEPA documents. I am worried that the Department of Energy is trying to bias the selection of sites by presenting such a wide range in the number of fatalities due to accidents in the HEU EIS. It appears to me that either the section was prepared by very junior scientists, by personnel that are insensitive to the public's safety, or we are victims of DOE propaganda. I sincerely hope that the latter is not the case. I have always trusted the DOE and hope to continue my confidence. I would like to see an explanation of what kind of modeling was used to calculate these high death rates. Why, all of the sudden, do the numbers in this document increase significantly compared to those recently prepared by the DOE for the exact same sites? Are these numbers correct now and were previous numbers used by the DOE in recent DOE NEPA documents for the exact same sites, and in some cases, the previous documents much more radioactive materials? ARE THESE NUMBERS CORRECT NOW AND WERE PREVIOUS NUMBERS USED BY DOE INTENTIONALLY REDUCED IN ORDER TO FOOL THE PUBLIC INTO THINKING IMPACTS WOULD BE LOWER FOR PET PROJECTS OF THE PAST?

As a scientist, I would certainly would be interested in the methodology used to create these numbers.

Thanks for your attention to this matter.

C. S. Bittner, PhD

21.018

21.018: Accident consequences presented in the HEU Draft EIS were estimated using the GENII computer code. GENII is generally used and best suited for modeling impacts of radiological releases under normal operation of facilities because it handles a large number of radiological isotopes and accounts for the ingestion pathway. GENII was used with 50 percent meteorology (average meteorological conditions that would occur 50 percent of the time in any given period) during the accident. It is assumed that the noninvolved worker is placed in the sector that yields the maximum dose calculated by GENII. Latent cancer fatalities were calculated by applying this dose to all workers assuming that they are located 1,000 meters (m) away (or at the site boundary if less than 1,000 m) from the accident due to lack of data on site-specific worker distribution. This was done to compensate for a lack of data regarding onsite worker distribution, but yields highly conservative results. Also, this approach yielded disproportionately higher impacts at Y-12 and SRS because of the larger workforce at those sites compared to commercial sites.

In response to public comments, accidental releases of uranium were re-modeled using the MACCS computer code with more detailed site-specific information to better estimate noninvolved worker cancer fatalities at each candidate site. MACCS is a widely used code and offers better capabilities than GENII in terms of modeling accident conditions. It uses actual (recorded onsite) meteorological conditions and distributes data recorded over a 1-year period. The worker distribution data for each site were also collected and incorporated into MACCS runs to obtain a more realistic estimate of potential worker accident consequences.

The results obtained from MACCS runs have been incorporated into Section 4.3 of the HEU Final EIS. The methodology for the accident analysis has been added as Section 4.1.9. and Appendix E.5 of the HEU Final EIS.

BEGIN comment =

The numbers in the facility accidents environmental consequences sections concerning the latent cancer fatalities, and the dose to the noninvolved worker alarms me and my family that still reside in both Georgia and South Carolina. I think it is important for the DOE to prepare an appendix to the EIS that provides the methodology of analyses in this section, so I could better understand how the number of 39 cancer fatalities and dose of 97,900 person-rem were calculated for an earthquake induced criticality at Y-12.

As a proud native son of Aiken, SC and the son of a member of the Republican Senatorial Inner Circle, I am deeply concerned and ashamed that the proposed project has calculated 76 fatalities and 188,000 person-rem dose for noninvolved workers at the Savannah River Site. Don't you think these numbers are extremely high? Why are these numbers so much lower at commercial sites in the vicinity? I'm certain that the surrounding residents of SRS are VERY CONCERNED AND WORRIED ABOUT THE NUMBERS. I am sure that Senator Thurmond would be concerned about this and I am surprised that a public meeting regarding these high facility estimates has not been held. What would be the impact of all those innocent people killed and what would happen to their children? I am concerned that such fatality estimates will have a VERY negative effect on property values of land around Aiken and Augusta. If these numbers are correct, are we at risk today with the facilities that were previously built using much lower fatality numbers than those in the HEU EIS? Thank you.

DOE / Fissile Materials Disposition FAX # 1-800-820-5156
c/o SAIC/HEU EIS
Washington, DC 20026

Gentlemen:

I'm troubled by reports that you plan to permit the making of nuclear reactor fuel from highly enriched uranium. This is a bad idea and I object because:

- It will create spent fuel, a highly toxic and radioactive waste we have no solution for. | 10.024
- It will create plutonium, a violation of our non-proliferation goals. | 09.018
- Other options have not been adequately explored, including storing downblended uranium.

On the other hand, I do support the following:

- Downblending all highly enriched uranium so it cannot be used in weapons. | 10.023
- Developing the capacity to downblend all uranium declared surplus in ten years. | 03.020
- Having international controls on all nuclear materials.

I sincerely hope you will give careful thought to the well being of future generations before you take action.

Sincerely yours,

Gerhard Blombach
4520 Ball Camp Pike
Knoxville, TN 37921
FAX #1-800-522-2409

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

09.018: The Department of Energy does not consider the option of blending surplus HEU for extended storage reasonable because it would delay beneficial re-use of the material; delay recovery of the economic value of the material; add storage costs; reduce net revenues in the near term; not meet all aspects of the purpose and need of the proposed action; and be practically applicable without additional construction to only a small portion (20 t or approximately 40 t if a solidification facility is proposed and constructed at or near SRS) of the current surplus inventory.

10.023: Existing facilities analyzed in the HEU EIS have sufficient capability to blend down all surplus HEU to LEU in a reasonable timeframe. However, DOE does not anticipate being able to make much more than about 8 t per year available for blending. Therefore, DOE considers that it will likely take 15 to 20 years to blend the entire surplus HEU inventory.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to IAEA controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky Flats sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

SUBJECT: Responses to HERO EIS

Attached for your reference is BNFL's comments on DOE's EIS for the Disposition of HERO. We made an attempt to get this to you on Friday, January 12, but due to the storm, I could not get into the office and my colleague in the UK tried to fax it from there. However, due to the 1-800 number, they were unable to get it through. My British colleague spoke with a Kevin Donovan at DOE who advised them that the comments could be submitted by Tuesday, January 16, due to the public holiday (not to mention the delays due to snow).

Therefore, please accept the following comments. Please let me know if there is a problem with the transmission at (202) 785-2635.

Many thanks for your cooperation.

Rachel McKillan

Comments on DOE's Draft Environmental Impact Statement for the Disposition of Surplus Highly Enriched Uranium.

BNFL applauds the Department of Energy's efforts to further the goals of nonproliferation and to recognize the energy value of highly enriched uranium (HEU) formerly used for weapons related activities as safe, commercial fuel. Specifically, BNFL strongly supports the Department's proposal to blend down "off-specification" material into low enriched uranium (LEU) that can be fabricated into commercial reactor grade fuel. This option provides an economical and safe method of managing this excess material that would otherwise be considered a waste.

This "off-spec" material is a valuable asset in two ways. The U.S. taxpayer saves the cost of storing and managing this material as a waste and it is utilized as an energy resource that has no additional impact to the environment. No additional spent fuel is created and its use as fuel replaces the need to mine additional uranium, minimizing the wastes created. This HEU will only provide such a benefit in commercial reactors when blended with unirradiated depleted (DU) or slightly enriched uranium (SEU). As other DOE sites possess excess DU and SEU, using them as blend stock would solve another potential waste management problem for the Department.

According to the Draft EIS, there is approximately 40 MT of non-spec HEU at various DOE sites. For many years, BNFL has been fabricating fuel with very similar isotopic content (high U234 and U236 content) for use in UK reactors. The UK has been successfully burning this type of fuel in existing reactors, supplying power to the country for several decades now.

BNFL encourages DOE to move forward stabilizing and blending down this material at a DOE site. DOE has the basic infrastructure and existing facilities for these activities. Such a program is an investment in the US and its expertise. Currently, no existing commercial fuel fabricators can handle this material. By bringing in private investment to assist in the conversion of the material from a blended down form to LEU, expertise can be maintained at a DOE site while supplementing the industry's capabilities in handling recycled material, operating experience and licensing processes.

Putting this material in the most stable, proliferation resistant form possible specifically furthers the Administration's nonproliferation policy goals as well as eases their environmental and waste management burden. DOE could move forward more expeditiously with the disposition of this material by implementing a plan to apply the technology that exists in handling "off-spec" LEU fabrication and its use in reactors. Again, BNFL strongly supports DOE's proposal to recognize this material's value as an energy resource and is ready to assist DOE in supporting this goal.

With kindest regards,

Rachel A. McMillan
Program Associate
Fuel Cycle and Materials Processing

10.019

10.019: The HEU EIS analyzed environmental impacts of the proposed action at four candidate sites. These candidate sites currently have technically viable uranium blending capabilities and could blend surplus HEU to LEU for commercial fuel or waste. Once environmental, cost, and scheduling studies are completed, DOE will make programmatic decisions as to whether surplus HEU should be blended for commercial use or for waste. Decisions about where specific batches of HEU will be blended are expected to be based largely on business considerations and may involve USEC, other private entities that may act as the Government's marketing agent, or DOE.

Yes, my name is Kate Boniskin. I am calling from North Carolina. I am very concerned about this apparent plan to go ahead and turn highly enriched uranium into nuclear fuel. I think we need to be moving in the direction of down blending and phasing out all nuclear materials because we still don't know what to do with all this waste that's accumulating. And I'd like very much to add my voice to all the other voices that are not in favor of this plan to create more waste and not really solve the problem. Thank you very much.

14.014

14.014: The Department of Energy's Preferred Alternative is to blend down the HEU but minimize the amount of waste generated. Commercial use of the material minimizes the waste generated, because HEU blended to fuel replaces fuel that would be used anyway; HEU blended to waste is additional to the amount that would be otherwise generated.

January 18, 1996

Dear Sir/Madam,

I am writing to comment of the Department of Energy's (DOE) Disposition of Surplus Highly Enriched Uranium Draft Environmental Impact Statement (HEU EIS), dated October 1995.

My particular concern regards the analyses presented in the Public and Occupational Health sections of the EIS. In the Facility Accidents environmental consequences sections, statements are made concerning the number of latent cancer fatalities and the dose to the noninvolved workers. I would like to know the methodology employed to create these numbers. Specifically, how are the number of 39 cancer fatalities and dose of 97,900 person-rems calculated for an earthquake induced criticality at Y-12, Oak Ridge Reservation (Table 4.3.3.6-1)? Similarly, how are the number of 76 fatalities and dose of 188,000 person-rems calculated for noninvolved workers at the Savannah River Site (Table 4.3.3.6-2)? These numbers seem extraordinarily high. Why are the numbers so much lower at the two commercial sites? Is the DOE trying to bias the selection of sites by presenting such a wide range in the number of fatalities? What modeling was used to calculate these high death rates? What assumptions concerning worker location and dose went into your calculation? Why is the facility accident methodology absent from the EIS? Are these impacts realistic? If they are realistic, the DOE must surely want to reconsider the location of these blending activities and the safety of involved and noninvolved workers.

Thank you for the opportunity to comment. I would like to see a more thorough presentation of the analysis of risks of Facility Accidents presented in the Final HEU EIS.

Sincerely,

Diane L. Case, Ph.D.
Health Physicist

21.018

21.018: Accident consequences presented in the HEU Draft EIS were estimated using the GENII computer code. GENII is generally used and best suited for modeling impacts of radiological releases under normal operation of facilities because it handles a large number of radiological isotopes and accounts for the ingestion pathway. GENII was used with 50 percent meteorology (average meteorological conditions that would occur 50 percent of the time in any given period) during the accident. It is assumed that the noninvolved worker is placed in the sector that yields the maximum dose calculated by GENII. Latent cancer fatalities were calculated by applying this dose to all workers assuming that they are located 1,000 m away (or at the site boundary if less than 1,000 m) from the accident due to lack of data on site-specific worker distribution. This was done to compensate for a lack of data regarding onsite worker distribution, but yields highly conservative results. Also, this approach yielded disproportionately higher impacts at Y-12 and SRS because of the larger workforce at those sites compared to commercial sites.

In response to public comments, accidental releases of uranium were re-modeled using the MACCS computer code with more detailed site-specific information to better estimate noninvolved worker cancer fatalities at each candidate site. MACCS is a widely used code and offers better capabilities than GENII in terms of modeling accident conditions. It uses actual (recorded onsite) meteorological conditions and distributes data recorded over a 1-year period. The worker distribution data for each site were also collected and incorporated into MACCS runs to obtain a more realistic estimate of potential worker accident consequences.

The results obtained from MACCS runs have been incorporated into Section 4.3 of the HEU Final EIS. The methodology for the accident analysis has been added in Section 4.1.9 and Appendix E.5 of the HEU Final EIS.

October 28, 1995

U.S. Department of Energy
Office of Fissile Materials Disposition
Forrestal Building
1000 Independence Avenue, S.W.
Washington, DC 20585

Dear Sirs,

Since HEU usually costs more to produce than weapons-grade plutonium-239, it appears that 200 metric tons of surplus HEU were produced at a cost of well over \$2 trillion, about \$10 billion per metric ton. If it has a scrap value of only 2% of its cost, it is still worth much more than gold!

The DOE has asked for advice from the technological community. The four alternatives outlined on page 3 of the Fall, 1995, newsletter do not represent good or even sound advice. The alternative of safeguarding 100% of the surplus, extremely valuable HEU as LEU is not mentioned. This material represents a national treasure which cannot be lightly disposed of as waste. Conservation and safe storage of such a national treasure is not only mandatory; it is also excellent policy, fiscally and environmentally.

Incidentally, the blending of HEU to produce a "low-level waste" for disposal could easily result in an environmental disaster. Uranium is a heavy metal. It produces heavy metal poisoning in humans. When concentrated as metal or oxide, all fully enriched or depleted uranium is self-shielding to its own radiation. Its radioactivity is so low that it is already "low level". Concentrated forms of uranium are routinely handled without causing any significant exposure to radiation. Diluting HEU to produce an enormous volume of "low level" waste will merely contaminate that volume with this heavy metal poison. Disposing of a large volume of poisoned material could be difficult. Is the DOE disposing of its stores of depleted uranium by diluting it in this way?

Evidently, the DOE is not aware of the conditions which caused the breakup of the former Soviet Union. The bureaucracy in the U.S.S.R. simply ceased to function efficiently. The bureaucrats didn't have the field experience and technological expertise to understand the functions they were asked to perform. A centralized bureaucratic government fails when bureaucrats are novices.

Under these circumstances, the DOE should select the "No Action" alternative. Leave the disposition of this national treasure to persons who are able to appreciate its value.

Sincerely,

Walston Chubb
Walston Chubb
3450 MacArthur Drive
Murrysville, PA 15668
412-327-8592

10.007: The No Action Alternative does not satisfy the purpose and need for the proposed action. It would leave the nuclear proliferation problem unaddressed, continue to incur storage costs, and not recover the economic value of the material. DOE agrees that the surplus HEU material represents a national treasure and therefore does not intend to dispose of it as waste if that can be avoided. DOE's goal is to maximize the economic value of this HEU by blending it to LEU and gradually selling it in the commercial market for use in commercial reactors. See discussion of the Preferred Alternative in Section 1.4.2.

14.001: The HEU disposition program does not propose to "dilute" HEU with non-uranium materials merely for purposes of disposal. Rather, the HEU that must be disposed as waste would be blended with depleted uranium down to LEU primarily to make it non-weapons-usable. The resultant product to be disposed of would be essentially pure uranium oxide, at an enrichment level (about 0.9 percent) that approaches a natural level. It is true that the volume would be greatly increased (by about a factor of 70), and that disposal is not a simple matter, which is one major reason DOE prefers to minimize the quantity that must be disposed of as waste by using as much as possible in commercial fuel.

Citizens for National Security
Comments on Disposition of Surplus Highly Enriched Uranium
Draft Environmental Impact Statement

Independent of the blending process that will be utilized, the Y-12 Plant, and its larger Oak Ridge Reservation, offer the same advantages as the other three sites evaluated in the EIS, plus additional advantages. Therefore, the Y-12 Plant and the Oak Ridge Reservation should be considered as the top of the list for all processes used to blend highly enriched uranium. The many advantages that Y-12 and the Oak Ridge Reservation have to offer include:

- The Oak Ridge Reservation has ample and more-than-adequate resources required for blending highly enriched uranium.
 - Its Y-12 Plant already has facilities that can be utilized for many of the blending operations being considered.
 - It has the necessary infrastructure required for any new facilities (for example, electricity, transportation, and other utilities).
 - It has state-of-the-art systems for treatment and disposal of waste streams generated during blending operations.
 - Many other existing missions located at Y-12, X-10, and X-25 would provide tremendous support for blending operations.
 - It has more professional, technical, and craft experience and expertise in the safe handling of highly enriched uranium than any other site in the world.
 - It offers state-of-the-art security that is second-to-none.
- The civilian population surrounding the Y-12 Plant and the Oak Ridge Reservation in general has a thorough knowledge of and a high level of interest in technologies and processes related to highly enriched uranium. This regional population has a high level of support, confidence, and trust in the facilities and expertise associated with current missions. This regional support has existed now for over 30 years.

10.008

The two DOE sites (Y-12 Plant or Savannah River Site) should be considered among the candidate sites for uranium hexafluoride blending operations. In particular, the Oak Ridge Reservation (of which Y-12 is only a small part) should be considered as the ideal location for the new uranium hexafluoride blending facility. There are many important and significant advantages of locating uranium hexafluoride blending at Y-12 or on the Oak Ridge Reservation. First, all of the advantages listed previously would be realized, including:

- the benefits of existing infrastructure and utility systems
- the benefits of existing systems for waste treatment and disposal
- the support provided by other existing missions on the Oak Ridge Reservation
- the benefits available by its top-notch professional, technical, and craft work force, and the experience and expertise they bring to this type of operation
- the benefits of existing advanced security systems
- the benefits of the high level of support and trust of the surrounding public.

09.025

Also, since the highly enriched uranium that will be blended as proposed in the EIS will originate at Y-12, blending it on the Oak Ridge Reservation will save money and significantly reduce risks and environmental impacts associated with transporting the highly enriched uranium over long distances to any other site.

20.006

10.008: The Y-12 Plant is one of the four alternative sites evaluated in the HEU EIS as having the capability to provide uranium blending processes. To be in compliance with NEPA, the HEU EIS must assess the environmental impacts of the proposed action and alternatives at all potential candidate sites without favoring one over another and provide this information to the decisionmakers.

09.025: Uranium hexafluoride (UF₆) blending would only be used to make fuel for the commercial reactor industry. In light of existing UNH and metal blending (at the Y-12 Plant) capabilities of the DOE facilities, DOE believes that it would not be reasonable to add UF₆ blending capability at DOE sites for commercial fuel feed due to the capital investment required and the limited use, if any, of such capability for other DOE missions.

20.006: Assessment of impacts resulting from the proposed action were conducted at sites where facilities for UNH and metal blending processes currently exist and would not require new construction even for a new UF₆ capability at commercial sites. This provides the decisionmaker a reasonable range of site options to consider. However, because environmental and transportation related risks are low for all alternatives, it is anticipated that decisions on blending locations will be a function of other factors, such as material forms, availability of facilities when needed, and business decisions.

Transportation risk assessments showed that risks would be only slightly lower for blending to low-level waste (LLW) at ORR. For blending to fuel feed material as UNH crystals, ORR is not the lowest risk alternative. Two significant factors contributed to these conclusions: (1) onsite material handling represents the greater part of the total risk, and such handling would still be necessary even to blend at ORR, and (2) the highest transportation risk for these scenarios is not in transporting HEU, but in transporting the significantly larger volume of fuel feed material and LLW after blending.

CITY OF OAK RIDGE

ENVIRONMENTAL QUALITY ADVISORY BOARD

POST OFFICE BOX 1 • OAK RIDGE, TENNESSEE 37831-0001

January 10, 1996

U.S. Department of Energy
Office of Fissile Materials Disposition
c/o SHC/HEU EIS
PO Box 23786
Washington, DC 20026-3786

Dear Office of Fissile Materials Disposition:

The City of Oak Ridge Environmental Quality Advisory Board (EQAB) has reviewed the Department of Energy Draft Environmental Impact Statement (DEIS) on Disposition of Surplus Highly Enriched Uranium and has made the following observations:

1. Alternative 5, Maximum Commercial Use of surplus highly enriched uranium, appears to be the environmentally preferable alternative. Among the alternatives considered in the EIS, the maximum commercial use alternative would derive the greatest benefit from past efforts to obtain and enrich the uranium that is now considered surplus. This alternative would avoid some new environmental impacts from mining, milling, and enriching new sources of uranium for commercial reactor fuel, and it would minimize the impacts from disposal of material that could be a valuable resource. 10.003
2. Environmental impacts from activities at the Y-12 Plant would not be significant under any alternative; however, socioeconomic impacts at Y-12 analyzed in this DEIS could be significant. Specifically: 24.007
3. Subalternatives involving use of commercial facilities only to blend surplus uranium (such as Alternatives 4B and 5B) give us concern, as they would cause serious adverse socioeconomic impacts in Oak Ridge due to the loss of employment opportunities at the Y-12 Plant.

Should you have questions regarding these comments, please contact Ms. Ellen Smith, Vice-Chair of EQAB, at (423) 574-7396. On behalf of the Board, we appreciate the opportunity to comment on this DEIS.

Sincerely,
For the Board

Gerald Falau, Chairman

cc: Honorable Mayor and Members of Oak Ridge City Council
Key Fitzgerald, ORR Local Oversight Committee

10.003: Comment noted.

24.007: The types of socioeconomic impacts assessed in an EIS include potential losses in income and employment arising from downsizing or phasing out of facilities. For proposed actions involving large construction projects, potential adverse impacts to public services and municipal finances are also assessed. However, to assess the potential loss in employment opportunities because a project might be located at a site other than ORR is beyond the scope of the HEU EIS. Furthermore, surplus HEU disposition would generate a maximum of 125 direct jobs, which would have an insignificant effect in the region where the work would take place.

Disposition of Surplus Highly Enriched Uranium Final EIS

Comments on the Options for Disposal of Surplus HEU

Your solicitation of comments on what to do with 200 metric tons of surplus HEU is a two-edged sword. On the one hand, you get good marks for being politically correct and enabling a democratically acceptable resolution of the "problem". On the other hand, it must be recognized that most who participate in this exercise are sufficiently ignorant of the situation that their opinions represent something less valuable than a collection of incoherent fears. It is certainly true that all the cards are not on the table. The number of tons of HEU not declared surplus is a sensitive number that is not available to me or to anyone else in the public domain. Nevertheless, based on what I know, I will proceed with opinions, which is what you profess to want.

The entire discussion is how to safeguard the material. The options considered here are only three: (1) no action, (2) out enrichment to a level appropriate for commercial use in a power plant, and (3) cut the HEU into low level waste for disposal at Yucca Mountain or WIPP. Options for incremental cuts to waste and commercial use are clearly not optimal and will not be considered. The conservative view is that (1) is the preferred option because it costs the least and preserves the first two options.

To remind you at DOE of what you already know, 200 metric tons, while it sounds like a lot of stuff, is not! We are dealing here with a total inventory of surplus HEU the volume of which is scarcely 10 cubic meters. That's the mass of uranium divided by the density:

$$200 \text{ tons} * 1000,000 \text{ gm/ton} / (19 \text{ gm/cc} * 1,000,000 \text{ cc/m}^3) = 10 \text{ m}^3.$$

This is less than the volume of a full load of ready-mix concrete. Granted that it cannot be stored in such a small volume because of criticality, but the important point is that there is not a lot of stuff that needs to be safeguarded. Make no mistake. It is important that it not fall into the wrong hands, but with such a small volume, the "problem" is apparently much smaller than the average citizen might suspect.

The second point is the cost of HEU. The value is proportional to the cost to make it. The general public has not seen the race tracks at Y-12 in Oak Ridge where electromagnetic separation began 50 years ago. They are

10.026

15.007

10.026
cont.

10.026: The President, acting on the advice of the Nuclear Weapons Council, has determined that sufficient quantities have been retained in the strategic stockpile and that the materials declared surplus are not needed to address any credible threat. More HEU could be declared surplus in the future if additional treaties are signed between the United States and other countries that possess nuclear weapons. As the commentator notes, the price paid to make HEU has been quite high. However, DOE believes that the value of surplus HEU is not proportional to the cost of making it. Value is what the surplus HEU could be sold for in the commercial market. DOE had more HEU than it needs and since storing and safeguarding the material would continue to incur cost, DOE intends to sell LEU fuel derived from surplus HEU to recover monetary value and to set an example to other nations.

15.007: Although the volume of surplus HEU is relatively small, it is nonetheless a sufficient quantity to potentially make thousands of nuclear explosives if it gets into the wrong hands. The United States is properly safeguarding the material in its current form, but to reduce costs and set an example for other nations, the United States proposes to make the surplus material permanently non-weapons-usable.

unaware of the miles of barriers in the gaseous diffusion plant at K-25. They don't know that a 1000-MW steam plant had to be built to operate K-25. While they appreciate the movie Star Wars, they have no idea that a laser must be tuned to a resonant frequency within parts per million for efficient atomic vapor laser isotope separation. They never heard a set of turbines in a gas centrifuge fail at a gut-wrenching tens of thousands of rounds per minute. They marvel at the exhaust of a fictitious space ship but are ignorant of the shear power and flux of material required to accumulate a few grams of enriched material an atom at a time. In short, there is no appreciation of the difficulty of the task of separation. The United States worked hard and long and paid dearly to enrich uranium: untold thousands of man years of work and billions upon billions of dollars. One must approach a decision to scrap this investment with religious solemnity.

The value of the surplus lies in two areas. First, as weapons grade material, we either have HEU or we don't. As is known, if we don't have it, a Herculean effort is necessary to obtain it. It is infinitely better to have it and not need it than to need it and not have it. As an example, suppose we needed to fabricate a 100-megaton device to deflect an asteroid, etc. The desired option in this case is the status quo choice. [To assess this argument, the number of tons of HEU not declared surplus is needed. You guys know. I don't.] The second value of HEU, should this option be politically unacceptable, is the maximum commercial use option. Reactor fuel is generally enriched above the level of naturally occurring uranium. By blending the uranium down to reactor fuel enrichment, we reduce the stockpile of HEU but retain its value as reactor fuel. This is not why it was enriched in the first place, but maximizes its use for our good. Sooner or later, the last lump of coal and the last barrel of oil will be consumed. Then is when the ability to breed fissile material from U238 will at last be fully appreciated.

The "waste for disposal" option, option (3), must be refuted as not being intelligent. Option (3) costs us resources, incurs extra effort, and does not accomplish the unstated goal of making the world a safer place, the apparent point of this whole exercise. The lost resource argument has already been addressed. However, option (3) also makes work for us. The make-work work is the effort to license and locate the "waste" at Carlsbad, for example. Though about as dangerous as the original ore, the waste

10.026
cont.

10.027

10.025

10.027: The No Action Alternative, which preserves the option of continued storage, does not serve the purpose and need for the proposed action because the material would remain in weapons-usable form. DOE agrees that maximum commercial use is the most intelligent option and acknowledges that political considerations (in an international rather than a domestic partisan sense) constitute an important aspect of the purpose and need for HEU disposition actions.

10.025: The Department of Energy agrees that blending for disposal as waste should be minimized, although it will not be possible to avoid it altogether because some of the surplus material would not be economic to develop for commercial use. The blend of all surplus HEU to waste was evaluated in the HEU EIS to provide a comprehensive evaluation of a full range of alternatives. The waste from this program would be disposed of in a LLW repository, not a deep geologic repository for transuranic waste, such as the Waste Isolation Pilot Plant facility near Carlsbad, NM. DOE also agrees that fissile materials in Russia constitute the real proliferation threat, as opposed to U.S. fissile materials. However, we disagree that domestic fissile material disposition actions are merely empty gestures, as the willingness of Russia and other nations to continue to work to address their proliferation problems would be limited in the absence of any reciprocal actions on our part.

COBBLE, JAMES A., WHITE ROCK, NM
PAGE 3 OF 3

would have an enormous impact on the operating budget of the waste disposal site (and for no reason). In cutting the enrichment from 90+% to less than 0.5%, the mass becomes 20,000 metric tons -- 100 times greater. (U238 must be used to prevent chemical re-separation.) We have the cost for the factory for the dilution too. However, the main result would be an enriching of the competing atomera associated with DOE and whoever is oppusing it now. Finally, neither does the "waste" option accomplish its goal of making the world safer. With loads of fission materials floating around Russia with unknown security in place, the impact of "securing" the US surplus makes no meaningful contribution. There is so much of this stuff available through other channels that it is ridiculous to spend time or money securing what is already secure and safe. The non-proliferation aspects of this shabby behavior have no meaning.

To restate my suggestion for action: the "no action" option is cost effective, safe, does not contribute to proliferation, and preserves our options. (There will be a different president in five years or less whose political agenda is different.) The "maximum commercial use" option is the only other option which at first glance offers us anything. The waste disposal" options are all summarized as foolhardness.

I credit the DOE for their proposal for maximum commercial use as the most intelligent option given the political nature of the "problem" they have been given. Perhaps in a few years, this nonsense will stop -- or at least be different. This is one instance where bureaucratic foot dragging is helpful indeed.

Hello. My name is Nathan Coggins. I live downstream from the Erwin facility, down the [Mulchucky] River, and I would just like to comment that we appreciate the jobs that it would bring. What about waste that's gonna be stored in the area or in Oak Ridge. If there is going to be waste, I would just as soon see it shipped back to Rocky Flats or wherever they're going to bring the uranium in from. The people in Colorado don't want it, you know. Is it that harmful that we need to sacrifice our health for the dollars? I'm not sure. My number is 753-9509.

10.003

14.015

10.003: Comment noted.

14.015: Any utility purchaser of nuclear fuel derived from surplus HEU would be responsible for disposal of the resulting waste. Under the *Nuclear Waste Policy Act*, DOE manages the Nation's civilian radioactive waste program in return for fees assessed on nuclear electricity generation, so the waste would eventually be sent to a DOE permanent repository (or possibly an interim storage facility). A location where LLW derived from DOE's down-blending to LEU can be disposed of has not yet been designated. Additionally, Rocky Flats is neither evaluated as a waste disposal site nor considered for any aspect of the HEU EIS.

DOE Office of Fissile Materials Disposition
c/o SAIC-HEU EIS
P.O. Box 23786
Washington, DC 20026-3786

Dear DOE:

If you are truly seeking input from area residents who have no interest pro or con, with nothing to loose or gain financially. Here is one families comments, based on the Summary of and partial and continued examination of the full study, (Disposition of Surplus Highly Enriched Uranium Draft Environmental Impact Study).

From these publications, persons I am familiar with at NFS and my own personal experiences and beliefs. I have formed this following opinion of the matter; As I understand the least harmful method would be to blend all HEU down to LEU however this may not be the most cost effective. I from limited information, believe the lowest impact to all areas and residents, and the most feasible if there is a market for LEU, would be to distribute the HEU evenly to all four sites to be blended. My reasoning is; 1st there would be no transportation cost or risks at ORR. 2nd Even though the are around NFS is the most populated of the conercial sites. If the work is to be distributed to all available atomic workers in all four locations, this location should receive it's share one fourth of the work. 3rd Since this is a very hazardous and potentially lethal substance Alternative 5 seems the most sensible way to handle the process if it is profitable. I have no figures as to the feasibility of blending HEU to LEU vs blending HEU to LMW. Although LEU should have a much higher value than LMW. I have seen no figures to indicate this, but I will assume this is so. Distributing the 200t of HEU to all four site would minimize impact on any one site plus finish the job in a timely manner. This would reduce the risk of accidents during transportation and during actual blending to any one site vs one or two sites doing 100% of the work. To use less than all four sites would greatly increase the risks to the other sites and surrounding areas. HEU is a hazardous material that needs to be dealt with swiftly under close Fed Govt scrutiny to assure safety and reduce long term effects of this project on the areas involved. This is not the type of industry residents, rich or poor, educated or uneducated, are seeking for their area, no matter what industrial recruiters, politicians, or the media may express. This is a opportunity to change negative for positive, let's get it done as swiftly and safely and with the lowest amount of negative impacts as possible.

10.011

Sincerely,

Nathan Coggins & Family

10.011: The HEU EIS analyses showed that blending down the entire stockpile of surplus HEU to LLW would generate the highest environmental impact among other alternatives evaluated in the EIS (Table 2.4-2). Moreover, DOE agrees that the fastest and safest disposition course would be, as described in Section 1.4.2, the Preferred Alternative, to blend down surplus HEU to LEU using a combination of four sites. The goal is to achieve DOE's objectives that would satisfy programmatic, economic, and environmental needs, beginning as soon as possible after the ROD is issued and proceeding, as necessary, until all surplus material is blended down.

Colorado Springs, CO, 80903//719-389-6409
January 16, 1996

Introduction

This paper explores some of the economic issues surrounding a major area of expenditures now facing the US: the disposition of weapon-grade plutonium and highly enriched uranium (HEU) either through 'burning' in nuclear reactors for power generation or by other means.¹ Under the current budgeting philosophy, programs managed by the Department of Energy (DOE) tend to compete with one another for the total funds assigned to that agency. For example, in the FY1995 DOE budget a tradeoff was made between increased funding for nuclear weapons and reduced funding for site cleanup. Thus, no matter which disposition alternative is chosen, if disposition funds are controlled by the DOE, disposition is likely to compete directly or indirectly with other alternatives for energy funding. And if subsidized by the US government, either research into plutonium or HEU as reactor fuel or the operations associated with such use are likely to consume funds that might otherwise be available to support sustainable energy alternatives.

06.018

Over the last three years, the uneconomical aspects of burning plutonium have been made abundantly clear by a number of studies. In spite of this, of all the materials, systems, facilities, and laboratories

¹For example, see Chow, Brian G. and Kenneth A. Solomon, *Limiting the Spread of Weapon-Usable Fissile Materials*, National Defense Research Institute, RAND, Santa Monica, CA, 1993, and *Management and Disposition of Excess Weapons Plutonium*, Committee on International Security and Arms Control, National Academy of Sciences, National Academy Press, Washington, D.C., 1994.

"Burning" is the techno-slang word for using Pu or HEU in nuclear reactors by down-blending (essentially, diluting) HEU to reactor-strength uranium or mixing Pu with uranium to form a mixed oxide fuel (MOX) that can be burned in light water reactors (LWRs).

06.018: The Department of Energy agrees that there is increasing competition for funds within a declining DOE budget. However, this program would require very little of DOE's diminishing budget for implementation, because it would use either existing DOE facilities or commercial facilities, may involve commercial financing of disposition actions, and would use revenues from sales of LEU to recover blending costs. By providing for disposition of this material, DOE would save storage and safeguards costs.

Involved in the design and operation of nuclear weapons, the most readily available assets for reuse are usually identified as being the HEU and plutonium from warheads. Over the last two years, quasi-private consortia have put considerable effort into convincing the US government to embark on such a program. These efforts have either (1) assumed that there was an economical way to burn plutonium and HEU for power, (2) proposed the construction and operation of new reactors specifically built to burn plutonium as part of a regional conversion plan for old nuclear weapon sites, or (3) claimed that even if power generation itself was uneconomical, it would still provide a way to dispose of the large stocks of plutonium and HEU that was economically sound in the long run and was worthy of government support.

At the same time, other "technical fixes" for the plutonium problem have also been proposed. Many of these are transmutation techniques that would require large amounts of federal research and development money to construct facilities to turn plutonium into shorter-lived elements.² Others, such as shooting plutonium into the sun, are equally as expensive. With the exception of the Integral Fast Reactor (IFR), which has also been marketed under category (2) above, transmutation has generally been proposed as a pure government research project.

In this paper, comparisons between plutonium and down-blended HEU burning and other forms of nuclear power generation will be made using the general "industry model." In these comparisons, the costs associated with the wastes generated during the creation of nuclear power will not be explored because these costs are approximately identical no matter what kind of nuclear operations are undertaken. However, a full accounting of these costs would be necessary before any form of nuclear power generation is compared to coal, gas, hydroelectric, or solar generation schemes.

As a further issue, it should also be remembered that most nations are currently struggling with nuclear proliferation issues. Recent problems with North Korea have clearly demonstrated that because plutonium is normally produced as a by-product of reactor operations, civilian nuclear power generation is fundamentally at odds with proliferation goals in spite of international safeguards installed at most

²Elements with half-lives of 50 to 100 years instead of the 24,000 years possessed by plutonium.

plants. Further, actually burning plutonium for power legitimizes the reprocessing of spent fuel and the possession of plutonium, both of which vastly complicate the proliferation issue. When evaluating any disposition option, one should keep firmly in mind that the major obstacle to building a bomb is getting plutonium. When that obstacle is overcome, the rest is much simpler.

The Value of Plutonium and Highly Enriched Uranium

A value for plutonium and HEU has usually been assigned by DOE based on the costs required to manufacture either material. This is not a market-based approach, nor are such costs necessarily rational given the manner in which DOE operations are conducted. DOE's theory appears to be that if something cost a great deal to produce, it must be worth a great deal of money. The fallacy in such an argument is clear, but this remains the standard way of pricing both plutonium and HEU.

Value is normally established through a market mechanism in which a buyer and seller negotiate a price viewed as fair by each. However, the only market for civilian plutonium in recent years has been the one created by Japan's purchase of plutonium from France for future use in its power reactors. Pricing in this market is not public, but Japan's unique lack of alternative energy sources make its determination of the value of plutonium inapplicable to other countries. Further, adverse publicity generated by the 1994 Japanese purchase will undoubtedly prohibit similar purchases by Japan in the future—thus terminating the market. It is probable that there is another, illicit market for plutonium, but prices in this market are surely much higher than the actual value of plutonium because of the risk involved. Hence, neither the Japanese experience nor the illicit market provide much guidance as to the actual worth of plutonium.

Since there is no open, operating market in either plutonium or HEU, and since existing prices for these commodities have in the past been set by governments for political purposes, it is fair to say that no one has established the real market value of either material. This is bound to cause problems in pricing that cascade through all operations that try to use plutonium or HEU because a material with no established market value is being introduced into a commercial power-generating regime where careful market analysis and cost control govern which power sources are exploited.

If all costs of plutonium and HEU were considered, both materials would be some of the most expensive items ever created by man. The true costs of generating plutonium and HEU through dismantlement of nuclear weapons would have to include the following past costs:

- The research costs accumulated in developing the materials.
- The initial costs to extract uranium, to purify the materials and to make elements such as plutonium in reactors or HEU through gaseous diffusion.
- The cost to fabricate the materials into weapons.
- The cost to maintain the materials in weapons.
- The cost to dismantle the weapons and free the materials for other uses.

And finally, the list of costs would have to include the future costs of disposition.

Accounting for any past costs of plutonium and HEU would make either material too expensive for any alternative use and, whether legitimately or not, these costs are usually counted as the costs of doing business during the Cold War. As a result, alternative uses of these materials are usually considered under the assumption that all past costs are sunk costs and future decisions are based only on the future costs of disposition.

When the alternative of burning is evaluated for disposition, certain physical rules apply: First, reactors using any acceptable material—uranium, plutonium-based MOX, or down-blended HEU—will generate approximately the same amount of power from those materials. And second, the total quantity of material put into a reactor will become the total quantity of spent fuel generated by the reactor. Thus, only two cost comparisons are appropriate to show whether plutonium or HEU can be burned with any economic benefit:

(1) The cost of processing and fabricating reactor fuel—and whether this cost would be higher or lower when plutonium or HEU is used. Lower costs may apply in the case of burning HEU, but this has not been demonstrated.

(2) Whether the cost of disposing of these materials might be lowered by burning them in a reactor, or whether the overall costs of disposition can be reduced by simply disposing of either material without first submitting it to a reactor. Here, there must be counted among the costs those of possible reuse in weapons if the materials are disposed of improperly.

The Nature of the Industry

Since its inception, subsidies have been a way of life in the nuclear power industry. A 1992 report found that over the period 1950 to 1990, 20% or \$96 billion of the \$492 billion (in 1990 dollars) spent to develop and obtain nuclear power was provided by the federal government.³ According to the DOE, of total subsidies to the energy sector provided by the federal government in 1992, nuclear energy received \$899 million of \$4.88 billion expended—or about 18%. However, while most other sources of energy (oil, coal, etc.) received either tax subsidies to lower prices or direct subsidies to encourage consumer use—both of which acted to stimulate demand for the product—nuclear energy received almost all of its subsidies (\$890 out of \$899 million) in Research and Development. In fact, nuclear energy received 44% of all energy R&D subsidies in 1992.⁴

Over the last forty years, funding of nuclear energy research has continued with little actual implementation of the results of this research. As construction of new reactors has stopped, a few large companies have stayed in the reactor research and development business without having to sell economically viable reactors. In such a situation, there has been no need for commercial products—instead, the emphasis has been on selling and maintaining large research and development programs. As reactor construction has ceased, each new R&D project proposal has been further and further removed from the last project private industry and the public was willing to accept and fund. One result of this policy of R&D subsidization has been to create an industry interested in the development of sources of power, not the economics of producing power.

This helps explain the nuclear industry's continuing research into, and attempts to commercialize the use of, plutonium burning reactors in the face of overwhelming evidence that such reactors would be economically unfeasible. As time has passed, the economic viability of even standard nuclear reactors has deteriorated. This is unlikely to improve in the future when plans to generate power from plutonium or HEU burning are proposed to take place. Shearson Lehman reports that:

³These figures significantly understate the current estimates of the costs to bury nuclear wastes and decommission reactors.
Kornoff Energy Associates, *Elect Fission: The Economic Failure of Nuclear Power*, 270 Lafayette, Suite 400, New York, NY, December, 1992.

⁴*Federal Energy Subsidies: Direct and Indirect Interventions in Energy Markets*, SR/EIEU/92-02, Energy Information Administration, U.S. Department of Energy, Washington, D.C., November, 1992, p. 7.

"Evidence suggests the average operating costs of nuclear power plants are now higher than those of conventional plants and other power supply alternatives."⁵ And Moody's has stated that:

"Given increasing competition from other types of generating facilities and renewed efforts via conservation and demand side management programs to reduce the need for new capacity additions, nuclear power's economics must be comparable with alternative fuel sources and energy efficiency and conservation options. In a deregulating environment, the pressure to maintain competitively low rates will compel utilities to select the most economic option. And given the challenges outlined above, we do not think that nuclear plants are likely to provide such economic benefits."⁶

Among other things, this casts doubt on the future feasibility of using HEU in nuclear reactors—unless down-blending and fuel fabrication can be accomplished at prices significantly lower than the already depressed prices now encountered for normal low enriched uranium (LEU) fuel fabrication.

Burning Plutonium

The use of mixed oxide fuel (MOX) containing plutonium in Light Water Reactors (LWRs) is technically proven. Reactors that use low enriched uranium can have 1/3 of their core in MOX. Three reactors of the System 80 type at the Palo Verde Nuclear Generating Station are pressurized light water reactors (PWRs) that could handle a full core load of MOX. Using these reactors, it would take 30 reactor years—or 10 years for all three reactors—to convert 50 tons of plutonium into spent fuel.⁷

A National Academy of Sciences study estimated that a new MOX fabrication facility would cost between \$400 million and \$1.2 billion and would take about a decade to complete.⁸ Estimates are that the cost of MOX fuel fabrication is over \$2000 per kilogram of heavy metal, about six

⁵Electric Utilities Commentary, "Are Older Nuclear Plants Still Economic?, Insights from a Lehman Brothers Research Conference", vol. 2, no. 21, May 27, 1992, p. 1.

⁸Management and Disposition of Excess Weapons Plutonium, Op. Cit., p. 159-160.

times the fabrication cost of low-enriched uranium fuel.⁹ At MOX fabrication costs of \$1300-\$2000 per kilogram, the cost of uranium would have to rise to \$123-\$245 per kilogram just to equal MOX fabrication costs even if the plutonium used was free.¹⁰

Cost estimates for geologic repository disposal of spent fuel from commercial power reactors are about \$300,000 per ton of heavy metal (in 1988 dollars). However, the cost of disposal of a ton of plutonium would be higher because it must be diluted to make re-extraction difficult. Assuming a cost on the order of several million dollars per metric ton of plutonium, total disposal costs would range from \$100 million to \$300 million for 50 metric tons of plutonium.¹¹

As was previously noted, the economics of plutonium burning have been investigated and rejected. Chow and Solomon looked at five options for the use of plutonium in reactors:¹²

1. Use plutonium as fuel in existing fast reactors without reprocessing. Using weapon-grade plutonium in this manner would cost \$18,000/kg.
2. Use LWR's with 1/3 or partial MOX fuel without reprocessing. The cost for this is \$7,600/kg with weapon-grade plutonium.
3. Use LWR's with full MOX fuel loads without reprocessing. The cost for this is \$5,600/kg with weapon-grade plutonium.
4. Store plutonium for 20 or more years. Cost: \$3,800/kg.
5. Mix plutonium with waste and dispose of it as waste. Cost: \$1,000/kg in marginal costs over storing the waste alone--which would lead to costs of about \$4,800/kg.

None of these options has any commercial value. In the first three, the extra costs of handling plutonium because of its radioactivity, toxicity, and potential weapon use outweigh any benefits. Further, storage sites will not be ready until 2010 at the earliest, and when storage costs are taken into account, they raise the cost of burning plutonium in LWRs by \$4000 to \$10,000/kg.

Because of this, the use of plutonium in civilian reactors creates no economic benefits and has a large proliferation risk. Chow and Solomon

⁹Nuclear Fuel, January 26, 1992.

¹⁰Ortvedson, H.A., Plutonium Fuel: An Assessment, OECD, Paris, 1989, p. 69.

¹¹Mahdjani and Mahdjani, Op. Cit., p. 66.

¹²Chow and Solomon, Op. Cit., pp. xxi, xxx.

estimated that thermal cycle plutonium use¹³ will not be feasible until the price of uranium-bearing yellowcake reaches \$100/LB and they estimated that this will not occur for 50 years.¹⁴ They further projected that fast reactors will not be profitable until yellowcake price reaches \$220/LB in about 100 years.¹⁵

Note that the costs of burning plutonium are always compared with the costs of burning HEU or LEU in reactors. Thus, the inherent costs (waste disposal, worker health, contamination, etc.) involved in any nuclear operations—including plutonium burning—are never discussed. The full costs should always be considered when comparing alternative power sources.

Down-blending and Burning HEU

The economics of down-blending HEU for use in reactors may be more favorable than those for plutonium. Weapon-grade HEU typically contains over 90% U-235 that must be diluted to levels of 3-5% to generate the low enriched uranium used in reactors.¹⁶ DOE's October, 1995, Draft Environmental Impact Statement on the Disposition of Highly Enriched Uranium (DEIS) defines HEU as anything enriched above 20% U-235, and assumes an average enrichment of 50% U-235. As of January, 1996, DOE had declared 165 metric tons of HEU "surplus" to the stockpile. Of course, any strategy to down-blend HEU and sell it as reactor fuel will require eventual storage of the highly toxic and radioactive spent fuel—which will still contain both plutonium and HEU.¹⁷

14.017

To down-blend HEU it is simply blended with natural uranium, depleted uranium (2-3 percent U-235), or slightly enriched uranium (.8 to 2 percent U-235). It is possible that this can be done so it is price-competitive with fuel made from uranium and thus, is as commercially viable as standard reactors.¹⁸ A quasi-private corporation, US Enrichment Corporation (USEC), has been established to purchase the Portsmouth, OH, and Paducah, KY, enrichment plants from the DOE for the

06.021

¹³Reprocessing Pu and U from spent fuel and using Pu-bearing mixed-oxide (MOX) fuel in thermal nuclear power plants.

¹⁴Chow and Solomon, Op. Cit., pp. xvi, xvii.

¹⁵Ibid., p. xvii.

¹⁶Makhlani and Makhlani, Op. Cit., p. 16-17.

¹⁷Draft Environmental Impact Statement on the Disposition of Highly Enriched Uranium, U.S. Department of Energy, Office of Fissile Materials Disposition, Washington, D.C., October, 1995.

¹⁸Makhlani and Makhlani, Op. Cit., p. 17.

14.017: Use of HEU blended to LEU as reactor fuel would indeed lead to spent fuel storage. However, spent fuel that results from commercial use of LEU fuel derived from surplus HEU would displace spent fuel that would be generated in any event in the absence of the HEU disposition program. In fact, overall, DOE believes that the environmental consequences of blending down HEU would be considerably less than the consequences of mining, milling, conversion, and enrichment for the displaced natural uranium. The spent fuel would be managed and eventually disposed of together with other domestic commercial spent fuel pursuant to the *Nuclear Waste Policy Act*. Commercial spent fuel contains some Pu but does not contain HEU.

06.021: The blending of surplus HEU to LEU would be done to recover the full economic value of the material at going market prices (it will be "price competitive"). USEC was created by the *Energy Policy Act* of 1992 to take over DOE's uranium enrichment operations. Although USEC may be used to market LEU derived from DOE's surplus HEU, that is not the purpose of USEC; it is strictly an ancillary function. USEC only leases the enrichment plants from DOE. DOE does not agree that commercial use of LEU derived from surplus HEU increases the proliferation potential. Although fuel derived from U.S. surplus HEU and sold abroad could conceivably be reprocessed in some countries to separate Pu for commercial (non-military) use in mixed oxide fuel, that LEU fuel derived from surplus HEU would simply replace other fuel, so no incremental Pu would be created as a result of this program.

THE COLORADO COLLEGE, COLORADO SPRINGS, CO
PAGE 9 OF 21

purpose of pursuing down-blending as a commercial venture. DOE has acknowledged that US Enrichment Corp. (USEC) will market the reactor fuel internationally. The US would not control the spent fuel generated by foreign reactors and this spent fuel would be a candidate for reprocessing to extract the plutonium. No protocols forbid reprocessing or require the return to the US of spent fuel generated from this material.¹⁹

Four down-blending scenarios have been considered by DOE to meet its stated goals of nonproliferation and realizing the "peaceful beneficial use" of HEU in a way that will return money to the US Treasury.²⁰

1. Down-blend to less than 1% U-235 and dispose of as low level waste. This would address all proliferation concerns.
2. Limited commercial use-- down-blend 35% of HEU into reactor fuel, the rest to less than 1% U-235.
3. Substantial commercial use-- down-blend 65% into reactor fuel, the rest to less than 1% U-235.
4. Maximum commercial use -- down-blend 85% into reactor fuel, the rest to less than 1% U-235.

DOE's preferred option is maximum commercial use which, DOE claims, will return the most money to the US Treasury. However, the DEIS does not present a credible analysis demonstrating a positive economic return, and the maximum commercial use option would create more than 5 million pounds of spent nuclear fuel (2,380 metric tons, assuming an assay of 50% enrichment for 170 metric tons of material). Further, under its fastest down-blending scenario--down-blend to 4% and sell as reactor fuel--DOE's plan would take 10 years to process 200 tons of HEU. During that 10 years, it is likely that more HEU will be declared surplus. DOE argues this will not increase the amount of spent fuel, since reactors will burn something anyway. Further, it will reduce environmental impacts since new uranium will not have to be mined for reactor fuel.²¹ For this claim to be true, the use of down-blended HEU will have to be so complete that it replaces the current US uranium mining industry, and if this occurs, it is questionable whether this industry could ever be restarted.

Another option, down-blending to 4% for storage until economic and reprocessing concerns are addressed, has been rejected by DOE who

²¹Ibid.

06.021
cont.

04.013

12.012

09.021

04.013: Cost estimates for the alternatives analyzed in the HEU EIS have been developed to provide the decisionmaker, DOE, comprehensive information upon which to make decisions. The cost analysis, which is available in a separate document with the HEU Final EIS, supports DOE's position that commercial use of LEU fuel derived from surplus HEU makes the most economic sense and would save considerable money. The spent fuel that would result from commercial use of LEU fuel derived from surplus HEU would supplant spent fuel that would be created in any event in the absence of the program.

12.012: The Department of Energy believes that it is not necessary for domestic uranium production to be completely displaced in order for the quantity of uranium mined to be affected by HEU disposition actions. Rather, the quantity of reactor-grade uranium that enters the market from HEU disposition actions at market prices will displace an equivalent quantity of material that would otherwise have to be mined, milled, converted to UF₆, and enriched to make it suitable for use in reactor fuel. The amount of surplus HEU (103 t) that would eventually be blended over a 10- to 15-year period would provide about 4 percent of current annual domestic needs for LEU fuel.

09.021: The Department of Energy does not consider the option of blending HEU for extended storage reasonable because it would delay recovery of the economic value of the material and incur unnecessary costs in a very tight budget environment as well as environmental impacts due to the need to build additional storage capacity to accommodate the increased volume of the material. Spent commercial nuclear fuel contains some inaccessible Pu, but it does not contain any HEU.

claimed it provides "no proliferation advantage over down-blending and selling." However, blending to 4% and storing retains the fuel option while maintaining security of the material in a relatively stable state which contains neither plutonium or HEU.²²

Conversion as a Rationale for Plutonium Disposition

The Triple Play Reactor, proposed for the Savannah River Site (SRS), and Project Isalah, proposed for the old Washington Public Power System (WPPS) reactors around the Hanford site, have both been suggested as conversion programs where new or refurbished reactors would burn plutonium. Further, both programs claimed they would be privately financed and, by implication, profit-making.

As a general principle, economic conversion is both site and sector based. On a site basis it preserves the local economic community by changing the base of economic support for the site. In an economic sector, it frees resources to be used in other ways for the benefit of the nation at large. Thus, the purpose of conversion is not to substitute one government-funded program for another, it is to change the economic base (the source of funds) for the region or sector. This cannot be achieved unless conversion generates economic benefits, and the Isalah and Triple Play options demonstrate how the conversion approach to disposition has tried to adapt to the economic realities of plutonium burning.

The Isalah Project

Proposed in 1993, this project involved burning plutonium in mixed oxide fuel (MOX) and producing electricity by completing the WPPS #1 reactor at Hanford, WA and the #3 reactor at Satsop, WA. It has been claimed this would create 9,000 direct construction jobs, 2,500 permanent operations jobs and 13,500 secondary jobs in the region. Each plant would produce 1,300 MWe.²³

In 1993 dollars, completion costs for WNP-1 were \$1.7 billion and for WNP-2 they were \$1.6 billion. Operating costs were estimated at about \$21 million/year, and O&M costs at about \$123 million/year including the spent fuel disposal fee. When financing costs were included, the \$1.7 billion completion cost for WNP-1 rose to \$2.8 billion. However,

²²Ibid.

²³Letter from Robert Wages, President, OCAW, to Elmer Chatak, President, Industrial Union Department, November 3, 1993.

private financing was supposed to cover all project completion costs and return \$4 billion to the Federal government.²⁴

While these financial arrangements sound promising, the poor economics surrounding this plutonium burning project were summed up by a clause in the Project Isiah contract that stated that DOE would "enter into a long term contract....[with] a federal obligation to make debt service payments if revenues from the sale of steam [power is] not adequate."²⁵ (My italics)

Triple Play Reactor

The "triple play" reactor was proposed by a quasi-private consortium to burn plutonium, produce tritium and generate electricity at the Savannah River Site. Aside from the inherent contradictions in using a new reactor to dispose of plutonium from weapons by producing tritium for weapons, the proposed System 80+ Program Plan also displayed considerable "uncertainty in costs" in MOX fabrication²⁶ and it proposed that the federal government provide \$50 million in up-front financing.²⁷ The private consortium offered to pay back the \$50 million if DOE ultimately decided to proceed with the proposal at the end of the three year study phase.²⁸

In addition, the Triple Play reactor required an extensive list of other subsidies:

The federal government had to provide a site and infrastructure at no cost to the consortium.²⁹

The consortium pays disposal fees for waste, but then passes them through to the government, not to the consumer of the power.³⁰

²⁴Letter from John R. Howland, SAC, to Dr. Matthew Bunn, National Academy of Science, November 9, 1993.

²⁵Communication from Lauren Dood, Battelle Institute, "The Isiah Project", Pacific Northwest Laboratories, October 1, 1991.

²⁶Department of Energy, "System 80+ Program Plan for MOX Fabrication at Savannah River Site, System 80+ Term, Savannah River Site, Aiken, S.C., March 31, 1994, p.8.

²⁷Ibid., p.4.

²⁸Department of Energy, "System 80+ Program Plan for MOX Fabrication at Savannah River Site, System 80+ Term, Savannah River Site, Aiken, S.C., March 31, 1994, p.8.

²⁹Program Plan for Development of a System 80+ Multipurpose Nuclear Facility at Savannah River Site, Op. Cit., p.66.

³⁰Ibid., p.70.

The government supplies plutonium oxide, depleted uranium oxide, and the site lease, all at no charge, and it further agrees to sole-source irradiation services from the plant.

The "annual fees" required from the government were estimated at \$78 million for plutonium burning alone—about a 10% subsidy.

An annual fee would also be assessed for tritium production based on revenue losses and other factors.³¹

The government shared liability for any increased costs due to regulatory changes or any other factors over which the consortium had no control.³²

Similar subsidies are likely to be required by project Isalah because a majority of the proposed revenues from both projects are from electrical generation. An electricity-producing, plutonium-burning light water reactor is not economically feasible because of the additional facilities and security procedures required for plutonium handling. MOX fabrication will also add hundreds of millions of dollars to normal operating costs. Each of these factors increases the financial risk associated with building a new reactor.

Disposition Requirements

Total Quantities of Plutonium

In 1991, the US had about 19,000 nuclear warheads and the Former Soviet Union (FSU) had about 32,000. Under START I and START II, the US and FSU agreed to reduce to 3,500 US and 3,000 FSU strategic warheads by 2003. Numbers of remaining tactical warheads may vary, but a good estimate would be about 1,500 US and 2,000 FSU tactical warheads. Thus, each side will have about 5,000 nuclear warheads in 2003. About 2,500 warheads could be dismantled each year in the US, but only about 1,170 will be dismantled if parity is maintained with the FRS's rate of 2,250 per year.³³

At present, 50 or more metric tons of excess weapon grade plutonium exist on each side.³⁴ In addition, based on the assumption that there are less than 4 kg of plutonium in each warhead and there are 20

³¹Ibid., p. 75 and personal communication between Brian Costner and George Davis of ABB Combustion Engineering in May, 1995.

³²Ibid.

³³Chow and Solomon, *Op. Cit.*, pp. 9,10.

³⁴Management and Disposition of Excess Weapons Plutonium, *Op. Cit.*, p. 1.

metric tons of plutonium in the military inventories of other nuclear weapons powers, the global inventory of plutonium is:

Military plutonium	248 metric tons
Separated civilian plutonium	122 metric tons
Unseparated plutonium in civilian spent fuel	332 metric tons ³⁵

Total Quantities of HEU

To further non-proliferation goals, the United States has also agreed to buy a total of 500 tons of Russian HEU for \$11.9 Billion over the next twenty years if certain conditions are met. The US plans to resell this material to fulfill demand for nuclear fuel in domestic and world markets.³⁶ According to current plans, HEU from the former Soviet Union is to be de-enriched by US Enrichment Corporation (USEC) at its plants in Paducah, Kentucky and Portsmouth, Ohio. USEC is supposed to be a for-profit company, and during these operations a price for HEU may actually be established. However, at this time the actual worth of HEU is unknown and there is no market mechanism for generating its market value. This raises questions about how the \$11.9 billion price was determined, whether it can be regarded as a real, market price of HEU and, if not, what price will actually be charged for this material.

16.018

As opposed to plutonium, HEU is neither used nor made in reactors. There are about 2300 metric tons of HEU worldwide, almost all of it in the former Soviet Union and the US.³⁷ Total US HEU production from 1945 to 1992 was 994 metric tons. Of this, 483 metric tons were made at the K-25 facility at the Savannah River Site between 1945 and 1964, and 511 metric tons were made at the Portsmouth, Ohio plant between 1956 and 1992.³⁸

12.013

³⁵Makhljan and Makhljan, Op. Cit., p. 11.

³⁶Management and Disposition of Excess Weapons Plutonium Op. Cit., p. 5.

³⁷Makhljan, and Makhljan, Op. Cit., p. 16-17.

³⁸Lesly, Hazel, Remarks Concerning a DOE fact sheet on HEU, DOE, Washington, D.C., June 27, 1994.

16.018: Current plans for the Russian HEU are to have it blended down to LEU oxide in Russia prior to its shipment to the United States. Even if the Russian HEU were to be blended down in the United States, the work could not be done at the Portsmouth or Paducah enrichment plants, because those facilities can only blend HEU in the form of UF₆ (a gas). There is no need to establish a market for HEU—indeed, it is the nonproliferation policy of the United States to avoid the development of such a market. The value of HEU is realized after it is blended down to LEU. There is clearly a need for fuel-grade LEU, to fuel existing reactors, on a global scale.

12.013: The HEU EIS is concerned only with the disposition of up to 200 t of current and expected future surplus HEU. The quantity of HEU that remains in the U.S. strategic stockpile (non-surplus) remains classified. At present, there are 113 to 138 t of domestic surplus HEU (the larger number includes an additional 25 t that may be declared surplus in the future) and 500 t of Russian HEU that are considered likely to become commercialized worldwide (an additional 62 t of surplus U.S. HEU is considered unlikely to be commercialized in the near term due to its forms). There appears to be little point in speculating about the impacts on the uranium market of blending 2,300 t of HEU, as such quantities are well beyond any reasonable expectation of what may be declared surplus.

The US inventory of HEU is located in the following locations:³⁹

Metric Tons	Location	Metric Tons	Location
0.6	Hanford, WA	26.2	BREL, ID
0.2	LLNL, CA	6.7	Rocky Flats, CO
3.2	LANL, NM	0.9	SRL, NM
Classified	Pantex, TX	1.6	Knolls, NY
0.2	Brookhaven, IL	23.0	Portsmouth, OH
168.9	Y-12, SRS, SC	1.5	K-25, SRS, SC
1.4	ORNL, TN	24.4	SRS, SC
TOTAL = 258.8 metric tons (not including Pantex)			

HEU consumed by the US since 1945 is estimated to be about 105 metric tons including uranium burned in reactors for plutonium production at SRS (about 42 metric tons), uranium burned by the Navy (about 12 metric tons), uranium consumed in research (about 25 metric tons), uranium exported to France and UK (about 6 metric tons), and uranium consumed in weapons tests (about 20 metric tons). This leaves 630 metric tons (994 - (105 + 259)) unaccounted for in the revealed inventories and this is probably split between the Pantex stockpile and the remaining nuclear arsenal.⁴⁰

12.013
cont.

When the number of nuclear weapons peaked at 32,500, independent experts estimated there were 500-550 metric tons of HEU in warheads, implying about 16 kg per weapon. The amount of HEU per weapon is thought to have declined slightly since then due to greater use of plutonium.⁴¹ New estimates suggest that about 50% more HEU was devoted to weapons than previously believed. Thus, either more was used in each bomb than had been estimated—which suggests that about 10 tons more would also have been consumed in tests—or there was considerable overproduction and stockpiling for an arsenal buildup that never occurred.⁴²

The amount of blendstock required for final blending down of 500 tons 93.5% HEU can be estimated as follows:⁴³

Blend Stock	HEU (mt.)	Blend (mt.)	4.4% LEU (mt.)
Depleted U(0.2% U235)	500	10,600	11,100
Natural U(0.711% U235)	500	12,100	12,600
Slightly Enriched U(1.5% U235)	500	13,400	13,900

³⁹ibid.

⁴⁰Communication from Peter Gray, June 30, 1994.

⁴¹ibid.

⁴²ibid.

⁴³Makhijani and Makhijani, *Op. Cit.*, p. 76.

If all 2300 metric tons of HEU was disposed of by down-blending, the resulting amounts of nuclear fuel are significant enough to alter the US uranium and fuel fabrication industries. In fact, it is easy to imagine a scenario where domestic uranium operations were put entirely out of business if down-blending of HEU can be done in an economical manner.

12.013

Costs of Transmutation and Other
Non-Burning or Technical Fixes

Complete elimination of plutonium is only possible through two means: first, wait until the natural radioactive decay destroys it--this would take thousands of years. Second, transmute plutonium by using some technique to bombard its nuclei and split them into fission products. Option two can only occur through a nuclear reaction in a reactor or in a particle accelerator.⁴⁴ Most elements created by transmutation would have much shorter half-lives than plutonium. Thus, the potential benefits of transmutation could be:

1. A reduced volume of material.
2. Reduced radioactive life of materials.
3. Less risk of human intrusion into storage areas.⁴⁵

Most transmutation techniques require reprocessing and, hence, are likely to be unacceptable on the basis of both proliferation and waste generation concerns.⁴⁶ In fact, the GAO has noted that "the reprocessing and separating of the waste are more difficult technical problems than transmuting the long-lived elements from the waste."⁴⁷

Waste transmutation would take many billions to develop and is not possible before 2015.⁴⁸ DOE managers believe it is not economically justifiable since a waste repository would still be needed. A complete transmutation system would include a reactor or accelerator to transmute reprocessed fuel, a spent fuel reprocessing and waste separation facility, a fuel fabrication facility, and storage facilities for spent fuel and residual wastes.⁴⁹

Particle Bed Reactor (PBR)	20-70 Units 40 Yr. 150 Yr. for Pu	Brookhaven National Lab	Develop: \$1.3b Development Time: 16 Yr. No cost estimates	Develop: \$1.3b Development Time: 16 Yr. No cost estimates	Yes Yes
Clean Up of Reactor Program (CURE)	Handled/Westinghouse		Cost: \$74-160 m No cost estimates	Cost: \$74-160 m No cost estimates	No Yes

Some of the other proposals for non-burning disposal of plutonium from wastebeds are:

1. Monitored Surface Storage
A monitored storage facility for 50 tons of plutonium has an estimated capital cost of \$170 million (1990 dollars) with an operating cost of \$28 million per year.⁵¹ Preliminary estimates are that storing plutonium would cost about \$1 per gram per year. Thus, storing 200 tons would cost roughly \$200 million per year for a net present value cost of \$2 billion.⁵²

⁵⁰Ibid., p. 10.
⁵¹Bloomster, C.L., E.L. Handstein, M.H. Klinger, and B.J. Jones, *Options and sequencing issues related to disposition of LWR and SFR spent nuclear fuel*, PNLS-54-18728, Pacific Northwest Laboratories, and Department of Energy, Washington, D.C., 1995, pp. 12-13.
⁵²Vetter, S.H., *Lawrence Livermore National Laboratory, Working Papers of the International Symposium on Conversion of Nuclear Wastebeds for Peaceful Purposes*, Rome, Italy, June 15, 16, 17, 1992, pp. 144-148.

2. Deep Geologic Disposal/Seabed Disposal

The cost is essentially that for vitrification and for burial in Yucca Mountain—i.e., the cost of both operations. See the vitrification option below.

3. Launching Plutonium Into the Sun

A 1982 NASA study estimated the cost of this option at \$200,000 per kilogram of plutonium. Several hundred kg could be handled at a time. This is probably not feasible due to public fears about the potential for a crash and resulting dispersion of plutonium from one of the rockets.⁵³

4. Underground Nuclear Detonation

In one Russian proposal, 5000 warheads would be destroyed in a single explosion of a 100-kiloton warhead. A US option proposed using small shafts to destroy 5 warheads at a time (about 3000 detonations would be required.) Even if one destroyed 50 warheads at a time, 300 detonations would be required—almost half of the 730 US underground tests conducted to date.⁵⁴

5. Vitrification

By 1994, the DOE had spent over \$1 billion trying to vitrify liquid wastes and had not yet succeeded. However, plutonium may not share these problems and it could be formed into blocks weighing thousands of pounds to make theft more difficult.⁵⁵ However, while vitrification of plutonium alone is an option, it doesn't present a sufficient barrier to reuse.⁵⁶ For this reason, prior to vitrification, plutonium will most likely be mixed with other materials that would make repurification more difficult.⁵⁷

There are three general vitrification options with potential for plutonium disposition:

⁵³International Physicians for the Prevention of Nuclear War and The Institute for Energy and Environmental Research, *Plutonium: Deadly Gold of the Nuclear Age*, International Physicians Press, Cambridge, MA, 1992, pp. 130-138.

⁵⁴*Ibid.*, pp. 130-138.

⁵⁵For a discussion of potential problems and benefits associated with vitrification, see comments by Wolfgang Panofsky, Kevin Wenzel et al, and Alex DeVoipt in "Letters", *The Bulletin of the Atomic Scientists*, vol. 52, no. 1, January/February, 1996.

⁵⁶Saitohjani and Mahdjani, *Op. Cit.*, p. 4.

⁵⁷Wald, Matthew, "Excuse Excess Plutonium in Glass, U.S. Urged", *The New York Times*, November 17, 1994.

1. Vitrification of plutonium mixed with gamma-emitting fission products so the resulting glass logs meet the spent fuel standard.⁵⁸ These fission products have much shorter half-lives than plutonium. For example, the half-life of Cesium 137 is only 30 years as opposed to 24,000 years for plutonium. Thus, the mix would become less resistant to proliferation over time. This is likely to take longer since vitrification plants are not prepared for this task.⁵⁹
2. Vitrification of plutonium with depleted uranium or some other alpha-producing element.
3. Vitrification of plutonium with a non-radioactive element, such as europium, that would render the mixture unsuitable for weapons without reprocessing.⁶⁰

According to one proposal, the US could incorporate high level waste (HLW) like plutonium into 25,000 tons of glass at a rate of about 1000 tons of glass per year. This would allow the disposal of 100 tons of plutonium in five years if the glass contained only 2% plutonium. A recent analysis by Pacific Northwest Laboratories estimates the total additional cost at \$100 million to convert 100 tons of plutonium metal to oxide and mix it with other HLW—ten times cheaper than storage, and ten to fifty times cheaper than MOX.⁶¹ One could also place a barrier to misuse by subnational groups by making the canisters in which vitrified plutonium is stored highly radioactive.⁶²

Conclusion

Several studies on the alternatives available for disposition of plutonium and HEU have noted that due to potential proliferation problems and the danger these pose for all people, disposition issues should be decided based on expediency and safety, and economic considerations should not play a major role in this process.⁶³ However, a student of the military budgeting process or the budget considerations surrounding a

01.009

⁵⁸The spent fuel standard proposes to make plutonium as difficult to retrieve as it would be if it was in the form in which it exists in nuclear reactor fuel that has been irradiated (used) to the extent that it can no longer effectively sustain a chain reaction and thus, has been removed from the reactor for disposal. This irradiated fuel contains fission products, uranium, and transuranic isotopes.

⁵⁹Makhijani and Makhijani, Op. Cit., p. 88.

⁶⁰Ibid., p. 4.

⁶¹Fetter, Steve, Op. Cit., pp. 144-148.

⁶²Makhijani and Makhijani, Op. Cit., p. 89.

⁶³For example, see Makhijani and Makhijani, Op. Cit.

01.009: The Department of Energy agrees that nonproliferation objectives (particularly in terms of setting an example for other nations) are preeminent; however, cost considerations are also important in the current budgetary climate. DOE deems all of the action alternatives (Alternatives 2 through 5) to be roughly equivalent in terms of serving non-proliferation objectives of the program. On the other hand, the sale of LEU fuel derived from surplus HEU would yield returns on prior investments to the Federal Treasury, offset blending costs, and reduce Government waste disposal costs. Consequently, the non-proliferation and economic objectives are complementary in the surplus HEU disposition program, particularly for the Preferred Alternative since both favor commercial use of the resulting material.

major infectious disease such as AIDS will realize that there is no precedent for real-world decisions—even those that concern threats to large numbers of people—being made in an environment free of economic considerations. In fact, in making such decisions it is not unusual for economic costs and benefits to be considered first, not last. For this reason, it is necessary to identify those factors involved in the disposition area that will create common costs across all options, and to specify those areas where specific factors are likely to be major cost drivers that could discriminate between the various disposition options.

This paper has shown that while HEU can be down-blended and burned by nuclear reactors for power generation, it will face the same economic forces as the nuclear industry in general. As a result, all other issues aside, it is unlikely to be financially successful in the United States in the long run. Current HEU disposition programs appear to be predicated on a positive financial return to the US government. Since this seems to be unrealistic, other goals may have to be developed. For example, the US may have to apply the same standards to HEU disposition as it applies to plutonium. Insistence on judging the success of the HEU program based on economic return is likely to end up generating a large amount of weapon-grade or down-blended HEU for which there is no economically viable reuse program and there are no other planned disposition options.

It is also clear that burning plutonium in power generating reactors is not economical and, further, it is unlikely to become economical at any time in the near future. As the recent National Academy of Sciences study stated,

"Exploiting the energy value of plutonium should not be a central criterion for decision making, both because the cost of fabricating and safeguarding plutonium fuels makes them currently uncompetitive with cheap and widely available low-enriched uranium fuels, and because whatever economic value this plutonium might represent now or in the future is small by comparison to the security stakes."⁶⁴

However, even if burning plutonium is not economical, is it still cheaper than other methods of dealing with or disposing of plutonium? This question incorporates both proliferation risk and economics, and the following framework of 'givens' provides a way in which it might be considered:

⁶⁴Management and Disposition of Excess Weapons Plutonium, Op. Cit., p. 3,4.

04.012

04.012: The Department of Energy does not judge the success of the proposed surplus HEU disposition program on economic return. The overall economics of HEU disposition actions from the Government's perspective will be determined more on the basis of avoided waste disposal costs than on any conclusion of positive financial return. In other words, even if the costs of blending exceeded the proceeds from market-price sales of LEU fuel derived from surplus HEU, the Government would still be economically ahead because it would not have to pay to dispose of the material. Any revenues from sales of LEU would help to offset blending costs and thus result in less Government outlays than noncommercial options—including storage over the long term with its attendant costs of storage, safeguards, maintenance, international inspections, etc. An analysis comparing the costs of HEU disposition alternatives has been prepared to aid the Secretary in reaching an ROD in this program. The cost analysis, which is available separately from the HEU EIS, supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU makes the most economic sense and would save considerable money.

First, it is obvious that increased handling of a material like plutonium leads to increased costs and increased proliferation risk.

Second, any proposal to burn plutonium in reactors to reach a spent fuel standard might also be accomplished more simply and cheaply by mixing plutonium with waste to a spent fuel standard to start with.⁶⁵ As an isotopically different element, plutonium can always be chemically separated from spent fuel whether it was generated inside a reactor or simply mixed with existing spent fuel, although the difficulty associated with this operation can be increased by adding other elements to the mix.

Third, waste storage costs, irrespective of the method of storage chosen, are based on volume and radioactivity and will be the same for all burning and non-burning options. In any process that requires putting material in a reactor, whether for power generation or simply to dispose of the material, the volume of material will remain constant throughout the process and the radioactivity of the spent fuel will be approximately the same for storage considerations. The only exception to this rule occurs when reprocessing is involved. Then both waste volume and costs rise dramatically.

And fourth, for transmutation, costs are altered because one is handling hotter material for relatively shorter periods of time-- but these time periods are still so extensive that discounted cost comparisons between alternatives cannot show significant differences. In addition, transmutation technologies still require reprocessing and they still must absorb the cost of research and development. Other options do not have either of these negatives.

Viewed in this light, final waste disposal costs will be incurred whatever disposal option is taken. These costs could potentially be offset by doing something profitable with the plutonium and HEU prior to final storage, but this paper has shown that finding a profitable use for either material is unlikely. Thus, the more probable case is one where the costs of basic waste storage are increased by whatever costs are associated with the disposition option chosen. The factors most likely to significantly increase costs are the major cost drivers that create

16.019

⁶⁵For a discussion of potential problems and benefits associated with "mix and melt" approaches to plutonium disposition, see comments by Wolfgang Panofsky, Kevin Wenzel et al, and Alex DeVolpi in "Letters", *The Bulletin of the Atomic Scientists*, vol. 52, no. 1, January/February, 1996.

16.019: The Department of Energy is confident that a profitable use for LEU fuel derived from surplus HEU will be available. The commercial use of HEU will shift the costs of waste disposal from the Government to the commercial user that derives benefit from the use of the fuel, and their costs would not increase beyond what they would have been anyway: (1) DOE does not agree that commercial use of HEU would need to be subsidized. (Revenues would offset blending costs for commercial material.) (2) Reprocessing would not be necessary for HEU disposition actions, although reprocessing of some DOE irradiated fuel for other reasons, such as stabilization for storage or disposal, might result in more separated HEU requiring disposition. (3) Once HEU is blended down to LEU, security costs would be minimal, and once it is sold, they would be zero. (4) No research and development is necessary for HEU disposition actions. Some of the commentor's points may have some validity with respect to Pu, but they do not appear to be valid with respect to HEU.

differences among the various options for plutonium and HEU disposition
At this point, these major costs appear to arise from four areas:
(1) The level of subsidization in the "profitable" parts of the
disposition program.
(2) Those items (such as reprocessing) that increase the volume of
waste and thus, the cost of waste disposal.
(3) The cost of security and its direct relationship to the number of
times a material is handled or moved.
(4) The cost of research and development of new methods of
disposition.
These four costs outweigh all other costs generated by disposition by
many orders of magnitude and, as a result, they should be the major
determinants when choosing among disposition options.

ComEd

January 11, 1996

DOE - Office of Fissile Materials Disposition
P. O. Box 23786
Washington, D. C. 20016-3786

Subject: Comments on Draft EIS for Disposition of Surplus HEU

Gentlemen:

ComEd wishes to submit the following comments on the Draft Environmental Impact Statement for Disposition of Surplus Highly Enriched Uranium

- 1. ComEd supports Alternative 5: Maximum Commercial Use (85% Fuel/15% Waste). This alternative minimizes the financial impact on the taxpayer, draws down the excess HEU stockpile in the most expeditious manner, produces the smallest volume of waste and utilizes processes which are well understood. 10.003
- 2. The ability of fuel fabricators to accept UNH liquid rather than UF₆ is limited. Only one domestic fabricator has even theoretical capability to do so. DOE's intent to market this material in a form other than what is in standard commercial usage will limit the value of the material and thus the return to the taxpayer. 04.015
- 3. Material should be blended down prior to sale. It is not at all clear that our material license will allow us to take possession of or title to highly enriched uranium. 01.006

Please contact me at (708) 663-5782 should you have any questions on this matter

Sincerely,

James E. Neving
Fuel Buyer

U.S. GOVERNMENT PRINTING OFFICE: 1985 O-345-111

10.003: Comment noted.

04.015: The HEU EIS contemplates the shipment of UNH crystals, not liquid, to fuel fabricators. DOE recognizes that the nuclear fuel industry would prefer to deal with UF₆; however, most of the surplus material is in metal and oxide forms and no capability currently exists to convert it to UF₆ form. The analysis of UF₆ blending was added to the alternatives to cover the possibility that some commercial entity may provide this capability in the future. (Both of the commercial firms whose facilities are analyzed in the HEU EIS, Babcock & Wilcox (B&W) and Nuclear Fuel Services (NFS), have indicated that they may install UF₆ blending capability.)

01.006: It is correct that few companies have Nuclear Regulatory Commission (NRC) licenses that would permit them to be in possession of HEU today. However, title to HEU might nonetheless be transferred to commercial entities, who would need to contract with properly licensed facilities (such as the B&W and NFS facilities analyzed in the HEU EIS) or DOE itself to blend the material on their behalf.

and Responses

405 COVENTRY PK., NASHVILLE, TN 37211-4505 DEC. 9, 1995

Dear friends,

I do not support making highly enriched uranium into nuclear reactor fuel because 10.024

(1) it will create spent fuel;
(2) it will create plutonium; and
(3) all options have not been adequately explored. 09.018

I do support
(1) downblending all highly enriched uranium 10.023

(2) developing the capacity to downblend all uranium
depleted surplus in ten years; and 03.020

(3) international controls on all nuclear materials.

Appreciatively,
Ray Conatser

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

09.018: The Department of Energy does not consider the option of blending surplus HEU for extended storage reasonable because it would delay beneficial re-use of the material; delay recovery of economic value of the material; add storage costs; reduce net revenues in the near term; not meet all aspects of the purpose and need of the proposed action; and be practically applicable without additional construction to only a small portion (20 t or approximately 40 t if a solidification facility is proposed and constructed at or near SRS) of the current surplus in inventory.

10.023: Existing facilities analyzed in the HEU EIS have sufficient capability to blend down all surplus HEU to LEU in a reasonable timeframe. However, DOE does not anticipate being able to make much more than about 8 t per year available for blending. Therefore, DOE considers that it will likely take 15 to 20 years to blend the entire surplus HEU inventory.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to IAEA controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky Flats sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

Yes. My name is Gary Condon. I live in Lynchburg, Virginia, and I am very much opposed of the plan to bring uranium into Lynchburg through B&W which will drop the value of our property and also cause an extra added risk that we do not need. Thank you very much.

10.006

10.006: Comment noted. However, it should be noted that the B&W Naval Nuclear Fuel Division is one of two licensed commercial facilities in the United States capable of processing HEU. B&W has been processing and fabricating HEU material at the Naval Nuclear Fuel Division and has maintained its NRC license for 37 years by adhering to radiological and health physics procedures and NRC license provisions to protect its employees and the environment surrounding the facility. The proposed action in the HEU BIS is well within the skills and experience, and could be implemented consistent with existing NRC license requirements for the B&W facility.

CONGRESS OF THE UNITED STATES,
HOUSE OF REPRESENTATIVES, WASHINGTON, DC
PAGE 1 OF 1

Disposition of Surplus Highly
Enriched Uranium Final EIS

12.008: The HEU Final EIS has been revised (Section 4.8) to reflect the enactment of the USEC Privatization Act (P.L. 104-134), and to address the prospects for the future operation of the U.S. enrichment plants in greater detail. DOE must adhere to the provisions of P.L. 104-134 that require the Secretary of Energy to avoid adverse material impacts on the domestic uranium industry, taking into account uranium transactions under the U.S.-Russian HEU agreement and the suspension agreement, when making decisions about domestic surplus HEU disposition.

ED WHITFIELD
Congress of the United States
House of Representatives
Washington, DC 20515-1701
December 27, 1995

Honorable Hazel O'Leary
Secretary of Energy
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585

Dear Madam Secretary:

Since coming to Congress, I have been carefully reviewing the Administration's actions that might impact the operations of the gaseous diffusion plant in Paducah, Kentucky. This plant, which is located in my Congressional District, is one of the largest employers in western Kentucky.

There are many issues which concern me, including: the terms of the United States-Russia HEU Agreement; the Suspension Agreement on uranium relating to Russia's dumping activities; the President's submission of legislation that would give him authority to waive our nation's trade laws and allow the government to ignore anti-dumping restrictions; the use of bypass arrangements by the Russians to sell their uranium in the U.S. marketplace; the legislation currently pending before Congress to allow DOE to sell natural and low enriched uranium in the future and, finally, the Department's Draft Environmental Impact Statement on the Disposition of Surplus Highly Enriched Uranium.

Taken individually, these actions may only have minimal effects on the enrichment industry and the plant in Paducah. However, their combined impact would be devastating. Therefore, I urge your Department to proceed very carefully when decisions are made to dispose of the surplus natural and highly enriched uranium stockpile.

At a very minimum, I believe the Department should abide by the provision contained in S.755, legislation pending in Congress to privatize the U.S. Enrichment Corporation. That bill states that "the Secretary determines that the sale of the material will not have material adverse impact on the domestic uranium mining, conversion, or enrichment industry, taking into account the sales of uranium under the Russian HEU Agreement and the Suspension Agreement", and that the price paid to the Secretary will not be less than fair market value.

I respectfully request that my concerns be registered officially in the record of comments on the Department's recent Draft Environmental Impact Statement on the Disposition of Surplus Highly Enriched Uranium.

Thank you for your consideration of my views, and I look forward to hearing from you at your convenience.

Sincerely,

 Ed Whitfield
 Member of Congress

January 8, 1996

Mr. J. David Nulton, Director
Office of NEPA Compliance and Outreach
Office of Fissile Materials Disposition
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585

Dear Mr. Nulton:

Re: Disposition of Surplus Highly Enriched Uranium Draft
Environmental Impact Statement (DOE/EIS-0240-D)

On behalf of ConverDyn, I am pleased to have the opportunity to submit the following comments regarding the referenced draft environmental impact statement ("EIS"). ConverDyn is a joint venture between affiliates of AlliedSignal Inc. (Morristown, New Jersey) and General Atomics (San Diego, California) which markets uranium conversion services worldwide. ConverDyn has exclusive marketing rights for the output of AlliedSignal Inc.'s Metropolis Works, located at Metropolis, Illinois, which represents the sole remaining domestic facility for the conversion of natural uranium concentrates (U_3O_8) to natural uranium hexafluoride (UF_6). More than 380 people are currently employed at the Metropolis Works. ConverDyn's current sales agreement portfolio includes nuclear utilities in the United States, Asia and Europe.

ConverDyn has reviewed the referenced EIS and finds the document, in its draft form, to be significantly deficient in the area of potential market impacts of the proposed actions/alternatives regarding the disposition of surplus highly enriched uranium ("HEU") from the U.S. inventory.

12.010

As you may be aware, the nuclear fuel market (natural uranium concentrates, conversion services and enrichment services) has been chronically depressed for more than 10 years. Although the factors contributing to this period of severe price depression are complex, the nuclear fuel supply industry has only recently begun to recover. In fact, due to depressed conversion market conditions, the uranium conversion facility owned by Sequoyah Fuels Corporation, an affiliate of General Atomics, located at Gore, Oklahoma, was placed on extended standby which will lead to final decommissioning with the attendant loss of hundreds of jobs.

3000 South Quebec Street, Suite 600, Denver, CO 80237-2705 Telephone (303) 770-0957 Fax (303) 771-1625

12.010: The Department of Energy has received conflicting comments from different segments of the industry regarding their expectations for the uranium market in general and the conversion industry in particular. The HEU Final EIS notes that the industry has been oversupplied in recent years, but the conversion market has tightened recently with the departure from the business of one of the domestic suppliers. The *USEC Privatization Act*, enacted in April 1996, requires the Secretary of Energy to determine that any DOE sales of uranium would not have adverse material impacts on the domestic uranium mining, conversion, or enrichment industries. In light of these developments, DOE has modified the HEU Final EIS (Section 4.8) with respect to impacts on the conversion industry, and now concludes that those impacts are unlikely to be significant in the long term.

CONVERDYN, DENVER, CO
PAGE 2 OF 2

Mr. J. David Nulton
Page 2
January 8, 1996

Although the draft EIS explicitly acknowledges the uranium conversion segment of the overall nuclear fuel cycle, there does not appear to have been any rigorous analysis of the potential impact on conversion of the proposed alternatives. Under Section 4.8, "Impacts on Uranium Mining and Nuclear Fuel Cycle Industries," the draft EIS recognizes that "the current price (constant dollars) of the uranium conversion process is less than it was 10 years ago, and competition is strong. Prices are apt to remain depressed until production capacity is reduced. Presently, there is an oversupply of conversion capacity and little growth in demand." (Page 4-182).

Under "Economic Consequences of the Proposed Action," the EIS recognizes the potential market impact of blending down Russian HEU into commercial grade fuel and then concludes that "blending DOE HEU to LEU for commercial use also would have some effects on the conversion industry. The already oversupplied sector of the nuclear fuel cycle would remain depressed for a slightly longer period of time than if this alternative were not implemented." (Page 4-185). Considering the fragile nature of the current market recovery, ConverDyn feels strongly that such an oversimplification is not appropriate for an issue as crucial as disposition of surplus U.S. HEU.

The domestic nuclear fuel cycle suppliers have been engaged in a protracted struggle to ensure that disposal of both Russian and U.S. origin HEU is conducted in a responsible manner by the governments involved. The proposed "USEC Privatization Act" contains specific criteria for the market introduction of HEU-derived LEU from both sources. ConverDyn supports the processes and procedures incorporated in that legislation and believes that the EIS addressing disposition of surplus U.S. HEU should fully recognize those provisions.

Regards,

James J. Graham
President

JJG/sav

cc: Cheryl Moss, NEI

12.010
cont.

12.021

12.021: The future uranium market is uncertain—different industry groups have proffered conflicting projections. Congress has indicated through provisions of the *Energy Policy Act of 1992* and the *USEC Privatization Act* that DOE's HEU disposition actions should avoid adverse material impacts on the uranium industry. The latter act includes a schedule that limits introduction of LEU into the U.S. market. DOE expects to abide by this requirement to avoid adverse material impacts on the industry, but also intends to satisfy the objectives of the fissile materials disposition program and the President's nonproliferation policy, as reflected in the HEU Final EIS.

December 22, 1995

Mr. Gregory P. Eudy, MD-1
Department of Energy
Office of Fissile Materials Disposition
P.O. Box 23788
Washington, DC 20020-3788

Dear Mr. Eudy:

I wish to offer the following comments concerning the "Disposition of Surplus Highly-Enriched Uranium Draft Environmental Impact Statement" to be issued by DOE/MD-1.

The quantity of surplus highly-enriched uranium-235 that will become available from dismantlement of a significant fraction of the U.S. thermonuclear-weapons stockpile will be quite large, in the order of hundreds of tons. This material represents a huge investment made by U.S. taxpayers over the last four decades, and should be used to a maximum effect for both national defense and public energy generation purposes. The uranium that has been enriched to approximately 93% U²³⁵ (or alloy) should, without question, be made available to the U.S. Navy nuclear propulsion program for consumption in both the presently operational (and future) nuclear submarines, aircraft carriers, and various types of cruisers.

I believe the U.S. operates 103 submarines of some five different types, 5 cruisers of several types, and 7 aircraft carriers, all of which are powered by differing types of nuclear reactors. Since many of these ships-of-the-line will have lifetimes of 50 years or more, we should provide the Navy with all excess supplies of >92% alloy for present and future use. The cost of storing this separated uranium isotope is essentially negligible and its use for nuclear propulsion applications is unlimited. Therefore, all supplies of alloy of U.S. origin should be stored for use as naval propulsion fuel, regardless of the small present stockpile of replacement naval reactor cores. Failure to implement such a scheme will be detrimental to the national security interests of this country. Using available data, I calculate a requirement of greater than 5 tons per year for such purposes, so that over the 50-year life span of the current ships that would total some 250 tons of alloy, reasonably close to the estimates of material that will become available over the next decade.

The lesser enriched uranium, ranging from 20% to 80% U²³⁵ could, and should, be used to develop advanced fast-reactor systems that certainly will be needed within the next fifty years. Although the uranium supply for LWR use looks very adequate in the short-term, every study made by industry or government indicates that the easily recovered natural uranium ores will be depleted by world-wide expansion of LWR use by 2040-2050, and the price of uranium ore will escalate rapidly after 2035. In this circumstance, it will become an economic necessity to move on to fast reactors for world electricity production. Our opportunity to develop and demonstrate this needed technology, without the development

09.011

09.011: A classified quantity of HEU is being retained in the strategic stockpile for use in the Naval Nuclear Propulsion program. The quantities of HEU declared surplus do not include material that is being retained for naval nuclear propulsion.

Retaining surplus HEU in its current weapons-usable form would not be consistent with the purpose and need for the proposed action. While the National Academy of Sciences has expressed support for the demonstration of advanced fast reactor systems, the National Academy of Sciences also considers it essential to our long-term national security to reduce global stockpiles of weapons-usable fissile materials. It is the current policy of the United States (Presidential Decision Directive 13) to discourage the civilian use of fast reactors due to concerns about their potential for breeding Pu in large quantities.

COOPS, MELVIN S., LIVERMORE, CA
PAGE 2 OF 2

2

of a plutonium fuel cycle, lies in the availability of a reasonably large stock of U²³⁵ that is enriched to about 46-50%, an ideal fuel for fast-reactor operation.

We have at hand a unique opportunity to perform this development work before our international competitors are forced into the fast reactor arena by the inevitable rise in LWR fuel prices. This is our opportunity to use the leverage we expended during the cold war period to gain back our international competitive edge; we dare not ignore this opportunity. For this compelling reason, I urge you not to reduce the existing surplus of weapons-enriched uranium to 20,000 kg, but to retain it with the existing stocks of weapons-enriched uranium for generation development. The cost to do this is negligible; the opportunity is currently at hand, and the need is obviously present.

The National Academy of Sciences just a few years ago strongly recommended that the top priority development in U.S. enriched fuel generation be "not" for political reasons of weapons-enriched uranium use in such systems. The availability of this surplus of weapons-enriched uranium will enable such work to go forth without any concern of nuclear weapons proliferation. We need to take action to conserve the materials now available to complete this work. This is an issue of our economic survival in the competitive world of the future.

Sincerely,

Melvin S. Coops

Transcription:

This is Susan Daly from Nashville, Tennessee. I wanted to put comments into the record that I do not support making highly enriched uranium into the nuclear reactor fuel. My objections are that it's going to create spent fuel which is just too toxic and too radioactive and we don't really know how to treat it or store it. The other objection is that it creates plutonium which would be a violation of the nonproliferation treaty, and that's something that I've been working on for several years. Another objection is that I don't feel that all options have been explored, which would include storing down blended uranium. The other objection is that there hasn't been a cost analysis that the public's been able to see anyway that shows the true cost to taxpayers if this HEU is down blended into fuel and then sold to utilities. I'm not sure that the Department of Energy would get back all the money that would be needed to transport, store, do the actual down blending, and then selling it at true cost. I'm afraid the taxpayers would get stuck with that deficit, and as we know, there's already too big a deficit right now in the government.

The things that I would support is down blending all the highly enriched uranium down to 0.7% so that it cannot be used in weapons. I also support developing the capacity to down blend all uranium declared surplus in the past ten years and also having good controls internationally on all nuclear materials. Thank you very much. Just in case you need my address, it's 211 37th Avenue North, Apartment B-9, Nashville, Tennessee 37201. Thank you.

10.024

09.018

16.015

10.023

03.020

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

09.018: The Department of Energy does not consider the option of blending surplus HEU for extended storage reasonable because it would delay beneficial re-use of the material; delay recovery of the economic value of the material; add storage costs; reduce net revenues in the near term; not meet all aspects of the purpose and need of the proposed action; and be practically applicable without additional construction to only a small portion (20 t or approximately 40 t if a solidification facility is proposed and constructed at or near SRS) of the current surplus inventory.

16.015: Cost estimates for the alternatives analyzed in the HEU EIS have been developed to provide the decisionmaker, DOE, comprehensive information upon which to make decisions. The cost analysis, which has been provided to this commentor and all others who have expressed an interest in this subject, is available in a separate document with the HEU Final EIS. It supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU would save billions of dollars compared to the alternative of blending HEU for disposal as waste.

10.023: Existing facilities analyzed in the HEU EIS have sufficient capability to blend down all surplus HEU to LEU in a reasonable timeframe. However, DOE does not anticipate being able to make much more than about 8 t per year available for blending. Therefore, DOE considers that it will likely take 15 to 20 years to blend the entire surplus HEU inventory.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to IAEA controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky Flats sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

subject = HEU Disposition

** The following is the text of the Author's Comment.

Rapid disposition of the material through its use as fuel for US commercial reactors is clearly the best course. Final decisions must consider the long term impact of artificially keeping this material off the market. Please consider the following points in your evaluation of alternatives.

1) Utilities will be reluctant to commit to long term contracts with suppliers as long as this material is lingering with the potential of entering the market. The most stabilizing treatment of the material would be an orderly, predictable entry into the free markets at the market price as soon as the material is available. Government overregulation of the process will lead to intervention by special interest groups desiring to protect overpriced supply sources for short term profit.

12.009

2) Entry into the market should be as blended down material meeting all ASTM specifications. This will allow for the most number of competitive bidders and therefore, the highest price to the government. It will also prevent manipulation by parties who can control the blending process and thus the price and entry of the material. Blending should be done by a commercial arrangement and the costs subtracted from the proceeds of the sale.

04.011

3) Equal access to the material should be granted to all market participants through some sort of regular auctioning process. This method will lead to a market price being paid for the material and can provide for the predictability needed to make long term procurement and production decisions.

12.009: The Department of Energy agrees that avoiding adverse material impacts on the uranium market will depend in part on DOE being predictable in its uranium transactions. The *USEC Privatization Act* requires DOE: 1) to determine that its uranium sales would not have adverse material impacts on the domestic uranium mining, conversion, and enrichment industries; and 2) to sell its uranium at not less than market prices.

04.011: The Department of Energy would seek to meet American Society of Testing Materials fuel specifications for commercial material to the maximum extent possible. However, some of the surplus HEU inventory has isotopic compositions that would prevent the blended down product from meeting current American Society of Testing Materials specs, particularly with regard to the U-234 and U-236 isotopes. Such off-spec material may nonetheless be commercially usable in reactors at slightly higher enrichment levels (to compensate for the fission-poisoning effects of U-236) with NRC license modifications. Recommendations concerning the appropriate commercial arrangements for blended down material are not relevant to environmental (NEPA) issues, but will be considered to the extent appropriate in the ROD(s) for this program.

4) Any price break to the US utility customers is fully warranted, should it occur, as they are the ones who bore the expense of the production of the HEU or at least the US component to act as a deterrent to the Russian market over the years. The price dividend should go to the ratepayers and taxpayers of the US, not to uranium miners, intermediaries, corporations and special interest groups.

Thank you for the opportunity to submit these comments.

P.O. Box 23786
Washington, D.C. 20026-3786

REF: DISPOSITION OF SURPLUS HIGHLY ENRICHED URANIUM DRAFT
ENVIRONMENTAL IMPACT STATEMENT

Dear Office of Fissile Materials Disposition:

Thank you for the opportunity to comment on the *Disposition of Surplus Highly Enriched Uranium Draft Environmental Impact Statement*. We would like to commend your office for providing information on the draft EIS via several avenues; the internet site has been particularly useful in quickly transmitting information on the fissile materials disposition program.

Thank you also for the opportunity to participate in the November 14, 1995 public meeting in Knoxville, Tennessee. As discussed with representatives of your office at that time, I would like to reiterate my concern with a statement contained in the Summary document for the draft EIS. In the section on "Highly Enriched Uranium Disposition Alternatives", footnote 8 (p. 8-10) states,

"Foreign fuel fabricators and foreign commercial electrical power nuclear reactors are not as reasonable or as likely as domestic fabricators and reactors for a number of reasons including transportation and associated environmental concerns that would need to be accommodated." (Emphasis added.)

07.011

This statement gives the erroneous impression that there are undue concerns associated with the international transport of low enriched uranium. As you are aware from the Department's lengthy experience in the sale of LEU to foreign customers, the transport of LEU is a routine procedure, nonetheless subject to strict requirements regarding packaging and handling.

07.011: The HEU Final EIS has been revised to eliminate the cited text.

U.S. Department of Energy
Office of Fissile Materials Disposition

REF: DISPOSITION OF SURPLUS HIGHLY ENRICHED URANIUM DRAFT
ENVIRONMENTAL IMPACT STATEMENT
Page 2

The commercial nuclear power industry has a tremendous safety record with regard to transports of all radioactive materials. Edlow International Company, which has provided expert transportation management services to the nuclear power industry for over 38 years, can attest to this excellent safety record.

07.011
cont.

Despite this record, many opponents of commercial nuclear power see fit to attack the lawful transport of LEU and other radioactive materials. It would be unfortunate if the above statement could be taken to reflect DOE's own concern in this regard. Accordingly, we request that the Department clarify the statement to avoid possible confusion or misconceptions.

Thank you for your attention in this regard. Please do not hesitate to contact me at (202) 483-4959 should you require additional information in connection with these comments.

Best regards,

Melissa Mann
Manager, International Affairs

DOE - Office of Fissile
Materials Disposition
c/o SAC/HEU EIS
P.O. Box 23786
Washington, DC 20026-3786

I am writing to comment on the plans for processing Highly Enriched Uranium (HEU) as proposed in the draft Environmental Impact Statement. The preferred plan is to down blend the HEU to make tons of ~~reactor~~ nuclear reactor fuel. However this is problematic. Spent fuel is deadly, we have no place to dispose of it, costs of storage, transportation and disposal will be huge, and most importantly, it can be processed to extract plutonium, so it is still a weapons threat.

14.002

14.002: It is correct that the use in reactors of nuclear fuel derived from surplus HEU would result in the production of spent fuel. However, this fuel simply supplants nuclear fuel that would be produced from natural uranium anyway, so no additional spent fuel would be generated as a result of this program. Although spent fuel contains Pu, it is extremely hazardous to process and separate the Pu. It is a tenet of U.S. nonproliferation policy, consistent with recommendations of the National Academy of Sciences, that weapons-usable fissile materials be made at least as proliferation resistant as spent fuel.

NOV 13 1995
MOODL6

I urge the blending down of the HEU to less than 1% and disposing it as low level waste. This is the cheapest, least environmentally hostile, most secure and safest option. It serves our nation's nonproliferation policy and sends a message to other nations that we are downsizing our nuclear ~~arsenal~~ arsenal. Please take this chance to truly make the world a safer and more healthy place.

Sincerely,
Linda Ewald

10.009

10.009: Blending down the entire stockpile of surplus HEU to less than 1 percent and disposing of it as waste was evaluated in the HEU EIS as one of the alternatives. The analyses showed that this alternative would generate the highest environmental impact among other alternatives evaluated in the HEU EIS (Table 2.4-2). DOE has developed cost estimates associated with the alternatives analyzed in the HEU EIS and has made them available in a separate document with the HEU Final EIS. The cost analysis indicates that commercial use of LEU fuel derived from surplus HEU makes economic sense and would save billions of dollars compared to the alternative of blending HEU for disposal as waste. DOE believes that all of the action alternatives (2 through 5) evaluated in the HEU EIS meet the objective of nonproliferation and will send a positive message to other nations.

P.O. Box 23786
Washington, DC 20026-3786

I am concerned about the disposition of ~~the~~ highly enriched uranium. I do not support downblending it into nuclear fuel because it will create spent reactor fuel, which is a highly toxic radioactive waste we have no solution for; it will create plutonium, a violation of our non proliferation goals; and all options have not been adequately explored, including ~~storing~~ storing down blended uranium.

I do support and encourage the down blending of highly enriched uranium so it cannot be used in weapons; developing the capacity to down blend all uranium

10.024

09.018

10.023

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

09.018: The Department of Energy does not consider the option of blending surplus HEU for extended storage reasonable because it would delay beneficial re-use of the material; delay recovery of the economic value of the material; add storage costs; reduce net revenues in the near term; not meet all aspects of the purpose and need of the proposed action; and be practically applicable without additional construction to only a small portion (20 t or approximately 40 t if a solidification facility is proposed and constructed at or near SRS) of the current surplus inventory.

10.023: Existing facilities analyzed in the HEU EIS have sufficient capability to blend down all surplus HEU to LEU in a reasonable timeframe. However, DOE does not anticipate being able to make much more than about 8 t per year available for blending. Therefore, DOE considers that it will likely take 15 to 20 years to blend the entire surplus HEU inventory.

declared surplus in ten years
and international controls on
all nuclear materials

10.023

cont.

03.020

Thank-you for your time and
attention.

Sincerely,

Linda Ewald.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to IAEA controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky Flats sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

Disposition of Surplus Highly
Enriched Uranium Final EIS

11-20-1995

Dear Sir,
I was born and raised in Union County. I
have seen it as a booming town, go down with
lot of jobs at railroad and log offa at NFS.
I am writing you this letter to ask you to please
give Nuclear Fuel Service the contract.

If NFS get the contract it would do
much to improve the economy of Union
County when others have been sustained.
The entire area would benefit if Nuclear Fuel
Service get the contract.

again I ask you to give NFS
the contract. alot of people will be
Call back from log offa.

Thanks for your time

Ken Lomas
 I thank you for your Oct 19, 1988
 letter.

I should like a copy of THE DEPT
 HEU-EIS.

If available I should like a copy
 of the oral comments made during the
 Nov 14 Knoxville Meeting and the Nov 16
 meeting in Oregate, Oregon as summarized
 in the "HEU-EIS Meeting Summary Report"

As a retired employee of FEC & ERDA
 I feel that the storage in Oak Ridge K-25
 of HEU is fine; unless there is use for
 the material or current health physics
 recommend its being moved.

Sincerely, I thank you,
 Kent H. Fearey

FERNALD AREA OFFICE, CINCINNATI, OH
PAGE 1 OF 1

Date: January 12, 1986
 To: Office of Fissile Materials Disposition
 FAX: 1-800-820-5156
 Subject: Comments on the Disposition of Surplus Highly Enriched Uranium
 Draft Environmental Impact Statement (EIS)
 From: Mary Beth Garels
 Fernald Area Office
 7400 Willey Road
 Cincinnati, Ohio 45030
 phone: 513-648-3181
 Fax: 513-648-3076

The possibility exists that some of the low enriched uranium (LEU) blendstock for the proposed blending action will come from the Fernald Environmental Management Project in Fernald, Ohio (350 MTU). However, the Draft EIS document does not clearly indicate this potential Fernald source of LEU blendstock in its discussion. It only notes Fernald as being a source of depleted material.

Recommendations:

1. Add "LEU in metal or oxide form would be shipped from Fernald, Ohio", in fifth bullet paragraph of Section 2.2.1 *Basis for Analysis*.
2. Add text to the paragraphs under the Transportation of Blendstock Materials heading in Section 4.4.3.2 *Surplus Highly Enriched Uranium Disposition Alternatives* that describes the possible transportation of LEU in metal or oxide form from Fernald. Possibly add this alternative to the transportation RADTRAN analysis, although the Hanford analysis may be sufficient since Hanford is being used as a representative site.
3. Add information where appropriate on the potential Fernald LEU blendstock source to any other sections/diagrams that discuss the blendstock materials to ensure that the environmental impacts of this possibility have been fully assessed.

Thanks for the opportunity to comment. Hope the program is successful.

11.014

11.014: The observation that LEU blendstock could originate from the Fernald facility is correct. The HEU Final EIS has been revised to reflect this in Section 2.2.1 and Section 4.4, Intersite Transportation.

The purpose of this card is to encourage communication between readers of the Newsletter and the Office of Fissile Materials Disposition. Your views, comments, and suggestions are appreciated.

Comments: NO WORLD NUCLEAR TESTING. CEASE ALL RADIO-ACTIVE production world-wide. Looking to Peter to pay Paul - looking for a safe disposal site is a joke. Prorx continuation on-in the planes

Please mail response to: Editor, Energy and Environment, 1000 Independence Ave., S.W., Washington, D.C. 20583
and an snail to good sense, and a total lack of humanitarian concern...

06.005

06.005: The Government has formally agreed that there should be no world nuclear testing and is pursuing a *Comprehensive Test Ban Treaty* to that end. The objective of the fissile materials disposition program is to convert surplus weapons-usable fissile materials to forms that are non-weapons-usable; that is, to make nuclear disarmament permanent. It is not to generate additional radioactive materials.

FRIENDS OF ORNL, OAK RIDGE, TN
PAGE 1 OF 1

Friends of Oak Ridge National Laboratory
Post Office Box 6411
Oak Ridge, TN 37831-0411
3 December 1993

U.S. Department of Energy
Office of Fissile Materials Disposition
P.O. Box 37184
Washington, D.C. 20516-37184

Sirs:

The Friends of Oak Ridge National Laboratory, an organization comprised of former and present staff members of ORNL and of other citizens of the area who are interested in the future welfare of the Laboratory and the community, wishes to comment on the draft *Disposition of surplus highly enriched uranium environmental impact statement*.

We understand that the alternative preferred by the Department of Energy is dilution of bomb-grade material with uranium of low ^{235}U content to an enrichment suitable for use in power reactors. We support this course, as a desirable route to compliance with arms-control agreements and as a beneficial use of excess weapons material.

We do not agree with the position taken by some that the isotope dilution should be to an enrichment approaching natural uranium, with subsequent burial. The proponents appear to be motivated primarily by antipathy to nuclear power. In any case, their alternative would only waste money without serious effect on power production, in view of the ample supplies of low-enriched uranium from other sources. Their further argument that fissionable material produced in power reactors might be used in proliferation of weapons also is unsubstantial. There are far easier routes for terrorist groups or nations to obtain weapons than by power-reactor plutonium. Probably the best way to lower the risk of proliferation is to reduce excess inventory of highly enriched uranium, as DOE is proposing.

We further have complete confidence in Y-12's capability to perform dilution safely and efficiently.

Sincerely,

William Robertson
William Robertson, President

10.003

10.008

10.003: Comment noted.

10.008: The Y-12 Plant is one of the four alternative sites evaluated in the HEU EIS as having the capability to provide uranium blending processes. To be in compliance with NEPA, the HEU EIS must assess the environmental impacts of the proposed action and alternatives at all potential candidate sites without favoring one over another and provide this information to the decisionmakers.

604 BUCKEYE STREET
ERWIN, TENNESSEE 37650
DECEMBER 1, 1995

Department of Energy
Office of Isotope Materials Disposition
P.O. Box 23784
Washington, D.C. 20026

Dear Sirs:

This letter, on behalf of myself and others in Van Ness County, is
to ask that you consider nuclear fuel services of
Erwin, Tennessee, as the site for degrading enriched
Uranium from weapons material to fuel. 10.003

The management and the personnel at nuclear fuel services
are well qualified to handle this project, and jobs are
hardly needed for our county. We are a poor county,
and federal ownership of 40% of our land leaves our
top base.

Most people, including my daughter and my son-in-law,
who formerly worked at NFS are either unemployed or are
working at part-time minimum wage.

(423) 745-6982

Sincerely
Jack A. Gardner (RETIRED)
JACK A GARDNER

Comment ID: P0044
Name: Susan Genetta
Address: Nashville, Tennessee

Transcription:

Hi, my name is Susan Genetta, and I'm a resident of Nashville, Tennessee, and today is Wednesday, January the tenth, and I'd like to leave just one or two short remarks regarding the enriched uranium being sold in the world market as plutonium. It is my opinion that this is not a good idea. I would like to see no nuclear materials bought and sold in the international market, and I would prefer the United States did not get involved in changing the enriched uranium into plutonium to be used in the market. If you would please take into consideration my comments. That's how I feel. Thank you very much. Bye-bye.

10.034

10.034: The Department of Energy's proposal to blend down surplus HEU to LEU as reactor fuel for commercial use is aimed to eliminate proliferation potential of the weapons-usable HEU. Although LEU used in power reactors would generate spent fuel, since this fuel (derived from surplus HEU) would replace nuclear fuel (created from newly mined uranium without this action), there would be no additional spent fuel generated. Spent nuclear fuel (generated as a result of the use of this fuel in power reactors) contains Pu; however, it is extremely difficult and costly to separate the Pu. In accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel.

**GEORGIA (AUGUSTA), AFTERNOON WORKSHOP
PLENARY SESSION
PAGE 1 OF 2**

**HEU EIS PUBLIC MEETING ORAL COMMENTS
AFTERNOON WORKSHOP
Augusta, Georgia
November 16, 1995**

SESSION: Plenary	32.009
Is DOE weighting the comments that are received on this EIS?	02.003
What is being done with the 20% of the HEU categorized as off-specification?	25.001
Is the Savannah River Site presently operating the vitrification facility to vitrify glass?	01.005
Why did the United States decide to take back foreign fuel? Since the United States is taking back the fuel, why is DOE and/or the government afraid of someone making a bomb?	22.006
Would someone please tell us about potential water contamination concerns to the areas surrounding the Savannah River Site activities and this project.	32.010
DOE should let another state take the Savannah River Site over. I would not mind letting someone else have our problems for a while.	30.010
I live close to the Savannah River Site and I am not concerned about the drinking water being contaminated.	13.005
This is the second time in the last month that DOE has scheduled public meetings at the same time and in locations far enough apart that interested members of the public can not attend both meetings.	16.007
I commend DOE for identifying the preferred alternative in the document. The final EIS should more closely relate to the requirements of NEPA. For example, fulfilling the requirements of future generations and impacts on resources.	
Do the utility companies have an interest in the HEU being blended down to metal as the final product. Do any commercial sites have metal blending capabilities?	
We (the public) are worried about the future, however, in 1000 years the only thing surviving at the Savannah River Site will be owls and buzzards.	
How much money was budgeted for this draft EIS?	

REVISED December 13, 1995

for presentation in this document.
Oral comments received in public meetings concerning similar issues were combined (grouped)

32.009: As part of the HEU Final EIS, all comments, along with DOE's responses, will be provided to the decisionmakers for their review and consideration prior to issuance of the ROD. All comments, both written and oral, regardless of the method in which they are submitted, have been given equal attention and consideration by DOE during preparation of the HEU Final EIS.

02.003: Surplus HEU that is off-spec is being stored until all options to utilize it have been exhausted. It appears that a considerable portion of it may be useful as commercial fuel. If no use is found for the material, it will be blended and disposed of as LLW.

25.001: The vitrification facility of the Defense Waste Processing Facility is currently undergoing an operational readiness review. It is expected to become fully operational in the first quarter of 1996.

01.005: The Department of Energy and the Department of State jointly proposed (in the Final EIS for the *Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel*, February 1996) to adopt a policy to manage spent nuclear fuel from foreign research reactors to promote U.S. nuclear weapons nonproliferation policy objectives. The purpose is to remove as much U.S.-origin HEU as possible from international commerce while giving the foreign research reactor operators and their host countries time to convert to operation with LEU fuel and to make their own arrangements for disposition of subsequently generated LEU spent nuclear fuel. The Government does not seek to indefinitely accept or otherwise manage spent nuclear fuel from foreign research reactors. The foreign research reactor spent nuclear fuel program is outside the scope of the HEU EIS. With regard to the fear of nuclear proliferation, the United States and others have determined that growing world stockpiles of excess weapons-usable fissile materials present a significant threat to U.S. and global security. Reducing those stockpiles is the primary objective of the HEU disposition program.

22.006: The potential for water and aquifer contamination from the proposed action around SRS and other candidate sites under normal operations is highly unlikely because, as discussed in Chapter 4 of the HEU EIS, there would be no direct discharge to groundwater. Any wastewater (nonhazardous) released to surface water would be treated prior to being discharged and would comply with its National Pollutant Discharge Elimination System (NPDES) permit.

32.010: The Department of Energy supports the public's involvement and is fully committed to giving the public access to information about its activities and opportunities for involvement in DOE's decisionmaking process. DOE makes efforts to coordinate meetings with other offices and agencies to the extent possible consistent with programmatic requirements. Unfortunately, some schedule conflicts are unavoidable.

Because public involvement is critical to the success of the program, other methods for submitting comments were also made available throughout the comment period: toll-free fax and voice recording, electronic bulletin board, and U.S. mail. These methods can also be used to request additional information or to be placed on the Office of Fissile Materials Disposition's mailing list.

30.010: Comment noted.

13.005: Public utilities deal in uranium oxide and UF_6 but not metal. Conversion contractors will need to make oxide or hexafluoride products for sale to the utilities. No commercial contractors have the capability to blend uranium metal.

16.007: Four million dollars are budgeted for both Draft and Final versions of the HEU EIS.

HEU EIS PUBLIC MEETING ORAL COMMENTS
 AFTERNOON WORKSHOP
 Augusta, Georgia
 November 16, 1995

SESSION: Discussion/Summary

OPEN DISCUSSION

What is the potential for contamination of the aquifers around the Savannah River Site and other candidate sites from this project?	22.006
Why is the scope of this EIS limited to 200 tons of HEU; why doesn't it cover disposition of all the HEU?	02.006
DOE should clarify the scope of the transportation impact analysis. It should include impacts of moving the material both from its current location to the blending site and from the blending site to its new location for either fuel fabrication or waste disposal.	20.007
Why doesn't the EIS provide us with information about long-term socioeconomic affects, proliferation, and other analyses required of NEPA documents?	30.006
What storage contingencies are being considered?	06.032
What are the dollar amounts associated with each of the alternatives, both cost and revenue potential?	16.009
What are the criteria for market decisions and what value is being placed on the HEU?	04.009

NEPA

This NEPA document does not seem to cover depletion and conservation of resources; long-term consideration of the resource value for future generations; ways to enhance the quality of depletable resources; or consideration of the value compared to energy value of fossil fuels. DOE has not gone with the spirit and letter of conformance related to NEPA, they need to do that. (The following references were cited regarding these comments)	30.007
<i>National Environmental Policy Act Handbook, United States Department of the Interior, October 1990, Section 4-10</i>	

REVISED December 13, 1995
 REVISED December 13, 1995

22.006: The potential for water and aquifer contamination from the proposed action around SRS and other candidate sites under normal operations is highly unlikely because, as discussed in Chapter 4 of the HEU EIS, there would be no direct discharge to groundwater. Any wastewater (nonhazardous) released to surface water would be treated prior to being discharged and would comply with its NPDES permit.

02.006: The HEU EIS covers the disposition of all HEU that has been or may be declared surplus in the future. To date, 175 t have been declared surplus, and the EIS analyzes also an additional quantity (assumed to be 25 t for purposes of analysis, although no such additional quantity has been identified or proposed) that may be declared surplus in the future. A classified quantity of HEU that remains in the national security reserve is not part of the surplus HEU disposition program.

20.007: The HEU EIS identified all potential transportation routes required for each alternative and evaluated the impacts associated with each. The impact assessments included transporting surplus HEU and the blendstock material from their storage locations to the blending sites and the LEU product from blending sites to either fuel fabricators or a representative LLW disposal site. The scope of the transportation assessment, details of the analysis, and the potential health impacts from transporting materials between sites can be found in Section 4.4 and Appendix G of the HEU Final EIS.

30.006: Socioeconomic impacts for each site are assessed in Section 4.3 of the HEU EIS, and socioeconomic impacts on the uranium and nuclear fuel cycle industries are discussed in Section 4.8. As discussed in Section 1.4.2 of the HEU EIS, DOE considers the nonproliferation implications of all the action alternatives (2 through 5) to be essentially equivalent, that is, LEU is non-weapons-usable whether it is at 4-percent enrichment for commercial use or at 0.9-percent enrichment for disposal. DOE believes the HEU EIS contains all the elements required of NEPA documents.

06.032: It is expected that HEU will continue to be stored as HEU until it can be either blended down for commercial use or blended down and promptly moved to a LLW repository for disposal. Thus, extended storage of LEU fuel derived from surplus HEU is not expected to be necessary. Until the HEU is blended down, it would be stored as HEU at the Y-12 Plant pursuant to the *Environmental Assessment for the Proposed Interim Storage of Enriched Uranium Above the Maximum Historical Storage Level at the Y-12*

Comment Documents
 and Responses

GEORGIA (AUGUSTA), AFTERNOON WORKSHOP
DISCUSSION/SUMMARY SESSION
PAGE 2 OF 8

F. Energy and Depletable Resources

"Energy requirements, conservation potential, and effects on natural or depletable resources should be a part of the impact analysis."

The National Environmental Policy Act of 1969, as amended (Pub. L. 91-190, 42 U.S.C. 4321-4347, January 1, 1970, as amended by Pub. L. 94-52, July 3, 1975, and Pub. L. 94-83, August 9, 1975.)

Title 1 - Declaration of National Environmental Policy

Sec. 101. (a) "... fulfill the social, economic, and other requirements of present and future generations of Americans."

Sec. 101. (b) (1) "fulfill the responsibilities of each generation as trustee of the environment for succeeding generations;"

Sec. 101. (b) (5) "enhance the quality of renewable resources and approach the maximum attainable recycling of depletable resources."

Sec. 102. (c)(2)(C) "include . . . a detailed statement by the responsible official on ---
(iii) Alternatives to the proposed action;
(iv) The relationship between local short-term uses of man's environment and the maintenance and enhancement of long-term productivity; and
(v) Any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented."

Sec. 102.(F) "Recognize the worldwide and long-range character of environmental problems and, where consistent with the foreign policy of the United States, lend appropriate support to initiatives, resolutions, and programs designed to maximize international cooperation in anticipating and preventing a decline in the quality of mankind's world environment;"

The HEU should not be made irretrievable. Materials that can be used are needlessly being buried. These materials could be used later. These materials could free the United States dependency on foreign energy sources. (The following references were cited regarding these comments)

Energy Policy Act - Public Law 94-580-OCT 21, 1976 (Subsequently modified to *Resource Conservation and Recovery Act (Solid Waste Disposal Act)*, 42 U.S.C. §6901 et seq., as amended)

REVISED December 13, 1995

30.007
cont.

17.008

Plant, Oak Ridge (DOE/EA-0920, September 1994), and, as appropriate, at the storage site(s) identified for HEU storage in the ROD for the upcoming *Storage and Disposition of Weapons-Usable Fissile Materials Final Programmatic Environmental Impact Statement*.

16.009: Cost estimates for the alternatives analyzed in the HEU EIS have been developed for inclusion into the ROD(s) and are available in a separate document with the HEU Final EIS. The cost analysis supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU would save billions of dollars compared to the alternative of blending HEU for disposal as waste.

04.009: The Government would be unable to sell uranium at above market prices and has no intention of doing so at below market prices, with the possible exception of off-spec material, which will probably be sold at some discount to compensate for the additional costs attending its use. The ultimate value of surplus HEU will be determined by the market at the time of particular sales.

30.007: The Preferred Alternative in the HEU EIS is to maximize conservation of the resource value of surplus HEU, and to conserve depletable natural uranium resources, by blending surplus HEU down to LEU and making it available for commercial use. The Preferred Alternative would also conserve the depletable resources required to mine, mill, convert, and enrich the virgin uranium that would be displaced by LEU fuel derived from surplus HEU. DOE disagrees that the document disregards these issues—indeed, they constitute a primary basis for the Preferred Alternative.

17.008: The Department of Energy's Preferred Alternative is to maximize commercial use of surplus HEU, and to minimize the portion that must be disposed of as waste. This preferred alternative is thus fully consistent with the spirit and letter of the *Resource Conservation and Recovery Act*.

<p>"Sec. 1002.(c) Materials - The Congress finds with respect to materials, that</p> <p>(1) millions of tons of recoverable material which could be used are needlessly buried each year;</p> <p>(2) methods are available to separate usable materials from solid waste; and</p> <p>(3) the recovery and conservation of such materials can reduce the dependence of the United States on foreign resources and reduce the deficit in its balance of payments."</p> <p>"Sec. 1004. As used in this Act: . . .</p> <p>(18) The term 'recoverable' refers to the capability and likelihood of being recovered from solid waste for a commercial or industrial use.</p> <p>(21) The term 'resource conservation' means reduction of the amounts of solid waste that are generated, reduction of overall resource consumption, and utilization of recovered resources."</p>	<p>17.008 cont.</p>
<p>The EIS does not compare blended down fuel versus other fuel sources such as coal and oil.</p> <p>The United States promotes all nuclear technologies in other countries, while the United States is depleting our reserve fuel supply. The United States needs a National Energy Policy. The United States is giving up on nuclear energy when the future generations may have to use nuclear energy as a power source. (The following references were cited regarding these comments)</p>	<p>06.033</p>
<p><i>Protection and Management of Plutonium</i>, American Nuclear Society, Special Panel Report Executive Summary, pgs. 11-13</p> <p>V.20. Global Energy Demand. "In a 1993 paper on "Global Energy and Electricity Futures," Dr. Chauncey Starr, President Emeritus of the Electric Power Research Institute, stated: 'By the middle of the next century, global energy demand driven by population and economic growth, will be in the range of 2-4 times the present level, depending on the effectiveness of energy efficiency and conservation globally. Even with maximum realistic conservation the electricity component will be more than 4 times present usage. A massive expansion of non-fossil sources would be needed to slow the future annual increase in carbon dioxide to the atmosphere.'"</p>	<p>06.034</p>
<p>V.22. Environmental Considerations. "... The impact of such a drastic step on the global economy would be unprecedented and incalculable.</p>	
<p>REVISED December 13 1995</p>	

06.033: Because reactor fuel derived from surplus HEU would simply supplant reactor fuel that would be used anyway, the use of the fuel in reactors would not constitute an incremental impact from this program and is not assessed in the HEU EIS. Thus, alternative fuels are also not assessed.

06.034: The future of nuclear power use in this country is not affected by the HEU disposition program, since LEU fuel derived from surplus HEU would simply supplant fuel derived from natural uranium. The HEU EIS assumes that nuclear power generation will continue in this country and abroad and be able to use the LEU fuel derived from surplus HEU.

31.001: The United States has agreed to purchase LEU derived from Russian HEU (blending is done in Russia) from its weapons stockpile in order to make that material non-weapons-usable and keep it out of general commerce, as well as to provide Russia with hard currency to aid in its economic rebuilding efforts. The U.S.-Russian HEU agreement is covered by an environmental assessment that was prepared by USEC (*Environmental Assessment for the Purchase of Russian Low-Enriched Uranium Derived from the Dismantlement of Nuclear Weapons in the Countries of the Former Soviet Union*, USEC/EA-94001, DOE/EA-0837, January 1994). This EA evaluates potential impacts of transporting Russian HEU which would already be blended to LEU to USEC facilities in the United States. The HEU EIS is concerned only with activities in the United States with regard to the disposition of HEU that has been declared surplus to the U.S. nuclear weapons and energy programs and any additional quantity of HEU that may be declared surplus in the future. Storage of non-surplus weapons-usable HEU is addressed in the Storage and Disposition Programmatic Environmental Impact Statement (PEIS). The transportation and blending of the Project Sapphire material, which is currently being processed at the Babcock & Wilcox site in Lynchburg, VA was evaluated in the *Environmental Assessment for the Disposition of Highly Enriched Uranium Obtained from the Republic of Kazakhstan* (DOE/EA-1063, May 1995). DOE does not currently anticipate receiving additional quantities of HEU from foreign sources except in the form of research reactor spent fuel, which is not weapons-usable material unless it is reprocessed for other reasons. The foreign research reactor spent nuclear fuel program, which is outside the scope of the HEU EIS, is addressed in the *Final Environmental Impact Statement for the Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel* (DOE/EIS-0218F, February 1996). The HEU EIS considers cumulative impacts associated with all these actions in Section 4.6. These related actions are not connected because they have different justifications for implementation, origins, alternatives, transportation scenarios, and impacts.

Comment Documents
and Responses

GEORGIA (AUGUSTA), AFTERNOON WORKSHOP
DISCUSSION/SUMMARY SESSION
PAGE 4 OF 8

V.32. No Need for Fuel Cycle Uniformity.

"... They also maintain the technological base that is essential to timely development and introduction of plutonium-fueled reactors should these be needed. We, therefore, strongly endorse the stated U.S. policy of the past several years of avoiding interfering in the fuel cycle decisions of our close partners."

V.36. The Need for Permanent Repositories and the Throw-Away Fuel Cycle.

"... The timing for construction of a permanent repository is a matter for national decision. In countries such as the United States, where the continued public acceptability of nuclear power is dependent on the firm adoption and implementation of a coherent waste management plan..."

Disposition of Surplus Highly Enriched Uranium Environmental Impact Statement Implementation Plan, DOE/EIS-0240-IP, June 1993, p. B-17

"DOE intends to comply fully with the letter and spirit of NEPA, as well as to make considerable efforts which go beyond the basic requirements of the NEPA regulations."

Scope of HEU EIS

The scope of this document may lead to choosing an alternative that would possibly not be chosen if all of the HEU was addressed in one document, not just the surplus HEU. If the EIS is not covering all the HEU, then decisions may be of limited value. Why doesn't this EIS include the foreign reactor fuel and non-surplus HEU? At the least, this EIS should provide specific information as to which DOE documentation is covering other HEU. Will this document also cover the HEU considered to be surplus in the future? Or will this process have to be completed again for additional surplus HEU identified? There should be a government commitment for all of the HEU. This would ensure that the HEU would be taken care of under the NEPA process, even though all of the HEU activities are in separate documents. The document should state that it reflects the present surplus HEU identified and that future identification of surplus HEU quantities will be handled by the same procedure. Does this EIS cover the Project Sapphire material being processed in Lynchburg, VA? DOE is piecemealing the approach to HEU. Is DOE looking at the cumulative impacts of blending down the HEU?

Why has the United States accepted HEU from Russia and why is that transaction not part of this project? What about considering HEU that may come from other countries in this project?

Transportation

What kind of transportation and accident analysis was performed? Where is the material now? How are the sites selected? What forms of security will be used?

REVISED December 13, 1995

06.034
cont.

31.001

20.008

20.008: The transportation analysis considered factors such as routes traveled, type of packaging, and quantity of material. Radiological impacts were calculated using the RADTRAN computer code (designed for this purpose). The total health effect from transportation is presented for each transportation scenario. The methodology for the transportation analysis is described in Section 4.4 and Appendix G of the HEU Final EIS.

For security, HEU is transported by safe secure trailers and receives continual surveillance and accountability by DOE's Transportation Safeguards System. Shipments by safe secure trailers are accompanied by armed guards and are monitored by a tracking system. All other materials are shipped commercially and protection is in accordance with Department of Transportation regulations.

The HEU material and spent nuclear fuel have different material characteristics and therefore risks are evaluated separately. HEU would be shipped in safe secure trailers under a high level of security. Foreign research reactor spent nuclear fuel contains significantly more radioactivity and is transported commercially in large shielded casks, employing different safety and security measures than required for HEU. Blendstock material would also be transported for which impacts were addressed and included in the HEU Final EIS.

06.035: There is very little commercial sector for HEU. The overwhelming majority of the world's HEU has been used in nuclear weapons programs, with small quantities also used in research or experimental reactors. It is not clear what processes the question refers to.

11.012: The Department of Energy has made no representation that blending at DOE facilities would be safer than blending at commercial facilities.

30.008: Proliferation is not treated as an environmental value and in that sense is not part of the comparison of alternatives in the HEU EIS. However, the nonproliferation objective of making surplus HEU non-weapons-usable is a fundamental part of the purpose and need for the proposed action and was a key criterion used in the screening of alternatives for the HEU EIS.

Is the transport of this HEU different from the transport of foreign research reactor spent nuclear fuel? Would it need to be more secure and would the blend stock need to be transported?	20.008 cont.
Proliferation	
If the commercial sector for HEU is so questionable and we keep the industry from having the same processes as they have overseas, then why don't we stop France and Canada from doing these processes also?	06.035
Why is it that if DOE blends down to fuel it would be safer than if commercial facilities do it? DOE is not under International Atomic Energy Agency (IAEA) inspections and is self-regulating.	11.012
I believe that the proliferation issue is beyond the scope of NEPA and does not need to be in this discussion.	30.008
How does DOE intend to prevent proliferation in other countries? What are the international aspects of this project? What is the International Atomic Energy Agency (IAEA) inspection role? What is the Nuclear Regulatory Commission (NRC) and Defense Nuclear Facility Safety Board (DNFSB) safety monitoring role?	03.014
Storage Capabilities	
What are the storage capabilities at the Savannah River Site? Is there enough storage space at the Savannah River Site for the HEU? When will the ultimate storage decision be made? Is storage of the HEU at the Savannah River Site considered to be temporary?	11.013
Does the Savannah River Site have similar capabilities as Oak Ridge? Is site capability an issue of who will be participating in blending down the HEU, storing the HEU, etc.?	
Choosing Facilities	
I do not understand how DOE will choose the facility for blending down. It seems that several facilities would be used for blending down the HEU, not just one facility to perform all of the work.	08.005
What criteria were used in site selection? Will the Record of Decision deal with specific sites? Will the Record of Decision consider competitive market processes and business decisions for selling the HEU?	07.008
Market Value and Cost Analysis	
We (the public) would like to see cost comparisons and dollar amounts for each of the	16.009 cont.
RRVISRD December 13, 1995	

03.014: The Department of Energy works to prevent proliferation in other countries by setting an example for them in terms of making surplus HEU non-weapons-usable. Russia has already agreed to sell 500 t of weapons HEU for commercial use, and this action is proposed to be reciprocal to that one. Much of the surplus HEU that remains in storage may eventually be made subject to IAEA inspection. The NRC currently has no role in monitoring of the DOE facilities involved in this program, but it licenses and regulates the two commercial facilities that may be used for surplus HEU disposition actions. The Defense Nuclear Facilities Safety Board monitors the safety of DOE defense nuclear facilities and makes recommendations for improvements to safety.

11.013: Present storage of HEU at SRS (about 20 t of surplus HEU is located there) should be considered temporary; that is, until material is either moved to the Y-12 Plant for storage or disposition actions can be taken. As the primary DOE site for HEU processing and storage, the Y-12 Plant currently has much greater HEU storage capabilities than SRS. However, SRS is a candidate site (along with Y-12 and four other DOE sites) for a possible consolidated Pu/HEU storage facility in the *Storage and Disposition of Weapons-Usable Fissile Materials Draft Programmatic Environmental Impact Statement* (DOE/EIS-0229-D, February 1996). The Storage and Disposition Draft PEIS does not identify a preferred alternative for storage, but the Final PEIS (expected late in 1996) will do so.

08.005: Under the Preferred Alternative, DOE considers it likely that more than one facility will participate in the HEU blending program. It is anticipated that competitive bidding procedures will play an integral role in the selection of blending facilities, and decisions could be made by USEC or other entities, in addition to DOE.

07.008: The sites that are considered in the HEU EIS are the two commercial and two DOE sites that can process significant quantities of HEU today. The Preferred Alternative contemplates the use of all four sites, although some alternatives or processes cannot be performed at all sites, as explained in the EIS. DOE does not expect to select the exact timing or use of the commercial and DOE sites in its ROD. It will make programmatic decisions whether surplus HEU should be blended for commercial use or for waste, and may also include decisions to proceed with disposition of one or more initial discrete batches of HEU. Decisions about where blending will occur will be based on business considerations, facilities being available when needed, transportation considerations, and

**GEORGIA (AUGUSTA), AFTERNOON WORKSHOP
DISCUSSION/SUMMARY SESSION
PAGE 6 OF 8**

alternatives. Costs should be given for all of the options and the revenues that could be generated for the Federal government. Cost information should be added to the document.	16.009 cont.
How will the commercial facilities bid against the government facilities and how would this work? How can this be a good strategy for the commercial facilities with the government facilities operating tax free, etc.?	08.008
The cost of having the commercial facilities blend down the HEU would be cheaper than the government facilities.	16.013
If avoided costs are calculated to be 7 billion dollars, why doesn't DOE store the fuel as HEU or blended LEU? Store it as HEU for long-term.	10.016
Disposal Contingencies	
What will happen storage-wise if Congress doesn't pass the Yucca Mountain legislation? What is the contingency if there is no Yucca Mountain? Will the low-level waste generated by this project be sent to Yucca Mountain? The spent fuel at Yucca Mountain with 0.9% HEU is being identified as low-level waste. There is nothing stated that the HEU from this program will go to Yucca Mountain. I am confused as to why Yucca Mountain is even mentioned. It does not seem to fall into the categories we are discussing today.	14.010
The government has not delivered on the Yucca Mountain facility. Hasn't the Federal government already received money from the commercial/utility sector? Also, isn't there already enough commercial fuel to fill the repository?	
Impacts	
What are the socioeconomic issues resulting from contamination of the environment from this project? Is there any threat at the Savannah River Site to drinking water or aquifers?	24.003 22.006
In reference to the contamination of the Tuscaloosa aquifer, I have read there has been contamination of the shallow aquifers. What about possible contamination of the deep aquifers?	cont. 22.007
Is the extensive contamination that has occurred at the Hanford Site a possibility that could happen at the Savannah River Site?	22.008
Did the document address the possibility of discharges at commercial facilities?	22.009
Socioeconomic Effects	
Does DOE know who wants the fuel that would result from this project or would the fuel be shipped internationally?	06.031

competitive bidding processes. The commentor is correct that the forms and locations of some batches of HEU may militate strongly in favor of particular sites for blending.

08.008: The Department of Energy anticipates that the facilities for blending of specific batches of surplus HEU are likely to be selected on the basis of a competitive bidding process. However, policy and timeliness considerations are expected to favor distributing the blending work among multiple facilities (the preferred site variation in the HEU EIS is to make use of all four analyzed facilities). If the proposal to transfer 50 t of HEU to USEC is carried out pursuant to the ROD following this EIS, that is the process that USEC tentatively plans to use to select blenders. DOE facilities can participate in that bidding process through DOE's "work for others" program. Although, as the comment suggests, the Government facilities may enjoy certain tax advantages over the commercial facilities, it is not correct to assume that the Government can always perform work at lower cost than the private sector.

16.013: The Department of Energy is unable to confirm or deny the commentor's assertion at this time. Another commentor suggested that DOE facilities would have an unfair cost advantage due to their untaxed status. The relative costs of blending at DOE versus commercial facilities would not be known until competitive bidding for blending work takes place. In any event, selecting sites for HEU disposition actions is not expected to be part of the ROD stemming from this action.

10.016: Storage of HEU will leave the nuclear proliferation problem unaddressed and continue to incur costs in the order of \$150,000 per t annually for HEU safeguards. However, blending and selling as much of the LEU derived from surplus HEU or surplus HEU for blending to LEU would save the Government additional costs required for storage as either HEU or LEU and disposal as waste. Blending and selling the surplus material would generate income to the Government. An analysis comparing the costs of HEU disposition alternatives has been prepared and made available separately from the EIS. The cost analysis indicates that commercial use of LEU derived from surplus HEU makes economic sense and would save billions of dollars compared to the alternative of blending HEU for disposal as waste.

Disposition of Surplus Highly Enriched Uranium Final EIS

What is the priority of concerns of the involved communities -- nuclear proliferation and contamination, or work and jobs?	17.009
A large group of participants at these public meetings are retirees who are not concerned with jobs, but we do want the resource value of the material recognized and not wasted. We know that DOE has the capabilities to deal with the HEU. Waste not, want not.	10.003
Is the marketing of the blended down fuel restricted to the United States market only?	06.031 cont.
Will this process increase the work force? With this material, it seems that it would only decrease the rate at which the jobs are presently being decreased. I often see construction jobs advertised in the paper but I do not see operation jobs for the Savannah River Site advertised.	24.004
<hr/> <p>¹Oral comments received in public meetings concerning similar issues were combined (grouped) for presentation in this document.</p>	
<p>REVISED December 13, 1995</p>	

14.010: The proposed Yucca Mountain repository for spent fuel and high-level waste is not intended to be used for disposal of LLW. DOE has long operated a LLW repository at the adjacent NTS, however, and that facility may be used for disposal of LLW from non-commercial HEU. Yucca Mountain is mentioned in the HEU EIS as a possible repository for the spent fuel that would ultimately result from the use of LEU fuel derived from surplus HEU.

24.003: The HEU EIS analyzes environmental impacts of the proposed activities under normal operations and releases to the environment resulting from accidents to determine potential human health effects. In addition, the HEU EIS analyzes environmental justice impacts, taking into account impacts from normal operations and accidents. The HEU EIS also analyzes other socioeconomic impacts, although "contamination" (and any economic issues associated with "contamination") is not anticipated from normal operations.

22.007: The potential for contamination of the deep aquifers at SRS is very low because the deep aquifers (such as Tuscaloosa aquifer) are separated from the shallow and intermediate aquifers by a Paleocene aquitard. The downward flow from the shallow and intermediate aquifers to the deep aquifers (Tuscaloosa) is restricted by the clay-rich sediments of the Paleocene aquitard thus preventing downward contamination.

The Cretaceous (Tuscaloosa) aquifer is the deepest aquifer found on the site. As discussed in Section 3.4.4. of the HEU EIS, the shallow aquifers at SRS have been contaminated by industrial solvents, metals, tritium, and other constituents used or generated on the site. These aquifer are not used for SRS operations or drinking water; however, they do discharge to site streams and eventually the Savannah River. However, most of this contamination is below just a few buildings and reflects past use or is from isolated accidents that occurred in the past.

22.008: Contamination that has occurred at Hanford is the result of past practices which have since been discontinued (direct discharges to the ground and no treatment for hazardous waste streams prior to their being released to the Columbia River). As discussed in Chapter 4, water resource sections of the HEU EIS and in the waste management sections, no hazardous waste will be directly released to the ground which could percolate down to the water table or aquifer. Any liquid hazardous waste stream will be treated down to a nonhazardous level prior to being released to surface water. All discharges will be within the NPDES permit requirements before being released.

Comment Documents
and Responses

22.009: All discharges from blending processes were evaluated for each site. It was determined that there would be no hazardous liquid waste released to the surface or groundwater. All hazardous waste would be treated prior to being released to the environment. Similarly, nonhazardous sanitary waste would also be treated prior to being released.

06.031: Low-enriched uranium fuel derived from surplus HEU is expected to be marketed on the global uranium market and to be fungible with any other nuclear fuel. It could conceivably be purchased by virtually any nuclear utility in the world. Off-spec material may need special marketing efforts and NRC license amendments for U.S. utilities to use it.

17.009: The Department of Energy has no factual basis for responding to this question. Jobs may well predominate the concerns of DOE host communities, but DOE's experience indicates they are also quite concerned about effects on their environment.

10.003: Comment noted.

24.004: The proposed alternatives would require up to 125 operation workers to implement. These workers would come from the available workforce in the SRS region. If downsizing continues, some of these labor requirements may be filled by the existing workforce. For some labor needs, however, it may be necessary to hire new workers with specialized skills.

HEU EIS PUBLIC MEETING ORAL COMMENTS
 EVENING WORKSHOP
 Augusta, Georgia
 November 16, 1995

SESSION: Plenary

The material that is blended to waste, where would it be disposed?	14.007
If the blending factor is 14%, what is the percentage that DOE is planning to blend to waste?	02.004
Why is DOE not using the HEU as HEU? DOE can get the energy value out of the HEU if they use it as HEU.	09.007
How much of the taxpayer's money was used to enrich the HEU? Now that DOE is classifying it as surplus, the initial enrichment was a waste of my money. How much work loss and job separations will result from this blending down project? These questions were asked during the scoping meetings and answers have still not been received.	16.008 17.010
I am upset that the Savannah River Site has become a political football. The United States provided foreign research reactor fuel to foreign countries and now the United States is having to take it back. What is DOE going to do with all of this waste? DOE needs to look at all of the political implications and how this can be solved. How can the United States stop proliferation abroad in foreign countries? Keeping the HEU in the United States is relatively safe, but is costly.	14.008
Why doesn't the EIS address the reprocessing issue? The mind set of, "if the United States does not reprocess, no one else will," is foolish. Just because the United States does not reprocess, does not necessarily mean that other countries will not reprocess. Other countries presently have the capability to reprocess.	09.008
Why doesn't the EIS consider blending down the HEU to 20% and using it in research reactors?	09.009
In reference to the reactors that the United States presently has, how long will they be operational?	06.026
Why doesn't the EIS consider using this material to support the naval nuclear fuel program? How long would the 165 tons of HEU identified support the naval service? Isn't the enrichment of the HEU 93%? Has the HEU been burned in a reactor? Is the amount of HEU that has been burned small? If DOE ignores this amount of HEU, how long would the present stockpile of HEU available to support the naval service last? Does the EIS contain a section on proliferation parity?	09.010

¹REVISED December 13, 1995

14.007: The site for the disposal of LLW from the HEU disposition program has not been selected. Programmatic decisions about DOE management of waste materials, including LLW generated by all programs in DOE, are being made in DOE's PEIS for Waste Management. The HEU EIS analyzes disposal in the LLW facility at the Nevada Test Site (NTS) as a representative site for purposes of transportation analysis.

02.004: Of the current surplus material (175 t), it is estimated that approximately 72 t could not be commercially recovered over the next 10 to 15 years because 10 t is currently under IAEA safeguards and 62 t consists of irradiated fuel and other difficult to retrieve forms from which it may not be economical to recover the HEU. Depending on how much of that material ends up commercially usable and how much ends up being disposed of in its current form without the HEU being separated from it (that is, the irradiated fuel might be directly disposed of in a high-level waste repository), DOE estimates that 15 to 30 percent of the surplus HEU inventory may ultimately need to be blended down for disposal as waste.

09.007: Because of its high proliferation potential, it is part of the nonproliferation policy of the United States to discourage the civil use of HEU, such as in research reactors. There are no commercial reactors that use HEU. Alternative uses for HEU in weapons-usable form would not achieve the purpose and need for this program. The long-term HEU needs of the Naval Nuclear Propulsion program are being supplied from non-surplus stocks of HEU.

16.008: The cost of making nuclear weapons over the past 50 years has been very high but cannot be specified with any degree of precision. We are now reducing our nuclear stockpile, and most of that cost cannot be recovered. However, one of the objectives of the Preferred Alternative in the HEU disposition program is to maximize recovery of the value of the surplus material.

17.010: No job loss is anticipated. The socioeconomic impacts analysis in the HEU EIS suggests that modest job increases (on the order of 125 jobs) could result from the proposed actions at each involved site. At DOE sites, which are already experiencing significant job losses, these impacts are more likely to be counted in terms of "jobs not lost" rather than as new positions.

GEORGIA (AUGUSTA), EVENING WORKSHOP
 PLENARY SESSION
 PAGE 2 OF 4

I love the idea of working for nonproliferation by setting a good example, but it is useless. If other countries are reprocessing then it is okay in a parity sense. Are the Russians behind our schedule in blending down their HEU? Is the Russian HEU under International Atomic Energy Agency (IAEA) inspection? Does the United States have to pay to move the Russian HEU? It may not be a good decision to declare the Russian HEU to be under IAEA inspection. Why does the United States have to pay for the IAEA inspections, whereas Russia doesn't?

03.013

Why are the 50 tons of Russian HEU being transferred to USEC? Why doesn't the EIS discuss the role being played by USEC, including the fact that they provide a market for LEU obtained from Russia?

06.027

Why doesn't Russia sell their HEU to Russian corporations and further disperse the HEU throughout Russia?

06.028

There is an area in the EIS that ties together blending down and storing the HEU in the future. Is there somewhere in the EIS that ties together cost analysis and storage? DOE needs to provide cost data on continued storage of HEU for various time frames.

16.009

DOE needs to clarify that no additional spent fuel is created as a result of this project.

14.009

Will DOE sell the blended down material at market value? The government has had some strange practices in the past, so I just wanted some clarification on the this issue. Will DOE get a fair full market price on the blended down fuel? DOE needs to further clarify whether all the material that is blended to fuel will be sold at fair market value.

04.008

Why is there no discussion on future shipments of HEU that are coming back to the United States from the foreign research reactors? Why is this project proceeding so rapidly when the foreign research reactor material has been around for years and still nothing is being done about it?

06.029

¹Oral comments received in public meetings concerning similar issues were combined (grouped) for presentation in this document.

14.008: Your comment about foreign research reactor spent fuel is being forwarded to the DOE Office of Environmental Management, which recently published a final EIS on a *Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel* (DOE/EIS-0218F, February 1996). The HEU disposition program is part of U.S. efforts to curtail global nuclear proliferation. By making surplus stockpiles of HEU non-weapons-usable, the program seeks to ensure that these materials will never be returned to weapons use.

09.008: Except to the extent that reprocessing of spent fuel from the weapons program or research programs for other reasons might result in the creation of additional separated HEU, it is unnecessary to consider spent fuel reprocessing in the context of disposition of surplus HEU. The prospect for commercial nuclear fuel reprocessing, such as occurs in some other countries, is not related to HEU disposition, since HEU is not used in commercial reactor fuel.

09.009: There is a large market for LEU in the 4- to 5-percent enrichment range, but little or none for 19-percent LEU.

06.026: The length of operation of U.S. reactors is not expected to be affected by the surplus HEU disposition program. Reactors are licensed in the United States for a period of 40 years, with the possibility of license renewal for additional 20-year terms. It is expected that some plants will get their licenses renewed, some will close before their 40-year license expires, and some will close at the end of their 40-year license period. Even without any license renewals, there is expected to be more than sufficient reactor operation to make use of LEU fuel derived from surplus HEU.

09.010: Very little of the inventory of surplus HEU would be suitable for naval nuclear propulsion purposes. The average enrichment of the surplus HEU considered for disposition in the document is 50 percent and very little is in the 93-percent range used for naval fuel. Some of the surplus HEU is contained in irradiated fuel (the total quantity remains classified, although the Secretary's February 1996 *Openness Initiative* announcement revealed that at least 18 t is in this form). Irradiated fuel would not follow the disposition paths described in this EIS unless it were processed to separate the HEU for other reasons outside the HEU disposition program (such as for stabilization for storage or disposal). Information about stockpiles and fuel use rates for naval nuclear propulsion is classified. Proliferation parity is not within the scope of a NEPA EIS.

03.013: The U.S.-Russian HEU agreement is not part of the domestic HEU disposition program that is the subject of this EIS, although it is related in terms of cumulative impacts on the uranium industry and in terms of reciprocity—the proposed U.S. program is reciprocal to the Russian program to sell 500 t of its weapons-usable HEU. The Russian HEU is being managed by USEC acting as executive agent for the United States. The Russian HEU is being blended to LEU in Russia and is under IAEA inspection to ensure that it is not reconverted to weapons use.

06.027: Under the current proposal, if the ROD is published consistent with the Preferred Alternative presented in the HEU Final EIS (to maximize commercial use), it may include a decision to transfer title to the 50 t of surplus (U.S., not Russian) HEU to USEC. This is planned to increase the value of USEC and thus the proceeds to the Federal Treasury from the sale of USEC. As explained in the HEU Final EIS, until recently, USEC was the only marketing agent for the sale of DOE enriched uranium, including that derived from surplus HEU, pursuant to the *Energy Policy Act* of 1992. USEC also acts as the executive agent of the United States with respect to the U.S.-Russian HEU agreement. The *USEC Privatization Act*, signed by the President on April 26, 1996, eliminates the restriction on direct DOE marketing of uranium and authorizes the proposed transfer of 50 t of HEU to USEC (Section 3112(c) of P.L. 104-134).

06.028: The purpose of the U.S.-Russian HEU agreement is to prevent Russian surplus HEU from entering world commerce in weapons-usable form by providing for it to be blended down to non-weapons-usable LEU and then sold in the United States (or other allied nations) for commercial use.

16.009: Cost estimates for the alternatives analyzed in the HEU EIS have been developed for inclusion into the ROD(s) and are available in a separate document with the HEU Final EIS. The cost analysis supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU would save billions of dollars compared to the alternative of blending HEU for disposal as waste.

14.009: The HEU EIS notes in Section 1.4.2 that no additional spent fuel would be generated as a result of this program.

04.008: The Department of Energy fully expects that commercial grade LEU fuel derived from surplus HEU will be sold at full market value. Off-spec material, to the extent that it can be sold for commercial use, will probably have to be discounted.

06.029: The foreign research reactor spent fuel program is not connected with the domestic HEU disposition program and has its own EIS (*Final Environmental Impact Statement for Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel*, DOE/EIS-0218F, February 1996).

HEU EIS PUBLIC MEETING ORAL COMMENTS
 EVENING WORKSHOP
 Augusta, Georgia
 November 16, 1995

SESSION: Discussion/Summary

OPEN DISCUSSION

I support maximum commercial use of the blended down fuel. The United States will reduce waste and be able to reap the benefits. The advantages to blending down are:

- It solves the nonproliferation problem
- removes weapons-grade material
- provides economic benefits to the United States
- alleviates by-products

10.003

The HEU can be blended down safely and DOE has the technology available to perform this operation. I want to express my support to blend down the HEU to LEU.

What other alternative uses are there for HEU, besides weapons and reactor fuel? Can HEU be used in the triple play reactor, in any of the advanced light water reactors, or by the naval reactors? The advantages of using HEU rather than LEU as a reactor fuel has not been addressed in the EIS. Are the only uses for HEU in the naval fleet or reactors?

06.030

Since the material is being securely stored now, why are we considering moving it around and putting it in the hands of commercial operators where its security could be jeopardized?

15.002

What is the cost of getting the material blended down? Has DOE performed any cost analysis for this project? What are the security costs for the material being stored? What is the cost of working with our HEU and the cost of storage? I think DOE should work with the international HEU first to get it out of their countries.

16.010

The United States needs to keep in mind the problem with international terrorism and bombs. How does the United States plan to keep the Russians from selling the blended down fuel to other countries that could use it against us? How secure is our nation against possible actions of this nature? I understand the United States is trying to set an example. My concern is the example that Congress sets. The countries that were formerly the Soviet Union are putting the HEU out in their private enterprise. With this being the case, how will the United States be secure? DOE needs to look at the potential misuse of the fuel internationally. If Russia has tight control, the United States needs to have tight control. Russia could get more money for the blended down fuel by placing it in the international market. How does the United States deal with the fuel in the foreign markets? I do not see how the example the United States is trying to set

15.003

REVISED December 13, 1995
 REVISED December 13, 1995

10.003: Comment noted.

06.030: Because of its high proliferation potential, it is part of the nonproliferation policy of the United States to discourage the civil use of HEU such as in research reactors. The Office of Fissile Materials Disposition has been given the job of making weapons-usable fissile materials non-weapons-usable, so the office has not been seeking alternative uses for those materials in their weapons-usable forms. A considerable portion of the high-quality HEU being removed from nuclear weapons is, in fact, being retained in the strategic stockpile for use as a long-term fuel supply for the Naval Nuclear Propulsion program.

15.002: The Department of Energy does not contemplate putting material into the hands of anybody in a manner that would constitute a security threat. The same commercial entities that might take part in the HEU disposition program have securely stored and processed HEU on the Government's behalf to make fuel for the Naval Nuclear Propulsion program for decades.

16.010: Cost estimates for the alternatives analyzed in the HEU EIS have been developed for inclusion into the ROD(s) and are available in a separate document with the HEU Final EIS. The cost analysis supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU would save billions of dollars compared to the alternative of blending HEU for disposal as waste. The cost of safeguarding HEU is about \$150,000 per t per year.

15.003: Because LEU blended down from HEU is not weapons-usable, it could not be "used against us" militarily. This comment relates to nonproliferation foreign policy issues beyond the scope of the HEU Final EIS. It is being referred to DOE's Office of Nonproliferation and National Security.

Comment Documents
and Responses

GEORGIA (AUGUSTA), EVENING WORKSHOP
DISCUSSION/SUMMARY SESSION
PAGE 2 OF 4

will help change the future. A good example may not be very good because Russia does not have the controls to safeguard the material as the United States has. The President is treating the HEU issue very light heartedly with the stroke of a pen. The United States needs to realize that Russia could make the HEU a national asset to make more money. The United States needs to place the Central Intelligence Agency (CIA) in Russia to watch the material and see where it is going. The United States needs to get their head out of the clouds and quit thinking that the United States can set an example.	15.003 cont.
DOE should have planned for the foreign research reactor HEU and the HEU returning to the United States.	28.001
The International Atomic Energy Agency (IAEA) is not concerned with the storage of commercial fuel because it is low enriched uranium.	03.015
Is the cost of storing the HEU high? During the discussion tonight, we keep coming back to the cost issue. Can the public get a commitment from DOE to get the cost analysis before preparing the final EIS? Could the comment period for the EIS be prolonged in order to receive this information before the comment period ends? How can citizens get a copy of the cost documentation for this project before the close of the comment period? What would DOE lose if the EIS is delayed? Is the 50 metric tons going to USEC equate to real money?	16.011 16.009 16.011 cont.
The compartmentalization of DOE documents places limits on the scope of public comments.	32.011
There is no evaluation of the impacts of the higher level decisions in the EIS, such as policy decisions, setting a good example, and nonproliferation. Everything we (the public) have talked about tonight is out of the scope of this EIS.	17.005
There is an advantage to having an HEU reactor that does not produce plutonium.	
The cost of storing the HEU from now until the end of time does not even approach the blend down costs. Why shouldn't we store the HEU forever? When (timeframe-wise) would the cost of storing equal the cost of blending down? It would be cheaper to store the HEU. DOE can not see into the future to make sure that the United States will not need the HEU later. Also, it is expensive to make HEU.	16.011 cont.
Why shouldn't the United States make some money for the treasury by blending down to fuel and then selling?	
The people that made the decision on what should be surplus, are they members of this Administration?	02.005

28.001: The Department of Energy and Department of State jointly proposed (in the *Final Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel*, DOE/EIS-0218F, February 1996) to adopt a policy to manage spent nuclear fuel from foreign research reactors to promote U.S. nuclear weapons nonproliferation policy objectives. The purpose is to remove as much U.S.-origin HEU as possible from international commerce while giving the foreign research reactor operators and their host countries time to convert to operation with LEU fuel and to make their own arrangements for disposition of subsequently generated LEU spent nuclear fuel. Because the foreign research reactor spent nuclear fuel program is outside the scope of the HEU EIS, this comment is being forwarded to DOE's Office of Environmental Management, which manages that program.

03.015: The commentor is correct that the IAEA is generally not concerned with non-weapons-usable materials such as LEU.

16.011: The Department of Energy estimates that the cost of safeguards alone is about \$150,000 per t of HEU per year. Storing HEU indefinitely is represented by Alternative 1, the No Action Alternative, in the HEU EIS. Pursuing that course of action would not serve the purpose and need for this action, which is to reduce proliferation potential by making surplus HEU non-weapons-usable and to recover the value of the material to the maximum extent.

16.009: Cost estimates for the alternatives analyzed in the HEU EIS have been developed for inclusion into the ROD(s) and are available in a separate document with the HEU Final EIS. The cost analysis supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU would save billions of dollars compared to the alternative of blending HEU for disposal as waste.

32.011: The Department of Energy recognizes the programmatic relationship of surplus highly enriched uranium disposition to other DOE actions and decisions. The HEU EIS identifies the other NEPA actions that are related to its scope in Section 1.5.3.

In order to adequately assess the potential impacts that could result from proposed DOE actions, it is necessary to narrow the scope of the document to address the specific activi-

Why was the specification of 0.9% uranium-235 for waste chosen? If DOE placed controls on the blended down fuel, could a higher percentage be used? What are the current and proposed blend down percentages of the waste stored at the Nevada Test Site? Why didn't DOE use 0.9% HEU as a target for blend down?	33.002
Does the value of USEC, when privatized, represent real money for the treasury?	06.023
How can we (the public) change the direction the nuclear program is going?	
How is the Russian HEU going to be used, once our government purchases it?	17.006
Can fusion reactors use HEU?	06.030 cont.
How could the United States becoming a part of the market be a problem? It seems that the government will be competing with the commercial sector. Is this aspect covered in the EIS? Is the blended down fuel going to be dumped on the market slowly?	17.007
Will this process (blend down) use the cascades as opposed to the centrifuge?	07.007

¹Oral comments received in public meetings concerning similar issues were combined (grouped) for presentation in this document.

REVISED December 13, 1995

ties being proposed. However, in Section 4.6 of the HEU EIS the cumulative relationship of impacts resulting from this specific action is assessed considering the wide-ranging view of DOE's programs, environmental management, and other outside interactions.

17.005: The HEU EIS discusses these programmatic issues in Chapter 1, particularly in Section 1.4.2, which describes the Preferred Alternative and the policy reasons it is preferred. Among the alternatives considered, only Alternative 1 does not satisfy the purpose and need for this action, because it leaves the HEU in weapons-usable form and sets a bad example for other nations. DOE considers Alternatives 2 through 5, which represent blending different portions of the surplus HEU to waste or fuel, as roughly equivalent in terms of proliferation potential, and much more proliferation resistant than the HEU in its present form.

02.005: The President of the United States determines what material is reserved for national defense and what is surplus, based on the recommendations of the Nuclear Weapons Council, which includes representatives of the Department of Defense, the Department of Energy, and the Joint Chiefs of Staff.

33.002: The representative enrichment level of 0.9 percent (used for analytical purposes) was selected for material destined for waste disposal based on experience in both the United States and Europe where waste has been disposed of at slightly greater than 1-percent U-235. This enrichment level assures that an inadvertent criticality would not occur. It is possible that uranium at higher enrichment levels could be disposed of (the LLW facility at NTS has accepted 1.25-percent enriched uranium in the past), but the lower level was selected for purposes of conservatism in the HEU EIS analysis. Blending to an enrichment level less than 0.9 percent would substantially increase the amount of waste product and cost of blending (for example, blending to a natural uranium state of 0.7 percent would increase the waste volume by 40 percent) without any incremental criticality protection. The actual percentage of blend down will be determined by the waste acceptance criteria of the selected waste disposal site.

06.023: The proceeds from the sale of USEC to the private sector will be real.

17.006: The Russian HEU is not part of the domestic HEU disposition program analyzed in the HEU EIS, although the impacts on the uranium industry from that action are considered as cumulative impacts in Section 4.8 of the HEU EIS. The LEU derived from Russian HEU is gradually going to be sold (by USEC) in the global uranium market for use in nuclear reactors.

17.007: The Department of Energy expects to be required to ensure that its sales of uranium will have no adverse material impact on the domestic uranium industry, taking into account the purchases of Russian LEU fuel derived from surplus HEU. This restriction, and the physical ability of DOE to make the material available for blending, will cause the material to be introduced into the market on a gradual basis.

07.007: While the enrichment cascades at the Portsmouth and Paducah Gaseous Diffusion Plants could be used to blend HEU in the form of UF_6 , the overwhelming majority of the surplus HEU stockpile is in the form of metal or oxides rather than UF_6 . The cascades at Portsmouth are currently being used to blend 13 t of HEU that is in the form of UF_6 and that was transferred to the USEC pursuant to the *Energy Policy Act* of 1992. The cascades are unlikely to be used for other blending activities. None of the analyzed blending facilities (nor any other current U.S. facilities) use centrifuge technology.

	This is Cliff Giland, Erwin, Tennessee. I'd like to comment on the prospects of reopening the nuclear plant here in Erwin and personally, I think it would be a very good idea. There have been a great many people laid off, lost their jobs. Some of them lost their homes and such, and I think it would be an excellent idea for Nuclear Fuels Services here in Erwin to get the contract to process the uranium coming from those bombs that we're scrapping. Okay. Thank you.

November 16, 1993
Disposition of Surplus Highly Enriched Uranium EIS Public Comment
Charles R. Goergen
310 Beaufort Road
Aiken, SC 29803

I am providing this comment to support the option of maximum commercial use. I urge the Department to make maximum economic advantage of all surplus Highly Enriched Uranium (HEU) by isotopic dilution to Low Enriched Uranium (LEU) and sale to commercial users. Conversion of the maximum amount of available surplus HEU will reduce waste of this resource and unnecessary environmental impacts. HEU can be sold as a prime method of keeping the economic "pulse alive" from activities of the Cold War.

Significant advantages to this approach are:

- The HEU will be converted to LEU and is not able to be used directly in a nuclear weapon, thus solving a non-proliferation concern.
- This dilution permanently removes the material from the potential weapons-usable inventory and is an internationally demonstrable action of reducing the weapons stockpile.
- The United States taxpayers will realize the maximum economic benefit of increased separative work units (SWU) expended to produce HEU.
- Isotopic dilution of the material will be done in a form and at a site which is desired to be produced, converting it into a usable form and thereby remediating two categories of material.
- Safety and security concerns for the material will be concomitantly reduced with the isotopic dilution.

I disagree with opposing viewpoints that dilution and sale would result in over-employment of the nuclear power industry. Recognize the fact that greater quantities of United States electrical power supply is generated by nuclear power than by any other source. This material will be sold to the nuclear industry and placed in fuel element reactors. This material will be used to produce a secure energy source with less environmental impact than fossil fuels. I also consider that conversion of this material to low-level waste for disposal to be a grievous waste of national assets.

I work in a facility that is a candidate for blending of this material. I know that it can be processed in an environmentally safe and sound manner with low risk to the public and workers. The technology, experience, and capacity exists to accomplish this task safely.

10.003: Comment noted.

13.001: The Department of Energy agrees that the proposed HEU disposition program would have a neutral effect on the nuclear power industry.

COMMONWEALTH of VIRGINIA
DEPARTMENT OF ENVIRONMENTAL QUALITY

Peter W. Schmidt
Director

January 11, 1996

P.O. Box 10099
Richmond, Virginia 23240-0099
(804) 782-4000

U.S. Department of Energy
Office of Fissile Materials Disposition
P.O. Box 23786
Washington, D.C. 20026-3786

To Whom It May Concern:

This is in response to your request for comments on the Disposition of Surplus Highly Enriched Uranium Draft Environmental Impact Statement. The Department of Environmental Quality is responsible for coordinating Virginia's review of federal environmental documents and responding to appropriate federal officials on behalf of the Commonwealth. The following locality and agencies participated in this review:

Department of Environmental Quality;
Department of Health;
Department of Historic Resources;
Department of Transportation;
Virginia State Police;
Campbell County; and
City of Lynchburg.

In addition, the Department of Game and Inland Fisheries, Department of Emergency Services and the Central Virginia Planning District Commission were invited to comment through the Department of Environmental Quality.

The document assesses the environmental impacts at four sites that may result from alternatives for the disposition of United States-origin weapons-usable highly enriched uranium (HEU) that has been or may be declared surplus to national defense or defense related program needs. In addition to the no action alternative, it assesses four alternatives that would eliminate the weapons usability of HEU by blending it with depleted uranium, natural uranium, or low-enriched uranium (LEU) to create LEU, either as commercial reactor feedstock or as low level radioactive waste. The potential blending sites are the Y-12

HEU EIS
 Page Two

Plant in Oak Ridge, Tennessee; the Savannah River site in Aiken, South Carolina; the Babcock & Wilcox Naval Nuclear Fuel Division Facility in Lynchburg, Virginia; and the Fuel Services Fuel Fabrication Plant in Erwin, Tennessee. The preferred alternative is to blend down surplus HEU to LEU for maximum commercial use as reactor fuel feed which would likely be done at a combination of sites.

The Commonwealth offers the following comments:

Any transportation of wastes through Virginia should be preceded with advance notification to the Department of Emergency Services and the affected localities so that adequate safety precautions may be taken. As previously requested, the localities should be notified directly in advance of any notification to the news media.

20.011

The City of Lynchburg and Campbell County have no objections to the proposed project.

The Department of Environmental Quality will coordinate the Commonwealth's review and response on the final environmental impact statement for this proposal. Correspondence should be addressed to: Director, Office of Environmental Impact Review, Department of Environmental Quality, P. O. Box 10009, 629 East Main Street, Richmond, Virginia 23240-0009.

Thank you for this opportunity to comment on the draft document. The comments of the reviewers are attached for your review and consideration. If you need further information, please contact Tom Felvey, (804) 698-4315, or my staff.

Sincerely,

Michael P. Murphy
 Director, Grants Management
 and Intergovernmental Affairs

<p>DAVID R. CERR COMMISSIONER</p> <p>November 17, 1995</p> <p>Department of Environmental Quality Office of Environmental Impact Review 629 East Main Street, Sixth Floor Richmond, VA 23219 Attn: Thomas Perry</p>	<p>RE: Project # 95-1177 Disposition of Surplus Highly Enriched Uranium</p> <p>I have reviewed the "Disposition of Surplus Highly Enriched Uranium Draft Environmental Impact Statement" written by the U. S. Department of Energy for its potential impact on the transportation infrastructure for the Commonwealth of Virginia. The review of the transportation related issues and does not determine the merit of the proposed blending of highly enriched uranium (HEU) with uranium-238 to negate the nuclear weapon capability of the HEU.</p> <p>One of the potential blending sites is the Babcock & Wilcox Company located in Lynchburg, Virginia. The facility currently purifies and recovers approximately 24 tons a year of HEU. According to the draft environmental impact statement, about 10 tons a year of HEU would be blended at this site over the next 20 years to reduce the surplus of HEU from various military installations located across the United States. This equates to between 100 and 150 additional treatment-operations per facility a year. These shipments would be made to Department of Energy owned and operated facilities. The HEU would also be shipped from the facility of the processed low enriched uranium along with a percentage of low level radioactive waste.</p> <p>Since the Babcock & Wilcox Company is already in the radioactive processing business and the addition of another 150 metric tons over a years time should have little impact on the transportation infrastructure in the Lynchburg area, the Virginia Department of Transportation is not opposed to the Babcock & Wilcox Company being a blending site for HEU.</p> <p>Should you have any questions concerning this matter, please call me at (804) 786-6824.</p> <p>Sincerely,  Perry E. Re: Draft Environmental Impact Statement
"Disposition of Surplus Highly Enriched Uranium"
Campbell County, Virginia
DHR file no. 95-2117

Dear Sir:

Thank you for requesting our comments on the draft EIS "Disposition of Surplus Highly Enriched Uranium." The existing Babcock & Wilcox facility in Campbell County, Virginia, will be used in the process.

Because the undertaking will involve no new construction or ground-disturbing activities, and because the undertaking will use a facility that is already involved in the processing of nuclear fuel, we have determined that the undertaking will have no effect on historic resources.

Thank you for the opportunity to comment on this project. You have met the requirements of Section 106 of the National Historic Preservation Act of 1966, as amended. Please contact Clark H. Metz or John E. Wells at this office if you have questions about our comments.

Sincerely,

David H. Turner

The City of Lynchburg has reviewed the Federal Environmental Impact Statement regarding the disposition of surplus highly enriched uranium and seeks several clarifications with the Department of Energy Services for the State of Virginia concerning this matter. As well, Lynchburg has concerned with Newark and Wilson (VA) regarding their possible participation in the Disposition of Surplus Highly Enriched Uranium project. Lynchburg has concluded that EIS's involvement with this project offers no apparent additional benefits environmentally or otherwise to this area. The City of Lynchburg does not take any exceptions to this project.

This is Teresa Harris. I'm an employee who was laid off at NFS two years ago. My husband Robert also was laid off at the same time. We have three small children and had just built a new home when we were laid off. We're hoping the government will look close and hard at the project for NFS. We know that they can do the work. He had fourteen years in and I had thirteen years in operations. The economy of Unicoi County suffered a whole lot when NFS laid off. Thank you. Teresa Harris.

This is Jean Hawkinson calling from Minneapolis, Minnesota. I'm calling regarding making uranium into reactor fuel. I am much opposed to that. I do not support making the uranium into reactor fuel.

10.024

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

RE: HEU EIS

I do not support making highly enriched uranium into nuclear reactor fuel for the following reasons:

- * it will create spent nuclear fuel for which we have no solution. | 10.024
- * as part of that waste product, plutonium will be created, a material that jeopardizes our nonproliferation goals. | 09.018
- * all options have not been explored, including storing down blended uranium. | 16.015
- * the financial analysis is incomplete or nonexistent, despite the fact that citizens have requested one for almost two years.

I do support:

- * down blending all HEU. | 10.023
- * international controls on HEU. | 03.020
- * safe storage of HEU prior to its down blending. | 10.032

Thank you for your consideration.

David Hedgepeth
1160 Fox Farm Rd
Logan, UT 84321

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

09.018: The Department of Energy does not consider the option of blending surplus HEU for extended storage reasonable because it would delay beneficial re-use of the material; delay recovery of the economic value of the material; add storage costs; reduce net revenues in the near term; not meet all aspects of the purpose and need of the proposed action; and be practically applicable without additional construction to only a small portion (20 t or approximately 40 t if a solidification facility is proposed and constructed at or near SRS) of the current surplus inventory.

16.015: Cost estimates for the alternatives analyzed in the HEU EIS have been developed to provide the decisionmaker, DOE, comprehensive information upon which to make decisions. The cost analysis, which has been provided to this commentor and all others who have expressed an interest in this subject, is available in a separate document with the HEU Final EIS. It supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU would save billions of dollars compared to the alternative of blending HEU for disposal as waste.

10.023: Existing facilities analyzed in the HEU EIS have sufficient capability to blend down all surplus HEU to LEU in a reasonable timeframe. However, DOE does not anticipate being able to make much more than about 8 t per year available for blending. Therefore, DOE considers that it will likely take 15 to 20 years to blend the entire surplus HEU inventory.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to IAEA controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

10.032: The Department of Energy is committed to safely storing surplus HEU pending its ultimate disposition.

HEINEMAN, MARY ELLEN, WAVERLY, TN
PAGE 1 OF 1

Honored Sirs: Jan. 2, 1996

Radioactive waste is a huge problem,
so we don't make highly enriched uranium
reactor fuel. It would also
create plutonium, one of the most dangerous
substances.

10.024

But

Downblend so it can't be used
as fuel or weapons.

10.023

Then please plan how to downblend
all uranium.

02.008

Work for international controls
and a non-nuclear world.

03.020

Thank you for your attention.
We have had enough cancer
and other ills caused by
nuclear radiation, so don't
exacerbate our problems by
burning HEU into reactor fuel.

Yours sincerely,

Mary Ellen Heineman

Waverly, TN 37185

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

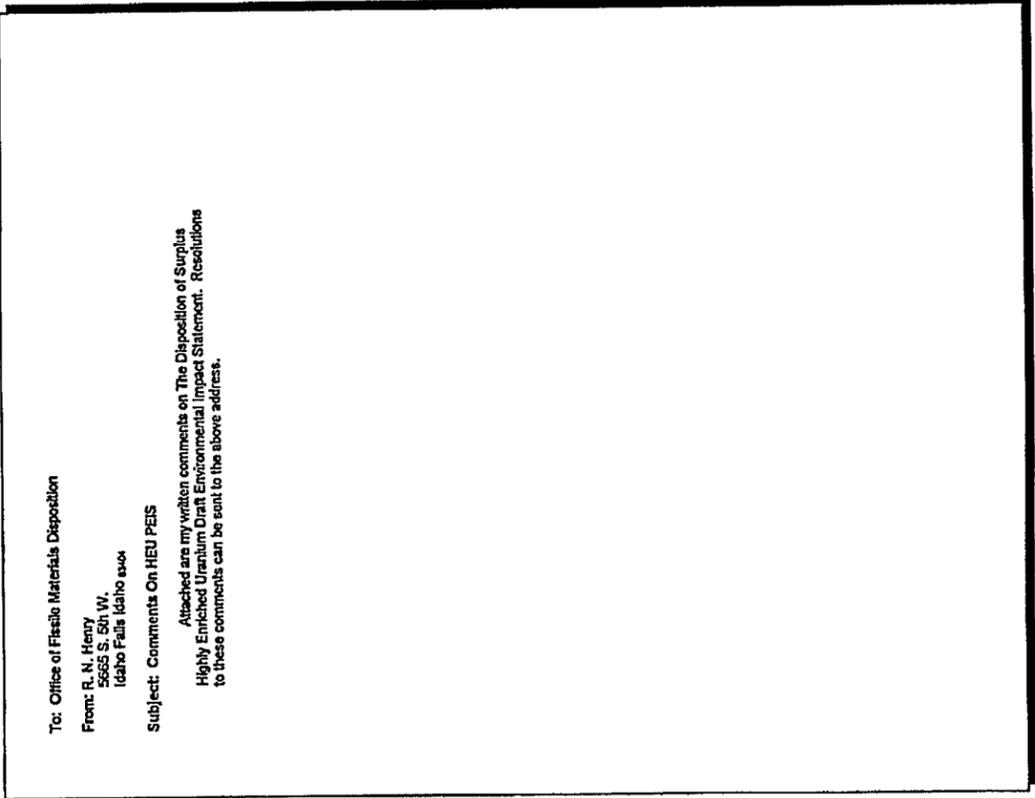

10.023: Existing facilities analyzed in the HEU EIS have sufficient capability to blend down all surplus HEU to LEU in a reasonable timeframe. However, DOE does not anticipate being able to make much more than about 8 t per year available for blending. Therefore, DOE considers that it will likely take 15 to 20 years to blend the entire surplus HEU inventory.

02.008: At this time, DOE is authorized only to determine the ultimate disposition of HEU that has been declared surplus to national security needs by the President. To date, 175 t of HEU have been so declared. The HEU Final EIS considers the disposition of that quantity plus an additional 25 t (not yet identified) that may be declared surplus in the future.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to IAEA controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky Flats sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

Subject: Comments On HEU PEIS

Attached are my written comments on The Disposition of Surplus
Highly Enriched Uranium Draft Environmental Impact Statement. Resolutions
to these comments can be sent to the above address.

HENRY, R.N., IDAHO FALLS, ID
PAGE 2 OF 8

Document Location	Comment/Issue	Proposed Resolution	
1 Page 1-2; Section 1.1.1	What types and forms of HEU are included in the 200 MT? Are different types of HEU SIF included in this inventory?	Describe the general contents of the excess inventory by material type e.g., SIF, metal logs, oxide, etc.	33.001
2 Page 1-3; second paragraph	The statement that 15% of the HEU inventory can only be disposed of as waste, appears to be an assumption that is stated as fact. Why is it "waste"? If this is an assumption, then other HEU management options are needed.	Identify the specific U isotopes that make this 15% inventory unacceptable and discuss why it is "unacceptable"? Is it reactor physics or radiation exposure during fuel fabrication? How unacceptable is "off-spec" post cold war LEU if the price is right?	33.004
		Develop "customer driven" post cold war LEU spec. Evaluate blending all HEU to dilute unwanted isotopes, then dilute unwanted isotopes again via conversion to LEU. Compare results with new "post cold war" LEU spec.	
		Since USEC is planning on using AVUS technology in the near future, evaluate an option to store this 15% HEU until AVUS experience can be made available to isotopically purify the U-235.	
		Evaluate use of this 15% HEU inventory in Pu disposal via MOX fuel fabrication.	
		Identify where the 15% non-commercial HEU is located and determine if there is a more optimal dilution location that would avoid shipping HEU to east coast locations and then back across the country to a western waste disposal site (e.g., NTS).	
		Evaluate the possibility of diluting this non-commercial HEU to <2% and sending it to another country (that has the resources to make it useful) for an equal amount of LEU that we can use or simply pay them to process it.	
3 Page 1-4; Section 1.3	It is not clear from this discussion why the western locations facilities were not evaluated for the dilution missions e.g., WEL, Hanford. These sites are "reasonable" and would provide a better envelop for post ROD optimization of blending.	Expand discussion to address use of WEL and Hanford facilities. These "second-generation" facilities provide significant safety benefits that are not available at SRS and OR and also provide additional processing capacity.	09.016

33.001: Forms of surplus HEU are mainly metal, compounds, solutions, oxides, irradiated fuel, reactor fuel, UF₆, scrap, and material in weapons that have been retired but have not been transferred to Pantex for disassembly. Surplus HEU is currently located at 10 DOE sites around the country and is shown in Figure 1.3-1 of the HEU Final EIS.

33.004: As described in Chapter 1 of the HEU Final EIS, approximately 62 t of the currently declared surplus HEU (165 t) may not be available for commercial use because it consists of spent fuel and material with very high ratios of undesirable isotopes (U-232, U-234, and U-236) relative to the U-235 isotope. Therefore, this material would need to be disposed of as waste. U-234, which is one of the two main undesirable isotopes, is the major contributor to radiation exposure and the other, U-236, inhibits the nuclear reaction in reactor cores.

The LEU specifications for commercial reactor fuel are currently set by American Society for Testing Materials to meet commercial reactor fuel feed requirements. A portion of the currently declared surplus HEU inventory (about 20 t) is being considered as off-spec material because it would not meet the American Society for Testing Materials standards when blended down. If buyers are found that would accept some portion of the non-commercial HEU inventory despite its isotopic composition then more of the surplus HEU inventory may be used as commercial fuel material or off-spec material. Some of this HEU could be used later for mixed oxide fuel fabrication, but DOE believes that there is no reason to reserve it for that purpose. Once surplus HEU is blended down to commercial-grade LEU, it is fungible with any other commercial-grade LEU. The use of off-spec material for mixed oxide fuel fabrication is unknown at this time.

Evaluation of new technologies and processes were not included within the scope of this EIS. Similarly, conversion and blending down of the non-commercial material for further potential use in the Atomic Vapor Laser Isotope Separation program was also excluded from the scope because the Atomic Vapor Laser Isotope Separation program is not currently funded and, therefore, DOE cannot plan and make decisions on programs or technologies that may never be developed.

Details on the specific location of the surplus non-commercial HEU is partially classified and could not be included in this EIS due to national security reasons. However, DOE evaluated transportation of surplus HEU between existing sites for blending and fuel fabrication, and a representative site for waste disposal (NTS is only a representative site for waste disposal since no LLW disposal site has currently been identified for the material).

Document Location	Comment/Issue	Proposed Resolution:	
		Provide a map of the 11 HEU storage locations and their inventories (current and future) and all candidate dilution sites. Identify impacts of transportation strategies with and without a western dilution location.	09.016 cont.
		Compare throughputs and operating costs for all (western and those currently identified) candidate sites. At least mention that there are other facilities that may be used to optimize the blending process which would be covered by a supplement to the EIS.	
4 Page 1-4, Section 1.3	Evaluate the possibility of converting aqueous LEU to U3O8 via ICPP resources (fluidized bed denaturation)	Conduct a preliminary feasibility study to estimate processing rates and capabilities. Mention this capability as an option in the PERS suggest it would be covered by a supplement to the EIS if it is selected.	33.005
5 Page 1-4, Section 1.3	Discuss the expected lifetime of the "first generation" (1960's) facilities at SRS and OR continue. Will they operate long enough to support this dilution program and future ones? Can they operate as cost effective as other smaller DOE facilities?	Provide a discussion of how long the dilution mission is expected to last and compare that with the expected lifetime of the proposed facilities.	25.003
		Provide a comparative discussion of the operational costs, site balance of plant features and safety barriers for each proposed candidate dilution site.	
6 Page 1-4, Section 1.3	It is not clear why old first generation facilities are proposed when DOE has newer facilities, at larger sites, located in more remote locations?	Discuss site and facility specific operational safety features that are associated with each candidate dilution site and facility e.g. seismic design criteria, site and facility fire protection system, etc.	07.010
7 Page 1-6, Section 1.4.2	Near surface disposal of HEU diluted to LEU is not likely to be supported by the NRC (chemical toxicity and radiological impacts) and may not provide an acceptable disposal strategy for this PERS. (see attached letter)	Assess the impact of deep mine disposal of LEU as uranium oxide (U3O8). Identify the denaturation capacity of those sites that are capable of converting non commercial HEU to LEU (U3O8) and estimate the processing time for this conversion.	33.006

Results of these analyses did not reveal any major risk of transportation. Therefore, it is anticipated that decisions on blending locations will be a function of material forms, availability of facilities when needed, and business decisions.

The possibility of diluting the non-commercial material to less than 20-percent enrichment and trading it to another country is not precluded by this EIS but would be unlikely since DOE is not aware of any interest in this regard. If, in the future, a decision is made to sell LEU derived from surplus HEU to other countries, supplementary NEPA documentation would be needed to evaluate potential impacts associated with that action.

09.016: The HEU Final EIS analyzes as potential blending sites two commercial facilities and two DOE facilities (the Y-12 Plant and SRS) that have existing capability and experience blending HEU to LEU. Idaho National Engineering Laboratory (INEL) and Hanford do not currently have operations or the facilities that might be used to process HEU (such as the Idaho Chemical Processing Plant) because they are permanently closed and are being decommissioned.

33.005: Conversion of aqueous LEU to triuranic-octoaxide (U₃O₈) using the Idaho Chemical Processing Plant was not analyzed since this plant has been shut down and will be decommissioned. There are adequate uranium blending facilities other than the Idaho Chemical Processing Plant and, therefore, there is no programmatic or economic basis to re-start this plant.

25.003: As described in the HEU EIS, there are currently four candidate blending sites, two DOE and two commercial, that are capable of conducting HEU blending operations. Based on currently available information, DOE estimates that blending the commercially usable surplus HEU (103 t) is likely to take 10 to 15 years to complete. DOE considers this a reasonable timeframe and, therefore, anticipates facilities at the four analyzed blending sites are adequate to accommodate required blending operations in compliance with DOE safety orders and/or NRC regulatory requirements. Cost analyses such as cost-benefit analyses or cost effectiveness studies are not required as part of the NEPA environmental impact analysis and thus need not be provided in the EIS (40 CFR 1502.23). However, cost estimates for the alternatives analyzed in the EIS were developed to provide the decisionmaker comprehensive information upon which to make decisions and are available in a separate document with the HEU Final EIS.

Document Location	Comment/Issue	Proposed Resolution	
8 Page 1-8; Section 1.5.1	It is not clear why disposition decisions for HEU will not impact decisions for Pu. Current policy does not promote different levels of criticality safety risk for each type of fissile materials. Thus, the HEU program will influence Pu.	Discuss the criticality safety policy that is used for disposal of all types and forms of fissile materials. Identify the risk level that must not be exceeded HEU and how this compares to Pu	28.002
9 Page 2-2; Section 2.1	It is not clear why 0.9% was selected as the HEU concentration for waste material?	Discuss the selection of 0.9% vs other possibilities such as 0.7%. Explain why 0.9% is best case for FEIS	33.002
10 Page 2-3; Section 2.1.1	It is not clear why "non-commercial" HEU is "impossible" to use. Customers can be found for the "of spec material", then why can't customers be found for this inventory or why can't the inventory be blended to near "of spec" levels?	Assume ASTM spec is not valid benchmark for post cold war era. Develop a new "customer driven" LEU spec for post cold war HEU.	33.008
		Evaluate blending all HEU to dilute unwanted isotopes, then dilute unwanted isotopes again via conversion to LEU. Compare results of HEU blending strategy with proposed post cold war LEU spec.	
11 Page 1-11; Section 2.2.1	Disposal of HEU at (0.9% or 0.7%) as LLW may not be a feasible assumption. See comment #5	See proposed resolutions for comment #5.	33.002 cont.
12 Page 2-2; Section 2.2.3.1	No information is provided to support that statement "new facilities would require capital investment and may not be cost effective"	Identify the facilities that were considered. Provide a comparative cost discussion with modifications for other sites and based on those results modify this statement as required.	16.014
13 Page 2-2; Section 2.2.3.1	It is not clear why new construction would produce impacts from normal operations that would be similar to existing impacts from older facilities.	Provide a discussion or reference a report that supports how older facilities can meet release rates from new facilities.	21.017
14 Page 2-2; Table 2-4.1	The information in this table does not agree with the information in the referenced tables in Section 4.3	Identify which values are correct and make them consistent throughout the report.	21.009

07.010: The HEU Final EIS analyzes as potential blending sites the two commercial facilities and two DOE facilities (the Y-12 Plant and SRS) that have extensive facilities for and experience with the processing of HEU. The DOE facilities meet all DOE environment, safety, and health requirements, and the commercial facilities meet all requirements contained in their NRC licenses.

33.006: The Department of Energy will meet whatever the waste acceptance criteria are prior to shipment of the waste material and fully comply with applicable laws and regulations during transfer of the material to its destination.

28.002: Although criticality safety requirements for HEU and Pu are comparable in terms of their objectives, that does not establish a connection between disposition actions for the two materials. DOE does not agree that decisions in the surplus HEU disposition program in any way constrain decisions in the plutonium disposition program.

33.002: The representative enrichment level of 0.9 percent (used for analytical purposes) was selected for material destined for waste disposal based on experience in both the United States and Europe where waste has been disposed of at slightly greater than 1-percent U-235. This enrichment level assures that an inadvertent criticality would not occur. It is possible that uranium at higher enrichment levels could be disposed of (the LLW facility at NTS has accepted 1.25-percent enriched uranium in the past), but the lower level was selected for purposes of conservatism in the HEU EIS analysis. Blending to an enrichment level less than 0.9 percent would substantially increase the amount of waste product and cost of blending (for example, blending to a natural uranium state of 0.7 percent would increase the waste volume by 40 percent) without any incremental criticality protection. The actual percentage of blend down will be determined by the waste acceptance criteria of the selected waste disposal site.

33.008: The potentially non-commercial portion of surplus HEU consists of spent fuel and material containing very high ratios of U-232, U-234, and U-236 relative to the U-235 content. The spent fuel could be reprocessed to separate out the HEU. If this is done, it would be made commercially available for blend down to LEU for reactor fuel.

Document Location	Comment/Issue	Proposed Resolution	
14 Page 3-56; Section 3.4.3	The structural impact of large earthquakes within 100 of the SRS site is not discussed. Similar discussion is missing for the other candidate sites.	Provide an overview discussion of the impacts of a "Charleston" type earthquake on the SRS facilities, balance of plant support systems and site safety related systems e.g., fire protection. Provide similar information for the other candidate sites.	22.016
15 Page 4-68; Section 4.3.3.6	If the material at risk was determined for each facility, why was it normalized to a single value. Each facility is uniquely different and would have different amounts of material at risk. One facility should not be penalized for another's defects.	Establish bounding conditions for each facility and compare impacts. The result will still present bounding conditions and provide additional insight about the candidate facility features and equipment.	21.010
17 Page 4-68; Section 4.3.3.6	Why are energy sources normalized when they are likely to vary by facility and process equipment?	Defend assumption or modify calculation to reflect facility differences. Failure to evaluate these differences for accident cases make facility selection impossible.	21.010
18 Page 4-68; Section 4.3.3.6	It seems impossible that the protective features of four different facilities could release the same amount of material. Only the protective features of the site size and possibly the local meteorological conditions appear to have been considered.	Adjust dose estimates to reflect specific facility protective features. Explain fire filter scenario for SRS card filters.	21.011
19 Page 4-68; Section 4.3.3.6	It is not clear if the proposed criticality is single event or several within a two hour period.	Identify the number of criticalities.	21.012
20 Page 4-68; Section 4.3.3.6	It is not clear if the proposed releases (Kr, Xe and I) result from single criticality or several criticalities within a two hour period.	Identify the number of cores released per criticality.	21.012
21 Page 4-68; Section 4.3.3.6	Given the energy source of a criticality and the presence of uranium oxide, why aren't particulate releases of fission products and uranium assessed in addition to the Kr, Xe and I?	Assume HAV failure from seismic event and include impacts of particulate releases. Calculate new dose estimates for all candidate site (including western locations e.g., BNEI)	21.013

Similarly, if any of the non-commercial material could be processed to make it off-spec, that material will be offered for sale to the commercial industry. However, some of the off-spec material has such high quantities of U-234 and/or U-236, DOE believes that it would be of little interest to the industry. DOE also believes that blending this material with high ratios of U-234 and U-236 to "near off-spec" levels would not be attractive because as U-235 is blended down to 4- to 5-percent range, the high quantity of U-234 and U-236 remain the same at those dilution levels and, in some cases, it may simply be too high for any commercial use.

16.014: It is not necessary to incur the expense of the construction of new facilities, because the existing facilities that are analyzed in the HEU EIS are available, capable of performing the proposed mission in a reasonable timeframe, and meet applicable environmental, safety, and health requirements.

21.017: Existing facilities, at both DOE sites and commercial sites, are available for blending and possess operating expertise and have been in compliance with all environmental release requirements that a new facility would have to meet. Therefore, construction of new facilities, which would likely have some degree of environmental consequences due to land disturbance and construction activities, could not be justified.

21.009: The information in Table 2.4-1 pertaining to facility accidents has been revised to reflect updated results obtained using the MACCS computer code which were presented in Section 4.3 of the HEU Final EIS.

22.016: As discussed in the geology and soils section, the Charleston earthquake of 1886 had an estimated Richter magnitude of 7.5. It has been estimated that at the time of the earthquake, the SRS area experienced an estimated peak horizontal acceleration of 10 percent of gravity (0.10 g) (SR DOE 1995e:3-7). All facilities at SRS are designed to withstand an earthquake of 0.20 g or 20 percent of gravity at the structure base which is estimated to occur once every 5,000 years. Discussions of large earthquakes at other candidate sites have been added to the HEU Final EIS.

21.010: The material at risk was not determined for each facility and site. It is true that each facility is uniquely different and have process design variations as well as different

Document Location	Comment/Issue	Proposed Resolution	
22 Page 468, Section 4.3.3.6	Why doesn't a criticality occur for the EBE? The damage is significantly greater than the earthquake induced criticality.	Assess impact from criticality. Include particulate releases of uranium oxide and fission products and volatile isotopes.	21.014
23 Page 468, Section 4.3.3.6	What type of meteorology conditions are assumed for calculating the exposures?	Use class "F" krigston and site specific meteorological data.	21.015
24 Page 468, Section 4.3.3.6	The doses in the text do not agree with the tables (4.3.3.6-1 to 4)	Change text or tables so that they are consistent with one another.	21.016

throughput capacities. However, because details on some site-specific processes were proprietary, one set of representative data were used in the HEU EIS for each blending process with nominal throughput rates that assumed a full-scale operation with bounding values for operational requirements, emissions, waste streams, and other parameters. The data used in the HEU EIS to characterize each blending process, including generic (normalized) accident releases, are considered reasonably representative of the releases that would occur at each site.

21.011: Public and occupational health assessments revealed that the maximum incremental cancer fatalities would not occur at ORR when all four sites were involved in blending. However, estimates showed that ORR would have higher incremental cancer fatalities when blending occurs at two DOE sites.

For a uniform irradiation of the body, the incidence of cancer varies among organs and tissues; the thyroid and skin demonstrate a greater sensitivity than other organs. However, such cancers also produce relatively low mortality rates because they are relatively amenable to medical treatment. Because of the readily available data for cancer mortality rates and the relative scarcity of prospective epidemiologic studies, somatic effects leading to cancer fatalities rather than cancer incidence (nonfatal) are presented in this EIS.

Transportation risk assessments showed that risks would be only slightly lower for blending to LLW at ORR. For blending to fuel feed material as UNH crystals, ORR is not the lowest risk alternative. Two significant factors contributed to these conclusions: (1) onsite material handling represents the greater part of the total risk and such handling would still be necessary even to blend at ORR, and (2) the highest transportation risk for these scenarios is not in transporting HEU, but in transporting the significantly larger volume of fuel feed material and LLW after blending.

21.012: The criticality event discussed in Section 4.3.3.6 is an initial burst of 1×10^{18} fissions followed by repeated bursts of 1×10^{17} fissions within an 8-hour period after the initial burst. This accident has been approximated (due to model limitations) by a single event of 1×10^{19} fissions with the radioactive releases occurring over a 2-hour period after the event.

21.013: The criticality event was assumed to be initiated in the HEU EIS by an evaluation basis earthquake. The energy source of the evaluation basis earthquake is much greater than a criticality, and therefore the energy from the criticality is not included in

the impact analysis except to the release of fission products (krypton, xenon, and iodine). These isotopes are consistent with the *Nuclear Regulatory Commission Regulation Guide 3.34* where they are identified as the dominant isotopes for exposure. For the consequences of a combined criticality and evaluation basis earthquake, the results are summed for the release of halogen materials (46,000 curies of krypton isotopes, 65,000 curies of xenon isotopes, and 1,600 curies of iodine isotopes) from the criticality and for uranium (0.076 curies of which 67 percent is U-234 for UNH blending to 4 percent) released during the earthquake.

21.014: As stated in Section 4.3.3.6, it was assumed that all of the accident scenarios considered in the HEU EIS can be initiated by the evaluation basis earthquake with the exception of the filter fire and fluidized bed release. The evaluation basis earthquake is also assumed to initiate the nuclear criticality. The evaluation basis earthquake accident scenario assumes that the building collapses, resulting in ruptured containers, piping, and tanks releasing uranium solutions, water, toxic gases, flammable gases, and toxic and reactive liquids. The nuclear criticality mitigating safety features of the storage racks and facilities are assumed not to be compromised. Therefore, only the consequences from the release of radioactivity and hazardous chemicals into the environment are presented for the evaluation basis earthquake. For the earthquake induced criticality, the incremental consequences of this criticality are presented. To be conservative, both the consequences from the evaluation basis earthquake and earthquake induced criticality were assumed to occur together added to yield the total consequences from both the release of radioactivity and hazardous chemicals into the environment and a criticality.

21.015: For normal operations, the meteorological data used for all four of the sites was site-specific joint frequency data files. A joint frequency data file is a table that lists the following:

- the fraction of time the wind blows in a certain direction
- the fraction of time the wind blows at a certain speed
- the fraction of time the wind blows within a certain stability class

The joint frequency data files for each of the four sites are based on site-specific measurements over a 1-year period to account for seasonal variations. At the two DOE sites (ORR and SRS), the measurements are at several locations and at several heights. At the two commercial sites (B&W and NFS), the measurements are at a single location and several heights. For exposures due to normal operations, average meteorological conditions (averaged over the 1-year period) were used.

For accident conditions, one year of sequential hourly meteorological data was used. This

is actual data recorded at each site except B&W for which the best available complete data set was that of the Roanoke, VA airport.

21.016: The doses in Section 4.3.3.6 do agree with the data presented in Tables 4.3.3.6-1 through 4 because the doses in the text are a combination of doses in the tables. For example, the latent cancer fatalities in the population within 80 km (50 mi) is 0.069 at Y-12. Table 4.3.3.6-3 states that at Y-12 the earthquake induced criticality yields (0.0015) latent cancer fatalities and the evaluation basis earthquake scenario yields (0.067) latent cancer fatalities. As the text in Section 4.3.3.6 states, "the combined evaluation basis earthquake and earthquake induced criticality accident release results in the highest consequences." Therefore, for Y-12, the maximum latent cancer fatalities in the population within 80 km (50 mi) is 0.069 ($0.0015 + 0.067 = 0.069$).

Hello, My name is John Hepler. I live on Hadenburg Road, Whitleyville, Tennessee 38588. I am calling because I strongly believe that this highly enriched uranium needs to be decommissioned out of a state in which it can be possibly made into weapons. This would also, if it is down blended properly, turn it into low-level waste, which at least can be disposed of under current law. In addition, this would help us to lead the way in showing by example, international controls on all nuclear materials. I think any other use of this stuff is a very bad idea. Thank you very much.

10.031

10.031: The Department of Energy agrees that blending down surplus HEU to either commercial fuel or waste would move the weapons-usable material out of its current storage and will make the material non-weapons-usable. With this action, the United States will set an example to other nations and encourage international controls on all weapons-usable nuclear materials.

I'm very much against you making highly enriched uranium into nuclear reactor fuel, and I hope you won't do it. My name is Fay Hirsch, and I live in Boca Raton Florida, and my number is 407 482-3905. Thank you

10.024

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

04.010

04.010: A cost analysis for the alternatives analyzed in the HEU EIS have been developed for consideration as part of the ROD(s) and has been made available for comment separately from the HEU Final EIS. (The cost report has been disseminated to this commentor and all others who expressed an interest in this subject.) The cost analysis supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU makes the most economic sense and would save considerable money. It is anticipated that the Government will realize most of the profit from the sale of LEU fuel derived from surplus HEU commercial fuel. Any commercial entities involved in the disposition actions will also expect to realize some profits in compensation for their contributions.

Hi. This is Jeannine Honicker, 362 Binkley Drive, Nashville, Tennessee, 37211. I went to the public meeting that was held on November 14 in Knoxville, Tennessee, and during the meeting I asked about the cost of the blend down and was told that there was no cost available, but however, there were working papers. So, I was told that I would be sent a copy of these working papers, but I was not told when and by whom. So, I wanted to reiterate that I am expecting them shortly, and that it should be all of the costs associated with the proposed blend down, including how much it will totally cost to do the program, and how much the expected revenue will be from whom, and I would like very much to have a response telling me how soon this material will be available. You can fax that to area code 615-333-2879. Thank you. Good-bye.

04.010

04.010: Cost estimates for the alternatives analyzed in the HEU EIS have been developed for inclusion in the ROD(s) and have been made available as a separate document with the HEU Final EIS. The cost analysis supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU makes the most economic sense and would save considerable money. It is anticipated that the Government will realize most of the profit from the sale of LEU fuel derived from surplus HEU commercial fuel. Any commercial entities involved in the disposition actions will also expect to realize some profits in compensation for their contributions.

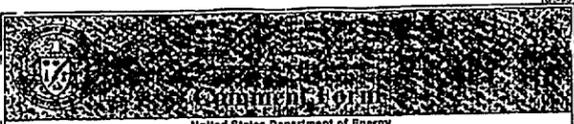

Hello. My name is Linda Horton. I live in Unicoi County, and I am very distressed to think that there may be hazardous nuclear waste in my county. I do not want it in this county, and there are a lot of people that agree with me. I plan to hopefully come to the workshop in Knoxville, and I will talk to you there. Thank you. Bye.

10.002

10.002: The Nuclear Fuel Services Fuel Fabrication Plant is one of two licensed commercial facilities in the United States capable of providing HEU processing services. NFS has been processing and fabricating special nuclear materials since 1958 while fully complying with the stringent safety and environmental requirements established by NRC, the State of Tennessee, and the Environmental Protection Agency (EPA), as well as its own internal requirements. The proposed action of the HEU EIS is well within the skills and experience of NFS and would neither increase hazardous nuclear waste beyond the permitted limits nor would it alter NFS's waste management operations.

 TELEPHONE: (423) 666 5125

I attended please session section C. I was in the afternoon meeting on Nov 14 1995 in Knoxville TN. One question asked you get allowed due to the contract in one I would like to know more about the question asked to. Although I being listed on the "public" alternative I don't think the question was asked. I would like to help you find a way to the proposed action. I would like to see the action, with question, some information available for you. I would like to see the alternative, schedule, schedule for the meeting, please, this is a usual part of question one of all the factors involved given equal weight.

I would appreciate more information concerning the above.

07.004

Please return your comments to the registration desk or mail to
 U.S. Department of Energy
 P. O. Box 23786, Washington, D.C. 20026-3786
 Or fax comments to: (800) 820-3156

07.004: As explained in Section 1.4.2 of the HEU Final EIS, DOE prefers the maximum commercial use alternative because it would best serve the purpose and need for the proposed action, which is to make the surplus HEU non-weapons-usable and, where feasible, recover its economic value. It is self-evident that the economic recovery objective is best served by an alternative that seeks to maximize commercial use of the material, because the alternative of blending the material to waste recovers no value and greatly increases the required blending and disposal costs. DOE believes that the nonproliferation objective is equally satisfied by all the action alternatives (2 through 5).

<p>January 6, 1996</p>		
<p>Officers-in-Charge Department of Energy Washington, D.C., U.S.A.</p>		
<p>Dear Gentlemen:</p>		
<p>Members of our Secretariat's Executive Council and officials of our organization who are spread in 98 countries are becoming very highly concerned in seeing members of our government especially favor making highly enriched uranium into nuclear reactor fuel.</p>		
<p>10.024</p>		
<p>This action is bound to create spent fuel which is a highly toxic and radioactive waste that is disastrous in the long range. Besides, it will create plutonium which is a violation of our nonproliferation objectives. However, in case of necessity, we do support downblending all highly enriched uranium so it cannot be used in weapons. We also support developing the capacity to downblend all uranium declared surplus over the next decade. In addition, we firmly believe in international controls on all nuclear materials.</p>		
<p>10.023</p>		
<p>03.020</p>		
<p>For our nation and, as a matter of fact, for every nation on earth, the health of the people is more important than the financial profits of dangerous industries which include, above all, the weapons industry. The American people want their government to protect their lives not from some imaginary Don Quixote coming from the sky, but from the dangerous toxic wastes that are being produced to satisfy the financial greed of big corporations which nowadays seem to have taken full control over our government.</p>		
<p>Thank you very much for your attention.</p>		
<p>Sincerely yours,  Dr. Charles Mercéca Executive Vice President, IAEPW</p>		

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

10.023: Existing facilities analyzed in the HEU EIS have sufficient capability to blend down all surplus HEU to LEU in a reasonable timeframe. However, DOE does not anticipate being able to make much more than about 8 t per year available for blending. Therefore, DOE considers that it will likely take 15 to 20 years to blend the entire surplus HEU inventory.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to IAEA controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky Flats sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

C/O SAIC-HEU EIS
P.O. Box 23786,
Washington, D.C. 20026-3786

To Whom It May Concern:

Please consider the following comments in making final decisions on the Disposition of Surplus Highly Enriched Uranium.

We of Local 252, of the International Chemical Workers Union, at Oak Ridge, TN, fully support the Department of Energy's proposal to blend-down surplus Highly Enriched Uranium (HEU) to Low-Enriched Uranium (LEU).

Although, the Department of Energy's preferred alternative, (Alternative 5, Variation c) is one we could support, we prefer (Alternative 5, Variation d) as our first choice and then Alternative 5, Variations a and c respectively.

We do not favor variation (b), of Alternatives 4 or 5. It would be a terrible disservice to the workers at the Y-12 Plant to send this new peacetime mission to the commercial sites and send Y-12 Defense Program workers looking for a job.

The blending-down of the surplus HEU, using any variation of Alternative 5, would allow the United States a chance to recover some of its investment in the Cold War efforts, by converting surplus HEU to commercial fuel.

Also, the blending-down of surplus HEU using any of the alternatives, rather than the no-action alternative, would demonstrate to the world that the United States is seriously pursuing our nonproliferation objectives. That we walk what we talk.

Our preferred alternative (Alternative 5, Variation d), is the single-site alternative and, of course, we think the Y-12 plant should be that single site.

The advantages of Y-12 as the (one-site variation) would include:

- HEU would not have to be shipped off site to be processed, since most of it is already at the Y-12 Plant.
- HEU could be blended-down using two processes, HEU to LEU as Uranyl Nitrate Hexahydrate and HEU to LEU as metal, at the same time.
- Y-12 has several large buildings that would be suitable to house a new uranium hexafluoride blending facility, should such a facility be needed as a third process later on.

10.003

10.003: Comment noted.

- Y-12 has existing systems for waste treatment and disposal.
 - Y-12 has the support of the surrounding community which believes in the professionalism of the work force.
 - Y-12 has already in place a Security Force that is considered second to no other in the country.
 - The Department of Energy could utilize the experienced work force from the Cold War effort who's jobs are in jeopardy because of the downsizing of Defense Programs. This would meet some of the objectives of Section 3161 of the National Defense Authorization Act and allow a trained work force to use their experience performing a new peacetime mission.

10.003
cont.

We strongly feel the Draft Environmental Impact Statement (EIS) on the Disposition of Surplus Highly Enriched Uranium grossly underestimated the processing rate capabilities of the Y-12 Plant, if utilized to the maximum, and that other facilities were overestimated.

We realize the true capabilities could have intentionally been erroneous for National Security reasons, but if not this data certainly needs corrected.

The EIS also indicates that just a few minor upgrades and modifications would be required to begin metal blending in Building 321-M at the Savannah River Site, but in fact the open top furnaces of Building 321-M would not be acceptable for the blending of HEU.

We have been advised that a lot of money has already been invested in extensive cleanup activities of Building 321-M at Savannah River and some of the buildings at Nuclear Fuel Services. If so, will some areas be recontaminated from these proposed blending activities and was this factored into the EIS?

The EIS leads us to believe that a targeted batch of HEU in the form of Uranium Hexafluoride, has already been chosen to be the first of the 200 metric tons to be blended down and the two commercial sites were the only sites considered for that batch. If so, why wasn't the two enrichment facilities considered as candidate sites for HEU in the form of Uranium Hexafluoride?

25.005

25.006

08.006

Your consideration of these comments would be greatly appreciated.

Sincerely,
Frank Scott
 Frank Scott
 Business Agent
 Local 252
 International Chemical Workers Union

25.005: The assumed blending rates are based on dilution ratios for blend down and anticipated blending capability and capacity. The rate of 10 t per year analyzed in the HEU EIS for blending to commercial fuel was based on current assessments of annual availability of surplus HEU. Although each candidate blending site has specific processing rate capabilities which are described in Chapter 2 (the Y-12 Plant is described in Section 2.2.3.2) based on the best available information submitted by each site, the principal reason of using a constant throughput rate (amount of LEU produced) at each site and process instead of site-specific rates was to provide a fair comparison of the potential environmental impacts between alternatives.

25.006: Operations at Building 321-M have been terminated and the remaining HEU has been transferred to another location. The building is in the process of being decommissioned and will no longer be available for metal blending. The HEU Final EIS reflects this change at SRS.

08.006: None of the HEU that is the subject of this EIS is in the form of UF₆. The only HEU UF₆ that exists, no longer in DOE's inventory, is 13 t located at the Portsmouth Gaseous Diffusion Plant. That material was transferred to USEC by the Energy Policy Act of 1992 and is currently being blended at Portsmouth. DOE does not rule out the potential use of DOE sites for any particular batches of HEU.

I am opposed to the spent of nuclear
weapons materials.

I do not support making highly
enriched uranium into nuclear fuel (reactor)
because:

- 1. it will create spent fuel;
- 2. it will create plutonium which
denies/violates our hope for
nonproliferation of nuclear material
& weapons;
- 3. DOE needs to exhaust
all options in responsible and
ethical manner/ways,
including storing blowblended uranium
including storing, processing, dangerous

We have no urgent and pressing government
need to see the government
agency - DOE/Fissile Materials Disposition Unit
downblend all highly enriched uranium
as it can't be used in weapons,

- 1. develop control/support international controls
on all nuclear weapons; and,
- 2. develop the capacity to downblend
all uranium depleted surplus
within ten years.

3. The hope for progressive and
wise action that will
also minimize uses and
production of our oversight over
nuclear weapons materials.

Sincerely,
Erik T. Johnson

Please send me a copy of the Draft Environmental Impact Statement. My name is John Johnson, P.O. Box 281, Chattanooga, Tennessee 37401. I am opposed to making highly enriched uranium into nuclear reactor fuel because nuclear power is inherently unsafe. It will create spent fuel, a highly toxic and radioactive waste that nobody has any kind of solution for. It will create plutonium which is a violation of nonproliferation goals and treaties, and the DOE has obviously not adequately explored all options, including storing down blended uranium in some kind of heavily guarded facility so that international terrorists don't get it. To that end, I do support down blending all the highly enriched uranium so that it cannot be used in weapons. I think the DOE should develop the capacity to down blend all uranium declared surplus within ten years, and very obviously, there needs to be international controls on all nuclear materials because the stuff is very dangerous and we're leaving a very unhealthy and deadly legacy for future generations, and I don't see how you can do that to your children and live with a clean conscience. Thank you very much and have a good day.

10.024

09.018

10.023

To Whom It May Concern

The Kentucky Resources Council, Inc., a non-profit environmental advocacy organization whose membership includes individuals who are concerned with the enrichment of uranium because of historic releases and contamination associated with DOE's Paducah Gaseous Diffusion Plant, is writing to express our concern with the processing of highly enriched uranium into nuclear reactor fuel. The Council believes that the EIS should more thoroughly explore the range of reasonable alternatives, including storage of downblended uranium, and the downblending of all highly enriched uranium in order to prevent the use of the material for weapons.

09.022

I thank you for your consideration of these comments.

Sincerely,
Tom Fitzgerald
Tom Fitzgerald
Director

09.022: The Department of Energy does not consider it reasonable to blend HEU to LEU and then store it for an extended period of time. Such a course would maximize Government expenditures for disposition, because it would necessitate the construction of new storage facilities for the much higher volume of material and would involve no offsetting revenues from sales of commercial material. The proposed action is to blend down all surplus weapons-usable HEU to make it non-weapons-usable.

Yes. Today is Friday, December 8, and I was calling to comment on the draft document that has been issued for the disposition of highly enriched uranium. I would like to urge the Department of Energy to accept the "No Action" alternative which is outlined in the draft document. My name is Claudine Kramer. I live in Weaverville, North Carolina, and should you wish to reach me for further comment, my telephone number is 704-658-0294. And again, I would like to urge the Department of Energy to adopt the "No Action" alternative. Thank you.

10.026

10.026: The No Action Alternative does not satisfy the purpose and need for the proposed action. It would leave the nuclear proliferation problem unaddressed, continue to incur storage costs, and not recover the economic value of the material.

SUBJECT: Disposition of surplus HEU Environmental Impact
Statement:

We, the undersigned, believe that the BEST, and indeed the
only logical option, is that of NO COMMERCIAL USE!

We believe that any other option will just help perpetuate
the Nuclear cycle. It is time for the world to get off the
Nuclear addiction. Blending ALL HEU to low-level waste
would be one small but important step. It is time for the
United States to show real leadership.

Sincerely:

Dale Meeker
Sherry Larsen-Benville
Paul J. Husan
Luci H. ...

10.015

10.015: Blending down the entire stockpile of surplus HEU to LLW was evaluated in the HEU EIS as one of the alternatives. The analyses showed that this alternative would generate the highest environmental impact among other alternatives evaluated in the HEU EIS (Table 2.4-2). In addition, additional costs of blend down and storage would be incurred which may or may not be a significant factor in decisionmaking. DOE has developed cost estimates associated with the alternatives analyzed in the HEU EIS and has made them available in a separate document with the HEU Final EIS. The cost analysis indicates that commercial use of LEU fuel derived from surplus HEU makes economic sense and would save billions of dollars compared to the alternative of blending HEU for disposal as waste. DOE believes that all of the action alternatives (2 through 5) evaluated in the HEU EIS meet the objective of nonproliferation and will send a positive message to other nations.

DOE - Office of Fissile Materials Disposition
c/o SAIC/HEU - EIS
P. O. Box 23786
Washington, DC 20029-3786

Dear Sir or Madam:

Louisiana Energy Services, LP (LES) is a Delaware Limited Partnership that has applied for and is awaiting final action on a U.S. Nuclear Regulatory Commission license to build and operate, in Louisiana, the first privately-owned U.S. uranium enrichment plant. As such, LES has a direct interest in the manner and timing of any introduction into the U.S. market for enrichment services of LEU derived from HEU from any source.

We agree with the conclusion of the Draft EIS that the most appropriate means for disposition of surplus HEU from the U.S. nuclear weapons program is "to blend down to LEU and, where practical, to reuse the resulting LEU in peaceful, beneficial ways that recover its natural value." However, the rate and manner in which this LEU is introduced into the U.S. market for enrichment services is of crucial importance to the market and to current and potential future U.S. suppliers of enrichment services, such as LES. This quantity of material can certainly affect the equilibrium in the market and exacerbate the existing imbalance between an excess of supply and shrinking demand. There has already been an impact on market stability after the fall of the Soviet Union and the increased sales of its considerable stocks of uranium and enriched product, initially at below fair market value. Adding significant quantities of U.S. stockpile material in the market place would worsen these circumstances. Congress was mindful of this problem when it enacted the Energy Policy Act of 1992 and required the U.S. Enrichment Corporation to conduct its business as exclusive agent for sales of Russian HEU in a manner that would minimize the impact on domestic industry.

Congress has again expressed a similar concern in recent legislation which would privatize the U.S. Enrichment Corporation. This legislation has been passed by both houses but remains stalled in the ongoing debate over the Budget Reconciliation Legislation of which it is a part. Nonetheless, the bill expressly requires that any sale of U.S. stockpile material, in this case by Department of Energy, be preceded by a determination by the Secretary of Energy that such sale "will not have an adverse impact on the domestic uranium mining, conversion and enrichment industry" and that the price "not be less than the fair market value of the material." Even the tons of natural and enriched uranium being transferred to USEC from the U.S. stockpile are

12.016

12.016: The Department of Energy agrees that the rate at which LEU derived from surplus HEU is introduced into the market is important to the stability of the uranium fuel cycle industry. Due to the forms the material is in and the limited capacity to process it, it will not be possible to make U.S. HEU available for disposition at the high rates suggested by the scenarios assessed in the HEU Draft EIS, which were analyzed to bound the highest impacts that might be experienced. DOE must abide by the stricture in the *USEC Privatization Act* that its HEU disposition actions should avoid adverse material impacts on the domestic uranium industry. Statements in the HEU Draft EIS concerning the blending of 10 t per year refer to the potential blending rate at each site. With multiple sites more than 10 t per year could be blended, but in actuality DOE does not anticipate being able to make more than about 8 t per year available for blending. The schedules in Table 2.1.2-1 have been revised in the HEU Final EIS to reflect these more pragmatic assumptions.

The Department of Energy does not agree with the position that the rate of introduction of LEU fuel derived from surplus HEU into the market is outside the scope of the HEU EIS, for the very reason that Louisiana Energy Services is concerned about the program: the effects on the uranium industry are foreseeable socioeconomic impacts that are required to be considered in an EIS. The EIS notes several times that decisions about marketing, business arrangements, and contracting for sales of LEU fuel derived from surplus HEU do not affect the environmental impacts, other than socioeconomic impacts on the uranium industry.

constrained by the legislation, and can only be delivered for commercial end use on a delayed schedule and within fixed annual quotas.

In our judgment, the Draft EIS fails to recognize the importance of this issue, and its treatment of the matter is both inadequate and confusing. In this regard, we note that the "Preferred Alternative" indicates (page S-6) that up to 170 tons of HEU, (including the 50T already proposed to be transferred to USEC in legislation passed as the privatization bill) would be blended over an approximate eight-year period. The additional 120 tons of HEU so blended would result in the incremental introduction into the U.S. market of some 18,000,000 SWU. If this material is introduced over the eight-year period suggested in the Draft EIS, the annual introduction from this source alone would be 2.25M tons annually or some 20% of the U.S. domestic market for enrichment services. The privatization bill itself establishes more conservative schedules for release of stockpile material into the market in order to minimize the impact. It expressly requires as well that decisions of DOE about releases of U.S. stockpile material take account of the sales of uranium under the Russian HEU Agreement and the Suspension Agreement.

12.016
 cont.

It is apparent that a reduction in the U.S. market for enrichment services of the magnitude permitted under the Draft EIS could have a serious and adverse impact on the timing of any new enrichment source, including the more energy efficient and environmentally benign enrichment process to be employed by LES. No explanation is required to indicate the adverse environmental impacts of a delay in the introduction of more energy efficient enrichment technology, but these impacts are nowhere mentioned in the Draft EIS.

05.012

Elsewhere, the Draft EIS refers (page S-20) to "The commercial use alternatives involving blending 10T of HEU to 4 percent LEU per year." We are unable to reconcile this statement with the statement cited earlier that up to 170 tons would be blended over an eight-year period, which would result in a rate of more than 21 tons per year, and a correspondingly higher percentage of the U.S. market. In noting this serious discrepancy, however, we are not suggesting that a 10 ton blending and introduction rate is acceptable in terms of its market and environmental impacts. The appropriate rate of introduction of LEU resulting from the blending down of U.S. surplus HEU is an extremely complex issue that, in our judgement, is beyond the scope of this EIS and can be adequately dealt with only through a clear-cut legislative mandate to avoid interference with the domestic market for enrichment services. We strongly urge, therefore, that the Draft EIS be modified to give explicit recognition to the importance of the introduction rate and to propose that the rate of introduction be determined by legislation in a manner and at a rate designed to avoid interference with the domestic market for enrichment services. It should be further noted that this rate would, therefore, be set separately from, and might well be considerably below, the rate at which surplus material is blended.

12.016
 cont.

We also wish to comment on the statement (page S-6) that "2) marketing of the fuel may be made by USEC under current law, or by a private corporation, as successor to USEC, or by DOE, depending on subsequent legislative changes." It is apparent that this statement does not

05.012: The HEU EIS does not permit or predict a reduction in the U.S. market for enrichment. Rather, it analyzes the potential impacts as required by NEPA and concludes that disposition of currently declared and commercially usable domestic surplus HEU will have small impacts on the market over a 10- to 15-year period. The cumulative impacts of those programs are considered in Section 4.8 of the HEU Final EIS. DOE intends to abide by legislative guidance that it should avoid adverse material impacts on the domestic uranium industry.

LOUISIANA ENERGY SERVICES, WASHINGTON, DC
PAGE 3 OF 3

define all the possible modes for marketing of the fuel that would result from blending of surplus HEU. For example, some or all of such fuel could be sold by an entity or entities other than USEC, its successor, or DOE; could be marketed through auction to either final users or intermediate purchasers, and so on. We request that any statement in the EIS concerning marketing make it clear that the marketing approach, including prices, quantities, sales agencies and methods for controlling adverse impact on the domestic industry, is outside the scope of the EIS and would be determined by appropriate legislation.

Thank you for your consideration of these comments.

Sincerely,

Joseph DiStefano
Secretary and Counsel

Yes, my name is Wade McCurdy and I'm calling from Nashville, Tennessee to encourage the Department of Energy to down blend all the highly enriched uranium they have so that it can't be used in weapons. | 10.023

10.023: Existing facilities analyzed in the HEU EIS have sufficient capability to blend down all surplus HEU to LEU in a reasonable timeframe. However, DOE does not anticipate being able to make much more than about 8 t per year available for blending. Therefore, DOE considers that it will likely take 15 to 20 years to blend the entire surplus HEU inventory.

DOE/Fissile Materials Disposition
c/o SAIC/H&U EIS
P B Box 23786
Washington, D. C. 20026

Dear Sir:

This letter concerns the policies of disposition of nuclear reactor fuel. I support the downblending of all highly enriched uranium so that it cannot be used for weapons. The US government has supported international controls on nuclear materials, but has been reluctant to apply the same standards to our own industry. The DOE needs to put more emphasis on downblending all uranium that is supposedly surplus.

In addition, I congratulate the DOE and Hazel O'Leary in the steps taken to clean up the disposal mess and to work toward long-term solutions. Keep it up and do even more in the coming years. Thank you.

Sincerely yours,

Russell R. Morgan

10.003: Comment noted.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to IAEA controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky Flats sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

Disposition of Surplus Highly
Enriched Uranium Final EIS

January 8, 1996

U.S.D.O.E.
Office of Fissile Materials Disposition
Washington, D.C. 20515

Re: Freedom of Information Request #512200002

To: The Office of The Secretary Hazel O'Leary:

Thank you for extending the public comment period for the Disposition of Surplus Highly-Enriched Uranium Draft E.I.S. to January 12, 1996. But, we deem it necessary to reopen the public comment period 30 (thirty) days after the financial cost analysis is made public. The financial costs of the planned disposition should be available for citizens to make informed comments on this draft E.I.S. The Record of Decision should reflect public comments on the full financial costs of reprocessing.

30.005

Since we have made repeated requests for this financial information, the Record of Decision must reflect why the full financial disclosure was not provided prior to the public comment deadline.

Please respond to this request, at the fax number below, by the end of the current public comment period, January 12, 1996 on the Disposition of Surplus Highly-Enriched Uranium draft E.I.S.

Thank you for your attention to this matter.

Sincerely,

Julie Tilton

This is Mary Neatling. I live at 1319 Doris Street in Knoxville, Tennessee, and I want to stop the uranium into nuclear reactor fuel. It's going to create spent fuel and plutonium, but I would like some development of down blending uranium. We need to look into down blending, but I don't like nuclear reactor fuel. Okay, bye.

10.024

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

Yes. I'd like to say that B&W I know has the experience and the best of the people and workers' welfare in being able to do this job, and I think that they should be allowed to do it. I know that the Lynchburg facility definitely has the means and the knowhow to do it, and do it safely with no problem. I just want to say that it would be good work for the people, and it can be done properly and safely. Thank you.

10.001

10.001: Decisions about where specific batches of HEU will be blended are expected to be based largely on business considerations and may involve USEC, other private entities that may act as the Government's marketing agent, or DOE. Competitive bidding processes are likely to be key components in site selection.

PAGE 1 OF 1

Hi. I am a resident of Lynchburg, Virginia, and I am writing to or calling to comment on Babcock and Wilcox. I think they are an excellent corporate citizen of the community, and I believe that they will do a responsible and good job of reprocessing the uranium. I am very much in favor of this activity in my community. My number is 804-832-3511. Good-bye.

10.001

10.001: Decisions about where specific batches of HEU will be blended are expected to be based largely on business considerations and may involve USEC, other private entities that may act as the Government's marketing agent, or DOE. Competitive bidding processes are likely to be key components in site selection.

Hello. I am a citizen of Lynchburg, Virginia, and I would just like to say that I am completely in favor of this program. I would like to see the uranium diluted into uranium suitable for use in commercial nuclear power plants. I think this nuclear swords-to-plowshare idea is an excellent idea and one that will further benefit mankind. And I'm all in favor of this program, and I think a substantial amount of this work should be awarded to Babcock and Wilcox. They are a proven leader in this area, and they need the employment for this area. They have the capabilities, and they'll do a good job. Thank you.

10.003

Competitive bidding processes are likely to be key components in site selection.

Yes. I would like to have some information on what is this diluting process. What does it consist of? Does any kind of uranium go into the water in Lynchburg? Where do I get these answers? Thank you.

| 08.001
| 22.001

08.001: As explained in Section 2.2.2 of the HEU Draft EIS, there are three potential blending processes that could be used for different portions of the HEU disposition program: UNH liquid blending, which could be used to produce either commercial fuel or waste; molten metal blending, which would only be used for waste material; and UF₆ gas blending, which would only be used for commercial material.

22.001: As discussed in Chapter 4, no direct discharges to groundwater are expected to occur and, as a result, no uranium would be released directly to the water. All industrial, process, and sanitary liquid waste generated from the processes would be treated to comply with NPDES permit levels prior to being released into the environment. However, accidental releases of uranium as discussed in Chapter 4 of the HEU Final EIS could occur.

Just don't do it. You people are fools. We don't need any more toxic, radioactive waste and stuff we don't have any solution for and need for. And we don't need nuclear energy, it doesn't work very well. You guys just suck.

10.029

10.029: The Department of Energy's proposal to blend down surplus HEU to LEU as reactor fuel for commercial use is aimed to eliminate proliferation potential of the weapons-usable HEU. Although spent nuclear fuel would be generated as a result of the use of this fuel in power reactors, since the nuclear fuel derived from HEU would displace nuclear fuel that would have been created from newly mined uranium without this action, there would be no additional spent fuel generated. The domestic spent fuel would be stored, and potentially disposed of, in a repository or other alternative, pursuant to the *Nuclear Waste Policy Act*, as amended (42 U.S.C. 10101 et seq.). DOE is in the process of characterizing the Yucca Mountain Site in Nevada as a potential repository. Furthermore, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel.

Date Received: 1/11/96

I'd recommend down blending it all. But it's pretty silly to use it for nuclear power plant fuel, because that'll just turn it into nuclear waste which we still don't know what to do with. Plus of course, they could reprocess the plutonium back out of it and you'd have bombs again. It's certainly important to find some safe place to store the stuff that's down blended. I think you'll have a better chance of doing that correctly than finding a place to store lots more high level nuclear waste from the spent fuel. And certainly, you know, let's get rid of the bomb grade stuff. We ain't needing any more bombs. Thank you.

10.024

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

North Carolina Wildlife Resources Commission

512 N. Salisbury Street, Raleigh, North Carolina 27604-1188, 919-733-3391
Charles R. Fullwood, Executive Director

MEMORANDUM

TO: Melba McGee
Office of Legislative and Intergovernmental Affairs

FROM: Owen F. Anderson, Piedmont Region Coordinator
Habitat Conservation Program

DATE: December 4, 1995

SUBJECT: Disposition of Surplus Highly Enriched Uranium Draft Environmental Impact Statement, October 1995, 96-0357

Staff biologists with the North Carolina Wildlife Resources Commission have reviewed the summary document. Our comments are provided in accordance with provisions of the National Environmental Policy Act (42 U.S.C. 4332 (2) (c)) and the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661-667d) and the North Carolina Environmental Policy Act (G.S. 113A-1 through 113A-10; 1 NCAC 25).

23.001

The Department of Energy proposes to blend down surplus Highly Enriched Uranium (HEU), weapons useable material, to a Low Enriched Uranium (LEU) that is not weapons useable without a significant amount of costly technology and processing. Three alternatives were presented: no action, conversion of surplus HEU to LEU and 100% disposal as low-level radioactive waste (LLW), and conversion of HEU to LEU and maximizing commercial use. The preferred alternative is to maximize commercial use with a minimal amount of LEU being disposed of as LLW.

None of the alternatives should have significant direct impacts to North Carolina fish and wildlife or habitat, since the blending would take place at facilities outside of North Carolina. There would be some minor risks involved with transportation accidents between sites and to the OE Plant at Wilmington, which would be involved with production of uranium oxide used for blending and fuel fabrication.

23.001
cont.

We believe that the preferred alternative to maximize commercial use of the surplus HEU would not have significant impacts to North Carolina fish and wildlife resources and is the most environmentally sound alternative.

Thank you for the opportunity to review and provide input into the draft environmental impact statement for this project. If we can further assist your office, please contact our office at (919) 528-9886.

Chairman

January 11, 1996

Mr. J. David Nulton, Director
Office of NEPA Compliance and Outreach
US Department of Energy
Washington, DC 20585

SUBJECT: PRELIMINARY ENVIRONMENTAL IMPACT STATEMENT FOR THE
DISPOSITION OF 200 METRIC TONS OF HEU

Dear Mr. Nulton:

Nuclear Fuel Services, Inc. supports the federal government's initiatives relative to dispositioning surplus highly enriched uranium (HEU). The following comments are made relative to the preliminary environmental impact statement.

1) The program for dispositioning surplus HEU needs to be substantially accelerated. Not only does the downblending of HEU into low enriched uranium (LEU) ensure non-proliferation of US nuclear weapons materials, it also provides an incentive for the Russians to do likewise. The Russians have already begun their HEU to LEU blend-down efforts. However, senior Russian officials have indicated a reluctance to expand their HEU dispositioning programs until (and unless) the US takes similar definitive actions. Administrative delays in implementing the US program contribute to international delays relative to HEU dispositioning. This subjects the world to a higher risk of nuclear proliferation because of political instability in countries of the former Soviet Union.

To speed the US dispositioning of HEU, the DOE should:

- a. Eliminate further unnecessary delays in the NEPA evaluation process. The public has had ample time and notification to submit comments. There have been no new concepts proposed relative to dispositioning HEU during two years of discussion and review. Comments received should be evaluated in an expeditious manner so that a decision can be made.

05.011

05.011: The Department of Energy is making every effort to complete the HEU EIS expeditiously. If the Preferred Alternative is selected by DOE in the ROD, the first HEU to move to disposition would be the proposed 50 t transfer to USEC. Decisions about contracting for blending of that material would be made by USEC, not DOE. The possibility of shipping surplus HEU to commercial vendors in classified form with appropriate security measures is being explored by DOE. Considerations other than contracting, such as DOE's ability to make surplus HEU available for disposition, and avoiding adverse material impacts on the uranium industry, are expected to be the limiting factors in the rate of disposition activities.

09.009: There is a large market for LEU in the 4- to 5-percent enrichment range, but little or none for 19-percent LEU.

Mr. J. David Nulhen, Director
January 11, 1996
Page Two

05.011
cont.

- b. Explore creative ways to expedite procurement activities. Since there are only two commercial vendors, it seems possible for the government to offer contracts to both companies based on cost estimates done by DOE personnel to date. The Federal Accounting Regulations and government auditors provide adequate protection to the US taxpayer. Such a program could save a year or more in implementation time. Note that NFS, in conjunction with AlliedSignal, submitted a proposal to the Secretary of Energy in November, 1993. We would be willing to use this document to begin immediate price negotiations.
- c. Extend security clearances as needed so that the commercial vendors could receive the HEU in its current form. Both vendors already have approved DOE classification and security programs. Delays in reprocessing the HEU at a government site can be significantly reduced if the HEU is shipped directly to the commercial vendor.
- d. Initiate procurement activities for HEU other than the 50 metric tons planned to be transferred to the US Enrichment Corporation. The DOE can select an executive agent to administer the programs at a later date. Long-term processing contracts will result in lowest cost, and therefore maximum benefit to the government and the US taxpayer.

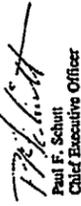

09.009

2. The environmental impact statement should include an analysis of dividing the HEU to under 20% enrichment. This material can be used for research reactor fuel or other end products. Future NEPA evaluations would be unneeded, thereby providing flexibility relative to HEU dispositioning.

NFS is prepared to assist the DOE as needed to convert "nuclear sweets into plowshares" as expeditiously as possible. This program will reclaim a substantial part of the investment already made by our parents for the benefit of our children.

Sincerely,

NUCLEAR FUEL SERVICES, INC.

RE: Comments on the October 1995 Disposition Of Surplus Highly
Enriched Uranium Draft Environmental Impact Statement (EIS)

Ladies/Gentlemen:

Because of our experience in the nuclear fuel market, we are writing to your organization to offer our comments on the above mentioned report's Section 4.8, *Impacts on the Uranium Mining and Nuclear Fuel Cycle Industries*. NUKEM, Inc. is one of the world's leading suppliers of nuclear fuel. Together with our parent company, NUKEM GmbH of Alzenau, Germany, the NUKEM group has supplied uranium concentrates, conversion, enrichment and other nuclear fuel-related services to utilities since 1978, with annual sales in excess of \$400 million.

With regard to the effects on the uranium market from the DOE transfer of 7,000 MT of natural uranium (containing 18,200,000 lbs uranium oxide) and 50 MT of HEU (containing 12,800,000 lbs of uranium oxide) to USEC (DOE Material) and the possible sale of an additional 120 MT of HEU (containing 33,900,000 lbs of uranium oxide), our position in the marketplace has led us to a different conclusion than that reached in the report. The EIS concludes that the introduction of this material into the market would reduce domestic uranium production by 700,000 lbs of uranium oxides annually, with an accompanying reduction of approximately 90 person years in employment.

NUKEM believes that the introduction into the market of the DOE Material as well as up to 120 MT of additional surplus HEU, will not reduce domestic uranium production or employment numbers. The USEC Privatization Legislation dictates that the DOE Material to be transferred to the United States Enrichment Corporation can only be introduced into the domestic market at a rate not to exceed 4 million lbs of uranium oxide or the equivalent contained in UF₆ a year beginning in 1998. An additional restriction not mentioned in the EIS is the availability of existing facilities for the blending of HEU. Based upon the assumed world blending capacity of 10 MTU of HEU a year it would take 17 years to blend down all of the HEU mentioned above (assuming all the uranium from the blended down HEU meets the commercial specifications for use in nuclear reactors,) which equates to 3,800,000 lbs of uranium oxide sold into the market annually or 2.5% of total, annual world reactor demand.

12.017

12.017: The HEU Final EIS does not assume that world blending capacity is limited to 10 t per year. Rather, it is the assumed rate at which each of the analyzed domestic facilities could blend commercial material. However, DOE does not expect to be able to make HEU available for blending at a rate that would assume the use of all four facilities at that rate simultaneously. Thus, DOE agrees that it is not likely to market more than about 3.8 million pounds of uranium oxide from domestic HEU disposition in any given year, and that such quantities represent only about 2.5 percent of total annual world demand. There appears to be substantial disagreement among different segments of the industry as to the future performance of the world uranium market. DOE agrees with this commentator that uranium supply will continue to tighten in the next several years, but it also agrees with other commentators (for example, from the domestic uranium producers) that entry into the market of uranium from Russian and domestic HEU disposition actions together would increase supplies and possibly soften the market. DOE intends to move cautiously and to abide by the requirement in the *USEC Privatization Act* that it avoid adverse material impacts on the domestic uranium industry in undertaking its uranium transactions.

Office of Fissile Materials Disposition
January 11, 1996
Page Two

According to generally accepted market data (see attached graph), world demand for uranium is over 160 million lbs uranium oxide annually, while current world production is less than half of that demand. Uncovered demand for uranium oxide is currently being met through inventory drawdown. If drawdown of inventory continues at its current rate, the amount of material in inventory available for Western reactors is scheduled to be exhausted by 1999.

Assuming that the Russian HEU material and the DOE material enter the market pursuant to the USEC privatization requirements and the limited capacity for the blending of HEU, there remains a supply and demand worldwide gap of between 20 to 30 million lbs of uranium oxide per year. Even with the introduction of the DOE material, the additional surplus HEU, and the uranium resulting from the Russian HEU, the current gap of uncovered demand can only be met with new production. Our review of the market's supply and demand situation illustrates that, on an international and domestic basis, introduction of surplus inventories will not depress the production and sale of domestic uranium product or reduce employment in the domestic uranium mining industry.

It is NUKEM's position that the demands of the nuclear fuel market will require world production of uranium oxide to increase.

Thank you for the opportunity to submit these comments. Should you have any questions or comments or need additional information on our position, please do not hesitate to contact us immediately. You are forwarding to your office by FedEx, a color copy of the attached graph.

Sincerely yours,

NOTES: World Uranium Supply/Demand Chart

(1) World production assumes to be constant at 1994 levels as follows:

Country	1994 Actual Million lbs U3O8
Canada	25.2
Niger	7.7
Russia	6.8
Australia	5.7
Kazakhstan	5.5
Uzbekistan	5.5
Namibia	5.0
South Africa	4.4
United States	3.5
China	3.1
France	2.7
Subtotal	75.1
Others	7.8
Total	82.9

(2) CIS Utility Inventory Drawdown

Assumes demand to fuel reactors in the CIS is entirely filled by the Russian natural uranium stockpile which is estimated to be up to 560,000,000 lbs or up to 25 years worth of demand

(3) Non-CIS Utility Inventory Drawdown

This is the Drawdown of the following excess inventory:

31.7 Million lbs in Western Europe
16.4 Million lbs in the Far East
20.5 Million lbs in the U.S.

(4) Russia HEU

This assumes the blending of 6 MTU of HEU in 1995, 12 MTU in 1996, 10 MTU/yr in 1997-1999, and 30 MTU/yr from 2000-2015. From 93% HEU to 4.4% LEU. This does not include the uranium component of the blending material.

(5) Russia Blending Material

The Russians are enriching depleted uranium (tails) into blending material of 1.5% enrichment. This part of the graph is the uranium component of the blending material.

(6) US HEU/Natural

This shows the drawdown of 5 MTU @ 70%, 45 MTU @ 37.5%, and 120 MTU @ 45% of US HEU blending to 4.0% (not including the blending material) and 7,000 MTU of natural uranium

This material represents the following UO8:

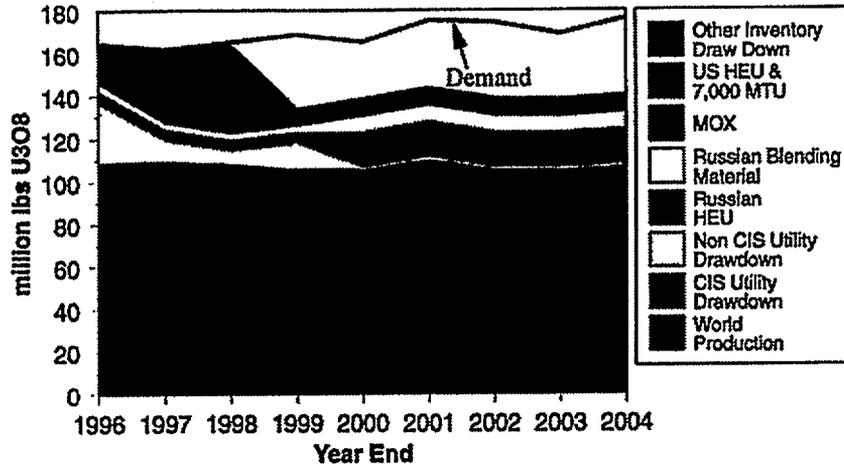

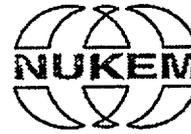

5 MTU @ 70% and 45 MTU @ 37.5%	lbs UO8
120 MTU @ 45%	12,800,000
7,000 MTU Natural	31,900,000
TOTAL	18,200,000
	64,900,000

The drawdown of this uranium is limited to 4,000,000 lbs/year starting in 1998 pursuant to the USEC Privatization Bill (S.755). HEU blending capacity of 10 MTU of HEU per year is also a limiting factor. At 10 MTU of HEU per year it would take 17 years to blend the HEU mentioned above. If the 64,900,000 lbs UO8 is delivered over 17 years this would represent 3,800,000 UO8/year

(7) MOX is pursuant estimated MOX production and consumption.

(8) Other inventory Drawdown is an estimate of the Drawdown of 85,700,000 lbs UO8

World Uranium Supply and Demand

January 12, 1996

VIA FAX: 202 586 4078

Mr. Dave Nulton
 Office of Fissile Materials Disposition
 US Department of Energy
 1000 Independence Avenue SW
 Washington, DC 20585

Dear Mr. Nulton:

The Department of Energy's HEU EIS looks at the impacts of decisions on the disposition of 200 metric tons of HEU. DOE states in the HEU EIS that its goal is two fold—to achieve nonproliferation goals and to realize the "peaceful beneficial use" of this material in a way that will bring money back to the federal coffers.

DOE's preferred option is MAXIMUM COMMERCIAL USE of surplus HEU. DOE argues that this will return the most money to the federal coffers. DOE argues that this will not increase the amount of spent fuel, since reactors will burn other fuel anyway. DOE argues that this will reduce environmental impacts, since new uranium will not have to be mined for reactor fuel. DOE does not address proliferation concerns of spent fuel. And DOE says disposal of spent fuel is being considered in another document.

We believe DOE's preferred option is short-sighted and inappropriate for the following reasons.

- DOE acknowledges that reactor fuel derived from downblended HEU will be turned over to the US Enrichment Corporation which will then market it for fuel. DOE stated in its public meetings on the draft HEU EIS that it was likely the fuel would be marketed internationally. It is currently unclear that there will be control over the spent fuel generated to prevent it from being reprocessed to extract the plutonium/HEU in the spent fuel. DOE references no protocols forbidding reprocessing or requiring return to US of spent fuel generated from this material. | 14.012
- DOE does not present a credible economic analysis demonstrating a positive economic return. DOE did promise, in November of 1994 and again in November of 1995, to provide such analysis to the public. To date, DOE has been unable or unwilling to do so. Since the driving force behind DOE's preferred option is "commercial use," and since DOE uses this claim of a supposed financial benefit to over-ride more proliferation resistant options under consideration, DOE must provide a clear and credible analysis to support its claim. | 04.014
- DOE ignores the fact that downblending to <1% removes proliferation concerns for all time and is more in keeping with the US nonproliferation and export control policy which accords nonproliferation a "higher priority." | 03.012
- DOE discards the option of downblending to 4% for storage (until reprocessing and economic concerns are addressed) saying it provides "no proliferation advantage over blending and selling"—a statement which is not true. Blending to 4% and storing preserves the use-as-fuel option and maintains security of the material in a relatively stable state which does not contain Pu or HEU. Blend and sell for use as reactor fuel requires eventual storage of a highly toxic and radioactive material which contains Pu and HEU. | 09.013
- DOE maintains a double standard, saying it would not begin to downblend to <1% until a disposal site were identified and approved. The same requirement does not apply to downblend-and-use-as-fuel, since no disposal site exists for spent nuclear fuel. | 07.009
- DOE skews the time required to complete the various alternative scenarios by limiting the sites | 05.008

14.012: Once HEU is blended down to commercial-grade LEU, it is fungible with any other commercial-grade LEU. As the market for uranium and reactor fuel is a global one, it is correct that some LEU fuel derived from surplus HEU could be sold abroad. It is also correct that some foreign nations reprocess spent fuel to extract Pu and uranium for civilian (non-military) use, although it is the policy of the United States to discourage civilian reprocessing. However, as any such LEU fuel derived from surplus HEU would simply replace fuel that would have been used anyway in the foreign reprocessing programs, there would be no additional reprocessing resulting from this program, and inversely, no less reprocessing abroad in the absence of this program. The resultant spent fuel would present no greater proliferation hazard than any other commercial spent fuel (in contrast to HEU-based research reactor spent fuel). Commercial spent fuel does not contain HEU, as the comment suggests. The commentor may be referring to U-235, which is present in spent fuel at a lower enrichment level than fresh fuel due to the fact that some of it is transformed in the reactor by the fission process. The uranium in commercial spent fuel is low enrichment and not weapons-usable.

04.014: Cost analysis is not required as part of an EIS, but one comparing the HEU disposition alternatives has been prepared to aid the Secretary of Energy in reaching an ROD. The cost analysis, which is now available separately from this EIS, which has been provided to interested parties, supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU makes the most economic sense and would save considerable money compared to the alternative of blending HEU for disposal as waste. DOE does not agree that blending for commercial use is less proliferation resistant than blending to waste, because no increase in the generation of spent fuel would result from this program, and spent fuel is not considered proliferation prone.

03.012: The Department of Energy agrees that blending to less than 1 percent removes the proliferation potential of HEU. It is for that reason that the HEU EIS evaluates an alternative (alternative 2) that would blend all of the surplus HEU to waste for disposal. However, DOE disagrees that blending to 4 percent for commercial use is less effective in serving the nonproliferation objective, since spent fuel would be created in any event from reactor operations (that is, no additional spent fuel would be created from this program), and spent fuel is considered to have low proliferation potential. Moreover, while the President's *Nonproliferation and Export Control Policy* (fact sheet included as HEU EIS Appendix A) mentioned by the commentor does focus on nonproliferation, it also explicitly mentions conversion of HEU to peaceful use as reactor fuel (in the context of the purchase of Russian HEU).

and Responses

OAK RIDGE ENVIRONMENTAL PEACE ALLIANCE, OAK RIDGE, TN
PAGE 2 OF 5

(Portsmouth and Paducah, potential downblending sites, are ignored) and assuming no increase in capacity is possible. Even under its fastest scenario, downblend to 4% and sell as reactor fuel, DOE's plan would take 10 years for the initial 200 tons of HEU. During that 10 years, it is likely that more HEU will be declared surplus.	05.008 cont.
• The preferred option, Maximum Commercial Use, would result in more than 5 million pounds of spent nuclear fuel (2,380 metric tons, assuming an assay of 50% enrichment for 170 metric tons of material). DOE does not analyze the environmental impacts of this spent fuel, claiming the impacts of spent fuel are analyzed in a separate NEPA document. DOE makes no effort to integrate the findings of the two documents.	14.013
We recommend: The removal of HEU from the weapons cycle once and for all is a priority goal for the US and the world. Downblending HEU is the quickest and surest way currently available for achieving the nation's nonproliferation goal.	03.022
DOE must not compromise proliferation goals for money. Selling downblended HEU on the international market absent controls on reprocessing is an unacceptable proliferation risk.	
Absent a credible treatment and disposal plan for spent fuel, DOE should not create more spent fuel. The "spent fuel standard" establishes a minimum level of proliferation resistance against which options are to be measured; it does not require the creation of spent fuel, nor does it establish a goal for the disposition of weapons usable radioactive materials.	14.013 cont.
DOE must adopt a "cradle to grave" analysis of environmental impacts, as NEPA requires, in the EIS. If spent fuel would be generated as a result of DOE action, spent fuel must be accounted for to the grave.	
DOE must develop its disposition plan as a "long-term" plan and may not rely on short-term solutions which leave us with long-term proliferation problems.	
Disposition decisions may not compromise the health and safety of workers, the public, or the environment.	17.011
DOE must consider a more reasonable range of sites for downblending, including those which could accommodate downblending activities with modifications.	09.014
DOE must consider options which offer considerable proliferation advantages while not shutting off economic or "beneficial use" options such as downblend to 4% and store indefinitely.	09.013 cont.
DOE must provide a credible economic analysis in the EIS to support its "preferred option" since the preferred option is preferred primarily for its commercial value.	04.014 cont.
DOE must balance its rhetoric and include "proliferation risk" with "commercial use" in describing the options—so "Maximum commercial use" becomes "Maximum Proliferation Risk/Commercial Use."	03.022 cont.
DOE should include in its analysis a "blend to 4% and dispose of as unspent fuel" option—this would eliminate proliferation concerns and minimize environmental, health and safety risks. Physically, this might end up looking the same as "blend to 4% and store indefinitely." It offers a significant volume and time advantage over blend to <1% and dispose of as LLW.	09.015
Upon being declared surplus, weapons usable radioactive materials should be placed under International (IAEA) control and, if possible, possession.	03.021

09.013: The Department of Energy does not agree with the contention that commercial use of LEU fuel derived from surplus HEU increases the proliferation potential of the material. DOE does not consider it reasonable to blend HEU to 4-percent LEU and then store it for an extended period of time. Such a course would maximize Government expenditures for disposition, because it would necessitate the construction of new storage facilities for the much higher volume of material that would exist after blending, and would involve no offsetting revenues from sales of commercial material. As the commentor disapproves of the commercial use option, it is not clear why the commentor concedes the utility of preserving that option by storing LEU fuel derived from surplus HEU at the 4-percent enrichment level. Spent nuclear fuel contains about 1-percent Pu (in a highly inaccessible and thus proliferation resistant state), and it retains much of its LEU U-235 content (3 to 4 percent), but it does not contain HEU.

07.009: The Department of Energy does not intend to take actions to commence blending of HEU until there is a clear destination for the resultant material. In the case of waste material, that destination is an approved LLW disposal site. In the case of commercial material, the destination is fabrication into commercial reactor fuel. The normal nuclear fuel cycle in the United States is a "once-through" cycle ending in disposal of spent fuel. The alternative of blending HEU to waste would generate LLW for disposal that would not otherwise exist. In contrast, the spent nuclear fuel that would result from commercial use of blended-down HEU would not represent any increment over that which would exist in the absence of this program, since the LEU fuel derived from surplus HEU will simply supplant natural uranium-derived fuel.

05.008: The Portsmouth and Paducah sites are capable of blending HEU in the form of UF₆ in the enrichment cascades, but they do not have the capability to convert metal or oxide HEU to UF₆. Except for 13 t of HEU in the form of UF₆ at Portsmouth that is already being blended there, none of the surplus HEU is in the form of UF₆, so those two sites are not realistic candidates for future blending. DOE considers a 10- to 15-year period for blending currently declared surplus material (175 t) to be a reasonable timeframe for accomplishing this mission. This timeframe is based on DOE making a total of 8 t per year of surplus HEU available for blending to commercial use. The HEU EIS already contemplates the potential addition of 25 t of HEU to the currently declared surplus. If a total of more than 200 t of HEU are declared surplus, additional NEPA documentation would be required.

All disposition activities should conform to international standards of safeguards and transparency. Ideally, disposition decisions will have results which are irreversible; weapons-usable materials will be "non-recoverable."

03.021
cont.

All disposition decisions should be reflexive—they should mirror what we expect or desire of other nations.

01.007

Finally, DOE must develop the capacity to "dispose" all HEU expected to be declared surplus within the decade no matter which option is selected. The current HEU EIS points up the shortcomings of DOE's decision to separate some HEU (declared surplus) from the remaining US HEU, the disposition of which is being considered in a separate and not-integrated Programmatic EIS. Currently, DOE considers what to do with 200 tons of HEU. Presently, only 165 tons is declared surplus. DOE's current decision presumes use of current downblending capacity and projects, under its fastest scenario, nearly ten years for the downblending of the currently declared surplus and an additional 35 tons of HEU.

11.016

If, as is likely, additional HEU is declared surplus within the next decade, DOE will be required to stockpile the surplus HEU or develop new capacity for its downblending. In either case another NEPA document is likely to be required. Should the US determine it is wise to downblend our surplus HEU rapidly—both to increase its proliferation resistance and to demonstrate to other nations that we are practicing what we preach—further capacity for downblending will have to be developed. In an integrated NEPA analysis, we would be able to consider the requirements and impacts of developing additional downblending capacity now and begin to prepare that capacity so it would exist when it is needed.

We appreciate the opportunity to present our concerns to you at this time. We look forward to a your response and to the Department's development of an adequate HEU EIS.

Sincerely,

Ralph Hutchison, for

14.013: Because LEU fuel derived from surplus HEU would replace spent fuel that would be created from natural uranium-derived fuel in the absence of this program, there would be no additional spent fuel generated. Thus, the generation of spent fuel is not considered an incremental direct environmental consequence of this program. The resulting spent fuel would be subject to the same disposition decisions as all other domestic commercial spent fuel. Since the spent fuel disposal EIS (in connection with the proposed Yucca Mountain or alternative repository) has not yet been prepared, it is by definition impossible to integrate the findings. DOE does not understand the difference between "a minimum level of proliferation resistance against which options are to be measured" and "a goal for the disposition of weapons-usable radioactive materials," and considers that both of those phrases describe the way DOE is using the spent fuel standard in this program.

03.022: The primary purpose and need for the proposed action is to render HEU unusable in weapons, and down-blending is the approach DOE proposes to accomplish that objective. DOE does not agree that commercial use of LEU derived from surplus HEU increases the proliferation potential. Although fuel derived from U.S. HEU and sold abroad could conceivably be reprocessed in some countries to separate plutonium for commercial (non-military) use in mixed oxide fuel, that LEU fuel derived from surplus HEU would simply replace other fuel, so no incremental plutonium will be created as a result of this program. The nonproliferation and economic recovery objectives of this program are not in conflict; both are best served by the maximum commercial use alternative.

17.011: The Department of Energy agrees that disposition decisions should not compromise the health and safety of workers, the public, or the environment. The results of the analyses in the HEU EIS (Sections 2.4 and 4.3) indicate that any health, safety, or environmental impacts would be low and well within prescribed limits.

09.014: The HEU EIS analyzes potential HEU blending at the four domestic facilities that are equipped and (in the case of the commercial facilities) licensed to process HEU in the requisite quantities. DOE considers that some combination of those four facilities would be adequate to effect disposition of the surplus HEU inventory within a reasonable timeframe. If additional facilities are proposed in the future for HEU disposition activities, additional NEPA documentation, possibly in the context of NRC licensing for commercial facilities, would be necessary.

09.015: The Department of Energy agrees that the ability to dispose of 4-percent material as waste would offer a significant volume and time advantage. However, we are unaware of any LLW disposal facility acceptance criteria that would accept 4-percent enriched uranium as a waste form. In order to ensure against a potential criticality and meet waste acceptance criteria, the material needs to be near or below 1-percent enrichment.

03.021: The Department of Energy expects to make its surplus HEU subject to IAEA safeguards to the maximum extent possible. IAEA does not take "possession" of materials; however, all disposition will conform to all international safeguards and transparency requirements.

01.007: Once it is blended down to LEU, the surplus HEU would be as irreversibly non-weapons-usable as any other LEU. The spent fuel that would result from commercial use of LEU fuel derived from surplus HEU would be as irreversibly non-weapons-usable as any other spent fuel. It is possible to re-enrich LEU to make it HEU again, and it is possible to reprocess spent fuel to separate Pu, but both of those endeavors are very difficult and costly. Thus, LEU and spent fuel are both considered non-weapons-usable in as permanent a way as it is feasible to achieve. The blending of HEU to LEU would serve as an example to Russia and hopefully other nations to also blend their weapons-usable HEU to nonproliferation-prone forms.

11.016: Because of the forms the material is in, DOE does not expect to be able to make surplus HEU available for disposition at a rate that makes completing the program in less than 10 years possible, and does not consider it necessary to develop additional capacity. The decision to declare only part of the Nation's inventory of HEU surplus to defense needs was made by the President on the recommendation of the Nuclear Weapons Council, not by DOE, and simply reflects the fact that the United States has not decided to eliminate its entire nuclear arsenal nor to discontinue the use of naval nuclear propulsion systems. A classified quantity of HEU remains in the national security stockpile for those purposes and is not surplus. The *Storage and Disposition of Surplus Weapons-Usable Fissile Materials Draft Programmatic Environmental Impact Statement* (DOE/EIS-0229-D, February 1996) does not consider the disposition of non-surplus HEU, since that material is being retained in the stockpile and is not subject to disposition. The Storage and Disposition PEIS does consider the long-term storage of non-surplus HEU in conjunction with the storage of non-surplus Pu. Since existing capacity appears to be ade-

quate to effect the disposition of the current surplus inventory plus a nominal additional 25 t in a reasonable timeframe, a decision to build new facilities is not warranted at this time. The commentor is correct that if more than 200 t is eventually declared surplus, additional NEPA analysis will probably be necessary, but DOE believes it has adequately bounded the surplus material for the foreseeable future.

Anderson • Meigs • Rhea • Roane • City of Oak Ridge • Knox • Loudon

05.007: The timeframes presented in the cited table have been substantially revised in the HEU Final EIS to reflect more realistic assumptions about commercial considerations, availability of material, and other factors (such as legislative restrictions concerning impacts on the uranium industry) in addition to processing rates. DOE expects that a realistic estimate of the time needed to blend material for commercial use (out of 200 t) will be 15 to 20 years. The cited discussion concerning UF₆ at Portsmouth on page 4-187 of the HEU Draft EIS pertains not to the 50 t of HEU that are proposed to be transferred to USEC, but rather to 7,000 t of natural uranium that are proposed to be transferred to USEC as part of the same transaction. The 50 t of HEU that is proposed to be transferred to USEC is in the form of metal and oxides, not UF₆.

11.001: The GE Wilmington Fuel Fabrication Plant is used in the HEU EIS as a representative site where conversion of natural UF₆ blendstock to U₃O₈ for use in UNH blending might occur. This step is not likely to be necessary since DOE has plentiful supplies of natural uranium metal and oxide that can be used as blendstock for the UNH process. In the event that limited conversion of UF₆ blendstock is necessary, the impacts at the conversion facility would be negligible relative to the existing activities at the facility as discussed in Section 4.3.5 of the HEU Final EIS.

21.008: Results of accident analyses are summarized in the Environmental Justice in Minority and Low-Income Populations section of the Summary in the HEU Final EIS. In addition, Tables S-2 and S-3 in the Summary present a comparison of the potential incremental impacts from accidents for all the alternatives evaluated in the HEU EIS.

22.012: The cumulative impact sections have been revised to eliminate ORR as a candidate site for the Tritium Supply and Recycling program.

5. Any distinction between alternatives 4 and 5 depends on better characterization of the "off-spec" material.	07.012
6. While the near-term environmental impacts associated with the preferred alternative (maximum commercial use) appear to be less severe than those from fuel production using raw materials, the fact that no disposal site for commercial spent fuel currently exists may pose long-term environmental consequences that are not factored into the EIS analysis.	14.019
7. The EIS states that the proposed action would "maximize proceeds to the Federal Treasury," yet provides no economic analysis to support the conclusion. A recent General Accounting Office report estimates an excess U.S. Enrichment Corporation (USEC) inventory worth over \$ 300 million dollars. The final EIS should provide evidence that the proposed action will result in a net gain or loss.	16.015
8. On June 30, 1995, the USEC submitted its privatization plan and notified Congress of its intent to implement the plan. The plan assumes, among other things, that the government will ensure the USEC's ability to dispose of low-level waste. The final EIS should be very explicit regarding the potential impacts on Oak Ridge of low-level radioactive waste disposal associated with the proposed alternatives. Because of the uncertainties regarding the privatization of the USEC, it may be prudent to delay the proposed action until the USEC privatization is complete in 1996. The delay should not adversely impact the non-proliferation goals as described in the document.	14.016 05.010
9. The DOE contends that economic analyses are not required by NEPA. Given the current budgetary situation, the DOE should include estimates of the costs of each alternative. These costs should be included in the socioeconomic impact section. Neither of the two proposed private sites have total capabilities; thus an analysis may show that conducting more of the work at Y-12 is cost-effective.	16.015 cont.
10. Given that the State of Nevada is currently in litigation with the DOE, and is seeking to prohibit the disposal of low-level waste at the Nevada Test Site, the final EIS must have a contingency plan for LLW disposal. The final EIS should describe in detail what role the ORR might play if the NTS is not a viable option.	14.016 cont.
11. Section 2.1.2.3, p. 2-8 describes that only commercial sites will be considered by USEC for blending their 50t of HEU, regardless of the Commercial Use alternative selected. Without an evaluation of risks, impacts and costs associated with transportation and facility upgrades, it is unclear why existing DOE sites should not be considered for these activities.	11.015
12. Tables E.2.3-1 and E.2.3-2 do not have units given.	21.007
13. The second column printed on p. 3-17 belongs after the text printed on p. 3-18.	22.011
14. The chemical risk for the uranium hexafluoride process is high in the case of an accident. Thus, no more than one such site should be added to the nation's capability.	17.013

07.012: The Department of Energy agrees that the ultimate determination of the proportion of surplus HEU that can eventually be sold for commercial use will depend on more detailed characterization of the surplus inventory.

14.019: The amount of spent fuel that results from commercial use of surplus HEU will be no greater than spent fuel that would be generated from fuel derived from mined uranium in the absence of the HEU disposition program. LEU fuel derived from surplus HEU will merely displace that which would have been provided from newly mined uranium. It will be managed and eventually disposed of together with other domestic commercial spent fuel pursuant to the *Nuclear Waste Policy Act*.

16.015: Cost estimates for the alternatives analyzed in the HEU EIS have been developed to provide the decisionmaker, DOE, comprehensive information upon which to make decisions. The cost analysis, which has been provided to this commentor and all others who have expressed an interest in this subject, is available to the public for comment in a separate document with the HEU Final EIS. It supports the conclusion that commercial use of LEU fuel derived from surplus HEU would save billions of dollars compared to the alternative of blending HEU for disposal as waste.

14.016: Management of DOS's LLW is the subject of DOE's Draft Waste Management PEIS, a tiered or site-specific documentation. The possibility of LLW disposal at ORR is included within some of the alternatives in the Draft Waste Management PEIS document.

05.010: Although the HEU EIS contemplates the proposed privatization of USEC and the proposed transfer of 50 t of surplus HEU to USEC as part of that privatization (as authorized by P.L. 104-134), the environmental analyses in the document are not conditional on those events. Although the 50 t transfer is mentioned separately in the HEU EIS, the impacts resulting from it are not expected to be different from any other HEU that is blended down for commercial use. However, if an ROD from this EIS includes the transfer of this material to USEC, that action will increase USEC's assets and thus the proceeds to the Government from the sale of USEC.

OAK RIDGE RESERVATION LOCAL OVERSIGHT COMMITTEE, OAK
RIDGE, TN
PAGE 3 OF 3

Due to the adverse impact of federal budget cuts, Committee members believe that preference should be given to DOE sites. The Committee supports an alternative that emphasizes a substantial role for Y-12, and includes the potential for commercial treatment, if cost competitive. Relative costs for processing material already located at Y-12 should mean that most should be processed there.

10.008

Thank you for your consideration of these comments. If you have any questions, you can contact me at (423) 483-1333.

Sincerely,

Amy S. Fitzgerald, Ph.D.
Executive Director

cc: Tennessee Department of Environment and Conservation, DOE-Oversight Division

11.015: Alternative 3, Limited Commercial Use, represents the case where only the 50 t of HEU that is proposed to be transferred to USEC is commercialized and all the rest is blended for disposal as waste. For this alternative only, DOE made the simplifying assumption that only the two commercial sites would be used for blending of the 50 t of commercial material. This is due to the fact that DOE sites currently in a stand-down condition are not expected to be available during the next couple of years, when blending of the USEC material may begin. For the other commercial use alternatives, 4 and 5, DOE made no such simplifying assumption, and the DOE sites are considered candidates for any or all of the blending activities in the site variations.

21.007: Table E.2.3-1 includes the unit "curies" in its title which is consistent with the style chosen for the HEU EIS. Table E.2.3-2 inadvertently omits curies from the title. This has been corrected in the HEU Final EIS.

22.011: The HEU Final EIS has been revised to correct this discrepancy.

17.013: The HEU Draft EIS reflects the potentially significant consequences associated with a postulated UF_6 release accident, as well as the low probability of such an accident. See, for example, Tables 4.3.2.6-4 and 4.3.2.6-5. Whether any UF_6 and related blending facilities are developed will be decided by commercial entities based on business considerations and subject to licensing and regulation by NRC.

10.008: The Y-12 Plant is one of the four alternative sites evaluated in the HEU EIS as having the capability to provide uranium blending processes. To be in compliance with NEPA, the HEU EIS must assess the environmental impacts of the proposed action and alternatives at all potential candidate sites without favoring one over another and provide this information to the decisionmakers.

DOE/Fissile Materials Disposition
 to SAIC/HEU EIS
 P.O. Box 23786
 Washington, DC 20016-3786

Greetings for a safe, loving new year!

I am contacting you now concerning the idea of making highly enriched uranium into nuclear reactor fuel. I oppose this strongly:

- 1) it creates plutonium: a violation of our nonproliferation policy
- 2) it creates spent fuel - a radioactive toxic waste we have no storage for
- 3) all options have not been adequately explored, including storing downblended uranium

10.024

09.018

I support:

- 1) international controls on all nuclear materials
- 2) downblending all highly enriched uranium so it can't be used in weapons
- 3) developing the capacity to downblend all uranium declared surplus in 10 years.

03.020

10.023

We do not need to proliferate nuclear power or weapons. Renewable resources, combined with conservation, education and practical application is what will work to satisfy us, the people and protect all of our futures.

The line between the threat of nuclear power and brown's ferry and ballast water and nuclear energy is a line of weapons testing & storage. Please STOP!!

Sincerely, Kathleen O'Donohue
 P.O. Box 575
 Huntsville, AL 35804

10.024: The spent fuel that would be created as a consequence of commercial use of LEU fuel (derived from surplus HEU) in reactors would replace spent fuel that would be created in any case from natural uranium-derived fuel. Hence, no incremental spent fuel would result from this program. Although spent fuel contains Pu, because of the high level of radioactivity of spent fuel, it is extremely difficult and costly to separate the Pu. Thus, in accordance with recommendations of the National Academy of Sciences, it is the policy of the United States to make weapons-usable fissile materials at least as proliferation resistant as spent fuel from commercial nuclear reactors.

09.018: The Department of Energy does not consider the option of blending surplus HEU for extended storage reasonable because it would delay beneficial re-use of the material; delay recovery of the economic value of the material; add storage costs; reduce net revenues in the near term; not meet all aspects of the purpose and need of the proposed action; and be practically applicable without additional construction to only a small portion (20 t or approximately 40 t if a solidification facility is proposed and constructed at or near SRS) of the current surplus inventory.

03.020: The United States has begun to subject its stockpiles of surplus weapons-usable fissile materials to IAEA controls. There is some HEU under IAEA safeguards at the Y-12 Plant, as well as some Pu at the Hanford and Rocky Flats sites. It is DOE's intent to make additional quantities of surplus material subject to international controls to the maximum extent possible.

10.023: Existing facilities analyzed in the HEU EIS have sufficient capability to blend down all surplus HEU to LEU in a reasonable timeframe. However, DOE does not anticipate being able to make much more than about 8 t per year available for blending. Therefore, DOE considers that it will likely take 15 to 20 years to blend the entire surplus HEU inventory.

Department of Energy
Office of Fissile Materials Disposition
c/o SAIC/HEU EIS
P. O. Box 23786
Washington, D. C. 20026-3786

Gentlemen:

Enclosed are the comments of the Oil, Chemical and Atomic Workers International Union and its affiliated locals at the gaseous diffusion plants in Paducah, Kentucky and Portsmouth, Ohio, to the "Disposition of Surplus Highly Enriched Uranium Draft Environmental Impact Statement (DOE/EIS-0240-D)".

We have addressed our comments primarily to the "socio-economic" impacts portions of the document and have attempted to lay out our reasons why we believe that the Department of Energy should delay its plans to convert its surplus HEU and sell it into the commercial uranium fuel market. The effect of even a small amount, relatively speaking, of additional commercial grade LEU in the market along with large amounts of Russian HEU converted to LEU will, we believe, lead to the closure of gaseous diffusion plants in the U.S. We believe also that such action is unfair and should be carefully reviewed before any final decision is made.

Thank you for allowing us to comment on the Draft HEU EIS. We appreciate you making our written remarks part of the official record for review.

Sincerely,

Robert E. Wagon
President

REW:cdf
Enclosure

COMMENTS of OCAW

on
 Disposition of Surplus Highly Enriched Uranium Draft Environmental
 Impact Statement (DOE/EIS-0240-D)

January 12, 1996

The Oil, Chemical and Atomic Workers International Union (OCAW) and its local affiliates at the gaseous diffusion plants in Paducah, Kentucky and Portsmouth, Ohio assert that:

The conversion of Russian Highly Enriched Uranium (HEU) into commercial nuclear fuel under the Russian HEU Agreement with the United States and its sale into the commercial marketplace, as scheduled, will oversupply the market and displace U.S. domestic uranium production, conversion and enrichment. The conversion of surplus Department of Energy HEU and its sale into the commercial marketplace, as scheduled, will increase that oversupply condition in the market. That oversupply will cause material adverse effects in the U.S. uranium industry contrary to existing and proposed law. The most significant adverse effect will be the premature closure of one of the enrichment plants.

12.018

OCAW will address its remarks principally to the socioeconomic sections of the Draft HEU EIS with which we have our greatest concern.

In analyzing the socio-economic impact of its proposed actions on the enrichment plants in the Draft HEU EIS, the Department of Energy draws extensively from a document prepared by the United States Enrichment Corporation (USEC) entitled: "Environmental Assessment for the Purchase of Russian Low Enriched Uranium from the Dismantlement of Nuclear Weapons in the Countries of the former Soviet Union", dated January 1994. (USEC 1994a.) This document was not listed in the References in the appendix to the HEU EIS although referred to in the relevant parts of the principal document itself.

06.014

1. Starting in 1978, and increasing through the year 2000, the program of the U.S. and Russian governments to convert some of their HEU stockpiles to commercial nuclear fuel will create substantial excess supplies and glut the market.

12.018

OCAW's continuing concern is that the converted HEU from DOE will add to an already adverse oversupply problem caused by the Russian HEU Agreement. That Agreement will almost certainly force the shutdown of one of the enrichment plants unless USEC gains a comparable amount of market share or the converted HEU is held out of the market in inventory. Our concern about such results is fully justified based upon our review of USEC 1994a.

cont.

12.018: Predicting the future of the uranium market is not an exact science, and it is perhaps not surprising DOE has received conflicting comments on the projected uranium supply a few years in the future. The evidence seems to suggest that uranium from Russian and U.S. HEU disposition actions will enter the market at a time when annual production is expected to fall considerably short of demand, and prices are expected to rise substantially. In such an environment, and in light of the modest rates at which DOE expects to be able to make HEU available for blending, it is not expected that HEU disposition will have the severe impacts on uranium markets suggested by this comment.

The potential economic impacts to the enrichment plants should be significantly ameliorated by the provisions in the recently enacted *USEC Privatization Act*. The Act sets numerical limits on the quantities of Russian- and some U.S.-origin material that can be delivered to commercial end users, and requires DOE to determine that its sales of uranium would not have adverse material impacts on the domestic uranium mining, conversion, and enrichment industries. Based on the analyses performed for USEC's 1994 EA and DOE's analysis of the *USEC Privatization Act*, it is estimated that the U.S.-origin HEU would likely have only small marginal impacts on the domestic enrichment industry. The HEU Final EIS has been revised to reflect changes in delivery of the Russian and U.S. material under the provision of the *USEC Privatization Act* and the corresponding reduction in expected impacts.

The Department of Energy anticipates that supplying 50 t of HEU to USEC over a 6-year period will largely exhaust DOE's ability to make HEU available for blending during that period. Although DOE would not foreclose the possibility of making small additional quantities of HEU available during that period, it is expected that the bulk would probably not be available for commercialization until after the transfer of 50 t to USEC is completed. DOE intends to move cautiously and must abide by the requirement in the *USEC Privatization Act* that it avoid adverse material impacts on the domestic uranium industry in undertaking its uranium transactions.

06.014: The USEC *Environmental Assessment for the Purchase of Russian Low-Enriched Uranium Derived from the Dismantlement of Nuclear Weapons in the Countries of the Former Soviet Union* (USEC/EA-94001, DOE/EA-0837, January 1994) was inadvertently missing from the HEU Draft EIS reference list. This document has been added to the HEU Final EIS reference list (see USEC 1994a).

Comment Documents
 and Responses

This report establishes that the conversion and sale of the Russian HEU will displace substantial amounts of uranium production, conversion and enrichment in the United States. The displacement would result in significant job losses as a result of the shutdown of at least one of the U.S. enrichment plants in Paducah, KY or Portsmouth, OH. The conversion plant at Metropolis, IL is already running well below capacity and suffering depressed prices. The further reductions in conversion of uranium oxide (UO₂) to uranium hexafluoride (UF₆) gas that will be the result of the conversion and sale of the Russian HEU may make that plant wholly unviable. These results are inconsistent with the conclusions in the draft HEU EIS that there will be no significant economic impact on the uranium industry.

The HEU EIS notes at page 4-181 that, with regard to the economic impact on the enrichment process, "If HEU is blended down, less material would need to be enriched. Although blending would add new jobs, there would be little impact to enrichment-related employment because the escape operations and maintenance would need to continue (USEC 1994a)." To some extent, any long-term reduction of enrichment at the plants will have an adverse effect on employment. To the extent that production at the two enrichment plants is displaced and reduced to the point that continued production at both plants becomes uneconomical and one plant is shut down, then there will be a very adverse impact on employment, both at the shut down plant and in the surrounding communities.

Referring to the Russian HEU levels existing in the year 2000, the USEC report states, "The enrichment work required by the diffusion plants to meet demand would be low enough that either GDP [gross domestic product] alone could meet the demand." USEC 1994a, p. 6-21.

The Effect on Employment.

The shutdown of one of the U.S. enrichment plants would have a major impact on enrichment-related employment. Prior studies indicated the shutdown of the Paducah plant is estimated to result in an 11.5 percent increase in non-enrichment employment in that region; and if the Portsmouth plant is shut down, it is estimated to result in a 16.7 percent increase in non-enrichment there. In the "Funding of No Significant Impact..." included in USEC 1994a at page 6 it states, "[t]he purchase of the Russian HEU would have no negative impact on USEC's ability to meet customer demand. The possibility exists that total USEC production requirements could be met by our GDP [gross domestic product], particularly after the first five years when shipments from Russia would triple. Closure of one GDP could result in an increase in non-enrichment at Paducah by 11.5 percent, or at Portsmouth by 16.7 percent." (Emphasis added.)

The Russian HEU Agreement.

The U.S. government, and USEC as the Executive Agent for the U.S., have entered into an agreement with the Russian Federation and Minatom to purchase low enriched uranium (LEU) suitable for commercial nuclear fuel. It is to be converted from highly enriched uranium (HEU), which is to be derived from the dismantlement of nuclear weapons in the countries of the

12.018

cont.

former Soviet Union. USEC will contract for the purchase and delivery of the converted HEU from Russia and resale of it into the private nuclear fuel market primarily in the U.S. The DOE HEU will have a cumulative effect when added to the Russian HEU and should be considered in that context. At page 4-182 the draft refers to the Russian HEU Agreement as "a recent agreement but not a contract". We agree that the Russian HEU is indeed and, in fact, is critical.

This agreement was reached in 1993 and will be executed over a period of 20 years. It involves a total of 500 metric tons of HEU with an assay of 90 percent, more or less. It is to be converted and delivered at a rate of 10 mt of HEU, or 305 mt. of LEU, each year for the first five years. This was to begin in 1994, but delays resulted in only 6 mt. being delivered in 1995. The intent is to convert and deliver 12 mt. in 1996, with the balance delivered in 1997 - 99 at a rate of 10 - 11 mt. per year, more or less.

Beginning in the year 2000, the rate triples to 30 mt. of HEU, or 915 mt. of LEU, each year for the next 15 years. This compares to current U.S. demand for LEU produced at the two enrichment plants of 1,913 mt. per year. At these levels, the annual deliveries for the first five years would displace 16 percent of current production at the enrichment plants. Starting in 2000, the annual deliveries will displace 48 percent of enrichment production at the plants.

Displacement of SWU.

In order to understand the displacement impact of the Russian and DOE HEU being converted to commercial nuclear fuel, the best way is to look at the reduction on the separative work units (SWU) created in the enrichment process at the enrichment plants. The number of SWU produced measures the amount of work necessary to enrich the U235 content of natural uranium up to 3 - 5 percent. That compares to 90 percent U235, more or less, required for nuclear weapons. Currently, the two enrichment plants operate in tandem with Paducah enriching up to 1.5 percent and Portsmouth taking that and increasing it up to 5 percent.

Because the Russian and DOE HEU content of U235 far exceeds the 3 - 5 percent required for commercial fuel, it must be blended down. When USEC receives delivery it will already be in the form and percent of U235 necessary to fabricate into fuel pellets for electric utility customers. It does not go through the enrichment process at the plants.

The two U.S. enrichment plants now produce around 12 million SWU (MSWU) per year. The Russian HEU will displace just under 2 MSWU per year in the first five years. It will displace almost 6 MSWU per year starting in 2000. USEC calculated that SWU production at the plants would drop from 12 MSWU per year in 1994 to 10.1 MSWU per year in 1995-1999. Starting in 2000, SWU production would drop to 6.3 MSWU. USEC 1994a, Table 6-11, page 6-27.

The crucial determination made was that as long as the enrichment plants continue to run in tandem, it requires an enrichment production level of 7 MSWU per year to economically,

12.018
cont.

justify the operation of both plants. Either plant can operate independently, if licensed to do so. The USEC report states,

"[I]f levels of 30 MTU/yr of HEU, the enrichment work required by the diffusion plants to meet demand would be low enough that either GEP alone could meet the demand. As a result, even though the minimum demand of about 7 MSWU/yr to keep both GEPs operational from an economic standpoint would be met, there would be sufficient SWU capacity at one plant to meet increased demand." USEC 1994a, p. 6-21.

The Russian HEU will reduce enrichment at the plants below the 7 MSWU level. The 50 mt. of DOE HEU that is to be transferred to USEC under proposed legislation, and that is covered by the draft HEU EIS, will displace up to 400,000 SWU per year starting in 1998. In the year 2000, the cumulative effect of the DOE HEU and the Russian HEU will reduce enrichment at the plants to 5.5 MSWU/yr. Additional SWU from DOE sales of its remaining surplus HEU, if it comes into the market at the same time, would lower enrichment at the plants further, assuring the demise of one of the enrichment plants.

Other SWU from Russia, which is now subject to a dumping case and suspension agreement, or SWU from European countries made from Russia, Uzbekistan or Kazakhstan uranium, could reduce SWU production levels at the plants even more. USEC, the government corporation, might have been willing to operate the plants uneconomically, but USEC, the private corporation, will not be so inclined.

Overfeeding

USEC could add some or all of the nuclear uranium feed displaced to the enrichment process at the plants. That would reduce the adverse impact on uranium production and the conversion plant, but that would further reduce the total SWU produced and result in even more jobs lost at the enrichment plant. (USEC 1994a, Table 6-11, p. 6-27.) Furthermore, Mr. Wm. Timbert, Jr., President and CEO of USEC, testified before the Senate Energy Committee on June 13, 1994 that, "[t]he use of uranium by USEC for overfeeding is impractical under current economic conditions". Additional problems created by overfeeding the enrichment or otherwise reducing the overcapacity are described at pages 8 - 9 of the *Finding of No Significant Impact* cited above. See also USEC 1994a, pp. 6-28, 6-33 and 6-34.

The Cumulative Effect of the Converted DOE HEU

The DOE HEU proposed for conversion and sale is not of the same magnitude as the Russian HEU. However, the addition of the DOE HEU to the market will clearly be a factor in the decision to shut down one of the plants. USEC is supposed to be fully privatized this year and will be much more sensitive to cost and profit factors. USEC is required under contract law to "minimize the impact" on the enrichment industry, among others, from the sale of converted HEU. Under the proposed USEC privatization bill, the Secretary shall determine that the sale of

12.018
cont.

DOE/HEU will not have a material adverse impact on the domestic industry, taking into account the Russian HEU Agreement and the changing use disposition agreement. "Energy Policy Act of 1992", P.L. 102-486, Sec. 1408 (b), and proposed "USEC Privatization Act", S.755, Sec. 12 (d). The proposed legislation was also included in the Budget Reconciliation bill. Neither has yet been enacted.

2. USEC concluded that if it could not increase its market share enough to cover the increase from the Russian HEU, it would have to shut down one of the enrichment plants. USEC faces formidable obstacles to increasing its market share.

The USEC report states, "[Governmental impacts on the economic status of the communities surrounding the Portsmouth and Paducah CD's [uranium diffusion plants] are badly discussed in that the Russian LEM would involve significant enriched uranium that it might become economically attractive to close one of the CD's unless the anticipated increase in the market designed for USEC-enriched uranium occurs." Executive Summary, page 41, USEC 1994a. (Emphasis added.)

USEC outlines two scenarios in which it analyzes the effect on its business of the Russian HEU. One scenario is based on the Russians not converting the HEU. That minimizes the effect on the SWU and uranium markets, but has negative national security implications. The second scenario is based on the Russians converting the 500 metric tons of HEU, but selling it on the open world market rather than to USEC. This is the most relevant scenario and it is compared to the effects on the uranium, conversion and enrichment industries in the U.S. If USEC purchases all of the converted HEU as scheduled in the Agreement, under scenario 2, USEC would lose market share, revenues and profits. Under the Russian HEU Agreement as scheduled, at least one of the plants will shut down unless USEC gains additional market share. USEC 1994a, pp. 6-72 through 6-77.

USEC states in its 1994 Annual Report that the world market for SWU is essentially in balance between demand and enrichment at 33 million SWU. There are now 10 enrichment plants operating throughout the world (not counting small facilities in South Africa and Japan). Two are in the U.S., four are in the Russian Federation, and four are in Europe. In the 1970s the U.S. accounted for 100 percent of the commercial enrichment in the world. By 1991, the U.S. had been reduced to just under half of world demand. USEC 1994a, p. 5-16. In 1994, USEC held around 34 percent of that market. USEC Annual Report 1994. However, USEC also reports that the supply of enrichment will exceed demand by 50 percent over the next decade. Id.

The market for enrichment services is undergoing rapid change. With the end of the Cold War, governments are no longer intent on controlling the enrichment process for commercial nuclear fuel. Over the past two decades, uranium enrichment was "dominated by government-owned or supported suppliers with strong national security interests". Virtually all governments are now releasing the enrichment plants on the commercial nuclear fuel market. In the future, there will be a gradual "transition to commercially oriented suppliers operating in a

12.018
cont.

highly competitive market". (Longmacker, 1991) cited in USEC 1994a, p.5-16 and Reference, p. 9-2. But for now, a few governments still control the process. Some disruption in the market is inevitable with these changes.

The fundamental problem is that there is excess enrichment capacity, particularly with the entry of Russia into the market (Longmacker, 1991) USEC 1994a, p. 5-16. This excess capacity is producing an oversupply of enrichment, which is trying to force its way into a regulated and restricted marketplace. Furthermore, this "competition" for market share is taking place between what are essentially still government-owned or controlled producers. USEC 1994a, p. 5-20. USEC is to be privatized soon, but it will have to compete head-to-head with Minatom for market share.

The underlying problem of oversupply, excess capacity and government regulation of the market is now being exacerbated by the U.S. and Russian governments. The decision of the U.S. and Russian governments to convert substantial amounts of their bomb-grade uranium into commercial nuclear fuel will cause tremendous uncertainty and disruption in this emerging competitive market because they have such vast amounts of enrichment available from their nuclear arsenals relative to demand. The currently proposed volumes of Russian and DOE HEU converted to LEU is going to substantially oversupply the market for at least the next decade and probably beyond. This will drive down prices, possibly to unprofitable levels, unless something is done to cut supply or increase demand.

There will be no increase in demand for commercial nuclear fuel in the U.S. and, in fact, U.S. demand will start declining over the next ten years. With the addition of the DOE HEU, the supply of enriched uranium that will exceed demand by 50 percent or more over the next ten years. (See Quality of Operations Plan 1995 - 1997, page 3, prepared by USEC and Lockheed Martin.) The USEC 1994a report states, "Demand for nuclear fuel cycle goods and services in the United States will, at best, remain constant for the next 20 years and may even decrease." USEC 1994a, p. 5-17. (Emphasis added.)

There will probably not be enough new demand in other parts of the world to make up the difference. That means that USEC must take market share away from the European enrichment companies or from Russia.

3. USEC has restricted access to Europe for sale of enrichment services and cost-effective market enrichment services in Russia or other CIS countries. European enrichment capacity is fully operating and the U.S. cannot send uranium to Russia to be enriched. Both Russia and Europe restrict access to each others' markets. This is in sharp contrast to the open SWU market in the U.S.

The U.S., Europe and the Russian Federation are all trying to gain entry into each others' market while restricting access to their own. USEC 1994a, p. 5-19. The Europeans restrict their market through EURATOM with what amounts to an informal quota on export and enriched

12.018
cont.

uranium from the CIS countries. USEC 1994a, p. 5-19. Even the U.S. will have only limited access to this market under the recently renegotiated EURATOM agreement in which the U.S. will finally allow the Europeans to reprocess spent nuclear fuel of U.S. origin without prior specific approval.

The U.S. has, generally, banned the reprocessing of spent nuclear fuel for non-proliferation purposes and sharply restricts such reprocessing for customers of U.S. origin nuclear fuel. The U.S. requires prior approval for subsequent reprocessing. This has led many enrichment customers in reprocessing countries to forgo U.S. product, while the U.S. market is open to uranium from virtually all foreign sources. USEC 1994a, p. 5-20. This presents another obstacle to USEC efforts to gain market share.

There is a further problem with the Europeans and the CIS countries in the U.S. uranium market. Under the U.S. industry dumping case and suspension agreement, uranium imports from Russia, Uzbekistan and Kazakhstan were restricted. The industry thought, at the time, there would be little problem with SWU in enriched uranium since the Europeans were operating at capacity.

However, one of the European producers purchased Russian enriched uranium with the approval of EURATOM and delivered it to its utility customers. That freed up capacity at the European enrichment plant. The producer then purchased natural uranium from the CIS countries, which was bought at well below market price because it was restricted from the U.S. market. That producer then had it enriched in Europe which transformed its origin from CIS to European and the enriched uranium was then sold to U.S. utilities at very competitive prices.

These utilities were worried by the Commerce Department that this arrangement could result in entry being denied for these imports of enriched uranium because of circumvention of the dumping laws here in the U.S. These imports of enriched uranium have been held up, but may be permitted in by the Commerce Department under a grandfathering agreement for some past purchases. This could add another 4-5 million SWU to the market over the next three or four years. This has been referred to as the "bypass" problem.

There are additional differences between the U.S. and other markets that will make USEC's task to gain market share formidable. The U.S. market has a much greater proportion of its contracts on a short-term or spot basis than in other countries. USEC 1994a, p. 5-19. This not only makes USEC more vulnerable to competition, it has a much smaller number of foreign customers or bids for which it can compete.

12,018
cont.

4. Thus, if demand is not going to grow sufficiently to absorb all of the Russian and DOE converted HEU, and if USEC is not able to capture enough market share from other countries, then the only remaining option is to reduce supply.

IF USEC buys all of the converted Russian HEU and most of the DOE's, it must either hold it in inventory or cut back on purchases at the plants. If USEC holds the converted HEU in inventory, it can keep prices up, hold market share and maintain production. That will result in fewer negative effects on the uranium producers, the conversion plant and the workers at the enrichment plants. USEC 1994a, pp. 6-32 through 6-37.

IF USEC recalls all of the converted HEU back into the market, it must shut down at least one plant or prices will collapse. By shutting down one plant USEC may be able to save its profits, though the jobs will be lost. USEC concedes that it may be required to cancel the leases on one or both of the enrichment plants and cutback or terminate some of the electric power contracts for the plants. USEC 1994a, p. 6-36.

USEC sees three alternatives as much more desirable than not buying all of the converted Russian HEU and most of the DOE HEU. If USEC, or the U.S. government, does not buy the Agreement, if these supplies come into the U.S. or world market on a competitive basis, prices would drop and USEC would lose production, revenues and market share. USEC would probably still have to shut down a plant and suffer a loss as well. At least if USEC controls all of the converted HEU, it argues that it can maintain prices, profits and its customer base, even if it cannot gain market share and has to shut down one of both of the plants. These options are presented by USEC in two scenarios in its environmental assessment. USEC 1994a, pp. 6-32 and 6-37.

There are some of the conditions that USEC and the Secretary are required to take into account with regard to sales of converted Russian HEU, and sales of DOE HEU, during the Agreement. The Russian HEU Agreement and the suspension agreement in the Russian changing case. In any sale of converted HEU by DOE it will be difficult to avoid adding to the material adverse effects that will already be happening in the uranium production, conversion and enrichment industries as a result of the sales of the Russian HEU.

The problem is the massive and abrupt injection of excess supply by two governments into a market, already plagued by excess capacity and change. The solution is to phase in the additional supplies and open foreign markets to it. In either event, DOE must consider sale of its converted HEU in this excess supply context.

Proposed Changes to the Draft HEU EIS.

OCAW's initial concerns, as stated in Mr. Wagers letter of November 14, 1995 to Mr. J. David Nulken, were based on the proposal to convert and sell 170 mat. of HEU. Under the

12.018
cont.

"maximum commercial use" option, that could have been accomplished by 2002. There was no statement of the UZS5 assay of the HEU so we could not calculate how much enriched uranium fuel would be produced and dispatch U.S. uranium production, conversion and enrichment. In addition, the reference materials on which the HEU EIS based its conclusions about the socioeconomic impacts were not identified, so we were unable to evaluate the conclusions stated in the draft HEU EIS.

The conclusions were that the DOE HEU would displace two percent of world uranium production and seven percent of U.S. production, but because imports now represent 70 percent of U.S. demand the impact would be greater on foreign suppliers. The conversion industry is already depressed and that will make it worse and extend the time in which it might recover. Finally, there would be little impact on enrichment-related employment because the cascade operations and maintenance would be continued. That conclusion of little impact on enrichment-related employment was inconsistent with everything OCAW knows about the prospect for the enrichment industry in the U.S., particularly with regard to the impact of the Russian HEU Agreement.

Mr. Nibben and the staff of the Office of Fissile Materials Disposition have been very helpful and forthcoming in defining the scope of the actual amounts of HEU material that will be made available and the timing of their availability. Based on our meeting with the staff on December 13, 1995 and Mr. Nibben's letter response to ME. Wages of December 14, we have a much better understanding of the proposal.

That understanding is that a total of 175 metric tons of HEU material is covered by this proposal. However, only 103 metric tons will be converted to commercial nuclear fuel and sold into the market. Of that, 13 m.t. has already been transferred to USEC pursuant to the Energy Policy Act of 1992; and 50 m.t. will be transferred to USEC pursuant to pending legislation. The other 40 m.t. will be converted by DOE and sold into the market. Out of the balance of 72 m.t., ten tons will be reserved for other government program uses and the remainder will be converted to waste or some other unusable form.

The 50 m.t. to be delivered to USEC has an assay of 40 percent U235. The final HEU EIS will specify deliveries, on a fiscal year basis, of 2 m.t. in 1996; 5 m.t. in 1997; 10 m.t. in 1998; and 11 m.t. in 1999 - 2001. The 7 m.t. is currently available, but the balance depends on bringing facilities back on line at Oak Ridge to convert and process the HEU. It is equivalent to 3.3 million separate watt-meters (MSWU) or 12.48 million lbs. of U3O8 equivalent. Under the proposed legislation, USEC could not deliver any of that material to end users before 1998 and then at no more than 800,000 SWU per year. That would presumably take four to five years. Currently USEC is not licensed to hold HEU. USEC wants the HEU converted to UF6 but there are currently no facilities in the U.S. to convert metallic uranium to that form. USEC believes those facilities could be made available in about 18 months.

12.018
cont.

06.016: The cited information will be incorporated, as appropriate, in the HEU Final EIS and in any ROD(s).

The 40 mt. that will be converted by DOE to commercial fuel has an assay of 50 percent U235. It will yield 3.4 MGSWU or 12.58 million lbs. U308 equivalent. However, the staff indicated that it will take until FY1998 to bring facilities at Oak Ridge back on line to process and receive the HEU. When on line, the capacity at Oak Ridge would be approximately 10 m.t. per year and that would be a constraint on deliveries of HEU which then must be converted to commercial nuclear fuel. The conclusion is, therefore, that the 40 mt. of HEU could be delivered over a 10 - 15 year period for sale by DOE beginning as early as 1994, due to the constraints of bringing the Oak Ridge facilities back on line.

What is not clear is the extent to which the processing and delivery of the USBC material (50 mt. HEU) will proceed on a year-to-year basis with processing and delivery of the DOE material (40 mt. HEU). It is important to determine this in the final HEU EIS with as much precision as possible.

This information is necessary to determine the cumulative socioeconomic effects from the combination of the DOE HEU and the Russian HEU. This HEU will displace enrichment at the general diffusion plants (GDP), as well as uranium production throughout the U.S. and from foreign sources, and conversion at the Metropolitan, IL, plant. It is critical to know how much uranium and SWU will be available each year under this proposal, particularly in the years 1998 - 2003. These are the years that will have the greatest impact on the uranium production, conversion and enrichment industries due to the Russian HEU Agreement and the changing ease of negotiation with Russia. The Secretary is to take these agreements into account and avoid adverse impact on these domestic industries in this program to convert and sell surplus HEU from the DOE stockpile.

The 170 metric tons of HEU is the total of the material, together with some plutonium, that is covered by the U.S. obligations under SALT II. Unless there are further disarmament agreements that reduce the dismantlement of nuclear weapons, or the President otherwise declines some of DOE's surplus stockpile-HEU as surplus, there will be no further amounts of HEU converted to commercial nuclear fuel and sold into the private market.

We request that, to the extent it is accurate, all of the above information be confirmed and made part of the Record of Decision in the final HEU EIS.

Mr. J. David Nulton, Director
 Office of NEPA Compliance and Outreach
 Office of Fissile Materials Disposition
 U.S. Department of Energy
 1000 Independence Avenue, S.W.
 Washington, D. C. 20585

Dear Mr. Nulton:

The Department has recently published a "Draft Environmental Impact Statement for Disposition of Surplus Highly Enriched Uranium" ("HEU EIS"). The comment period ends on January 10, 1996. We are requesting a 120-day extension of the public comment period for the reasons set out in this letter.

The issue raised in the draft HEU EIS are complicated, and are of the utmost importance to the workers at the two uranium enrichment plants, the uranium producers and other suppliers and contractors in the uranium enrichment industry. We are vitally concerned about the impact this surplus HEU converted to LEU will have on the enriched uranium market.

A cursory review of the document does raise disturbing issues regarding the disposition options proposed. There appears to be little definitive analysis of the various options in terms of how they would impact the workers and production at the enrichment plants, particularly under the privatization process that is slated to occur starting next year. We are especially concerned about any large amount of HEU being dumped on the market from the DOE's stockpiles. The legislation to complete the privatization of USEC requires that there be no adverse impact on the enrichment industry. That issue needs to be addressed before the Department of Energy (DOE) considers adopting any of the disposition alternatives proposed in the HEU EIS. The disposition of the first 50 metric tons is addressed in the legislation, but the additional amounts are not addressed beyond the general requirement that there be no adverse impact. The option to blend the LEU to 19 percent and store it indefinitely appears to have received no consideration in the final options, when that might

32.003

12.001

09.001

32.003: The Department of Energy originally designated a comment period of 45 days running from October 26 to December 11, 1995. In response to requests from the public from several reviewers, the comment period was extended until January 12, 1996. DOE feels that the total comment period of 78 days provided an adequate period for review and comment based upon the length and content of the document.

12.001: The quantity of materials addressed in the HEU Draft EIS was established to evaluate the environmental impacts associated with the maximum amount and processing rate of HEU that might potentially be made commercially available for use in reactor fuel. The rate at which material would actually be introduced into the market by DOE would be significantly less because of DOE's ability to make the material available for blending and because a portion of the inventory is in forms (such as irradiated fuel) that would not be suitable for commercial use in the near term, if ever. The processing rates in the HEU Final EIS (Section 2.1.2) are revised to reflect more realistic assumptions about the rates at which LEU fuel derived from surplus HEU might be made available for commercial sale. DOE estimates that no more than 8 t per year total would be blended for commercial use.

The rate at which LEU fuel derived from surplus HEU-derived material could be introduced into the commercial market would be determined over time by many factors, including the rate at which the material becomes available from the weapons program, physical infrastructure, legislative guidance, and future market conditions. DOE's physical ability to make surplus HEU available for blending is constrained because much of it is in forms that cannot be used without prior processing and there is limited availability of processing capacity (such as for weapons dismantlement). It is anticipated that delivery of the proposed 50 t of material to USEC over the next 6 years will largely exhaust DOE's delivery capabilities during that period. From the existing surplus, only an additional 40 t of material is likely to be blended and introduced into the market for commercial use over a period of 10 to 15 years. Both the *Energy Policy Act* of 1992 and the *USEC Privatization Act* require the Secretary of Energy to determine that sales of uranium will not have adverse material impacts on the domestic uranium industry. Based on these considerations, DOE does not believe that the rates of disposition of domestic surplus HEU will have significant impacts on the U.S.-Russian HEU agreement. DOE will take these and other factors into account in making its decisions concerning uranium sales.

OIL, CHEMICAL & ATOMIC WORKERS INTL. UNION,
LAKEWOOD, CO
PAGE 2 OF 2

Disposition of Surplus Highly
Enriched Uranium Final EIS

Page 2

be the best alternative, including return to the Treasury when the privatization value of the corporation is taken into account.

This HEU, if converted to LEU in the form of nuclear fuel and sold on the schedule suggested, added to the LEU being brought into the market as a result of the U.S.-Russia HEU agreement, can only have one effect: the destruction of the U.S. uranium enrichment processing industry. There is absolutely no question that one and probably both of the processing plants will have to curtail operations if the planned disposition of the DOE stockpile proceeds on its present course. It would also appear to undermine the Russian HEU agreement to the extent it suppresses prices to levels unacceptable to the Russians. We believe that the effect that the preferred option would have on that agreement should also be considered.

It will be useful to hold the planned workshops in Tennessee and Georgia. Given the direct impact this would have on the enrichment plants, we suggest the hearings be conducted in Paducah, KY and Portsmouth, OH as well.

We will provide the Department with detailed comments on the HEU EIS after we complete our technical analysis. We also request that DOE provide the supporting documents and analysis on which its conclusions are based, particularly its economic analysis. We are particularly interested in the analysis used to conclude consideration of the option of blending to 19 percent and storing the LEU indefinitely. We would need additional time to consider this information and analysis, and we therefore respectfully request that you extend the time for additional comments.

Sincerely,

Robert E. Weges
President

09.001
cont.

12.001
cont.

32.004

30.002

09.001: The proposal to transfer 50 t of HEU and 7,000 t of natural uranium to USEC is specifically authorized by section 3112(c) of P.L. 104-134. This law also requires that the delivery of DOE uranium to end users should not have adverse material impacts on the domestic nuclear fuel cycle industry. DOE intends to comply with that requirement. The option to blend HEU to 19-percent LEU and store it indefinitely was not considered a reasonable alternative because it would not provide for recovery of economic value or peaceful, beneficial use of the material, it would necessitate construction of new or expanded storage facilities to accommodate the increased volume of the material (if applied to a substantial quantity of HEU), and it would require additional processing in the future either for commercial use or disposal as waste. If DOE decides to withhold material from the market for an extended period, it is likely to continue to be stored as HEU, possibly with IAEA oversight.

32.004: DOE must work within the constraints imposed by available funding and resources. To reduce costs of complying with NEPA of 1969, as amended, and due to the geographical proximity of three of the four candidate sites identified in the HEU EIS, DOE determined that two public meetings (Knoxville, TN and Augusta, GA) would be appropriate for this program.

Because public involvement is critical to the success of the program, DOE provided toll-free fax and voice recording, and an electronic bulletin board, as other methods for submitting comments throughout the comment period. Comments were also accepted by U.S. mail.

30.002: Technical documents supporting the HEU Final EIS are available for inspection in 12 DOE reading rooms, published in the *Federal Register* (60 FR 54867) on October 26, 1995, announcing the availability of the HEU Draft EIS. The option of blending to 19 percent and storing the LEU indefinitely was eliminated by the screening process for surplus HEU disposition alternatives because it would not recover the economic value of the material or provide for peaceful beneficial use; would necessitate the construction or expansion of storage facilities to accommodate the increase in volume of material; and would require additional processing for either commercial use or disposal. Cost estimates for the alternatives analyzed in the HEU EIS have been developed to provide the decisionmaker, DOE, comprehensive information upon which to make decisions. The cost analysis (which has been provided to this commentor and all others who have expressed an interest in this subject) is available in a separate document with the HEU Final EIS and supports DOE's preliminary conclusion that commercial use of LEU fuel derived from surplus HEU would save billions of dollars compared to the alternative of blending HEU for disposal as waste.

P.O. Box 23786
Washington, D.C. 20026-3786

REGARDING:

(a) Ltr. 10-19-95, Disposition of Surplus Highly Enriched Uranium EIS (HEU EIS)

COMMENT: EIS (HEU EIS) Regardless of the alternatives for disposition, storage will be required. In view of the Environmental opposition to locations, I wonder: Has former U. S. Army above ground storage areas been considered? Former Army Depot, Igloo S.D. had 50L above ground, isolated storage igloos with few people and large buffer zones.

06.001

(b) Fact Sheet, 10-17-95, Reading Room Locations, Storage and Disposition of Weapons-Usable Fissile Materials Programmatic EIS (FEIS)

COMMENT: EIS (FEIS) Same as above.--Has former U.S. Army above ground storage areas been considered?

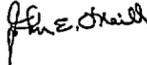

(c) Newsletter, Fall 1995, Vol 1, Management of Nuclear Weapons Materials, Management and Disposition of Excess Weapons Plutonium (a report)

COMMENT: Newsletter (Excess Plutonium) Madison Indiana has a large electric power plant (Indiana Kentucky Electric (IKE) that is producing power for Plutonium manufacture at Portsmouth Ohio. Would you comment on the future need for the electric energy?

06.002

Sincerely,

John E. O'Neill
1713 Oak Hill Dr.
Madison, IN 47250
PH: 812-273-1600

06.001: The Department of Energy's current plan is to store most surplus HEU at the Y-12 Plant at ORR pending its disposition. Extended storage is not contemplated after the material is blended down to LEU. Rather, HEU will only be blended down when it can be promptly moved into the pipeline for either commercial use or disposal. Thus, other sites, such as former military sites, are not needed for storage for this program.

06.002: The Portsmouth Gaseous Diffusion Plant in Piketon, OH, a DOE-owned facility that is leased by USEC, consumes large amounts of electricity in the process of enriching uranium for the commercial nuclear industry. The plant formerly produced HEU for the nuclear weapons program but it never produced or handled Pu. To the extent that blending down surplus HEU for commercial use displaces the need to enrich natural uranium, electricity consumption at the Portsmouth facility (and at its sister facility in Paducah, KY) would be reduced.

SUBJ: Disposition of Enriched Uranium-Fissile Materials

Dear USDOD Person;

I would suggest the following position in regard to the disposition of enriched uranium. I would favor the position that the uranium be stored in its current status, but given to the treasury at Fort Knox to be stored in safe and secure underground guarded storage out of the hands of the military, the DOE, and the private nuclear fuels sectors.

I believe that blending down would be a mistake because it creates more mass to be stored and secured and additionally burdens the environment and the national budget. I believe that its use in nuclear reactors should be prevented because nuclear reactors are too expensive and unsafe to build at present. There is a severe problem with nuclear power generation involving the generation and release of fission release heavy gases like Krypton and Xenon that don't mix well in the atmosphere, which decay to Strontium and Cesium that cause enormous damage to the environment and the health and welfare of the citizens of the United States. Krypton and Strontium reside in the same toxic class as Plutonium as a reference, except these are more dangerous because they are water soluble and pick up in the human chains. These problems have been covered up by the Atomic Energy Act that says any and all measures may be pursued to insure the production of nuclear weapons and also the NRC code Chapter 501 that states its OK to treat the illnesses, but not to disclose the causations. So, until the USDOD wants to engage in openness in the discussion and research of these problems associated with the real problems with the fission processes that they and private industry be denied the continuation of such an improper process, because its illegal and has some large liabilities.

I further believe it sends a positive message to the world to change the disposition of these materials from the DOE, the DOD, or the nuclear industry that the US has seen their is harm associated with these processes that we want to get away from as a country and as a world. I further believe the USDOD has been lax in its treatment of these materials and should not be entrusted with them as a simple message that they did not do their job for the US citizens. Y-12 has never been a proper place to store this stuff. Perhaps you haven't noticed, but the largest US nuclear accident is at the Y-12 burial ground called the walk in pits. Its almost a Chernobyl class accident covered-up by Y-12 and DOE and The people Protection Act. The DOE and Y-12 has proven beyond a shadow of a

10.020

10.020
cont.

10.020: One of the objectives of DOE's proposed action is to blend down surplus HEU to LEU to eliminate the risk of diversion for nuclear proliferation purposes. This action is aimed to set a nonproliferation example for other nations and encourage them to follow the same path in transforming HEU into other forms for peaceful and beneficial reuse of the material to the extent possible. Russia has already agreed to blend down and sell substantial portions of its HEU inventory. This proposed action would bring the United States into a reciprocal disarmament posture consistent with them. Storage of surplus HEU in its current form in a new facility with state-of-the art protection systems would require substantial capital cost and continued operating costs. However, storage of this material at the Y-12 Plant (where most of the material currently is) until disposition for up to 10 years, would avoid transportation impacts and additional costs for a new facility. An environmental assessment conducted for the storage of HEU at Y-12 facilities concluded that the facilities are adequate for up to 10 years. Any necessary storage beyond the 10-year period would be covered by the Storage and Disposition PEIS or subsequent tiered or supplemental NEPA documents.

PHELPS, JOHN E., KNOXVILLE, TN
PAGE 2 OF 2

doubt that it can't be trusted or store enriched uranium in a safe fashion!

I believe that the enriched uranium have a great value in their present form as a possible use in futuristic space platforms and space travel. They also possess a contingency value should they be required for future nation defense options, way down the unforeseeable road. I believe there is no value to be had in their blanding down to be used in nuclear power generations because the costs in health and building is to extreme. The storage of the uranium in its present form, largely metallic metals in sealed stainless steel cans be the most preferred option. That they be stored at a very secure and well protected place/s like Ft. Knox or a relocation of Government facility would also be preferred. That the protection systems be state of the art and provide for international inspection.

10.020
cont.

There have been enough cover ups of the problems associated with this stuff and it needs to stop. I regard tinting or vitrification of these materials as totally off base because it can be easily reclaimed chemically. I regard the blanding down as dangerous too because its us in nuclear power generation is dangerous to humans. Perhaps you have not noticed that when you fission uranium it produces fission gasses sometimes called fallout that is just as harmful as dropping a bomb except for the flash and percussion wave. It results in severely damaged immune system health disorders.

Just store it safely and compactly in a very safe location out of the DOD/DOE and nuclear industry misuses. I believe that if you consider these points carefully you or whoever can only come to the same conclusion and I believe I can systematically and logically substantiate this conclusion. I'm really tired of being lied to under the auspices of national security.

Sincerely

John E. Phelps

December 15, 1995

To: DOE Office of Fissile Material Disposition
HEU EIS
P.O. Box 21786
Washington, DC 20026-3786

Dear Sir:

Subject: Comments on Disposition of Surplus HEU Draft EIS (DOE/EIS-0240-DS)

Having reviewed the options proposed in the Draft EIS for the surplus HEU disposition, I have the following comments for your consideration. Among the options proposed, there is only one - Maximum Commercial Use - that makes reasonable sense. Recently, there have been numerous examinations of the legacy of the nuclear weapons complex by the NAS, ANS, EPRI, the Rand Corporation, and the Brookings Institution, among others. All of them reveal the enormous cost involved in the production of nuclear materials and the anticipated costs of environmental restoration from materials production. It is therefore reasonable to expect that the well-intentioned arms reduction process also examine alternatives that will minimize additional expenditures to U.S. tax payers in the name of nuclear material disposition.

While it is obvious that the production of fissile materials for nuclear weapons have been expensive, there are also arguments to substantiate that these materials are extremely valuable and can be put to beneficial uses for the next generation. HEU is indeed a very valuable material and the likelihood of it being stolen from U.S. stockpiles almost nonexistent. However, in order to encourage the Russians to remove materials from their stockpile and to convince the international community that arms reductions proposed by the U.S. is real, we have to remove it from the defense fuel cycle. Inexpensive of all the wifidul thinking on the U.S. side, the Russians consider the fissile materials as a valuable resource and are determined to use them for energy production or sell them to those who will provide them with hard currency.

HEU removed from defense fuel cycles can be put to use for the tax payers by using it for energy production in the commercial sector under IAEA safeguards. Since systems and technologies for safeguarding this material in the commercial fuel cycles are well established, it would be extremely important to maximize the use of this material for energy production. There are still about 35 research reactors, 110 commercial reactors, and 135 nuclear propulsion reactors in operation in the U.S. that can, in time, use up all these HEU and more. Although the cost recovery may not be much to crow about, the only intelligent option is to use the surplus HEU for peaceful purposes under IAEA safeguards.

Washington, DC 20026-3786

Page 2 of 3

The scenarios for blending discussed in the Draft EIS do not make much economic sense. It is appropriate at this time to recognize that the next major disaster waiting to happen within the defense production complex is the deterioration and leakage of some 200,000 m³ of UF₆ stored in open fields. The HEU disposition opportunity could be used to remove about 10,000 tons of the depleted UF₆ from its present vulnerable condition. A proper extension of this disposition program could also be used to stabilize and store all hazardous volatile forms of uranium.

06.007

From a process chemistry perspective, it would be prudent to blend the HEU as UNH, which is an intermediate in the preparation of oxides for nuclear fuel. This process, in principle, can be conducted at existing DOE sites or at the two facilities fabricating naval fuels. However, establishing a safeguards regime in existing facilities within the defense complex and facilities manufacturing naval fuels is not the ideal. Retro-fitting these facilities to meet IAEA safeguards requirements would be more expensive than building a new facility just to blend the HEU with DU. The Erwin facility and the B&W facilities are some of the most dilapidated and poorly kept facilities in the U.S. and they have been hiding behind the smoke screen of naval fuel production. The NRC has been somewhat delinquent in the enforcement of safety and safeguards at these two facilities because of the so-called importance of their mission. It would require enormous resources to bring these facilities into an international safeguards regime and considerable amount of information on "materials unaccounted for" at these facilities will have to be released while establishing safeguards for new operations. Unfortunately, no one has yet addressed the issues of establishing IAEA safeguards for a facility and the true costs associated with it. It is imperative that the blending facility be under IAEA safeguards because of the tremendous value in convincing the international community that the U.S. is really removing the excess HEU from the weapons fuel cycle.

15.004

Arguments in the draft document about job losses in uranium mining, milling, conversion, and enrichment are ridiculous if we consider the benefits of not mining uranium, at least for a while, and removing one of the dangerous residues of the weapons program - the depleted uranium hexafluoride - from the environment. I hope we are not going to wait for the next major disaster to erupt when hexafluoride containers by the thousands start leaking into the environment.

12.007

All uranium resources are valuable and they are part of the finite resources of this planet. It is incumbent on us to maximize the use of these resources that are already extracted to benefit mankind rather than burying it in Nevada or elsewhere. The people of Nevada are already objecting to creating plutonium and uranium mines of the future in their backyard through the burial of spent fuels there. If we start another initiative to bury excess uranium in Nevada, there will be a guaranteed postponement of the Yucca Mountain repository for at least another century.

06.007: The Department of Energy agrees that it would be advantageous to use its copious stocks of depleted UF₆ for the surplus HEU disposition program if possible. Unfortunately, for technical reasons having to do with the U-235 content of the product material, depleted uranium would generally not be the preferred blendstock for surplus HEU destined for commercial use. Depleted uranium is likely to be used as blendstock for material that must be disposed as waste, but since UF₆ blending would not be used for waste material, and DOE has ample depleted uranium stocks in the form of oxides and metal that are more readily used in the UNH and metal blending processes, the depleted UF₆ at the enrichment plants is once again unlikely to be used.

15.004: The fact that domestic safeguards regimes (pursuant to NRC or DOE rules) are already in place at the four facilities considered for HEU blending in the HEU Final EIS is one of the major advantages of those facilities over a potential "new" one. Moreover, IAEA safeguards have already begun to be implemented for HEU at two of those facilities, Y-12 and B&W. To the extent that those facilities, or either or both of the other two facilities analyzed in this EIS (SRS and NFS), are involved in HEU disposition actions, DOE's intent is to subject such activities to IAEA safeguards to the maximum feasible extent. Although some special expenditures are involved, it does not appear that "enormous resources" would be required to bring these and the other facilities into an adequate international safeguards regime with respect to their HEU disposition activities. As the commentor notes, the safety and safeguard issues with respect to the B&W and NFS facilities are the responsibility of NRC. The operating records of those facilities do not appear to support the suggestion that they have presented serious public safety or safeguard challenges in the past.

12.007: Socioeconomic impacts on the uranium industry are foreseeable consequences of HEU disposition actions involving commercial use of the material and so must be considered pursuant to NEPA. The positive environmental impacts from avoided portions of the uranium fuel cycle are also relevant consequences of the program and so they also are considered. Unfortunately, due to the need for particular isotopic compositions for commercial material, it is unlikely that any significant quantity of depleted UF₆ can be used as blendstock in the HEU disposition program.

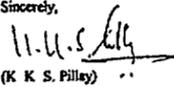

To DOE Office of Fissile Material Disposition
HEU EIS
P.O. Box 21786
Washington, DC 20026-3786

Page 3 of 3

Considering all the issues of HEU disposition, it seems prudent to remove the excess materials from weapons complex and store them under IAEA safeguards as soon as possible. This will also meet with the President's offer to place 200 tons of fissile materials under IAEA safeguards. For the long-term, the excess materials should be blended and introduced into the market without seriously impacting prices, while maximizing the energy-related and other beneficial uses. The blending operation should be performed in a brand new commercial facility, under IAEA safeguards, with no other mission conflict. The cost for this new facility should be recovered from the sale of fuel materials produced and sold. This initiative should be used not only to reduce, but to eliminate the DU inventory in gaseous form. The DOE's inventory of NU as hexafluoride may be sold to enrichment facilities for cash.

08.004

Sincerely,

(K. K. S. Pillay)

08.004: The Department of Energy agrees that commercial material needs to be introduced to the market at a rate that does not seriously impact prices. DOE does not consider new commercial facilities necessary for this activity but has no objection if commercial entities wish to license and build them. IAEA safeguards will be applied to HEU disposition activities to the maximum feasible extent. For technical reasons, the use of significant amounts of depleted UF₆ as blendstock is considered unlikely.

FAX (800) 820-5156

Dear Mr. Nulton:

Re: Comments on "Disposition of Surplus Highly Enriched Uranium Draft Environmental Impact Statement"

I appreciate the opportunity to comment on the October 1995 Draft EIS for surplus HEU disposition. I would like to provide the following comments on the Draft EIS.

- I fully support the DOE position that beneficial use of the surplus HEU is the preferred alternative. We do differ on the constraint that limits the scope of the EIS which are connected to the President's non-proliferation policy of September 1993. The policy doesn't work. The most recent evidence of this is discussed in recent newspaper article associated with the Russian sale of enriched uranium. The alternatives included in the EIS should not be constrained by this policy. 10.003
- The screening process is seriously constrained by accepting the President's Nonproliferation Policy. Before this action can be completed, there may be several Presidents, each with different policies. Don't constrain the alternatives analyzed in this EIS by this policy. 03.025
- Recognizing the government's commitment to the President's nonproliferation policy, I will confine the remainder of my comments on the EIS as if that was a given. The proposed action should commit to continued evaluation of the nonproliferation commitments and the uncertainties associated with sale of slightly enriched uranium and diluting HEU to LEU only as needed to meet sales commitment. 03.018
- Continued work should be expended to find a buyer for the HEU listed as potentially a waste before committing to discard it as waste. I hope that there is some value for the 20 to 45% of the 200 metric tons of HEU. Sale may not bring top dollars but it should have value. 04.016
- Don't blend down HEU for disposal until the surplus plutonium PEIS ROD has been issued and the final disposal of the similar plutonium materials are made. 28.004

10.003: Comment noted.

03.025: The alternatives considered in an EIS are not necessarily constrained by current legal requirements and policy positions. The President's nonproliferation policy stems from the end of the Cold War, the need to downsize weapons stockpiles, and the need to do something to reduce the threat posed by excess weapons materials. The President's policy constitutes the basis for the proposed action in this case. To give the administration flexibility to choose whatever course it wishes, the HEU EIS covers all possible reasonable alternatives, including continued storage of HEU (the No Action Alternative).

03.018: In general, DOE does not expect that blending actions will be undertaken until either sale of the material for commercial nuclear fuel or transportation to a repository in the case of blend to waste has been arranged.

04.016: The Department of Energy agrees that much of the off-spec material may have commercial value and intends to aggressively seek buyers for it.

28.004: Surplus Pu and surplus HEU disposition actions are not connected to each other. Consequently, it is not necessary to delay surplus HEU disposition actions, which are relatively simple, until more complex and unrelated surplus Pu disposition decisions are made.

- The EIS should include a discussion on the separative work loss associated with blend down. | 12.022
- I fully support safeguarding this HEU and continuing to work to ensure that every country has safeguards to keep this HEU out of the hands of people and countries that would use it for nuclear explosives or sabotage. | 15.005
- The employment figures given in the DEIS (primarily in Chapter 4) should be placed in perspective with other DOE employment changes. Will the added employment be met by DOE and M&O contractor personnel that would have otherwise been let go? | 24.006
- On page S-5 and elsewhere in the EIS the statement is made that "disposition actions (for this HEU) will be made by Department, USEC, or other private entities acting as marketing agents." This type decision rests with DOE alone and USEC and private entities should not be involved. Fix the EIS. | 01.008

Very truly yours

W. Lee Poe, Jr.
807 E. Rollingwood Rd.
Aiken, S. C. 29801

12.022: Section 4.8 of the HEU EIS includes a discussion of the expected impacts on the uranium enrichment industry (separative work loss) from HEU disposition. This discussion is enhanced in the HEU Final EIS to better account for the cumulative impacts from Russian HEU purchases and to reflect enactment of the *USEC Privatization Act*.

15.005: The United States is working with Russia and other nations to help improve safeguards of their fissile materials.

24.006: Some of the new jobs generated at the sites would likely be filled with current DOE and contractor employees who might otherwise have been let go, thereby reducing the impacts of planned DOE downsizing. However, some of the jobs may require specially qualified workers not already available at the site.

01.008: Programmatic and policy decisions concerning the disposition of surplus HEU will be made by DOE in consultation with other appropriate agencies. It is only the specifics of commercial, business, and contracting decisions pertaining to HEU disposition actions that might be made in part by USEC or other non-DOE parties.

This is Bernard Proctor. I live in Madison Heights, Virginia, and I live across the James River in close proximity to the commercial and naval nuclear fuel facility, Babcock and Wilcox. I have seen the articles in the Lynchburg news concerning the possibility of distributing uranium for the process of dilution and offer the following questions and comments. First of all, I'm not real sure or if will be made known what this process of dilution actually is, and how it might affect those of us adjoining the facility. Secondly, we live on a farm and have groundwater sources, and I am not certain what the impact would be on our soil and water quality. I believe the Environmental Impact Statement should address these issues, particularly on those areas in close proximity to this facility that might be contracted to process this material. The Lynchburg news indicated that the storage of the material would not be lengthy, and it indicated however, that there would be a certain portion of the material that would not be immediately useable or could be reused and it would require storage. It would appear to me that the question of storage should be addressed definitively in the Environmental Impact Statement to the extent that how it would be and what the final disposition of this waste product or byproduct would be until there was a or for long term storage or for some end-user. I believe safety has always been a concern at B&W and will probably continue to be. Several years ago, lights were added to provide for physical safety on the plant, and these have been somewhat of an annoyance to the adjoining property owners. It concerns me that there may be some process of dilution and storage of this highly enriched uranium which may impact us again, but we need to be fully informed of what we need to know with respect to safety and other quality issues. With respect to safety, if there is a release of this material or a release during some process of this material, then I think anyone living near the facility should be named specifically in some manner of an environmental hazard. According to the newspaper, there had been other releases at the facility, but these were not found to endanger any persons or property. I would be concerned that any release may be of some damage or be of some concern to the adjoining property owners and should be able to participate in the decision on whether such a release is potentially harmful. At least to know after the fact is not encouraging. I think these are all the concerns that should be included in the Environmental Impact Statement, and I would be happy to comment to anyone at the local facility to discuss these concerns, particularly with respect to the B&W facility here in Lynchburg. My address is Route 5. [At this point, time ran out on the message.]

22.002

26.001

21.002

22.002: The process of HEU dilution is discussed in Chapter 2, Section 2.2.2. Potential impacts of these processes on groundwater resources, soil, and water quality are described in Chapter 4 of the HEU EIS. As discussed in Chapter 4, there would be no direct discharges to surface water and groundwater, and, therefore, water quality would not be affected. Any wastewater that is to be discharged to surface waters would be monitored and treated prior to being discharged and would not be released until it meets all local, Federal, and State permit requirements.

26.001: The rate at which surplus HEU could be introduced into the commercial market for blend down to fuel would be determined over time by many factors, including physical infrastructure, legislative guidance, and future market conditions. Currently, DOE has committed to transfer 50 t of surplus HEU to USEC for blend down to LEU in the next six years. The remaining material would continue to be stored at DOE's Y-12 Plant. Based on future market demand and the factors explained above, additional material could be made available for commercial use. Any material that would not be suitable for commercial use would not be moved out of Y-12 and be blended to waste until a LLW disposal site is identified. The interim storage, pending disposition (for up to 10 years) of surplus HEU at the Y-12 Plant (where most of the HEU would be stored), was analyzed in the Y-12 environmental assessment. Should the surplus HEU disposition actions continue beyond 10 years, subsequent storage of surplus HEU pending disposition will be pursuant to and consistent with the ROD associated with the Storage and Disposition PEIS or tiered NEPA documents.

21.002: The HEU EIS analyzed radiological releases from the proposed blending processes during normal operations of the candidate blending sites as well as under a severe accident condition during which the highest atmospheric release of radioactivity and hazardous chemicals would occur. The analyses showed that all resulting doses during normal operations would be within radiological limits and would be well below levels of natural background radiation. In the case of a severe accident, an evaluation basis earthquake which causes equipment failures and a pressurized release of a UF₆ cylinder, 30 percent of a cylinder containing LEU is assumed to be released in the atmosphere. This assumption is consistent with the NRC's guidance presented in the *Nuclear Fuel Cycle Facility Accident Analysis Handbook* (NUREG-1320, May 1988). It was estimated that the maximum latent cancer fatalities for the population within 80 kilometers (km) (50 miles [mi]) of the NFS site would be 1.4. Considering the fact that the severe accident scenario used in the analyses is a highly unlikely event because of the geological and

seismic characteristics of NFS, any potential releases from uranium blending operations would pose no observable harm to the public within 80 km (50 mi). Nevertheless, all candidate sites have emergency preparedness programs that would deploy necessary measures to protect both workers and the public. Public and occupational health impacts of radiological releases during both normal operations and accident conditions are discussed in Sections 4.3.1.6, 4.3.2.6, 4.3.3.6, and 4.3.4.6 of the HEU Final EIS.

PROCTOR, JANE, MADISON HEIGHTS, VA

Transcription:

Hello. This is Jane Proctor calling from Madison Heights, Virginia. I live directly across from the B&W Mt. Athos site. I am concerned about the expansion and the dilution of uranium that is suggested in the article dated Lynchburg News Advance Wednesday, October 25, 1995. I want to know 1) Has an Environmental Impact study been done? 2) Have there been any soil or water or air testing in the area near the B&W Mt. Athos site? 3) How long are the materials going to be stored? 4) How are the materials going to get here? What transportation? 5) What safety assurances have been made to nearby land owners? 6) Since I live directly across the river from the B&W Mt. Athos site, no one has ever come over here to do any environmental testing at my location. I would be greatly interested to getting answers to these questions. I hope that you will be coming to the Lynchburg area, as I feel many people in this area are uninformed and uneducated about your process and what exactly will be happening and how it will impact the area. My number is 804-845-8421. I would appreciate a response. Thank you.

06.003

32.002

06.003: Chapter 4 of the HEU Final EIS addresses the potential impacts at the B&W facility from this proposed action, (Sections 2.4 and 4.3), as well as transportation of materials to and from the site (Section 4.4 and Appendix G). The safety of all nuclear activities at the site are governed by the facility's NRC license.

32.002: The Department of Energy welcomes your comments on the HEU Draft EIS, which describes actions regarding the disposition of surplus HEU that the President has declared surplus to our national defense needs. DOE considers every comment that is submitted with equal interest in assisting them to evaluate alternatives and make informed decisions.

However, DOE must work within the constraints imposed by available funding and resources. Because DOE is trying to reduce costs of complying with NEPA of 1969, as amended, and due to the geographical proximity of three of the four candidate sites identified in the HEU EIS, DOE determined that two public meetings (Knoxville, TN and Augusta, GA) would be appropriate for this program.

Because public involvement is critical to the success of the program, other methods for submitting comments were also made available throughout the comment period: toll-free fax and voice recording, electronic bulletin board, and U.S. mail. These methods can also be used to request additional information and to be placed on the Office of Fissile Materials Disposition's mailing list.
