Subject: RAI for Davis Besse

We would like to raise a question on the first bullet in page 13 of the Bulletin response by the Davis-Besse. That is the clarification and details of the risk assessment of the bounding analysis by Framatome. Particularly, we are interested in treatment of the recirculation blockage, rationale on initiation and mitigation, and basis of the discussion. With Oconee's ambiguity on human error treatment and initiating event analysis, we are skeptical of the Framatome report and its application to Davis Besse.
