**BROWNS FERRY NUCLEAR PLANT (BFN) - UNITS 1, 2, AND 3 - AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME) SECTION XI, INSERVICE TESTING (IST) PROGRAM FOR THE THIRD TEN-YEAR INTERVAL**

This letter submits the Third Ten-Year Inservice Testing (IST) Program for Units 1, 2, and 3 of the Browns Ferry Nuclear Plant. The Code of record for the Third Ten-Year Interval IST Program is the 1995 Edition, of the ASME OM Code through the 1996 Addenda, subject to the limitations and modifications specified in 10 CFR 50.55a(b)(3). The IST Program is applicable to all three BFN units, which are on a concurrent Ten-Year IST Interval. The Third Ten-Year Interval commences on September 1, 2002, and ends on August 31, 2012.

The Code of Federal Regulations, 10 CFR 50.55a(f), requires that inservice testing of ASME Code Class 1, 2, and 3 pumps and valves of a water-cooled nuclear facility meet the requirements of ASME Section XI. In addition, 10 CFR 50.55a(f)(4)(ii) requires that the IST Program be updated every 10 years to the latest NRC approved Edition and Addenda of Section XI, which is in effect 12 months prior to the start of the next 120-month interval. The enclosed program updates satisfy that requirement.

U.S. Nuclear Regulatory Commission  
Page 2  
September 6, 2002

The enclosure to this letter contains the updated BFN Units 1, 2, and 3 ASME Section XI IST Program for the Third Ten-Year Interval. The Program update includes two requests for relief for NRC approval. Relief request PV-1 (Appendix B) seeks approval to use alternative testing for the Standby Liquid Control Pumps. Also, relief request PV-2 (Appendix C) asks approval to use alternative testing for the Control Rod Drive scram inlet valves (185 valves per unit) and scram outlet valves (185 valves per unit). These two requests for relief are updated versions of requests for relief which were previously approved during the Second Ten-Year IST Interval at BFN.

TVA requests approval of this ASME Section XI IST Program update for BFN Units 1, 2, and 3 by March 1, 2003, to support ongoing Inservice Testing activities.

There are no new commitments contained in this letter. If you have any questions, please contact me at (256) 729-2636.

Sincerely,

# **BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM**

## **FOR THE THIRD TEN-YEAR INTERVAL**

### **INTRODUCTION**

#### **PURPOSE**

10 CFR 50.55a(f) requires the establishment and implementation of Inservice Testing (IST) to verify the operational readiness of pumps and valves whose function is required for plant safety. This document describes the implementation of IST of pumps and valves at Browns Ferry Nuclear Plant (BNF).

#### **SCOPE**

This document describes the IST Program for pumps and valves which are designated as ASME Code Class 1, 2, and 3 equivalent components that are required to perform a specific function in shutting down the reactor or in mitigating the consequences of an accident. The Code of Record for IST of pumps and valves for the Third Ten-Year Interval is the 1995 Edition of the ASME OM Code through the 1996 Addenda, subject to the limitations and modifications specified in 10 CFR 50.55a(b)(3). This IST Program is applicable to all three BFN units, which are on a concurrent Ten-Year IST Interval. The 3rd Ten-Year IST Interval begins on September 1, 2002 and runs through August 31, 2012.

#### **DEFINITIONS**

**ACTIVE VALVE** - A valve that must perform a mechanical motion during the course of accomplishing a system safety function.

**AUTHORIZED NUCLEAR INSERVICE INSPECTOR (ANII)** - Personnel qualified by written examination to meet the requirements of ANSI/ASME N626.1-1975 and who are employed by an Authorized Inspection Agency to perform inspections and verifications as required by Section XI of the ASME Boiler and Pressure Vessel Code.

**GROUP A PUMPS** - Pumps that are operated continuously or routinely during normal operation, cold shutdown, or refueling operations.

**GROUP B PUMPS** - Pumps in standby systems that are not operated routinely except for testing.

**CATEGORY A VALVES** - Valves for which seat leakage is limited to a specific maximum amount in the closed position for fulfillment of their function.

**CATEGORY B VALVES** - Valves for which there is no defined maximum seat leakage amount for the fulfillment of their function.

**CATEGORY C VALVES** - Valves which are self-actuating in response to some system characteristic, such as pressure (safety and relief valves including vacuum relief valves) or flow direction (check valves).

**CATEGORY D VALVES** - Valves which are capable of only one operation, such as rupture disks or explosively actuated valves.

**IST ENGINEER (REVIEWER)** - An individual who is knowledgeable of IST requirements, is capable of identifying testing requirements for affected components, and competent to verify that surveillance instruction packages are complete and that results document proper component operation.

# BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM

## FOR THE THIRD TEN-YEAR INTERVAL

### **DEFINITIONS (continued)**

**CONTAINMENT ISOLATION VALVE (CIV)** - Any valve which is relied upon to perform a primary containment isolation function. All CIVs are required to be included in the IST program as Category A valves.

**EXERCISING** - The demonstration based on direct visual or indirect positive indications that the moving parts of a valve function.

**FULL STROKE TIME** - The time interval from initiation of the actuating signal to the indication of the end of the operating stroke.

**LIMITING VALUE OF STROKE TIME** - The maximum allowable stroke time for a valve as determined by the owner. For BFN, the limiting values are generally established by Technical Specifications, the FSAR, or Design Criteria for individual systems. If not established by these documents, the limiting value is assigned by the IST Engineer.

**NONINTRUSIVE TESTING** - Testing performed on a component without disassembly or disturbing the boundary of the component.

**OBTURATOR** - Valve closure member (disk, gate, plug, ball, etc.)

**OPERATIONAL READINESS** - The ability of a valve to perform its intended function.

**PASSIVE VALVE** - A valve which does not perform a mechanical motion during the course of accomplishing a system safety function.

**PLANT OPERATION** - The conditions of startup, operation at power, hot standby, and reactor cooldown, as defined by the plant technical specifications.

**PRESSURE ISOLATION VALVE (PIVS)** - Valves which are normally closed or capable of automatic closure which serve to isolate a higher operating pressure system from an attached lower operating pressure system.

**REFERENCE VALUES** - One or more values of test parameters measured or determined when the equipment is known to be operating acceptably.

**SKID-MOUNTED COMPONENTS** - Components integral to or that support operation of major components, even when these components may not be located directly on the primary equipment skid. Generally, these components are supplied by the manufacturer of the major component. Examples include: diesel generator fuel oil pumps and valves, the steam admission and trip throttle valves for high-pressure coolant injection and auxiliary feedwater pump turbines, and solenoid-operated valves which provide control air to the air-operated valves.

**TRENDING** - A comparison of current data to previous data obtained under similar conditions for the same equipment.

IST PROGRAM ABBREVIATIONS FOR PUMP AND VALVE TESTING		
PARAMETER	ABBREVIATION	DESCRIPTION
VALVE TYPE	GA	Gate valve
	GL	Globe valve
	CK	Check valve
	RV	Relief valve
	SC	Stop check
	BF	Butterfly valve
	RD	Rupture disc
	PL	Plug valve
	BA	Ball valve
Actuator Type	MO	Motor Operated
	S	Solenoid Operated
	X	Explosive
	AO	Air Operated
	SELF	Self Actuated
	H	Manual
Safety Position	O	Open
	C	Closed
	O/C	Both Open and Closed
	LO	Locked open
	LC	Locked closed
Tests Performed	Q	Quarterly test
	ST	Full-stroke test
	FS	Fail-safe test
	LT	Leak-rate test
	RV	Relief valve bench test
	CV	Full-stroke check valve test
	VRPIL	Verify position indicator lights
	VI	Visual inspection
	CM	Condition Monitoring

# **BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM**

## **FOR THE THIRD TEN-YEAR INTERVAL**

### **GENERAL REQUIREMENTS**

Title 10, Part 50 of the Code of Federal Regulations, paragraph 50.55a(f) requires the Inservice Testing (IST) of certain nuclear power facility ASME Code Class 1, 2, and 3 pumps and valves whose functions are required for safety. This testing is required to be conducted in 120-month intervals, beginning with initial power operation and continuing throughout the service life of the facility. The testing must comply with the latest edition and addenda of the American Society of Mechanical Engineers (ASME) OM Code, incorporated by reference in 10 CFR 50.55a(b), 12 months prior to the start of the 120-month interval. Specific exceptions to these requirements of ASME Section XI are included here as Relief Requests. BFN Units 1, 2, and 3 are on a concurrent IST interval. The second 120-month interval for BFN expires on August 31, 2002. The third 120-month interval for BFN begins on September 1, 2002.

Portions of later editions and addenda of the ASME OM Code, which are incorporated by reference in 10 CFR 50.55a(b), may be used subject to limitations and modifications established by NRC, provided that all applicable requirements of the respective editions and addenda are met.

NRC Generic Letter 89-04 and NUREG-1482 provide alternatives to ASME Section XI IST requirements that are acceptable to NRC. In order to utilize the alternative methods, they must be complied with in their entirety and their use documented in the IST program.

The BFN IST program was prepared using the following for guidance:

- ASME OM Code, 1995 Edition through the 1996 Addenda
- NRC Generic Letter 89-04
- NRC Regulatory Guide 1.26
- NUREG-0800
- NRC Temporary Instructions 2515/110 and 2515/114
- NRC Inspection Procedure (IP) 73756
- NRC Generic Letter 91-18
- NUREG-1482
- BFN Updated Final Safety Analysis Report (UFSAR)
- BFN Technical Specifications (TS)
- BFN System Design Criteria

All plant pressure retaining components were reviewed for IST applicability and those meeting the following criteria have been included in the BFN IST program. Components that meet the criteria of ISTB 1.2 and ISTC 1.2 are excluded from the IST program.

- Components which are part of the reactor coolant pressure boundary and their supports must meet the requirements applicable to components which are classified as ASME Code Class 1.
- Other safety-related pumps and valves that are required to perform a specific function to shut down the reactor or maintain the reactor in a safe shutdown condition, mitigate the consequences of an accident, or provide overpressure protection for safety-related systems must meet the requirements applicable to components which are classified as ASME Code Class 2 or Class 3. Components must meet the test requirements applicable to components which are classified as ASME Code Class 2 and 3 to the extent practical. Classification is determined by TVA Site Engineering and designated on the controlled Inservice Inspection (ISI) series of drawings.

# **BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM**

## **FOR THE THIRD TEN-YEAR INTERVAL**

### **IST OF PUMPS**

The BFN Code of Record for IST of pumps is the 1995 edition of the ASME OM Code through the 1996 Addenda. Actual requirements may be modified in accordance with NRC NUREG-1482, NRC Generic Letter 89-04, Relief Requests, Refueling Outage Justifications, and Cold Shutdown Justifications. See Appendix A for detailed test requirements for individual pumps. Evaluation of test deficiencies shall be performed and documented in accordance with the site corrective action program. Relief requests pertaining to IST of pumps are contained in Appendix B.

### **IST OF VALVES**

The BFN Code of Record for IST of valves is the 1995 edition of the ASME OM Code through the 1996 Addenda, subject to the limitations and modifications specified in 10 CFR 50.55a(b)(3). Actual requirements may be modified in accordance with NRC NUREG-1482, NRC Generic Letter 89-04, Relief Requests, Refueling Outage Justifications, and Cold Shutdown Justifications. See Appendix E for detailed test requirements for individual valves. Valves are tested in accordance with the requirements of their particular category. Valves which fall into more than one category are tested in accordance with the requirements of all applicable categories. Duplication or repetition of common testing requirements for valves that fall into more than one category is not performed.

The ASME Section XI valve operability requirements being satisfied by this instruction include the exercising (cycling) of the valves to the position required to perform their safety function and the stroke timing of power-operated valves. Valves having fail-safe actuators are tested by interrupting the electrical or pneumatic power to the actuator and observing the required valve operation. Exceptions to the IST requirements are documented in the Relief Request portion or in the Refueling Outage/Cold Shutdown Justification portion of the Browns Ferry Pump and Valve IST Program. Relief Requests are contained in Appendix C, and the Refueling Outage/Cold Shutdown Justifications are contained in Appendix D.

Evaluation of test deficiencies shall be performed and documented in accordance with the site surveillance testing and corrective action programs.

### **VALVE STROKE TIMES**

The maximum allowable stroke time for any valve can not exceed any Technical Specification, FSAR, or Design Criteria requirement for maximum allowable (limiting value) stroke time, where such value exists.

For valve stroke times not addressed by the Technical Specifications or the FSAR, the maximum allowable (limiting value) stroke time will be established by engineering evaluation. In most instances, the basis for the stroke times comes from the first inservice test performed on the valve, or from the first inservice test performed following valve maintenance or modification. Maximum stroke time for these valves is established at 1.5 x the stroke time recorded on the test for valves with stroke times greater than 10 seconds, or 2.0 x the stroke time recorded on first test for valves with stroke times less than or equal to 10 seconds. In other instances, preoperational test data or valve trend data was used to establish maximum allowable stroke times (computed the same as for those based on test performances). Maximum stroke times for valves with stroke times greater than 10 seconds may be rounded off to the nearest second.

# **BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM**

## **FOR THE THIRD TEN-YEAR INTERVAL**

### **REMOTE POSITION INDICATORS**

Where possible, valves with remote position indicators will be observed at least once every two years to verify that valve operation is accurately indicated.

### **CHECK VALVES**

Check valves shall be exercised in both the open and closed directions. The exercise tests are not required to be performed concurrently.

### **EXCESS FLOW CHECK VALVES (ECKVs)**

Excess flow check valves are installed in instrument lines penetrating primary containment in accordance with Regulatory Guide 1.1. As such, the lines are sized and/or orificed such that offsite radiation doses will be substantially below 10 CFR 100 limits in the event of a rupture. Therefore, individual leak rate testing of these valves is not required for conformance with 10 CFR 50 Appendix J requirements. Functional testing of valves to verify closure can be accomplished by the process of venting the instrument side of the valve while the process side is under pressure. Such testing is required by Technical Specifications at least once per operating cycle for a representative sample of the EFCVs. Testing on a more frequent basis is not feasible for several reasons. Instruments serviced by these valves frequently have interlock or actuation functions that would be interfered with should testing be performed during plant operation. Also, process liquid will be contaminated to some degree, requiring special measures to collect flow from the vented instrument side. Functional testing with verification that excess flow is prevented will be performed for a representative sample of the EFCVs at least once per operating cycle per Technical Specifications.

### **FAIL-SAFE VALVES**

Fail-safe valves are tested in accordance with the OM Code for loss of electrical or pneumatic actuator power.

### **RELIEF VALVES**

Relief valves shall be tested in accordance with the OM Code Appendix I and NUREG-1482 for verification of seat tightness and opening pressure (setpoint). Relief valves are required to be tested on a percentage basis with 100% of the Class 2 and 3 valves being tested by the end of each Ten Year Interval. 100% of Class 1 valves are required to be tested in any five year interval. The intent is that relief valves be tested on a regular basis throughout the Ten Year Intervals.

# **BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM**

## **FOR THE THIRD TEN-YEAR INTERVAL**

### **SEAT LEAKAGE REQUIREMENTS FOR CATEGORY A VALVES**

Valves for which seat leakage is important may be generally classified as pressure isolation valves (PIVs), containment isolation valves (CIVs), or both. CIVs are required to be included in the IST program as Category A valves. Testing is performed in accordance with OM Code requirements for Category A valves.

The testing of primary containment isolation valves is performed under the BFN 10 CFR 50 Appendix J Program. For Category A PIVs the maximum allowable leak rate is established at 50% of the capacity of the upstream relief valve for the PIV. In order to ensure that any PIV does not exceed this ultimate leak rate, any PIV which has a leak rate greater than 50% of its upstream relief valve capacity shall be repaired to reduce its leak rate below the 50% figure. The maximum allowable leak rate for closed-loop water-sealed CIVs that are not PIVs is set at the capacity of the upstream relief valve. These limits may be reduced administratively to provide an additional safety margin against excessive leakage between tests.

### **COLD SHUTDOWN (CSD) TESTING**

Some of the components listed in the IST program cannot be tested at the quarterly frequencies required by the OM Code. These components are identified as Cold Shutdown components and are addressed by the Cold Shutdown Justifications listed in Appendix D. Testing of these components is required to begin as soon as possible (within 48 hours) after the applicable unit reaches the cold shutdown conditions except as follows:

- Testing is not required if the component is within the periodicity requirements of the OM code due to a recent cold shutdown (no need to test simply because of entry into a cold shutdown). This would be the case if a cold shutdown occurred and all tests within the cold shutdown test group had been performed within the last three months. Any decision to forego cold shutdown testing based on time since the last cold shutdown testing must ensure that the three month interval will not be exceeded before the unit is ready to return to power.
- If the unit is entering a planned outage (refueling, major maintenance) where there will be sufficient time to test all of the required cold shutdown components before return to power operation, the 48 hour requirement may be waived.
- All cold shutdown tests are required to be performed during each refueling outage.

Once started, testing shall proceed in a normal manner until either all testing is completed or the unit is ready to return to power operation. Completion of all cold shutdown testing is not a prerequisite to return to power operation, unless the unit is in a refueling outage. Any testing not completed during a cold shutdown must be continued at the next cold shutdown, time and plant conditions permitting, beginning with the last valve tested during the previous cold shutdown. The valve with the longest interval since its last test and which can be tested in the current plant conditions should be tested first. Then the valve with the next longest interval should be tested, and so on until all valves deferred to CSD are tested. Any valve testing skipped due to plant conditions should be tested as soon as conditions allow.

# **BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM**

## **FOR THE THIRD TEN-YEAR INTERVAL**

### **PASSIVE VALVES**

Category A, B, C, and D passive valves are not required to be stroke-tested for IST purposes. Passive valves are required to be tested for position indication. Category A passive valves are tested to determine compliance with seat leakage criteria. Appendix F contains a listing of valves that have been determined to be passive valves.

### **BFN CONDITION MONITORING PROGRAM**

The 1995, 1996 Addenda, ASME OM Code contains an mandatory appendix (Appendix II) which details requirements for implementation of a Condition Monitoring Program for check valves. BFN has identified check valves which will be monitored using this appendix in lieu of the requirements of ISTC 4.5.1 through 4.5.4. The BFN Condition Monitoring Program is described in Appendix G of this program.

**BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM  
FOR THE THIRD TEN-YEAR INTERVAL**

**APPENDIX B**  
Page 1 of 1

**REQUESTS FOR RELIEF  
FOR THE ASME SECTION XI PUMP PROGRAM**

Relief Request No. PV-1

System:	Standby Liquid Control (SLC) (63)
Drawing:	1, 2, 3-47E854-1
Components:	SLC Pumps A and B (all three units)
Class:	2
Function:	Emergency injection of sodium pentaborate into the reactor vessel to bring the reactor from full power to shutdown condition.
Impractical Test Requirement:	ISTC 4.7.1(f) - Frequency response range of the readout system shall be from one-third minimum pump shaft rotational speed to at least 1000 Hz.
Basis for Relief:	<p>ASME OM Code (1995, 1996 addenda) requires a frequency response range of from one-third minimum pump shaft rotational speed to at least 1000 Hertz (Hz) for vibration measuring instruments. The SLC pumps are not variable speed pumps. The SLC pump shaft rotational speed is 520 RPM, which translates to a frequency response of 8.67 Hz. To comply with the OM Code, TVA would be required to monitor a frequency range of 2.89 Hz (one-third of 8.67 Hz) to 1000 Hz; however, TVA intends to monitor from 6 Hz to at least 1000 Hz.</p> <p>NUREG-1482 states that the frequency response range of vibration monitoring instrumentation must meet the requirements of ASME/ANSI Standard OM-6 unless the information gained at the low frequency does not apply for the bearing design of the pump in question.</p> <p>The information gained at a frequency lower than shaft rotational speed is used to detect oil swirl in sleeve type bearings. The bearings on the SLC pumps are roller type. Accordingly, there is no information gathered at a frequency lower than shaft rotational speed that would be applicable.</p>
	Therefore, TVA requests relief in accordance with 10 CFR 50.55a(a)(3)(ii) in that compliance with the test requirement would result in hardship or unusual difficulty without a compensating increase in the level of quality and safety.
	This request for relief was previously approved for use in the BFN Second Ten-Year IST interval. TVA submitted the request for relief (see PV-2) by letter dated May 2, 1994. TVA's request was approved by NRC letter dated May 16, 1995.
Alternative Testing:	TVA will monitor the SLC pump vibration using a frequency response range of 6 Hz to at least 1000 Hz. This will encompass all frequencies from just below shaft rotational speed to the 1000 Hz minimum required by the ASME OM Code.

**BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM**  
**FOR THE THIRD TEN-YEAR INTERVAL**

**APPENDIX C**  
Page 1 of 1

**RELIEF REQUESTS**  
**FOR THE ASME SECTION XI VALVE PROGRAM**

Relief Request No. PV-2

System:	Control Rod Drive (CRD) (85)
Drawing:	1, 2, 3-47E820-2; 2-47E820-5; 1, 3-47E820-6
Components:	Scram inlet valve FCV-85-39A (185 valves per reactor) Scram outlet valve FCV-85-39B (185 valves per reactor)
Category:	B (FCV-85-39A and 39B)
Class:	1 (FCV-85-39A and 39B)
Function:	Control Rod Scram Water Flow Path.
Impractical Test Requirement:	ASME OM Code 1995 through 1996 addenda, ISTC 4.2.1 and 4.5.1 - Exercise valves every three months and measure stroke time.
Basis for Relief:	These valves located on the hydraulic control units for the 185 control rod drives function on a reactor scram signal from the reactor protection system to insert the control rods rapidly into the reactor core. Cycling these valves requires scrambling a control rod. There are 185 control rods in the reactor. Scramming every rod once every three months is not practical for the following reasons: <ul style="list-style-type: none"><li>a. A power reduction is required to test the scram function. Reducing power for the length of time required to scram 185 rods is not practical.</li><li>b. Fuel preconditioning must follow this power reduction to avoid possible fuel damage. The longer the reduction in power, the longer the preconditioning.</li></ul> Their proper functioning is most practically verified by an actual scram test.
	Therefore, TVA proposes to use alternate testing requirements provided for in Generic Letter 89-04, Guidance on Developing Acceptable Inservice Testing Programs."
	This request was previously approved (see PV-21) for use in the BFN Second Ten-Year IST interval by NRC letter dated October 22, 1993.
Alternative Testing:	Scram testing and rod insertion timing will be performed in accordance with Technical Specifications Section 3.1.4 (at reactor coolant pressure 800 psig) for: <ul style="list-style-type: none"><li>a. All control rods prior to THERMAL POWER exceeding 40 percent after each refueling outage.</li><li>b. A representative sample (at least 10%) on a rotating basis at least once every 120 days cumulative operation in Mode 1.</li></ul>

Note: This testing is in accordance with Position 7 of NRC Generic Letter 89-04 and NUREG 1482

**BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM  
FOR THE THIRD TEN-YEAR INTERVAL**

**APPENDIX D  
REFUELING OUTAGE AND COLD SHUTDOWN JUSTIFICATIONS**

Page 1 of 4

Refueling Outage Justification RO-01

System:	Main Steam (1)
Drawing:	47E801-1
Components:	Valves FCV-1-14, 26, 37, 51
Class:	1
Function:	Main Steam Isolation Valve Inboard of Primary Containment.
Impractical Test	ASME OM Code, 1995 through 1996 Addenda, ISTC 4.2.1, Requirement: 4.2.2, and 4.2.6, stroke and fail-safe position testing of valves once each quarter or on a cold shutdown basis.
Basis for Relief:	The MSIVs listed, along with their control air isolation valves, stroke adjustment needle valves, and accumulators are located inside primary containment. The fail-safe testing of these main steam isolation valves requires the isolation of control air to the valve operator and the venting of the control air accumulator for the valve. The full stroke testing of these valves requires access to the drywell in order to adjust stroke times (if needed). Entry is precluded during operation because the containment atmosphere is inerted with nitrogen gas for oxygen and hydrogen control, and radiation dose rates are prohibitive. The inert atmosphere is maintained during most cold shutdown periods.
Alternative Testing:	The stroke timing, full-stroke exercising, and fail-safe testing of these valves will be performed during each refueling outage.

**BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM**  
**FOR THE THIRD TEN-YEAR INTERVAL**

**APPENDIX D**  
**REFUELING OUTAGE AND COLD SHUTDOWN JUSTIFICATIONS**

Page 2 of 4

Cold Shutdown Justification Number 1	
System:	Reactor Recirculation
Drawing:	47E817-1
Valves:	FCV-68-3, 79
Category:	B
Class:	1
Function:	Pump A&B discharge isolation.
Justification:	The recirculation pump discharge isolation valves are in the main flow path of the reactor recirculation system, which is necessary to maintain proper cooling and reactivity control of the reactor. Cycling of these valves during power operations would interrupt the driving core flow, possibly resulting in severe changes in core power level. Cycling of these valves would also isolate that loop of the recirculation system. Failure of the valve to reopen could result in a plant shutdown, depending on plant conditions.

Cold Shutdown Justification Number 2	
System:	Reactor Building Closed Cooling Water
Drawing:	47E822-1
Valves:	FCV-70-47
Category:	A
Class:	2
Function:	Primary Containment isolation.
Justification:	This valve is in the cooling water return lines for the reactor recirculation pump bearing and seal coolers as well as the drywell atmospheric coolers. Cycling of this valve during power operation would interrupt this cooling water flow, possibly causing pump bearing damage and seal failure. Drywell temperatures could also exceed allowable values, requiring unit shutdown.

**BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM  
FOR THE THIRD TEN-YEAR INTERVAL**

**APPENDIX D  
REFUELING OUTAGE AND COLD SHUTDOWN JUSTIFICATIONS**

Page 3 of 4

**Cold Shutdown Justification Number 3**

System:	Residual Heat Removal
Drawing:	47E811-1
Valves:	FCV-74-47, 48
Category:	A
Class:	1
Function:	Shutdown cooling isolation.
Justification:	These normally closed containment isolation valves are only required to open when bringing the unit to a cold shutdown cooling mode of RHR. Valve 74-47 is normally closed with its breaker off for Appendix R reasons. Cycling these valves with reactor pressure greater than 100 psig is prevented by logic interlocks.

**Cold Shutdown Justification Number 4**

System:	Main Steam
Drawing:	47E801-1
Valves:	FCV-1-15, 27, 38, 52 (Outboard MSIVs)
Category:	A
Class:	1
Function:	Main Steam Isolation for primary containment.
Justification:	Cycling of these valves during power operation requires a reduction in power to less than 70 percent of full power and involves the risk of a reactor scram.

**BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM  
FOR THE THIRD TEN-YEAR INTERVAL**

**APPENDIX D  
REFUELING OUTAGE AND COLD SHUTDOWN JUSTIFICATIONS**

Page 4 of 4

Cold Shutdown Justification Number 5	
System:	Main Steam (01)
Drawing:	2, 3-47E807-2 (MS)
Components:	Main Steam Steam Seal Supply Regulator valve 1-147
Category:	B
Class:	2
Function:	Boundary valve for the MSIV Alternate Leakage Path.
Justification:	This valve is normally closed when the unit is operating above 25% power. Because it is a boundary valve for the MSIV Alternate Leakage Path and it will open between 0% to 25% power, it is necessary to verify that it will close when it is needed. Opening this valve in order to stroke time it closed during operation would be a radiological and safety hazard for personnel. This valve will be tested on a cold shutdown basis.

Cold Shutdown Justification Number 6	
System:	Main Steam (01)
Drawing:	2, 3-47E801-2 (MS)
Components:	Steam Jet Air Ejector (SJAЕ) Pressure Regulator valves 1-151, -153, -166, -167
Category:	B
Class:	2
Function:	Boundary valve for the MSIV Alternate Leakage Path.
Justification:	These valves are normally open during operation to control operation of the SJAЕ stages 1, 2, and 3 (Trains A and B). Because of plant design there is no practical method of timing each valve closed without personnel being present at the valve. This would present a radiological and safety hazard during power operation. These valves will be tested on a cold shutdown basis.

**FOR THE THIRD TEN-YEAR INTERVAL**

**APPENDIX E**

**ASME SECTION XI VALVE MATRIX NOTES**

- A. This appendix provides a cross-reference of the valves in the BFN ASME Section XI Pump and Valve IST Program.
- B. The test frequencies and their respective abbreviations are as follows:
  - 1. O/OC: Once per Operating Cycle.
  - 2. CSD: Cold Shutdown.
  - 3. Q: Quarterly.
  - 4. COND: Conditional.
  - 5. O/2 yr: Once per two years.
  - 6. O/16W: Once per 16 weeks.
  - 7. O/RO: Once per Refueling Outage.
  - 8. E/RO: Every other Refueling Outage.
  - 9. CM: Frequency determined by the Condition Monitoring Program

# BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM

## FOR THE THIRD TEN-YEAR INTERVAL

### APPENDIX G

#### CONDITION MONITORING PROGRAM FOR CHECK VALVES

##### INTRODUCTION

The BFN check valve Condition Monitoring (CM) Program is a subsection of the BFN Inservice Test (IST) Program. This Program is implemented as allowed by the BFN Code of Record for the Third Ten-Year IST Interval, ASME OM Code-1995 through OMA-1996 Addenda, Appendix II.

##### REQUIREMENTS

The OM Code-1995 through OMA-1996 Addenda, Appendix II, establishes the method that is to be used to group, analyze, and monitor check valves under a CM Program. A CM Program is an alternative to the regular requirements for check valve IST specified in Subsection ISTC of the OM Code. In addition to the Appendix II requirements, three additional requirements specified by the NRC have been incorporated in the BFN Condition Monitoring Program. First, each check valve in the Condition Monitoring Program is bi-directional tested to assess its condition and confirm acceptable valve performance. Second, the time between the initial test or examination and second test or examination, is limited to two fuel cycles or three years (whichever is longer), with additional extensions limited to one fuel cycle per extension. The total interval is limited to a maximum of 10 years. An extension or reduction in the interval between tests or examinations would have to be supported by trending and evaluation of performance data. Third, if the CM program is discontinued for any valve, the provisions of ISTC 4.5.1 through ISTC 4.5.4 must be implemented for the valve.

##### GROUPING

Check valves tested under the CM Program are grouped based on the following:

- (1) Intended purpose of CM (e.g., to improve performance, or to optimize testing, examination, and preventive maintenance activities)
- (2) Analysis of test results and maintenance history
- (3) Design characteristics, application, and service conditions.
- (4) Grouping also considers the sample disassembly examination program grouping details of OM ISTC 4.5.4(c), which states that valves are to be grouped by similar design, application, and service conditions. The grouping also considers maintenance and modification history, potential flow instabilities, required degree of disassembly, the need for tolerance or critical dimension checks, valve manufacturer, design, service, size, materials of construction, and orientation.

##### ANALYSIS

Check valves tested under the CM Program have their test and maintenance history analyzed to establish the basis for specifying inservice testing, examination, and preventive maintenance activities. The analysis includes the following:

- (1) Identify any common failure or maintenance patterns
- (2) Analyze these patterns to determine their significance and to identify potential failure mechanisms
  - (a) determine if certain preventive maintenance activities would mitigate the failure or maintenance patterns
  - (b) determine if certain CM tests such as nonintrusive testing are feasible and effective in monitoring for these failure mechanisms
  - (c) determine if periodic disassembly and examination activities would be effective in monitoring for these failure mechanisms
  - (d) determine if changes in the valve groupings are required

# BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM

## FOR THE THIRD TEN-YEAR INTERVAL

### APPENDIX G CONDITION MONITORING PROGRAM FOR CHECK VALVES

#### **MONITORING**

##### (a) Performance Improvement Activities

- (1) If sufficient information is not available to perform the analysis in the preceding section, or if the analysis is inconclusive, then the following activities will be performed at sufficient intervals over an interim period of the next 5 years or two refueling outages, whichever is less, to determine the cause of the failure or the maintenance patterns:
  - (a) Identify interim tests (e.g., nonintrusive tests) to assess the performance of the valve or group of valves
  - (b) Identify interim examinations to evaluate potential degradation mechanisms
  - (c) Identify other types of analysis that will be performed to assess check valve condition
  - (d) Identify which of these activities will be performed on each valve in the group
  - (e) Identify the interval of each activity.
- (2) Complete or revise the CM Program test plans to document the Check Valve Program Improvement activities and their associated frequencies.
- (3) Perform these activities at their associated intervals until:
  - (a) sufficient information is obtained to permit an adequate evaluation of the specific application, or
  - (b) until the end of the interim period
- (4) After performance, review the results of each activity to determine if any changes to the program are required. If significant changes to the program are required, the program will be revised prior to the performance of the next activity, and the applicable requirements of the preceding sections must be repeated.

##### (b) Optimization of CM Activities

- (1) If sufficient information is available to assess the performance adequacy of the check valve or group of check valves, then the following activities will be performed:
  - (a) Identify the applicable preventive maintenance activities including their associated intervals that are required to maintain the continued acceptable performance of the check valve or group of check valves
  - (b) Identify the applicable examination activities including their associated intervals that will be used to periodically assess the condition of each check valve or group of check valves
  - (c) Identify the applicable test activities including their associated intervals that will be used to periodically verify the acceptable performance of each check valve or group of check valves
  - (d) Identify which of these activities will be performed on each valve in the group
  - (e) Identify the interval of each activity
- (2) Revise the test plans to document the optimized CM program activities, and the associated intervals of each activity
- (3) Perform these activities at their associated intervals
- (4) After performance, review the results of each activity to determine if any changes to the optimized CM program are required. If significant changes are required, the program will be revised prior to the performance of the next activity, and the applicable requirements of the preceding sections must be repeated.

# **BROWNS FERRY NUCLEAR PLANT INSERVICE TESTING PROGRAM**

## **FOR THE THIRD TEN-YEAR INTERVAL**

### **APPENDIX G CONDITION MONITORING PROGRAM FOR CHECK VALVES**

#### **CORRECTIVE MAINTENANCE**

If corrective maintenance is performed on a check valve, the analysis used to formulate the basis of the CM activities for that valve and its associated valve group must be reviewed to determine if any changes are required. If significant changes are required, the program must be revised and the applicable requirements of the preceding sections repeated.

#### **DOCUMENTATION**

The CM Program will be documented and will include the following information:

- (a) list of valves in the program
- (b) list of the valves in each valve group
- (c) dates valves were added/deleted to the program and the reason for their inclusion/deletion
- (d) analysis forming the basis for the program
- (e) identified failure and maintenance history patterns for each valve
- (f) CM Program activities and their associated intervals for each valve or valve group.

NOTES:

- (1) Unit 1 check valves are listed in the Program listing, but are not monitored until required to be operational. As U1 components are returned to operation they will be phased into the normal monitoring activities.
- (2) Monitoring activities include internal inspections (disassembly), radiographic inspections, flow/no flow testing, Appendix J leak rate testing, Maintenance Rule monitoring, SOER 86-03 Program inspections.
- (3) Initial intervals are two operating cycles (maximum) with evaluations for increase or decrease in intervals after individual activities are completed.
