Comanche Peak Steam

Ref. # 10CFR50.73(a)(2)(ii)(A)

CPSES-200203525 Log #TXX-02181 File # 10200

November 5, 2002

U. S. Nuclear Regulatory Commission ATTN: Document Control Desk Washington, DC 20555

SUBJECT: COMANCHE PEAK STEAM ELECTRIC STATION (CPSES) DOCKET NO. 50-445 TECHNICAL SPECIFICATION REPORT FOR STEAM GENERATORS MEETING C-3 CATEGORY LICENSEE EVENT REPORT 445/02-002-00

Gentlemen:

Enclosed is Licensee Event Report (LER) 02-002-00 for Comanche Peak Steam Electric Station Unit 1, "Steam Generator Tube Plugging".

TE22

TXX-02181 Page 2 of 2

 $\overline{\mathbf{v}}$

This LER is submitted pursuant to CPSES Technical Specification 5.6.10.c. This report also meets the reporting requirements specified in CPSES Technical Specification 5.6.10.a. This communication contains the following new commitment which will be completed as noted:

Commitment Number 27274

Commitment

The condition of SG 1-02 tube R41 C71 will be more completely addressed in a supplement to this LER after consideration of results from the tubes that were removed for failure analysis.

The commitment number is used by TXU Generation Company LP for the internal tracking of CPSES commitments.

Sincerely,

TXU Generation Company LP

By: TXU Generation Management Company LLC, Its General Partner

NARRATIVE (If more space is required, use additional copies of NRC Form 366A) (17)

I. **DESCRIPTION OF REPORTABLE EVENT**

Α. **REPORTABLE EVENT CLASSIFICATION**

The subject event is reportable pursuant to the requirements of CPSES TS 5.6.10, specifically 10CFR50.73(a)(2)(ii)(A).

B. PLANT OPERATING CONDITIONS PRIOR TO THE EVENT

On October 6, 2002, CPSES Unit 1 was in Mode 6, Refueling, during its ninth refueling outage.

С. STATUS OF STRUCTURES, SYSTEMS, OR COMPONENTS THAT WERE INOPERABLE AT THE START OF THE EVENT AND THAT CONTRIBUTED TO THE EVENT

Not Applicable - There were no structures, systems, or components that were inoperable at the start of the event which contributed to this event.

D. NARRATIVE SUMMARY OF THE EVENT, INCLUDING DATES AND **APPROXIMATE TIMES**

On September 28, 2002, CPSES Unit 1 began its ninth refueling outage. CPSES Technical Specification (TS) 5.5.9, "Steam Generator (SG) Tube Surveillance Program", requires that the results of each Steam Generator (EIIS: (AB)(SG)) tube inspection be classified as Category C-3 if more than 1 percent of the total tubes inspected are defective.

Additionally, if the results of the SG tube sample inspections are classified as Category C-3, then prompt NRC notification is required in accordance with TS 5.5.9 Table 5.5-2 and TS 5.6.10.c. During this ninth refueling outage, results of 3 SG inspections went into Category C-3 at separate times.

Two separate notifications were identified on the following dates and times:

1. On October 6, 2002, at 4:50 p.m., CPSES made notification of an event pursuant to the requirements of 10CFR50.72(b)(3)(ii)(A). The notification stated that analysis of eddy current testing data on SG 1-2 indicated that greater than 1 percent of the total tubes inspected in SG 1-2 were defective (Refer to NRC event number 39251).

| COM | ANCHE | PEAK STEAM ELECTRIC STATION UNIT 1 |
| NARRAT | TIVE (If more | space is required, use additional copies of NRC Form 366A) (17) |
| | E. | 2. On October 6, 2002, at 9:30 p.m., CPSES made notification of an event pursuant to the requirements of 10CFR50.72(b)(3)(ii)(A). The notification stated that analysis of eddy current testing data on SGs 1-3 and 1-4 indicated that greater than 1 percent of the total tubes inspected in SGs 1-3 and 1-4 were defective (Refer to NRC event number 39251). THE METHOD OF DISCOVERY OF EACH COMPONENT OR SYSTEM FAILURE, OR PROCEDURAL OR PERSONNEL ERROR The defective tubes were found during scheduled eddy current testing of the CPSES Unit 1 SG tubing. |
| II. | CON | MPONENT OR SYSTEM FAILURES |
| | А. | FAILURE MODE, MECHANISM, AND EFFECTS OF EACH FAILED COMPONENT |
| | | TXU Energy believes that the predominant degradation mechanism was ODSCC. Additional degradation mechanisms identified, to a very limited extent, (<0.5 percent) included Primary Water Stress Corrosion Cracking (PWSCC) and wear. |
| | В. | DURATION OF SAFETY SYSTEM TRAIN INOPERABILITY |
| | | Not Applicable – No safety system train was rendered inoperable. |
| | C. | SAFETY CONSEQUENCES AND IMPLICATIONS |
| | | The ODSCC associated with the hot leg expansion transition was found to be the predominant degradation mechanism seen during the CPSES 1RF09 inspection. A total of 667 tubes were repaired (plugged or sleeved) for this mode of degradation. SG 1-1 had 31 tubes affected; SG 1-2 had 186 tubes affected, SG 1-3 had 216 tubes affected, and SG 1-4 had 234 tubes affected. The total plugs and sleeves installed to date remain well below the 10 percent tube plugging allowance provided by the accident analysis described in CPSES FSAR Chapters 4 and 15. Eight tubes with ODSCC associated with the hot leg expansion transition were <i>in situ</i> pressure tested with no leakage or achieving the burst point. |
| | | However, during the <i>in situ</i> pressure testing on SG 1-02, tube R41 C71, leakage exceeded the pump capacity at 2.6 GPM and 2070 psig. Limited pump capacity prevented reaching the Structural Integrity Performance Criterion of NEI 97-06, "Steam Generator Program Guidelines," therefore meeting this criterion is indeterminate. Due to the inaccessability of tube R41 C71 for removal, two tubes with similar indications to tube R41 C71 were removed |
