

1           Immediately after the test, of course, we  
2 pulled the basket out to see what was going to be  
3 left, and we noticed that -- we took the basket out in  
4 the lab, and parts of the basket which was outside the  
5 point of contact, there was no permanent set of the  
6 basket.

7           And anywhere there was a point of contact  
8 during the contact, the deformation was minor. None  
9 of the rows had any signs of permanent set, none of  
10 the lip bolts failed, the environment was maintained,  
11 the criticality.

12           And that is only a part of the story. We  
13 obviously had to fix whatever we had to fix. We went  
14 back and did a whole series more of 30 foot drop  
15 tests, took the cask back from the lab, no permanent  
16 set.

17           So what we have concluded is we have  
18 actually taken a 30 foot actual drop, it is only  
19 supposed to occur one time, and we actually turned  
20 that into a normal operational condition, which is  
21 only a one foot drop.

22           So we felt like there was a massive amount  
23 of conservatism -- next slide, please -- in the  
24 design. Not just on the basket, but also on the cask  
25 body as well. And not just on the cask body, but in

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 the bolts and the lid, as well.

2 So, in summary we feel like the  
3 methodology shown is adequate, we showed the results,  
4 and we feel that there are inherent conservatisms in  
5 the methodology.

6 One, one of the largest that we see, is  
7 the ASME code methodology, we are using elastic  
8 analysis, neglecting the ductility of the stainless  
9 steel. And the inherent conservatism of the structure  
10 evaluation using acceleration beyond that which we see  
11 in the test.

12 And the other one that we feel that there  
13 is conservatism is that very few things are rigid in  
14 this world, especially when you have a quarter million  
15 pound object impacting.

16 So we feel like this demonstrates that the  
17 current designs that we have, have a large margin of  
18 safety during the transport.

19 Thank you very much.

20 MEMBER LEVENSON: Thank you. Any of the -

21 -

22 VICE-CHAIRMAN WYMER: I have sort of a  
23 general question, whichever one of you chooses to stab  
24 at it.

25 There are three different kinds of gamma

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 shielding material. You talked about stainless steel,  
2 lead, depleted uranium. And I would expect there to  
3 be differences in the performance, and the cost.

4 Would anybody care to tackle the gamma  
5 shielding materials?

6 MR. YAKSH: I would like to take the first  
7 stab. Mike Yaksh, NAC international.

8 The DU is on cask NI-1/2, we didn't renew  
9 it under BU85. So it is phasing in time, as it were.  
10 So that is probably not a good comparison. TE NI-1/2  
11 was an innovative cask in its time, but it is frozen.  
12 So we primarily use the lead, it is easy to pour. You

13 MR. SINGH: Do you want me to supplement  
14 it?

15 VICE-CHAIRMAN WYMER: Please.

16 MR. SINGH: All right. Well, in the cask  
17 you have two competing considerations. You have to  
18 maintain a certain diameter, which is the most you  
19 will make about 8 feet, 96 inches, and you have to  
20 have certain gamma attenuation capability.

21 Now, lead has a much greater density than  
22 stainless steel, or any form of steel. And,  
23 therefore, you are able to provide much more gamma  
24 shielding capability in a small diametrical space.

25 However, lead is a very weak structural

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N W  
WASHINGTON, D.C. 20005-3701

1 material, it tends to creep under sustained loads.  
2 And, therefore, if you were to make the cask out of  
3 steel instead, or stainless steel, or any form of  
4 steel, you have gamma shielding, as well as structural  
5 capability.

6 If you were to use lead, a lot of lead,  
7 and less steel, you will have more effective gamma  
8 shielding capability in the same diametrical extent,  
9 but you will have less structural capability.

10 Our cask is all steel, we do not use any  
11 lead.

12 VICE-CHAIRMAN WYMER: What cost?

13 MR. SINGH: The cost depends on the extent  
14 of welding you do in the cask, the manufacturing cost.  
15 The material cost is fairly constant. I mean, if you  
16 use lead, for example, and you were to pour lead,  
17 which is heated, temperature control operation, it is  
18 more expensive than installing lead bricks, which are  
19 pre-manufactured.

20 There are competing considerations. I  
21 guess the maximum, the most significant cost element,  
22 in making the cask, is the extent of joining, the  
23 welding work that you do, and maintain the dimensions  
24 that is where most of the expense is.

25 VICE-CHAIRMAN WYMER: Yes. One of the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 things that occurs to somebody who doesn't know  
2 anything about this business is that something like  
3 lead in an impact, from an accident, or a test, it  
4 might tend to flow a little bit, and change the  
5 position of the weight.

6 MR. YAKSH: NAC International, Mike Yaksh,  
7 I don't agree with that. We have done extensive  
8 testing, we exposed it to five times the G-load, we  
9 didn't see any slumping, we didn't see any bulging of  
10 the outer shell, or bulging of the inner shell.

11 VICE-CHAIRMAN WYMER: That is what I was  
12 trying --

13 MR. YAKSH: You would have thought, we  
14 would have seen that in the five times the G-load, but  
15 we didn't see that, because we did metrology  
16 measurements of the insides, as well, of the STC, so  
17 I would say I don't see any --

18 I know with some designs if you have a  
19 weakened shell you might have slumping, some damage.  
20 But since we are aware of that, that is not a problem.  
21 Thank you.

22 MR. SHIH: This is Peter Shih from  
23 Transnuclear. Kris is right, you know. Normally if  
24 we don't have a dimension constraint, like our TN-68  
25 dual purpose cask, and we are only design for

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 transport in the United States, so we use steel.

2           However, like our new NP-197, because we  
3 try to use this particular cask not only in the United  
4 States, but also in Europe, you know, so we had  
5 outside diameter constraints, we do have a lead  
6 filled, and it is lead filled stainless steel.

7           I just mentioned moments ago, I said,  
8 steel. But we do have a lead filled stainless steel.

9           VICE-CHAIRMAN WYMER: Thank you.

10           MEMBER LEVENSON: What you are really  
11 saying is that the regulators sometimes control the  
12 technology, the economics. There are different  
13 requirements for your European shipments than your  
14 American shipments, so you end up with a different  
15 design?

16           MR. SHIH: Yes.

17           MR. SINGH: The regulators contribute to  
18 the technology, of course. In a positive way, one  
19 would think.

20           MEMBER LEVENSON: John?

21           MEMBER GARRICK: I'm very impressed with  
22 your confidence in scale model testing. From two  
23 points of view, one is the point of view of  
24 demonstrating safety, and that is to say cask  
25 integrity. And, two, the point of view of

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 authenticating your analysis models.

2 Let me ask the question another way. Is  
3 there anything that we can learn from full scale  
4 tests, with respect to those two points, that you  
5 can't learn from scale model testing? Any of you can  
6 talk about that.

7 MR. SINGH: Well, you know, when you scale  
8 in any physical test, if you scale a structure, or a  
9 component, you use certain scaling algorithm, you will  
10 scale mass, you will scale volume, you will scale  
11 local rigidity of the materials.

12 But there are compromises involved. You  
13 don't have a direct, unless you are doing the test,  
14 for one specific loading, and one specific  
15 orientation, any scale model you will make would be  
16 ideal for that particular test, but it will be  
17 approximate, or depart from the scaling that you have  
18 done, for other loadings.

19 MEMBER GARRICK: Full scale test would  
20 have the same problem. For one particular angle, one  
21 particular load, etcetera, etcetera.

22 MR. SINGH: That is correct, but the full  
23 scale test, whichever loading you apply to it, will  
24 give you the response of the structures it would.

25 What I'm saying is that when you scale

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 anything down to a quarter scale, or a scaled  
2 structure would replicate, you will be able to scale  
3 up the response to the full size structure for that  
4 specific load, or for approximately for loads which  
5 are close to it in their nature and application.

6 But once you go you try to deal with a  
7 wide variety of loads that you want to study. Well,  
8 then you will depart from it. So scale models do  
9 serve a function, they do have -- they are much, much  
10 less expensive, and you can run many of them.

11 For example, we have numerous scale model  
12 tests when we were qualifying to license HI-STAR. We  
13 couldn't do all those many tests on a full scale, of  
14 course, that you will end up destructively modifying  
15 the cask in the process of testing.

16 So scale models have their place under the  
17 sun, but I think that to have, if you were to run a  
18 full scale test, you would have a much higher level of  
19 confidence. There are limitations when you scale down  
20 a structure.

21 MR. SINGH: But it sounded like what you  
22 were saying is that that may be true with respect to  
23 demonstrating the integrity of the cask. But as far  
24 as models are concerned, analytical models, scale  
25 models usually, can they not, do a very good job of

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 giving you what you need to analyze a full scale  
2 design?

3 MR. SINGH: To benchmark model, yes.

4 MEMBER GARRICK: Yes, to benchmark the  
5 model.

6 MR. SINGH: It will give you a useful  
7 tool. And that is what we do today. We have a scale  
8 model, we have scale model test results, and we have  
9 benchmark the analytical model to predict the cask  
10 response using the scale model.

11 And that is a satisfactory way to do  
12 things.

13 MEMBER GARRICK: But the question is, from  
14 an investment standpoint, is it worth the extra  
15 expense to go to full scale model to reduce, maybe,  
16 the uncertainty in your analytical model, by ever so  
17 small, if you really forthright in presenting the  
18 uncertainties in the first place?

19 MR. SINGH: Well, I don't mean to suggest  
20 that you cannot do scale model test and pull up a very  
21 high level of confidence with respect to the ultimate  
22 performance of the structure.

23 But it is a case of available funds versus  
24 the level of exactitude, or rigor, or quality of  
25 information you are looking for. I do -- I would love

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 to do a full scale test, as a scientist and as an  
2 engineer. But it is very expensive.

3 And scale models serve the function to  
4 establish a high level of confidence in the behavior  
5 of the structure.

6 MEMBER GARRICK: We engineer a lot of  
7 things without full scale models, of course. And  
8 somehow we've managed to, in most of those cases, do  
9 it right. And so I'm just very curious as to the  
10 experts here, as to what added benefit we get from  
11 full scale tests.

12 Maybe somebody else would like to talk  
13 about it?

14 MR. YAKSH: As Kris said, the scale  
15 modeling has its place under the sun. To us it has  
16 allowed us to benchmark our methodology to which we  
17 would do a full scale. And I think something needs to  
18 be pointed out more, is that in our experience we look  
19 at the quarter scale model not only just confirming,  
20 but also any kind of manufacturing details that need  
21 to be worked out, it is much easier to work them out  
22 on a quarter scale model than when you are dealing  
23 with something that weighs 4 tons, it is much easier  
24 to work with something that weighs 100 pounds.

25 So we look at the quarter scale modeling

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 not only as a means of benchmarking the methodology,  
2 but this is how we want to build it, because it is  
3 easier to work with a quarter scale, than it is to  
4 work with a full scale.

5 So it is really a dual purpose, it is just  
6 not benchmarking data, it is how we want to build that  
7 full scale. Because, ultimately, you are not going to  
8 transport the quarter scale model, you are going to  
9 transport the full scale.

10 And what everybody has been focused on is,  
11 primarily, I want to get back the results. The  
12 important thing is if you want to build a full scale,  
13 how you build a full scale, and influence your  
14 results. So you want to work all those wrinkles out,  
15 and details out, in accordance with scale model  
16 testing.

17 That is why, at this point, I don't know  
18 how much more testing we want to do, I don't know what  
19 we would learn if we did any more testing. We've  
20 built so many of these quarter scale models, learning  
21 so many things in fabricating, that I don't see any  
22 more how we would learn any more, if we were to go to  
23 a full scale.

24 MEMBER GARRICK: Thank you.

25 MR. SHIH: This is Peter Shih, from

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Transnuclear. Basically in my presentation, page 64,  
2 I list about three report, and in each report I have  
3 studied, extensively, between the scale, radiation  
4 shielding between the scale model and a full scale.

5 And based on the conclusion of these three  
6 report, you know, if your scale factor is one quarter,  
7 or greater, then the correlation is excellent. And,  
8 also, the CEGB, the full size cask, before, they also  
9 have a scale model test.

10 And based on the information I learned  
11 from those, you know, they have a camera, high speed  
12 camera, one-third scale model, and a full scale model.  
13 And it do a drop, and they behave almost identical,  
14 you know?

15 I don't have the report now, but this is  
16 based on my knowledge, you know, that third scale  
17 test, and the full scale test are almost identical.  
18 Thank you.

19 VICE-CHAIRMAN WYMER: Thank you.

20 MEMBER RYAN: I was going to ask a  
21 question, again, back at design. At least for highway  
22 casks, weight is really your limiting feature, is it  
23 not?

24 MR. YAKSH: Actual highway?

25 MEMBER RYAN: Yes, road versus rail.

1 MR. YAKSH: No, you can get higher than  
2 52,000.

3 MR. SHIH: You can have an overweight  
4 truck.

5 MEMBER RYAN: Sure, you are always kind of  
6 constrained to make that decision, either stay within  
7 the 8,000, or go over.

8 MEMBER LEVENSON: Maybe one more question  
9 on the modeling issue. It is a little bit  
10 philosophical, but maybe I can get three different  
11 opinions.

12 And that is, if you were making rather  
13 drastic changes in the design, so you don't have a lot  
14 of background, and you are starting with a relatively  
15 new model, the casks are designed, would you feel more  
16 comfortable if you had one test at full scale, which  
17 lets you test one data point, or you have multiple  
18 tests of small scale models, where you have multiple  
19 data points, but at a scale.

20 Which would give you a bigger sense of  
21 confidence?

22 MR. YAKSH: This is Mike Yaksh,  
23 International. I would rather have more data points,  
24 because if there is variability in manufacturing I  
25 will never pick it up with one data point, I will pick

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 it up with multiples.

2 And in all the tests we've done, whatever  
3 variability is there, we've observed it. And that  
4 gives us greater confidence. When we build the full  
5 scale, we will build it like we say we would build it.

6 MR. SINGH: I agree with Mike. The -- a  
7 single test, you know, a cask is not an isotropic  
8 homogenous body. So if you run one test, in any given  
9 direction you are going to get response for that  
10 particular loading.

11 The actual cask, of course, in real life  
12 has infinite number of loadings, directions it can be  
13 loaded. So a number of scale model tests, scale  
14 tests, gives you the ability to benchmark your model  
15 much more accurately than you could with one full  
16 scale test.

17 MR. SHIH: Again, I tend to agree. The  
18 reason is the cask, basically, you drop in different  
19 orientation, and a different part of component of the  
20 cask will respond differently.

21 Like for the basket, you know, the worse  
22 case would be a side drop. However, for the lip the  
23 worse case would be the seat drop through the lid. So  
24 basically, you know, I think for one drop in full  
25 scale, probably, you cannot represent the entire load

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 issue. Thank you.

2 MEMBER LEVENSON: It is interesting, the  
3 three of you agree. Historically back at the  
4 Manhattan project days, there was a physicist by the  
5 name of Sam Untermyer, who is really I guess is the  
6 inventor of the boiling water reactor, in later years.

7 But he argued it was never necessary to  
8 get more than a single data point, because physicists  
9 could understand everything from first principles, at  
10 one point you just knew where to put the curve, the  
11 shape of the curve came from theory. But you don't  
12 really agree with that.

13 Any questions for the Staff? Any of the  
14 other presenters have questions?

15 MR. AMMERMAN: Doug Ammerman, Sandia  
16 National Labs. And I would like to make a comment on  
17 the scale modeling. What the vendors said is exactly  
18 correct for structural testing.

19 But if you go and do thermal testing, and  
20 you want to relate the test results of the scale model  
21 to a full scale, it is impossible. You could use  
22 scale model to benchmark code, you can use the code to  
23 the full scale, directly compare the results of the  
24 scale model test, to the result of the full scale  
25 test.

1           For example, in Mike's presentation, for  
2 structural impact he said Gs were this, and you simply  
3 had to divide by four, in order to -- what the Gs  
4 would be for a full scale.

5           That works fine for structural, but it is  
6 not the same correlation for thermal testing. The  
7 other area that doesn't scale is leak testing. If you  
8 do a scale model testing and say the leak rate was X,  
9 it doesn't tell you anything about what the leak rate  
10 would be, or very little about what the rate would be  
11 for the full scale.

12           Which is why when people do scale model  
13 testing they say the leak rate is zero. I know how  
14 that correlates to full scale, it is still zero.

15           MEMBER LEVENSON:       Any comments or  
16 questions?

17           MR. BRACH: Bill Brach, NRC. Just one  
18 additional comment I want to add. Earlier this  
19 morning we were talking about full scale testing, or  
20 scale model testing, and we were discussing some of  
21 the needs, or benefits, or reasons coming from either  
22 a science perspective, or a safety perspective.

23           I juts want to mention there is one other  
24 aspect that we didn't discuss this morning, but  
25 although it was evident in at least one of the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 comments we heard, there also is a public interest  
2 perspective.

3 And I will just mention that within the  
4 NRC, in our strategic plan, I'm sure you are aware  
5 where strategic goes, is to increase public  
6 confidence. So speaking from the Staff's perspective,  
7 we do have to take into context those considerations,  
8 in addition to the earlier discussion we had on the  
9 science and safety.

10 MEMBER LEVENSON: Well, I think it is much  
11 broader than that, Bill. I think the Committee is  
12 well aware that while we much prefer to focus on the  
13 technical aspects, what you have to do, in operating  
14 an agency, is partially technical, and partially  
15 legal, and partly political, partly public opinion.

16 But we are trying to focus on the  
17 technical aspects. I think we realize that everything  
18 you do isn't purely technical, and it gets modified by  
19 all the other pressures.

20 And if it is an act of Congress it is  
21 somewhere at the top of the pecking order. But we are  
22 trying to separate.

23 MEMBER GARRICK: Mill, I want to draw Doug  
24 out a little bit on his observation about thermal  
25 versus structural.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1                   Is the difference because it is more  
2 difficult to constrain a thermal test? Otherwise I  
3 don't quite -- pardon?

4                   MR. AMMERMAN: No, it is because there is  
5 different regimes in a thermal test. The heat  
6 transfer is done by three modes, radiative,  
7 convective, and conductive. And not all those modes  
8 scale the same manner.

9                   The radiative heat transfer scales with  
10 temperature of the force, conductive scales with  
11 temperature, with temperature. And so the -- you have  
12 a mixed mode of heat transfer scaling laws become too  
13 complex.

14                   If you wanted to say I'm going to ignore  
15 two of those modes, I'm only going to look at, say,  
16 radiative because it dominates, then you can do scale  
17 model testing. Do a scale fire. Actually, it is  
18 still not very easy, you have to scale temperature and  
19 scale time to do a scale fire.

20                   In reality you have a similar situation  
21 with testing. That when you do a quarter scale test  
22 you actually have a 4G field. But we say that that is  
23 not important. So instead of doing quarter scale  
24 test, dropping it from a quarter scale distance, we do  
25 a quarter scale test dropping it from a full scale

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N W  
WASHINGTON, D.C. 20005-3701

1 distance, in a 1-G field, instead of a 4-G field.

2 It ends up with the same impact velocity.  
3 But where the quarter scale model doesn't behave the  
4 same as the full scale, it is in rebound. The quarter  
5 scale will rebound much higher, rebounding in a 1-G  
6 field, instead of a 4-G field, it is going to rebound  
7 four times as high as you expect it to, scale the  
8 rebound height for full scale.

9 MEMBER GARRICK: That is partly what I  
10 mean by constraining, though, is that you design an  
11 experiment where you understand those differences  
12 between the different parameters.

13 It seems to me if you could do that, then  
14 you ought to be able to get the same benefit. It  
15 sounds like, in the early days of reactor kinetics we  
16 had some of the same problems, of trying to properly  
17 constrain the transient experiments in such a way that  
18 we could really do a proper matching of the neutronics  
19 with the thermal hydraulics.

20 And as we learn more and more about how to  
21 do that, and how to constrain the experiment, then the  
22 concept such as scaling phenomena seem to fall in line  
23 more.

24 And I was just wondering if it was the  
25 same kind of thing here.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. AMMERMAN: Yes, it is a similar kind  
2 of thing. You do a replica scale for heat transfer,  
3 it is not actually the best way to do it, because what  
4 we would really like to do, your replica scale, you  
5 have to scale temperature.

6 Fires don't come in a wide range of  
7 temperatures, you get what you get. So to solve that  
8 problem you scale the conductivity. But you can't do  
9 that with the same material, you have to change  
10 material.

11 So a scale model that you would build for  
12 an impact test may not be the same scale model that  
13 you would use for a fire test.

14 MEMBER GARRICK: Yes, okay, thank you.

15 MR. FISCHER: I'm a little bit concerned  
16 because it seems like we've gotten into scale model  
17 testing just using like the pi theorem, and so forth.  
18 So I was talking about physical codes in scale model  
19 testing.

20 And when you use a physical model, these  
21 things are taken into consideration. I would like to  
22 think your PRONTO, and so forth, is a physical code,  
23 not just a scale code. I mean, they are doing  
24 physical phenomena.

25 So when you are using a good physical

1 code, you get the right answers. The only reason why  
2 you do the scale model testing is just to kind of see  
3 what is going on, and what regions are important to  
4 look at, and that you understand how bolts actually go  
5 in place, and friction between bolts, and will they  
6 untorque on you, how do these things react.

7 And if you went through scale I think you  
8 are close enough to say, yes, I benchmarked my code,  
9 just like when we do criticality analysis. We don't  
10 have the exact configuration of what you have in your  
11 cask, but you have something close.

12 And so I don't want to hear us going down  
13 the road of our scale model testing the way we used to  
14 do. We wrote an extensive report on that. Jerry Mach  
15 was the primary author on that.

16 And we spent a lot of time on that, and it  
17 never came out as NUREG because there was too much  
18 controversy, and so the bottom line is you better be  
19 using a physical computational code, or otherwise I  
20 don't trust scale model testing.

21 You have the inertia problem, and so  
22 forth, and that sort of thing. So there is not --  
23 that is a different type of test. That is what we  
24 used to do 15 years ago.

25 MEMBER GARRICK: This is when the workshop

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 gets interesting. We've come a long way.

2 MEMBER LEVENSON: That is why we have  
3 workshops, rather than a bunch of just presentations.  
4 Questions from the committee members, or the other  
5 presenters?

6 MR. RESNIKOFF: I appreciate your allowing  
7 us to -- Marvin Resnikoff. I have just two quick  
8 questions. One involves the presentation that was  
9 made by, I think, NAC.

10 And it showed that the deceleration of  
11 188, 86-G, I think. And now I remember Lawrence  
12 Livermore study that Holtec, or PFS presented at the  
13 hearing, where it said that the cladding would be  
14 damaged at 63-G.

15 In other words, it looks like the impact  
16 of 186-G would severely damage the cladding. Is that  
17 your understanding, is the question.

18 MR. YAKSH: I understand your question.  
19 Is the full scale see 188-Gs? The answer is, no, it  
20 doesn't. What you looked at there was the quarter  
21 scale. And as Doug pointed out, in order to see what  
22 the full scale G-load would be, you would divide 188  
23 divided by 4, which is much less than 63.

24 See, if you are transporting the fuel  
25 quarter scale fuel, you don't transport quarter scale

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 fuel, you transport full scale fuel, in a full scale  
2 cask. Therefore the acceleration that would be up  
3 there for the full scale would be one-fourth of that  
4 value.

5 MR. RESNIKOFF: In other words, if you  
6 dropped a full scale cask a 30 foot drop, it would  
7 only have a deceleration of 40-some G? Is that your  
8 understanding?

9 MR. YAKSH: Yes, sir.

10 MR. RESNIKOFF: I don't believe that is  
11 true.

12 MR. YAKSH: Yes, sir, it is. I have two  
13 experts over there that will agree with me, sir.

14 MR. FISCHER: That is what you designed it  
15 for, and I'm sure it does it. That is the problem  
16 when we start talking about scale tests. And as a  
17 rule of thumb we can divide by four, or whatever, or  
18 multiply.

19 But, again, when we get down to the real  
20 physics, we need a physics code to run it.

21 MR. RESNIKOFF: I'm back to the drawing  
22 boards, then.

23 MEMBER LEVENSON: There is another thing  
24 we have to remember, and that is that the number of Gs  
25 that the vehicle sees, or the cask sees, is not

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D C 20005-3701

1 identical to what fuel sees. There is significant  
2 energy absorption, many places between here and there.

3 MR. RESNIKOFF: The other quick question  
4 involves the type of carriage that the Holtec cask is  
5 going to be on. Maybe Mr. Fronczak is going to  
6 address this point.

7 I noticed in one of your views you had two  
8 double axle carriages at each end, that is where the  
9 airplane engine impacted the cask. But in another  
10 view you had single double axle carriages at each end.

11 And so my question is, is it the single  
12 double axle carriage at each end? And if so, are  
13 those movable carriages, or are they rigid?

14 MR. SINGH: Marvin, we are not designing  
15 the rail car. The portion of the structure that we  
16 designed is the cradle that is connected to the rail  
17 car. The car, for modeling purposes, was modeled, the  
18 platform was modeled, and the wheels were modeled.

19 In this model it was considered a rigid  
20 body. The one that you saw, with the engine impacting  
21 it, it was modeled as a rigid body. We wanted to see  
22 if there is no energy dissipation through deformation  
23 at all, would the cask separate from the rail car.

24 We did not focus on the railroad design  
25 aspect of the car.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. RESNIKOFF: Well, maybe Mr. Fronczak  
2 will be talking about that.

3 MR. SINGH: I'm sure he will enlighten us,  
4 later, on these things.

5 MR. FRONCZAK: We see one design.

6 MR. RESNIKOFF: What did you say?

7 MR. FRONCZAK: During my presentation you  
8 will see at least one design, which is the private  
9 fuel storage design.

10 MR. RESNIKOFF: One of your, I forget the  
11 name of the company, TT something or other, is the one  
12 that tests these casks, and are they associated with  
13 the Association of American Railroads?

14 MR. FRONCZAK: Yes, TTCI, it is  
15 Transportation and Technology Center, Incorporated, is  
16 a wholly-owned subsidiary, for-profit subsidiary, of  
17 AAR.

18 MEMBER LEVENSON: Any other questions or  
19 comments?

20 (No response.)

21 MEMBER LEVENSON: If not we will take a  
22 break a couple of minutes early, and reconvene sharply  
23 at 3:30.

24 (Whereupon, the above-entitled matter  
25 went off the record at 3:14 p.m. and

1 went back on the record at 3:31 p.m.)

2 VICE-CHAIRMAN LEVENSON: I think we're  
3 ready. Our first speaker after the break is Chris  
4 Bajwa from the SFPO. Chris?

5 MR. BAJWA: Thank you.

6 Before I start, I just want to make a  
7 small, short announcement. In the packages you  
8 received today, there are a set of slides for my  
9 presentation. Please disregard those slides that are  
10 in there. There is a handout that has the version  
11 that I will be presenting right now. We have extra  
12 copies of that handout up here on the corner of the  
13 table right next to Tim. They handed them out. So  
14 just about everyone should have gotten one. If we run  
15 out of those, we can make more copies for anyone who  
16 needs them.

17 All right. My name is Chris Bajwa. I am  
18 with the Spent Fuel Project Office. I am a federal  
19 engineer. Today I am going to talk to you about the  
20 staff review and analysis of the 2001 Baltimore Tunnel  
21 fire event.

22 In this presentation, I am going to cover  
23 several topics. First of all, I am going to tell you  
24 a little bit about the Baltimore Tunnel fire. Then I  
25 will talk about the staff's coordination with the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 National Transportation Safety Board, who has primary  
2 responsibility for investigating transportation  
3 accidents.

4 I will tell you about a preliminary  
5 scoping analysis that the staff did. I will also tell  
6 you about a National Institutes of Standards and  
7 Technology fire model that was done to model the  
8 Baltimore Tunnel fire. I will tell you a little bit  
9 about the validation of that NIST model. I will also  
10 tell you about a refined cask analytic model that the  
11 staff did based on the NIST data. And, finally, I  
12 will have some conclusions. My goal is to get through  
13 all of this without putting anyone to sleep. So we  
14 will see if we can accomplish that today.

15 Next slide. Well, they say a picture is  
16 worth 1,000 words. So I have four pictures up here.  
17 That's 4,000 words. I figure I probably don't have to  
18 say anything more for the entire presentation.

19 Anyway, these are some pictures that were  
20 taken during and shortly after the Baltimore Tunnel  
21 fire that happened last year, July 2001. It took  
22 place at the Howard Street Tunnel, which is in  
23 downtown Baltimore, right next to Camden Yards.

24 That particular tunnel is a single-rail  
25 tunnel. It's about 1.65 miles in length. And, just

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 to go through the pictures here, this is the east  
2 portal of the tunnel. The train that was traveling  
3 through that tunnel at the time was a CSX freight  
4 train. It derailed. And a fire ensued after the  
5 derailment.

6 It was traveling through. This is the  
7 entrance, the east portal. This particular car was  
8 removed after the fire. This car is a tripropylene  
9 tanker car. Tripropylene was the fuel that actually  
10 spilled out and ignited.

11 This is a hole that was in the car. It's  
12 about 1.5 inches in diameter. That hole was punched  
13 in the car when the car itself derailed. It was  
14 believed that the braking mechanism broke, flipped up,  
15 and punched a hole in the car. And that is where the  
16 tripropylene spilled out.

17 This picture up here was taken at the west  
18 portal during the fire itself. Obviously you can see  
19 there is a fair amount of smoke. And down there this  
20 is the west portal after everything was cleaned up.  
21 And you can see the difference between these two  
22 pictures. This is the same portal.

23 Next slide. As I said before, the NTSB is  
24 the lead agency for investigating transportation  
25 accidents. The commission and the staff requirements

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 memorandum asked the staff of FSPO to look at and  
2 analyze the Baltimore Tunnel fire and see if it had  
3 any impacts on transportation of spent nuclear fuels  
4 specifically and also if there were any regulatory  
5 implications for this particular event.

6 We met with NTSB and have met with them  
7 several times. The first time we met with them was in  
8 September of 2001. At the time, NTSB indicated that  
9 they would look into the fire and wanted to quantify  
10 the thermal conditions that were found in the fire.

11 Later they decided that the derailment,  
12 the cause of the derailment, was actually a primary  
13 concern to the NTSB. They kind of changed their minds  
14 and decided they would not look into the fire, which  
15 makes sense because the derailment caused the fire.  
16 And so the cause of the derailment is what the NTSB  
17 was interested in.

18 So the staff decided that our main  
19 interest was the fire because we believe that would  
20 have the biggest impact on the spent fuel  
21 transportation cask. So we decided that we would look  
22 at the fire and analyze that.

23 The NTSB provided information, data,  
24 technical expertise on rail events. They also made  
25 the rail cars that were taken out of the tunnel after

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 the fire available for our inspection. And we were  
2 able to take some samples and look at the damage that  
3 was done.

4 Now, in order to get our hands around this  
5 particular accident, we decided that we wanted to do  
6 a preliminary scoping analysis to kind of see how a  
7 spent fuel transportation cask might react if exposed  
8 to a severe fire. We also wanted to make sure that  
9 there wasn't an immediate concern over the performance  
10 of the cask if it were in, say, a tunnel fire  
11 accident.

12 We selected the Holtec HI-STAR cask, which  
13 Kris Singh told you about earlier. So you obviously  
14 have a lot of detailed information on what that cask  
15 looks like. Part of the reason we picked it is it's  
16 a certified cask, one that the NRC has certified for  
17 use.

18 The second reason is that it's likely to  
19 be extensively used. Specifically, if private fuel  
20 storage at that particular site is licensed and  
21 operational, there will be hundreds of shipments using  
22 the Holtec HI-STAR cask. I developed a HI-STAR  
23 analytic thermal model using the anisys finite element  
24 analysis program.

25 You heard probably a little bit about 10

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 CFR Part 71 and specifically Section 73, which talks  
2 about the hypothetical accident condition for spent  
3 fuel transport casks. This condition is a fully  
4 engulfing fire at a flame temperature of 1,475 degrees  
5 Fahrenheit for 30 minutes. That is what every cask  
6 that the NRC certifies has to meet. That's a  
7 condition in the regulations.

8 What I did for this particular analysis is  
9 I chose 1,500 degrees Fahrenheit. And I ran this  
10 analysis for seven hours. So the spent fuel cask that  
11 I was analyzing was fully engulfed for 7 hours at  
12 1,500 degrees Fahrenheit.

13 The schematics that Mr. Singh showed you  
14 are a little bit nicer than mine. So I am just going  
15 to run quickly through these. This is the HI-STAR  
16 cask. The MPC, the multi-purpose canister, is where  
17 the fuel is actually stored. That is a welded, seal  
18 welded, pressure vessel. This is the over-pack in  
19 which the MPC resides. What is missing from this  
20 picture obviously is the impact limiters.

21 Next slide. For this preliminary scoping  
22 analysis, we had boundary conditions of convection and  
23 radiation on the outside. And internally conduction,  
24 radiation, and convection were also accounted for.  
25 The initial steady state thermal conditions, normal

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N W  
WASHINGTON, D C 20005-3701

1 conditions for transport, were 100 degrees Fahrenheit.  
2 We let the cask reach a steady state temperature on  
3 the inside with 100-degree ambient temperature on the  
4 outside. There is a 20-kilowatt heat generation on  
5 the inside.

6 Given that we didn't know the thermal  
7 conditions that were present in the tunnel at that  
8 time, we chose the engulfing flame temperature to be  
9 1,500, which is slightly above the 7,173 requirement.  
10 For the fire, we increased the convection heat  
11 transfer on the surface of the cask in order to  
12 simulate the fire environment, which is a turbulent  
13 fire environment.

14 Next slide, please. Our conclusions from  
15 that particular preliminary analysis were the  
16 following. We determined that there would be no  
17 cladding failure for the fuel that was in that spent  
18 fuel cask that was in that fire. That was based on  
19 the temperature limits, short-term temperature limits.

20 There's no canister failure based on  
21 stresses at temperature and on the creep criteria.  
22 And if those two are true, then there would be no  
23 radioactive release, which is what we believe would be  
24 the case for this particular analysis. So now what do  
25 we do?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           Having completed a scoping analysis, we  
2 got a general feel for what the cask might do when  
3 exposed to severe fire. We wanted to get a better  
4 picture of what actually happened in the Baltimore  
5 Tunnel as far as what kind of a fire there was.

6           In order to get a better picture of that,  
7 we went to the National Institute of Standards and  
8 Technology. We contracted with them to quantify the  
9 thermal conditions that existed in the tunnel during  
10 the event.

11           For this, NIST used the fire dynamic  
12 stimulator code. It is a computational fluid dynamics  
13 code that models combustion, heat release rates, and  
14 gas flow in a variety of fire environments. It has  
15 been used with very high success on the reactor side  
16 to model fires in the reactor nuclear power plants.

17           For this project, the analytic model used  
18 by NIST was validated using data obtained by the  
19 Federal Highway Administration in their Memorial  
20 Tunnel test program. FHA tested several different  
21 sizes of fires in an abandoned tunnel in order to  
22 quantify what kind of temperatures you would see, what  
23 kind of flow regimes you would see in tunnels. So  
24 NIST validated the code using data from these  
25 experiments.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           The analysis results from the NIST fire  
2 model were input into the staff's revised cask  
3 analysis model. I will be talking a little bit more  
4 about this in a few minutes.

5           The Howard Street Tunnel fire model. What  
6 exactly did NIST do? First of all, they used a  
7 computational grid that extended the entire length of  
8 the Howard Street Tunnel. So they modeled 1.65 miles  
9 of the tunnel in FDS. They obviously used a finer  
10 grid in the areas of concern surrounding the fire and  
11 in the rail car areas immediately in the vicinity of  
12 the fire.

13           They modeled the rail cars in the derailed  
14 configuration. The NTSB provided a diagram that  
15 showed how the rail cars were laid out after the  
16 derailment had happened. And NIST used that in order  
17 to model the rail cars in their fire model.

18           The combustion of hydrocarbon fuel, which  
19 tripropylene is essentially a hydrocarbon fuel, that  
20 was modeled also. There was no ventilation in the  
21 tunnel at the time of the accident. The ventilation  
22 system was not operating. So the NIST model did not  
23 use any ventilation.

24           Finally, the NIST model reached  
25 essentially spent fuel steady state conditions in

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 about 30 minutes. As soon as they lit that fire off,  
2 it took about 30 minutes for it to reach its steady  
3 state conditions; in other words, the maximum  
4 temperature conditions.

5 Next slide. This is an animation of the  
6 Howard Street Tunnel fire model from NIST. I don't  
7 know exactly why that is not working, but we do have  
8 the .avi of that if you want to see that. I don't  
9 know why it is not working at this point.

10 The tunnel fire model, what you would see  
11 if it were working, basically the tripropylene pool  
12 was right here. The fire was flaming up between two  
13 cars. There were two cars on either side, this being  
14 the tripropylene tanker car. I don't know why it's  
15 not working. Anyway, we do have some data from that  
16 in a later slide. So I will be able to show that to  
17 you.

18 One of the thing that you will notice is  
19 that the temperatures in this particular fire model  
20 were obviously at the highest up here at the top of  
21 the tunnel. Because the fire was shooting up between  
22 these two cars, it was impinging directly on the  
23 tunnel and then spreading out along the length of the  
24 tunnel.

25 The one thing to say about this model is

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N W  
WASHINGTON, D.C. 20005-3701

1 that it does have a grade. Going from this direction  
2 to this direction, there is a slight upward grade. So  
3 the temperatures of the fire would actually be a  
4 little bit higher on this side of the car than on the  
5 down wind side.

6 Next slide. Now, unfortunately, I  
7 couldn't show you an animation of that, but we did  
8 want to make sure that we would confirm the NIST  
9 results. What did we have there to help us confirm  
10 the NIST results? We had physical evidence from the  
11 tunnel itself.

12 There was a fire. There were burned rail  
13 cars. There were bricks that had fallen down during  
14 the fire. There was a lot of physical evidence. We  
15 contracted with material and fire experts at the  
16 Center for Nuclear Waste Regulatory Analysis to  
17 analyze samples from the tunnel and also samples from  
18 the rail cars that were removed from the tunnel.

19 The center staff performed metallurgical  
20 analyses on several material samples and components  
21 removed from the rail cars that were in the tunnel  
22 during the fire. So the center's experts were able to  
23 look at what came out of the tunnel and determine what  
24 kind of temperatures those particular physical  
25 witnesses to the fire had seen

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           The analyses conducted by the center  
2 indicated that the temperatures predicted by the NIST  
3 model were consistent with the physical evidence that  
4 was analyzed. So we had a reality check on the NIST  
5 model, and it looked like the NIST model was  
6 consistent with the physical evidence that we saw from  
7 the tunnel.

8           Next slide. So now we have some data from  
9 NIST. What do we do with that? We applied the data  
10 from NIST to two separate assessments of a spent fuel  
11 transportation cask finite element analysis model.  
12 The first assessment was with the cask center 20  
13 meters, or approximately one rail car length, from the  
14 fire. The reason we chose that is that per federal  
15 regulations, any radioactive material package must be  
16 at least one box car away from any hazardous materials  
17 package. So, in reality, because the Howard Street  
18 Tunnel was a single rail car tunnel, it would be very  
19 unlikely for a spent fuel cask traveling through that  
20 tunnel to come any closer than one box car's length  
21 away from a fire.

22           Now, just to put a little bit of a bound  
23 on that, we also looked at the cask located adjacent  
24 to the fire, five meters from the fire to the center  
25 of the cask.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N W  
WASHINGTON, D.C. 20005-3701

1 Models we used are 2D cross-section  
2 models. I will show you some details of that in the  
3 next few slides. We did also model the support  
4 cradle, which Holtec, Mr. Singh showed you in the  
5 Holtec presentation.

6 Finally, we have a 3D model that is under  
7 development to better characterize the conditions that  
8 were in the tunnel and how they would affect the spent  
9 fuel cask.

10 Next slide. This is the refined cask  
11 model. We actually have a 24 fuel assembly basket.  
12 This particular model has about 27,000 elements. It  
13 explicitly models all of the gaps and the various  
14 features of the basket: the MPC, or multi-purpose  
15 canister; the gamma shields, gamma plates, which are  
16 carbon steel plates, the whole Type A neutron shield,  
17 and the stainless steel outer skin.

18 Next slide. This is a closeup of one of  
19 the fuel cells, fuel assemblies. We do use a  
20 homogenization for the fuel assembly itself and use an  
21 effective thermal conductivity that is based on  
22 verified with data.

23 This is some of the basket details. These  
24 here are the basket supports. And then you have the  
25 stainless steel support plates. This in here is

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D C 20005-3701

1 helium. And then on the sides here, you have the  
2 boron plates held with criticality control.

3 Next slide. Now, this graph is actually  
4 a little bit hard to see. It will be a little bit  
5 better in your packets. What this plot shows is the  
6 maximum temperatures that we derived from the NIST  
7 data. It is actually more to show you the trend and  
8 how we applied our boundary conditions to our refined  
9 cask model.

10 You see up here that you have the maximum  
11 temperatures at the top of the tunnel. This is from  
12 the upward slope is in this direction. The fire is at  
13 zero. That is where the fire is located, zero meters.  
14 And then there is a scale on each side of distance,  
15 the top of the tunnel, top of the rail cars, sides of  
16 the tunnel, wall temperatures. And then you go down  
17 to the floor of the tunnel down here.

18 As you can see, temperatures are higher on  
19 the upward side of the fire. That is to be expected  
20 because there is a little bit of flow.

21 MEMBER GARRICK: Chris, what would you  
22 expect those curves to look like if your model assumed  
23 ventilation?

24 MR. BAJWA: Well, ventilation would  
25 introduce obviously more oxygen to the fire. Most

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 likely fire temperatures would be higher if you  
2 introduced more oxygen.

3 Next slide, please. Again, this slide,  
4 unfortunately, will be a little hard to see, but it is  
5 in your handouts. This is the maximum ionic  
6 temperatures as a function of time for the 20-meter  
7 case.

8 Basically, the thing to look at here, a  
9 couple of things to point out. For the fuel  
10 temperature, the fuel really doesn't start heating up  
11 for about 15 hours into the fire transient when it's  
12 displaced 20 meters from the fire source.

13 The fuel exceeds the 1,058 short-term  
14 temperature limit, 1058 Fahrenheit, at about 116 hours  
15 into the transient. That's, of course, assuming the  
16 maximum fire temperature for that entire length of  
17 time.

18 Next slide, please. These are the maximum  
19 component temperatures as a function of time for the  
20 five-meter distance. Obviously if you move closer to  
21 the fire, your temperature is going to go up. That is  
22 what we see happen here. It is not unexpected.

23 One thing to point out is that fuel  
24 temperatures still take about ten hours before they  
25 start to rise from their normal condition

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 temperatures. In this case, we extend the 1,058  
2 short-term temperature limit at 37 hours. Again, that  
3 is for continuing the fire at its maximum temperature  
4 for that amount of time.

5 One of the things to point out is that the  
6 short-term temperature limit is by no means the  
7 temperature at which the fuel bursts open. The  
8 short-term temperature limit is actually determined  
9 experimentally where they exposed fuel cladding to  
10 that temperature for an extended period of time. And  
11 for periods of time from 30 days to 70 days at 1,058,  
12 they saw no significant cladding degradation or  
13 failure. So it is not a limit where you reach it and  
14 you blow up, but that is the limit that we currently  
15 accept for short term.

16 Next slide. This is basically just a  
17 summary of what I just told you. For 20 meters, we  
18 are at over 100 hours for exceeding the short-term  
19 temperature limit. For five meters, we are over 30  
20 hours.

21 And time to canister failure is also  
22 something that you want to look at because if your  
23 canister fails, then you have a possibility of  
24 radioactive release. If you fail your fuel and you  
25 don't fail your canister, most likely nothing is going

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 to come out. It will be a heck of a mess to clean up,  
2 but you won't have a radioactive release.

3 Using stress and creep standards from ASME  
4 to look at time to failure for the canister, which is  
5 a welded pressure vessel. For the 20-meter case and  
6 the 5-meter case, it's about the same. We are looking  
7 at over 30 years at temperature before this thing is  
8 going to fail. So we don't believe that that in this  
9 particular case is a problem.

10 Okay. Let's see if this one works. Would  
11 you click on it? Not working. Could you try using  
12 the pad other than the mouse? Give that a shot. They  
13 were working earlier.

14 Anyway, what you would see, this is an  
15 animation of the five-meter case. What we ended up  
16 doing here is we took the top third of this particular  
17 cask and applied the boundary conditions at the top of  
18 the tunnel. Then we took the third side, one-third of  
19 the side, and used the wall conditions from the NIST  
20 data. Then for the bottom, we used the conditions  
21 from the bottom of the rail car from the NIST data.

22 Now, what is interesting about this is  
23 this particular cradle is basically a box. So you  
24 have convection going on inside that box due to the  
25 temperature. So that was models in our particular

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 model.

2 The other thing to note is when you are  
3 five meters away from the fire, most likely the flames  
4 are going to be traveling over the impact limiter and  
5 will have a direct view of the cask itself. We model  
6 that in this particular model, and we get it running  
7 and are able to show you.

8 What you will see is that the tops of the  
9 cradle actually heat up because they have a direct  
10 view of the flames poring over the impact limiter. It  
11 has a direct view of the cask, middle of the cask.

12 Next slide, please. It is clear from this  
13 analysis that for this particular fire case, the  
14 particular fire that we analyzed, the cask maintained  
15 structural integrity. And fuel failure is not  
16 expected until well within the transient, if at all.

17 Currently it is believed that the most  
18 severe portion of the fire in the Howard Street Tunnel  
19 was within the first three hours and that the burning  
20 that occurred after that time was actually in the  
21 nonhazardous cargo. There were a number of box cars  
22 that had paper, paper products in them. Those  
23 obviously ignited at some point and burned but at a  
24 much lower temperature than the tripropylene.

25 The consequences of a spent fuel cask

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N W  
WASHINGTON, D.C. 20005-3701

1 being involved in a fire such as the one that occurred  
2 in the Howard Street Tunnel are minimal. And, as a  
3 result, the health and safety of the public would have  
4 been protected if such an event had occurred, such a  
5 fire had involved a spent fuel transportation cask.

6 Further, the Association of American  
7 Railroads has developed a performance standard for  
8 transporting spent nuclear fuel by rail. And that  
9 standard will most likely prevent hazardous materials,  
10 such as tripropylene or kerosene, from being shipped  
11 on the same train as a spent fuel cask. Bob Fronczak  
12 is going to talk about that. So I won't steal any  
13 more of his thunder.

14 The staff's preliminary conclusion is that  
15 additional regulatory requirements are not required to  
16 protect spent fuel shipping casks from severe fires if  
17 current regulations are followed. Following the AAR  
18 performance standard for shipping of spent fuel will  
19 add an additional margin of safety to the shipment of  
20 spent nuclear fuel.

21 VICE-CHAIRMAN LEVENSON: Thank you.

22 Mike?

23 MEMBER RYAN: Chris, this is a question  
24 out of my own ignorance. Would you tell me a little  
25 bit more about this 1,058 criteria? I realize it's a

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 criteria, but how does that relate to fuel failure  
2 ultimately in a fire circumstance? Do we know that?

3 MR. BAJWA: Bill may be able to add to  
4 what I would say. The 1,058 criteria is what we  
5 currently use in our reviews as the short-term  
6 temperature.

7 MEMBER RYAN: "Short-term" being how long?

8 MR. BAJWA: "Short-term" being 30 days.

9 MEMBER RYAN: Okay.

10 MR. BAJWA: That is a short-term length.  
11 It was verified experimentally since that fuel did not  
12 fail or it did not degrade noticeably for periods of  
13 30 days. So that's where the 1,058 comes from.

14 As far as temperature at which spent  
15 fuels, there are burst pressures that can be  
16 calculated. I don't know exactly what those are.

17 MEMBER RYAN: So the 1,058 is not a  
18 threshold failure number? It's a regulatory number  
19 that has conservatisms in it?

20 MR. BAJWA: That is correct. Yes.

21 VICE-CHAIRMAN LEVENSON: John?

22 MEMBER GARRICK: Were your results pretty  
23 much independent of the age and burn-up of the fuel  
24 and the possibility of damaged fuel?

25 MR. BAJWA: The analysis that we did took

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 into account the fuel that was certified to go into  
2 the cask. So we did not look at damaged fuel. We did  
3 not specifically look at high burn-up fuel.

4 MEMBER GARRICK: Okay. Thank you.

5 VICE-CHAIRMAN LEVENSON: Others? Go  
6 ahead.

7 MEMBER WYMER: I have a question. The  
8 Holtec cask uses aluminum honeycomb impact limiters  
9 wrapped in steel. What assumptions, if any, did you  
10 make about what happened to the aluminum at those  
11 temperatures?

12 MR. BAJWA: We were looking at the center  
13 line temperature of the cask. So the aluminum impact  
14 limiters didn't actually play into the analysis per  
15 se. We were looking at a cross-sectional.

16 MEMBER WYMER: I would think they would  
17 have because if the aluminum had, for example, melted  
18 -- I don't remember them melting aluminum -- then the  
19 whole thing would have sagged. It would have been a  
20 different geometry, would have checked the fire.

21 MR. BAJWA: It is possible. The other one  
22 actually melts at 600 degrees. The cradle itself  
23 supports. I don't believe that that design rests on  
24 the impact limiters. I believe the cradle supports  
25 the cask. So they could melt, and they would in this

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 case. But the cask itself probably would not move  
2 from the cradle.

3 MEMBER WYMER: The cat's cradle. One  
4 other question. Suppose there had been a lead shield  
5 at the cask. How would that have changed the results  
6 since it circulated?

7 MR. BAJWA: Probably the biggest result --  
8 and this is kind of speculation because we didn't look  
9 at it, obviously. The biggest result would be that  
10 you would melt the lead and lose your shielding  
11 capability. I could not say what kind of structural  
12 consequences there would be to lead.

13 The one thing, though, is that the lead  
14 would absorb quite a bit of heat trying to melt. So  
15 you would have a heat sink, at least for a certain  
16 amount of time, while lead was melting in there.

17 MEMBER WYMER: Thanks.

18 VICE-CHAIRMAN LEVENSON: Questions from  
19 the ACNW staff? Any questions? Come to the  
20 microphone and identify yourself.

21 MR. HODGES: I'm Wayne Hodges from the  
22 Spent Fuel Project Office.

23 One thing that is crisp he kind of  
24 mentioned in passing but is probably important to  
25 point out a little bit, the calculation he did was

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 assuming that this maximum fire temperature went on  
2 essentially indefinitely. In the Baltimore fire, we  
3 know that based on what events occurred, that the  
4 intense fire lasted probably for about three hours.

5 If it had not had a water main break,  
6 which tend to cool things down, based upon how much  
7 fuel you had in the tank car, the fire probably would  
8 have lasted maybe six and a half hours.

9 So even for the worst case, where you got  
10 to burn all of the fuel in the tank car, it is not  
11 going to go on indefinitely. And, if you recall from  
12 his analyses, you didn't start eating the fuel up  
13 until for the case where you are a tank car away until  
14 ten or more hours in the tank. In the real world, you  
15 are already out of fuel by that time and things are  
16 starting to cool down a little bit.

17 So, even though it is a better analysis  
18 than what was done initially, it is still somewhat a  
19 very bounding analysis and shows a lot of margin  
20 there.

21 MR. BAJWA: Thanks, Wayne. That is a very  
22 good point.

23 MR. REZNIKOFF: Marvin Reznikoff. I have  
24 a quick question. First of all, I found the analysis  
25 very impressive. happened to the neutron shield that

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 was around the cask? How would the neutron doses  
2 increase if that material melted? And what would be  
3 the effect on fire-fighters?

4 MR. BAJWA: Very good question. Most  
5 analyses assume that the neutron shield melts during  
6 the fire. And then they will assume --

7 MR. REZNIKOFF: Your analysis assumed  
8 that?

9 MR. BAJWA: I believe that we actually  
10 left the neutron shield intact during the fire to  
11 increase the amount of heat that was getting into the  
12 cask. Sometimes what is done is it will be replaced  
13 by air, which actually gives you a more insulative  
14 boundary to the heat that is moving into the canister.  
15 So I believe for the fire analysis, we actually left  
16 it intact.

17 MR. REZNIKOFF: In a real-life situation,  
18 it might melt?

19 MR. BAJWA: If it reached the melting  
20 temperature, certainly, yes, it would.

21 MR. REZNIKOFF: Then I know one  
22 consideration is what would happen to the fuel. That  
23 is what you are looking at. But I was asking another  
24 question. What would happen to emergency responders.  
25 How close could they get to a cask? That is why I was

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 asking that question.

2 MR. BAJWA: We obviously didn't look into  
3 that in this analysis, but that is definitely  
4 something that should be considered in the future.

5 VICE-CHAIRMAN LEVENSON: Any other  
6 questions?

7 MEMBER KOBETZ: Hang on a second. We're  
8 going to be able to show you this picture.

9 MR. GRUMSKI: I just have one more point.  
10 I think that the importance of this presentation is  
11 that the administrative controls that are put on  
12 shipments and, like any nuclear power plant, if you  
13 worked in a nuclear power plant, there are engineering  
14 controls, which would represent the cask design and  
15 protection of the cask; and there are administrative  
16 controls, which is how you ship spent fuel.

17 You are not going to ship spent fuel with  
18 that type of shipment in a tunnel like that. It is  
19 probably going to be in private train service and  
20 special train service. Those controls are regulated  
21 not only by DOT, the NRC, but also the shipper.

22 So something he really needs to bring out  
23 in his presentation is that scenario is very unlikely  
24 in a real world on the train shipments because it just  
25 won't happen. There won't be that train next to that

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 car. And I think that needs to be brought out.

2 Oh, I'm sorry. My name is Ken Grumski.

3 MR. FRONCZAK: Bob Fronczak with AAR.

4 The scenario he brings up is very possible  
5 if we were to ship in regular train service under the  
6 current just general regulatory scheme. I agree with  
7 you, and I am glad you pointed out that had you  
8 followed our performance standard and shipped in  
9 dedicated trains, you wouldn't have had that fuel  
10 source there. But if you were to ship just in regular  
11 freight service under a current regulatory scenario,  
12 that is a very real possibility.

13 MR. BAJWA: Well, look at that. All  
14 right. This is what I wanted to show you before.  
15 This is the NIST fire model. Obviously the source of  
16 tripropylene is down here at the base of this car, in  
17 between these two cars here.

18 What I was explaining before was you see  
19 the fire impinging directly on the top of the tunnel  
20 and then spreading out. What you are not seeing here,  
21 of course, is temperatures. And you're not really  
22 seeing flow. But you can see sort of how the fire  
23 behaves given the flow regimes that are being  
24 experienced there

25 CHAIRMAN HORNBERGER: Not seeing

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 temperature, not seeing flow, what are we seeing?

2 MR. BAJWA: You are seeing a visualization  
3 of what is combusting in there. Okay? Now, what you  
4 are going to see here is the top of the cask is  
5 obviously going to heat up the quickest because that  
6 is going to be the highest temperature regime. Down  
7 on the sides, there will be a lower temperature  
8 regime.

9 Then down on the bottom, towards the  
10 beginning of the fire, you actually have some cooling  
11 down here because the fire is sucking some air in in  
12 order to feed itself. So you have air flowing past  
13 this cradle and actually cooling it down a little bit.  
14 Here on the sides, you see the heating up of the  
15 cradle due to the direct view that it has of the  
16 flames that are on the top of the cask.

17 This simulation was run for 150 hours.  
18 You can see when you consider 150 hours, it takes  
19 quite a while for that heat to work its way down into  
20 the fuel. The fuel itself obviously and the cask,  
21 this whole unit, has a very high thermal inertia if  
22 you want to use that word. It takes a long time to  
23 heat it up and get the heat to go through the  
24 different layers and into the fuel basket.

25 That's it.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 VICE-CHAIRMAN LEVENSON: Thank you.

2 Our next presentation is by -- oh, I'm  
3 sorry. Microphone, please.

4 MR. GUTHERMAN: Brian Gutherman from  
5 Holtec.

6 I just wanted to add a little more  
7 perspective to the 1,058 temperature. The value for  
8 ECCS in operating reactors is 2,200 degrees Fahrenheit  
9 to give you some perspective that there is almost  
10 1,000 degrees there or 1,200 degrees. The melting  
11 point, zirconium or zircalloy cladding, is some number  
12 of degrees above that. So I just wanted to offer that  
13 up for perspective.

14 VICE-CHAIRMAN LEVENSON: Thank you.

15 MS. GUE: Could I comment?

16 VICE-CHAIRMAN LEVENSON: Yes.

17 MS. GUE: Sorry. I'll be quick. Lisa Gue  
18 with Public Citizen again.

19 I guess I just wanted to take issue here  
20 with the conclusion statement that the health and the  
21 safety of the public are protected. I understand that  
22 it is a very important consideration, the impact of  
23 this kind of long-duration fire on the fuel itself,  
24 but the way this study has been presented, just as a  
25 blanket conclusion that there would be no radiation

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 released that could be damaging to the public when it  
2 hasn't even been taken consideration the effect on the  
3 shielding and how that might impact energy response  
4 efforts is another example of how I think the NRC  
5 loses the confidence of the public in the studies that  
6 it does by presenting somewhat misleadingly the  
7 studies that are carried out.

8 So I guess I just want to put that out  
9 there as an example for the purposes of public  
10 communication, how it's really important to clearly  
11 communicate what was being studied, what was being  
12 tested, and limit the conclusions, then, to those  
13 parameters.

14 Thank you.

15 VICE-CHAIRMAN LEVENSON: Any other  
16 comment?

17 (No response.)

18 VICE-CHAIRMAN LEVENSON: If not, our next  
19 speaker is Robert Fronczak from AAR.

20 MR. FRONCZAK: Hopefully we have got these  
21 technical difficulties solved by this late hour. I am  
22 very impressed with the number of people that are  
23 still here.

24 My name is Bob Fronczak. I am not a  
25 testing expert. I am not a modeling expert, though I

1 have been around the railroad industry for about 25  
2 years. So I know a little bit about railroads.

3 First slide, please. What I am here to  
4 talk about or what I have been asked to talk about is  
5 testing. I want to cover some of the AAR cask  
6 testing, at least analysis work that we did, focus on  
7 four things that we came up with as issues, crush  
8 loads, collisions with structures and falls, thermal  
9 event frequencies, and structural strength of rail  
10 cars, and then go a little bit into our performance  
11 standard for spent nuclear fuel.

12 Next slide. As far as cask integrity  
13 goes, we for many years -- and some of you may  
14 remember this -- had a recommended practice in the  
15 rail industry where we recommended spent fuel ought to  
16 be shipped at 35 miles an hour with a standing pass  
17 rule, which means that if one train met another train  
18 carrying spent nuclear fuel, one train needed to stand  
19 while the other one passed it no faster than 35 miles  
20 per hour.

21 That was all based on the 30-foot drop  
22 test, which accelerates a cask to 30 miles an hour.  
23 Railroads are very conservative, and we felt that this  
24 was kind of a bet the company kind of issue.

25 With upcoming shipments, figuring that

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Yucca Mountain was going to open in 1996 or 1998, we  
2 commissioned a couple of reports to analyze what we  
3 felt was the state of the art on communicating to the  
4 public what testing, what the NRC testing, means to  
5 the actual environment. So we looked at the modal  
6 study very closely.

7 We commissioned two reports. One was done  
8 by Transys or Gordon English, et al. The other was  
9 done by Jim Rock at the Texas Transportation  
10 Institute. Both of those have already been presented  
11 or given to NRC. I think I talked about this in  
12 preparation for the package performance study about  
13 two years ago.

14 Next slide. The conclusion of those  
15 reports. The Transys report was that there are some  
16 accidents that might not be able to withstand forces  
17 in railroad accidents. One thing, to change our  
18 recommended practice, that was not good enough. So we  
19 commissioned another report.

20 What we looked at is the consequences of  
21 an accident if one were to occur with the release.  
22 That report determined that if you did have a release,  
23 that public health wouldn't be affected in a major  
24 way. Again, that is assuming that nobody is right  
25 next to the cask if that incident were to occur.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           Next slide. Some of the things that we do  
2 question or at least we think a little bit more work  
3 ought to be done on, -- and, again, I talked about  
4 this a couple of years ago -- crush loads. Crush  
5 loads are not required by NRC tests presently. Rail  
6 by definition is multiple packages being transported  
7 altogether. In derailment, we feel that crush loads  
8 are a very real possibility. So we do feel that crush  
9 loads ought to be considered.

10           One study looked at frequency of incidence  
11 of crush loading at one-tenth of that of impact  
12 loading. And only .8 percent experienced impact with  
13 a coupler or significant frame member of other  
14 vehicles.

15           Next slide. You can slice this many  
16 different ways. One way to look at it is that three  
17 percent of trains and accidents in 2001 derailed more  
18 than five cars, many of the accidents, 70 percent,  
19 less than 5 cars but 3 percent more. As the speeds  
20 increase in derailments, you derail more cars. So,  
21 again, you can go through this many different ways.  
22 As the speeds increased, those would be the accidents  
23 that would be of more interest.

24           So that is one area we feel needs a little  
25 bit more work. Perhaps some of that work is already

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 being done as a result of our previous comments.

2 CHAIRMAN HORNBERGER: Robert, out of  
3 ignorance, my own ignorance, that is, by "crush  
4 loads," are you talking about one car piling on top of  
5 the other? Is that the mechanism?

6 MR. FRONCZAK: That's exactly what we are  
7 talking about, yes. Again, it's a requirement for  
8 small packages. I think the idea is that the  
9 likelihood of a crush load with a large package is  
10 pretty small, but we feel in a North American rail  
11 environment that that is a real possibility. You're  
12 talking about fairly heavy loads. I mean, the  
13 standard rail freight vehicle is centered in 63,000  
14 pounds today going to 286.

15 MR. FISCHER: I do want to point out in  
16 the modal study, we looked at a G.E. locomotive  
17 landing on top of the cask. It did nothing to it,  
18 very little. That is in the report. I think that was  
19 a three or four hundred ton locomotive. So we did  
20 look at it. We felt a locomotive was the heaviest  
21 thing that could land on it. So we did look at it.

22 MR. FRONCZAK: And it was a crush  
23 accident?

24 MR. FISCHER: Yes.

25 MR. FRONCZAK: Okay. That is not what our

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 consultant found.

2 Similar sources of information that we can  
3 go to to look at this, this topic, is the FRA  
4 database. That includes the number of cars involved  
5 in derailments. Also, there is the AAR-RPI tank car  
6 safety research and test project. That is an  
7 over-30-year database of over 30,000 damaged tank  
8 cars.

9 To get at the data that we are looking at  
10 would require going through -- we don't want to have  
11 a search for crush loads in that database that would  
12 require going through individual records manually to  
13 get at that data, but it is available.

14 Next slide. The modal study used highway  
15 data to evaluate impacts with structures and falls.  
16 We feel that the railroad environment is a lot  
17 different by road. Roads go basically according to  
18 whatever the grade is. It will go over hill. And by  
19 rail, you can't do that. Rail, the maximum grade is  
20 about two, two and a half percent. So there are a lot  
21 of cuts and fills. We figured that we probably  
22 underestimated frequency of rock cuts, frequency of  
23 impact with embankments, water crossings, and large  
24 structures.

25 Next slide. As far as thermal event

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 frequencies, the mobile study looked at 81 percent  
2 fires less than one hour, 99 percent of the fires less  
3 than 7 hours. Although the Eggers data was actually  
4 evaluated and not used, they looked at 50 percent of  
5 the fires less than 11 hours and 9 percent of the  
6 fires less than 130 hours. We felt that the Eggers  
7 data would have been a more conservative choice.

8 Point to one railroad incident, which in  
9 1996 the fire lasted 18 days or 360 hours. That was  
10 in Weyauwega, Wisconsin. It was an LP gas derailment.  
11 We had the town evacuated for that amount of time.

12 Next slide. As far as the structural  
13 strength of rail cars, the modal study used 100,000  
14 pounds per foot or a million pounds for a 10-foot-wide  
15 locomotive and 1.6 million pounds for a 16-foot-long  
16 cask. The locomotives are designed to withstand one  
17 million pounds of force at the coupler without  
18 permanent deformation. Our finite element analysis  
19 indicated that three million pounds would be applied  
20 at the coupler height and ten million pounds at the  
21 frame's neutral axis.

22 Next slide. The next thing I wanted to  
23 talk about is our performance standard for spent  
24 nuclear fuel trains. This standard is a little bit  
25 different than most other standards that we have in

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 our manual standards and recommended practices in that  
2 it includes all the cars on the train. Most new cars,  
3 the car itself, need to be designed and tested. This  
4 one, all the cars in the train, including buffer cars  
5 and locomotive and security cars, will be tested.

6 Require static and dynamic modeling before  
7 construction requires full-scale characterization,  
8 both static and dynamic testing of each car and the  
9 train. That is all done at a test facility before the  
10 car is actually approved by AAR Equipment Engineering  
11 Committee. And then it needs to be analyzed or at  
12 least a report needs to be submitted after 100,000  
13 miles of operation just to make sure that it is still  
14 meeting the standard.

15 Next slide. The road worthiness criteria  
16 or performance requirements in the standard exceed  
17 standard freight car designs today. So you need an  
18 enhanced performance truck to meet the design criteria  
19 in this new performance standard. It also requires  
20 electronically controlled pneumatic breaks. That  
21 reduces stopping distance significantly. In a loaded  
22 coal train, you are talking about 30 percent benefit  
23 in stopping distance.

24 We envision a fairly short dedicated  
25 train. So you wouldn't get all of that benefit in

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 stopping distance. What that does provide you is a  
2 conduit between all the cars in the train for on-board  
3 monitoring of some defect parameters.

4 Next slide. The performance standard  
5 requires monitoring for things like truck hunting,  
6 where the trucks will actually go back and forth.  
7 Again, that is a mode of derailment. Wheel flats, you  
8 might hear that as cars go by, as that wheel pounds.  
9 That is another mode of derailment.

10 Braking performance, vertical, lateral  
11 longitudinal acceleration. So as that thing is going  
12 up and down or sideways on the track, we will be  
13 monitoring that.

14 Bearing conditions. We have hot box  
15 detectors, spaced periodically along the tracks to  
16 look for hot bearings. This will monitor the actual  
17 bearing temperature on board and will be able to stop  
18 that train if there were an increase in temperature  
19 before anything were to occur as well as speed and  
20 ride quality.

21 Next slide. This is kind of a schematic  
22 diagram of how we envision the system. Showing two  
23 locomotives here, that is not necessarily because it  
24 needs it for weight but primarily for redundancy in  
25 case you had a failure en route.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           You are looking at a buffer car between  
2 any occupied vehicle and a first cask car. That needs  
3 to be of consistent size and weight of the other cars  
4 in the train because you are looking at a 200-ton  
5 locomotive here and a 200-ton spent nuclear fuel cask  
6 car over here.

7           Then a security car at the end. We  
8 believe that the security car ought to be a personnel  
9 car or actually probably a retrofitted passenger car  
10 to allow permanent occupancy of the people that would  
11 be escorting the shipments. You don't have to get  
12 those people on and off en route. And then you have  
13 got the enhanced performance truck and then the defect  
14 detection equipment throughout the entire train.

15           Next slide. There are some other  
16 performance features that we have implemented to be  
17 able to allow us to rescind our 20-some-year-old  
18 recommended practice. One of those is OT-55, "These  
19 shipments will be done in accordance with OT-55."  
20 That is our recommended operating practice for  
21 hazardous materials.

22           In OT-55, there are increased track and  
23 equipment inspection requirements, increased defect  
24 monitoring. In other words, there are wayside hot  
25 bearing detectors spaced more frequently than on other

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 sections of track, increased maintenance frequency,  
2 increased employee training, and there is a maximum  
3 speed limit of 50 miles per hour. So, whereas, before  
4 we were recommending 35 miles an hour with a standing  
5 pass, now we are recommending 50 miles per hour with  
6 no restriction, passing restriction.

7 Tomorrow I don't know what Kevin Blackwell  
8 has to talk about, but FRA has got their safety  
9 compliance oversight plan. That has a bunch of other  
10 I guess extra-regulatory kind of requirements for  
11 inspection of spent nuclear fuel, high-level waste  
12 shipments.

13 Next slide. The Private Fuel Storage is  
14 the first organization to design to the new  
15 performance standard. Their cask car is being  
16 manufactured or it has been manufactured, the  
17 prototype, by Trinity Industries. The overall weight  
18 of that cask car-cradle combination is 476,000 pounds.  
19 It's very much heavier than a typical rail car.

20 The modeling and characterization have  
21 been done. The on-track testing is currently being  
22 performed out at our transportation technology center  
23 in Pueblo, Colorado, hope to finish that this year.

24 The performance standard does not require  
25 dedicated trains. The reason it doesn't require

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 dedicated trains is because the Supreme Court won't  
2 allow us to require dedicated trains. In fact, you  
3 lose a lot of the operating or a lot of the benefits  
4 of this performance standard if you don't ship it in  
5 dedicated trains because the on-board defect detection  
6 will be negated.

7 Private Fuel Storage is designing their  
8 system as a dedicated train system with all of the I  
9 guess requirements of the performance standard.

10 Next slide. This is what that car looks  
11 like at TTC. You can see it's a span bolster,  
12 eight-axle vehicle. There is a truck, two-axle truck  
13 here, two-axle truck here, the same thing on the other  
14 side. It's depressed well. And that's what it looks  
15 like.

16 Next slide. In summary, we feel that  
17 there are some issues that ought to be looked at as  
18 far as testing goes related to crush load, collision  
19 with structures, et cetera. NRR is committed to  
20 incorporating improvements in technology into the  
21 transportation of spent fuel and high-level waste. We  
22 will continue to do that as technology comes up that  
23 we feel could benefit.

24 That was all I had to say.

25 VICE-CHAIRMAN LEVENSON: Okay. Thank you.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE, N.W.  
WASHINGTON, D.C. 20005-3701

1 Mike?

2 MEMBER RYAN: Thanks.

3 I learned a lot about rail shipments  
4 today. A couple of questions, though. Are there any  
5 materials in transport now under a dedicated train  
6 arrangement?

7 MR. FRONCZAK: In actuality, most of the  
8 shipments of spent nuclear fuel have been made by  
9 dedicated train, whether they have been requested to  
10 be dedicated train or not. For instance, the Navy  
11 requests regular train service. Union Pacific will  
12 not ship that. BNSF will not ship that in just  
13 regular train service. They ship that in dedicated  
14 train.

15 MEMBER RYAN: So that is the railroad's  
16 choice, rather than the shipper's choice?

17 MR. FRONCZAK: It is not always that way.  
18 That is the way the Navy does it.

19 MEMBER RYAN: Right.

20 MR. FRONCZAK: By contrast, most of the  
21 Department of Energy shipments have been made by  
22 dedicated train at their request. For instance, the  
23 foreign research reactor shipment that was made out of  
24 Concord, California, FINEEL in -- I don't know -- '88  
25 or something, '86, that one in dedicated train -- no.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 '96 I think.

2 The same thing with the West Valley  
3 shipment. That was planned. Had that occurred, it  
4 was planned for dedicated trains.

5 MEMBER RYAN: I guess the question is you  
6 described a dedicated train with enhanced monitoring  
7 and all of those kinds of things. Is there any other  
8 material in commerce that is shipped under that kind  
9 of enhanced protection system now?

10 MR. FRONCZAK: No.

11 MEMBER RYAN: The other question is more  
12 generic. I mean, you gave a lot of statistics about  
13 accident rates and so forth. I assume that is for the  
14 industry as a whole and not for this dedicated train  
15 segment, which I guess I am assuming. Help me  
16 understand better. Are their performance numbers for  
17 a dedicated train segment much better?

18 MR. FRONCZAK: In other words, would the  
19 derailment rate, for instance, for a dedicated train  
20 be --

21 MEMBER RYAN: All the performance  
22 indicators of tip-over, derailments, and car failures,  
23 and all that sort of stuff. I mean, I would assume  
24 that if you had a dedicated train service, the basic  
25 statistics would be better or not? I don't know.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. FRONCZAK: The problem with that is  
2 that we don't have very much data with a dedicated  
3 train. We have got reams of data with regular trains.

4 MEMBER RYAN: It might be interesting to  
5 separate that out. Even though it is maybe not a lot  
6 of data, it would be interesting to see because that  
7 is really the question, "What am I buying?"

8 MR. FRONCZAK: Right, right. Exactly.

9 MEMBER RYAN: Thanks.

10 MEMBER GARRICK: Yes. I wrote a paper on  
11 this about 20 years ago and concluded that you're not  
12 buying anything.

13 What I wanted to ask you is I participated  
14 in some hearings with the ICC way back in the '70s.  
15 And the issue was whether there should or should not  
16 be special trains. The conclusion of those hearings  
17 was that there was no scientific basis for dedicated  
18 trains for the shipment of radioactive materials.  
19 What has happened between then and now that would  
20 cause the American Railroad Association to feel as  
21 strongly as you evidently do about special trains?

22 That was really a very high-level  
23 ventilation of all the scientific information in the  
24 '70s. And there was representation from all the major  
25 railroads and your association as well as the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 scientific community. This whole issue was washed  
2 pretty thoroughly at that time, and that was the  
3 conclusion. Has there been something happen in the  
4 meantime that this should be an issue?

5 Now, I think that if the user wants to  
6 finance a dedicated train, that should be their  
7 privilege. But what we have to deal with is  
8 scientific evidence.

9 I think Mike's question is a very good  
10 one. If you incorporate today's contemporary thinking  
11 about risk and apply that to the different kinds of  
12 cargoes that are on the railroads and you had 100  
13 hazardous cargoes, probably the nuclear from a risk  
14 standpoint would come out at the top in terms of being  
15 the most safe.

16 And so when you start talking about  
17 dedicated trains for nuclear, aren't you really  
18 opening up a hornet's nest with respect to sending the  
19 message to the public that there ought to be dedicated  
20 trains for all of the other extremely hazardous  
21 materials?

22 MR. FRONCZAK: We feel that -- and our  
23 members have felt this for years -- there are things  
24 that we can do to make these shipments safer. We feel  
25 that we owe it to the public to do that. We don't

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 feel like they're asking that much. Incidents that  
2 get blown out of proportion, like the Baltimore Tunnel  
3 fire, in a dedicated train scenario because the fuel  
4 would not be there.

5 Now, FRA has been asked to do a dedicated  
6 train study. That was mandated by Congress for  
7 completion in 1994. And that study has still not been  
8 published. And Administrator Rudder from FRA  
9 indicated that that was going to be done this year.  
10 In my understanding, it has been quite controversial.  
11 And that is why it has not been published. So I guess  
12 we will find out by the end of the year.

13 MEMBER RYAN: Maybe I can extend the  
14 question a little bit. You know, just in simple  
15 terms, things like chlorine and ammonia are shipped  
16 all the time, every day, in much larger quantities.  
17 So on a risk basis, you could think about the idea  
18 that if you made an incremental improvement there in  
19 terms of transportation safety overall, that would be  
20 a big win compared to an incremental improvement for  
21 something not in commerce very often, relatively  
22 speaking. So how does your organization prioritize  
23 the risks that you face an industry?

24 MR. FRONCZAK: We do it by risk  
25 assessment, risk management. There have been

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 tremendous improvements in chlorine tank cars over the  
2 last 20 years. There have been tremendous  
3 improvements in LP gas transportation. That  
4 derailment that we had in Weyauwega, Wisconsin had  
5 that happened 30 years ago, there would have been dead  
6 people as a result of that.

7 The safety improvements, the safety vents  
8 that we put on the cars, the thermal protection we put  
9 on the cars, the bottom and top outlet protection we  
10 put on those cars, all of those things have been done  
11 by industry initiatives, industry-funded research,  
12 where the safety of that transportation of those  
13 materials have been improved tremendously.

14 We have had, what, maybe 3 fatalities in  
15 the last 15 years caused by hazardous materials  
16 transportation by rail. Highway, there are probably  
17 18 to 20 fatalities per year. So we feel like we have  
18 done a lot to improve transportation of hazardous  
19 materials by rail.

20 CHAIRMAN HORNBERGER: I also have a  
21 follow-up question on this because I was actually  
22 impressed with you said that OT-55D was for hazardous  
23 waste.

24 MR. FRONCZAK: Hazardous materials.

25 CHAIRMAN HORNBERGER: Hazardous materials.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. FRONCZAK: Right.

2 CHAIRMAN HORNBERGER: Not hazardous waste.  
3 Hazardous materials. I would, therefore, infer from  
4 that that if you are recommending dedicated trains, it  
5 would be for all hazardous material.

6 MR. FRONCZAK: No. Like I said, we  
7 believe that the transportation of spent nuclear fuel  
8 ought to be done by dedicated trains. I didn't want  
9 to get into the reasons for that here, and I haven't  
10 really because there are a lot of reasons for that.  
11 Efficiency is one of those reasons.

12 We have locomotives that cost less than  
13 these casks cost. We are very hyper about having  
14 those things used all of the time. I don't think you  
15 guys want these things sitting around yards for 48  
16 hours waiting to be switched into another train. You  
17 don't want your guards sitting around yards, rail  
18 yards, for 48 hours waiting to be picked up by another  
19 train. There is a whole bunch of other reasons I  
20 haven't even touched on about the dedicated trains.

21 CHAIRMAN HORNBERGER: But all of those  
22 reasons -- and they are all very sensible reasons.  
23 Obviously you wouldn't want to do it that way, and I  
24 would imagine that the user want to do it. They have  
25 nothing to do with safety.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. FRONCZAK: I would argue that there is  
2 going to be less of a probability of derailment. Now,  
3 you can argue all you want about what would happen if  
4 that derailment were to occur. I guarantee you the  
5 public is concerned about that. We are very concerned  
6 about that. We don't want that incident to occur on  
7 our railroads.

8 CHAIRMAN HORNBERGER: I agree with that.  
9 But, again, if you want to talk about risk, as Mike  
10 said, then your comment is exactly the same for  
11 ammonia and chlorine and natural gas.

12 MR. FRONCZAK: That's why if we had a  
13 dedicated train, you would have fewer derailments.

14 CHAIRMAN HORNBERGER: Okay. But the  
15 public is very familiar with those kind of shipments,  
16 and they're not with this stuff.

17 MEMBER WYMER: No, that's enough been  
18 said.

19 CHAIRMAN HORNBERGER: Maybe too much.

20 VICE-CHAIRMAN LEVENSON: I guess, with  
21 that, maybe I shouldn't.

22 On this business of the dedicated train,  
23 since you don't have any data to indicate that it is  
24 really safer, is your recommendation based on a risk  
25 analysis or intuition?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           If it is risk analysis, I have some  
2 interest-taking observations, like if the crush load  
3 is really an important thing, you are much safer if  
4 you don't because the largest crushing load you have  
5 got in your whole system is a cask. Three or four  
6 casks in a row generate a much larger risk than one  
7 cask in the middle of an ordinary train.

8           So has there really been a risk analysis  
9 done to support this recommendation or is it just "We  
10 think it's a good idea," et cetera?

11           MR. FRONCZAK: We have looked at a lot of  
12 data as far as under the current railroad design  
13 criteria, what derailment rates would be for that  
14 versus what we would expect it to be if it were  
15 designed to the new performance standard. And our  
16 analysis would indicate that it's safer or we would  
17 have less derailments with dedicated trains.

18           Now, you're right. If you've got more  
19 than one package together or one cask together, there  
20 is a possibility of those casks impacting on each  
21 other. And that is why the performance standard  
22 requires double shelf couplers so that those cars stay  
23 together when they are derailed.

24           MEMBER RYAN: Have you published that  
25 analysis you mentioned?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. FRONCZAK: No.

2 MEMBER GARRICK: See, we don't mean to be  
3 hard on you on this, and you have done a good job of  
4 stating largely why you are doing what you are doing.  
5 It has a lot to do with the public and their views and  
6 things. And that has to be a major consideration.

7 What we are really focused on is what is  
8 the technical basis. And, as I say, the Interstate  
9 Commerce Commission, the Supreme Court, et cetera, et  
10 cetera, have not seen sufficient scientific evidence  
11 to support the view of dedicated trains for nuclear  
12 materials. We're still searching for that.

13 And, yet, the railroad industry appears to  
14 continue to believe very strongly that dedicated  
15 trains are in order for a material that is probably  
16 much less of a risk to the public safety than many  
17 other materials that you routinely ship on the basis  
18 of the technical evidence and the scientific evidence.  
19 We're just trying to search for that and see if there  
20 has been a change in the last 20 years that would  
21 account for your position.

22 MR. FRONCZAK: All I have to say is that  
23 the Private Fuel Storage is convinced that that is the  
24 way it ought to be shipped. So they see some benefit  
25 in it. As a matter of fact, most all shipments are

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 made by dedicated train.

2 VICE-CHAIRMAN LEVENSON: Okay. Any ACNW  
3 staff members there?

4 MEMBER KOBETZ: I want to follow up with  
5 something that Larry said about the crush and the  
6 engine dropping on a cask in the modal study or  
7 somehow crushing it. What was that based on?  
8 Obviously there hasn't been any testing of that type.  
9 And there are a lot of variables with the train  
10 landing or crushing. What was the scenario of the  
11 study?

12 MR. FISCHER: Basically I think it dropped  
13 a few feet on top of the cask.

14 MEMBER KOBETZ: How in-depth was the  
15 analysis? Again, something like that, it seems there  
16 are a lot of variables as far as where it hits.

17 MR. FISCHER: Well, what we saw is that  
18 there wasn't much damage done. So we decided not to  
19 look longer into that scenario because there were  
20 other scenarios we thought were much more significant,  
21 more credible.

22 MEMBER KOBETZ: Was it a direct hit, then,  
23 on top of --

24 MR. FISCHER: Yes. It was laying on top  
25 of it, yes. Right. As for the couplers, your

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 couplers are made to disconnect at about 1.3 million  
2 pounds. That's why we use 1.6. They disable  
3 themselves because they don't want to puncture the car  
4 in front of them. So that was the basis for the  
5 study, not the capability of the whole chassis.

6 When we looked at the capability of the  
7 whole chassis, the coupler was gone. And by that  
8 time, you got a dynamic situation. And as the train  
9 hits the cask, it accelerates the cask so you don't  
10 see the full static ten million pounds load because  
11 you're accelerating the cask and it's pulling away.

12 CHAIRMAN HORNBERGER: Unless it's --

13 MR. FISCHER: The train is pretty big,  
14 too, because it is going to hit whatever the cask hit.

15 CHAIRMAN HORNBERGER: So to follow up,  
16 then, on Tim's question, does this whole analysis  
17 depend upon the cars being launched airborne? We are  
18 really talking about an impact kind of situation and  
19 not a static load.

20 I am trying to think of the difference.  
21 Is it just a different impact? It's not just one  
22 laying on top of the other and crushing it, then.

23 MR. FISCHER: No. It's laying down on top  
24 of it with a dynamic load factor.

25 CHAIRMAN HORNBERGER: Dynamic load factor.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 VICE-CHAIRMAN LEVENSON: Not a 30-foot  
2 drop.

3 MR. FISCHER: But not a 30-foot drop.  
4 That's correct. No.

5 MR. YAKSH: I would like to make a comment  
6 on that. Mike Yaksh, AAC. Keep in mind all of these  
7 weigh about 200,000 pounds, roughly all designed at 60  
8 G's. These things are designed to take 60 G's. We  
9 got a 300-ton locomotive. It nowhere comes close to  
10 60 times 250,000 pounds. So if you just put it in  
11 perspective.

12 And the other thing, the locomotive is not  
13 a rigid item. So the loads will pass through. And  
14 the transport task is public supported. A load will  
15 pass through. So that is why it is nowhere near a  
16 controlling case.

17 MR. FISCHER: In fact, if you looked at  
18 what happened to the locomotive when the British ran  
19 it into the cask, the locomotive was destroyed. The  
20 engine actually was torn up. And then the intervenors  
21 claim that they took the bolts loose before they ran  
22 the test. So it goes on and on.

23 If you don't want to believe, you don't  
24 want to believe. That's okay. But it's not worth  
25 arguing over. And, by the way, G.E. didn't want to

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 ship dedicated train. But when it got time to get  
2 those spent fuel out of those pools, they were on  
3 dedicated train, and they were gone. You lost more  
4 money arguing than just doing.

5 MR. FRONCZAK: It's our right-of-way.  
6 It's our property we're trying to protect.

7 VICE-CHAIRMAN LEVENSON: Well, like I  
8 mentioned earlier to Bill in connection with the  
9 regulatory agency, railroads have a lot of different  
10 things other than technical issues on which they base  
11 decisions. I think we have to recognize that. It  
12 doesn't mean the committee has to involve itself in  
13 the economics and the efficiency. We're trying to  
14 focus on the technical issues.

15 I hope you understand we appreciate all of  
16 these things may be more important in any case. We're  
17 just trying to look on our chart.

18 Any other questions? Go to the microphone  
19 and identify yourself.

20 MR. MCCARVILLE: Hi. I'm Dave McCarville  
21 from Booz Allen Hamilton. Formerly I worked for Ed,  
22 Low, and Ashland and managed quite a few spent fuel  
23 shipments by rail.

24 The buffer cars were always empty. In  
25 here, I see you have got a 100-ton buffer car. You

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 should explain what analysis was done to come up with  
2 that recommendation and what configuration and how it  
3 would be procured if there were to be such an item.

4 MR. FRONCZAK: The reason for the loaded  
5 buffer car -- Union Pacific actually did this as a  
6 result of the Navy requiring their shipments to be  
7 done at the end of regular trains. What happens is  
8 that you get in-train forces that are so large that  
9 you can actually lift a lighter car off the track and  
10 cause a derailment. So that's the reason you want a  
11 car of consistent weight with the other cars in the  
12 train and not just a really lightly loaded or empty  
13 car as a buffer car.

14 MR. McCARVILLE: I assume some analysis  
15 between the security car and locomotive with personnel  
16 in it and crush testing. Has that been analyzed as  
17 well?

18 MR. FRONCZAK: I'm sorry? What?

19 MR. McCARVILLE: If the 100-ton buffer car  
20 is right next to a personnel car, wouldn't there be  
21 some crush testing safety effects there to look at?

22 MR. FRONCZAK: The one thing the  
23 performance standard requires is that the personnel  
24 car has to meet the same sort of design requirements  
25 as a freight car. And freight cars have been analyzed

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 for those kind of loans.

2 MR. MCCARVILLE: You say there is a report  
3 that analyzed that 100-ton requirement?

4 MR. FRONCZAK: Not specifically, but there  
5 is a report that analyzes the Navy situation.

6 MR. MCCARVILLE: One more question. What  
7 would a 100-ton buffer car look like as far as a  
8 configuration? Has there been any thought into how it  
9 would be laid out?

10 MR. FRONCZAK: My thought is it's a  
11 gondola car with ballasts in it, something like that.

12 MR. MCCARVILLE: Thank you.

13 VICE-CHAIRMAN LEVENSON: Someone else?

14 MR. GRUMSKI: Ken Grumski from MHF.

15 Bob, two questions, actually. What is the  
16 cost, average cost, per mile of a dedicated train?

17 MR. FRONCZAK: I can't answer that  
18 question. I am with the industry association.

19 MR. GRUMSKI: You don't know what the  
20 average is?

21 MR. FRONCZAK: We don't get involved in  
22 costs at all. Our members do that. And we are  
23 restrained by antitrust to talk about cost.

24 MR. GRUMSKI: Okay.

25 MR. FRONCZAK: Now, there is some

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 information out there. For instance, the Three Mile  
2 Island shipments, that information is in a report. I  
3 can't remember off the top of my head what that is.  
4 I've got that report in my office, and I can find it  
5 for you if you want to call me.

6 MR. GRUMSKI: I am curious because regular  
7 train service versus dedicated train, I am sure there  
8 is a huge cost difference. And I just wanted to know  
9 what --

10 MR. FRONCZAK: Well, it's a matter of  
11 transporting 100 cars versus however many you have in  
12 a dedicated train and the crew.

13 MS. GUE: Hello again. Lisa Gue with  
14 Public Citizen.

15 I appreciated your presentation. And I  
16 just had a quick question about the AAR. Does the  
17 association have an enforcement capability with these  
18 performance recommendation?

19 MR. FRONCZAK: I guess, yes, we do. Now,  
20 who is the AAR? The AAR is an industry association,  
21 nonprofit industry association. Our members are the  
22 Class 1 railroads. That is Burlington Northern Santa  
23 Fe. Amtrak is one also, Canadian National, Canadian  
24 Pacific, CSX Transportation, Norfolk Southern, Kansas  
25 City, Southern Union Pacific Railroad basically.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           We set voluntary standards because we have  
2 to interchange equipment with each other. Equipment  
3 gets interchanged all the time. If you didn't have  
4 couplers the same height, you couldn't interchange  
5 that equipment. If you didn't have tracks that had  
6 the same gauge, you couldn't move cars between  
7 railroads.

8           So yes, our standards are enforceable if  
9 you want to transport something in what is called free  
10 interchange in the U.S. rail network. Now, there are  
11 private agreements between carriers.

12           MS. GUE: Let me just specify a little bit  
13 more. Of course, there are things like the size of  
14 the railway track. Of course, there is not much  
15 flexibility there. But in the case of this  
16 performance recommendation, if a particular carrier  
17 wanted to travel faster than 50 miles per hour being  
18 paid on delivery, is there something that the AAR  
19 would do about that the way the DOT or the NRC would  
20 if they were federal regulations?

21           MR. FRONCZAK: I don't know that there is  
22 anything we could do since they're our members. If a  
23 member chose to ignore something, I don't know that we  
24 would just say, "Okay. You are no longer a member."  
25 I would have to think about that.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1                   Generally speaking, these are all  
2 recommended practices, though that the members have  
3 agreed to. So all of our members have agreed that  
4 this is the way they want to do it. They wouldn't  
5 agree to it if they didn't do it or want to do it.

6                   MS. GUE: I guess there is some experience  
7 with industry self-regulatory arrangements in other  
8 fields where that has been somewhat of a limiting  
9 factor. I would just express some concern from a  
10 public interest perspective to in relying on industry  
11 self-regulation, as important as your input obviously  
12 is, and we would certainly like to see some of these  
13 recommendations adopted by the federal regulatory  
14 agencies, including the NRC, than have the enforcement  
15 capabilities and the oversight abilities as well.

16                   And you have heard me make this comment  
17 many times before, but I would be remiss if I didn't  
18 comment on this discussion of relative risk management  
19 or what might also be referred to as safety triage.

20                   It is clear, I hope, to everybody that the  
21 large-scale shipment of high-level nuclear waste such  
22 as being contemplated to Yucca Mountain does pose  
23 unusual risks and that high-level nuclear waste is not  
24 the same as a number of other hazardous materials that  
25 are currently being shipped and, furthermore, that

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 what we have to be worried about is the combination of  
2 those risks.

3 So shipping on a non-dedicated train  
4 introduces the possibility that was dismissed by one  
5 of the comments in the discussion of the Baltimore  
6 train tunnel fire of having both an explosive or a  
7 flammable material in combination with a cask of  
8 high-level waste in the same accident situation.

9 So I guess from a public interest  
10 perspective, again, I am always concerned to hear  
11 those kinds of recommendations made about risk  
12 assessment that seem to imply that we are trading  
13 between two risks when, in fact, we are discussing  
14 adding an additional risk and that everything should  
15 be done by the regulatory agencies as well as the  
16 various industries involved to minimize those risks to  
17 avoid being exposed to like two additional risks.

18 MEMBER GARRICK: I don't want to get into  
19 a debate here, but I think that you should be held  
20 accountable in the same way that others are held  
21 accountable when it comes to make those kinds of  
22 observations.

23 You have made a pretty dramatic  
24 observation about the risk being unique with respect  
25 to what we are talking about here today. I guess my

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 comment to you is what is your evidence for this from  
2 a risk perspective?

3 I am an analyst. And I believe that  
4 analysis has to be based on real evidence. There is  
5 no evidence to support what you just said except  
6 opinions. I think if your cause is to be  
7 well-represented and you make those kinds of claims,  
8 it is time for you to come forth with the evidence  
9 that supports those claims because it is not in  
10 existence.

11 MS. GUE: Well, I guess the I think  
12 non-debatable evidence is just the nature of the  
13 substance that we're talking about here. Unshielded,  
14 a ten-year-old fuel assembly releases enough radiation  
15 to be lethal from just a few feet away within a matter  
16 of minutes.

17 I realize we are not talking about  
18 shipping unshielded fuel assemblies, of course, but I  
19 think it is very important to acknowledge the intense  
20 danger of the material itself, in part, to underscore  
21 the need for these regulations, for safety and the  
22 shipment of nuclear waste. If we pretend that this  
23 material is cotton balls, I don't think that anybody  
24 would be in favor of that. I think it is important to  
25 keep in mind what it is that we are talking about

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 shipping.

2 Another thing I just wanted to say -- and  
3 this is I guess more general because I think this is  
4 the final; this comment doesn't really relate to this  
5 particular presentation, but I think it would be very  
6 useful for the NRC to recommend to the Department of  
7 Energy that that released the specifics of the  
8 transportation plan with respect to Yucca Mountain  
9 because it becomes difficult to analyze some of these  
10 risks I think without the information about which  
11 routes will be used, which mode of transportation will  
12 be used. And it would be very good to know how many  
13 tunnels comparable to the Baltimore Tunnel are  
14 actually on the routes that might see high-level waste  
15 shipments in the Yucca Mountain campaign.

16 Finally, I was surprised that the agenda  
17 seems to have focused only on the impact tests and the  
18 fire tests. And I am wondering why the committee has  
19 not examined also the drop test and the submersion  
20 issues, particularly since we seem to be assuming a  
21 preference for train shipments here, which according  
22 to the Department of Energy will also include some as  
23 of yet unusual barge shipments of waste on the  
24 waterways. We would hope that the committee would  
25 also look into that.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Connected to that, of course, we're, as  
2 you know, concerned about the lack of inclusion in the  
3 regulatory requirements as well as in the package  
4 performance study outlines that have been released so  
5 far of consideration of explosive impacts, the  
6 terrorist vulnerability of these shipments. So I  
7 don't know if that might be something that is going to  
8 be looked at in the next couple of days of this or  
9 not.

10 Finally -- sorry. I have already said,  
11 "Finally." Really finally this time. I just did want  
12 to point out that with all of the conversation about  
13 the importance of public confidence on the relevance  
14 of these discussions, these regulatory activities, and  
15 test activities for public confidence, it does seem  
16 strange that the only presenters from outside the  
17 agencies were representatives of the industry, various  
18 industry interests. And I guess I would recommend to  
19 the committee to include in this type of fora in the  
20 future representatives of some of the public interest  
21 organizations with a stake in this process.

22 Thank you.

23 VICE-CHAIRMAN LEVENSON: I think one of  
24 the reasons the speakers are limited, as I tried to  
25 make clear earlier, the committee is trying to focus

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 only on the technical issues. There are many, many  
2 public issues. That is a whole different agenda.

3 If there were a public interest group that  
4 had a research organization, had technical data, I  
5 think we would be interested in hearing. We are  
6 trying to limit our discussion to technical.

7 Let me ask you one question, which may  
8 seem strange but as a follow-up to the discussion we  
9 just had of multiple risks. Mention was made of  
10 explosives added to other things. Do you allow trains  
11 to have box cars full of dynamite, TNT, on the same  
12 train that carries ammonia and liquid petroleum and so  
13 forth?

14 MR. FRONCZAK: Yes.

15 VICE-CHAIRMAN LEVENSON: Okay.

16 MR. REZNIKOFF: I just had one quick  
17 point. Actually, the Navy sometimes ships exclusive  
18 use trains when they're carrying some of their  
19 missiles, some of their torpedoes. There have been  
20 some horrendous accidents where it is only a train  
21 full of missiles and torpedoes. I just thought I  
22 would mention that in support.

23 I wanted to support what Lisa mentioned  
24 concerning sabotage. I think it would be very helpful  
25 if the NRC looked into this issue and published

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 something about this issue. I mention this because  
2 Dr. Singh earlier showed pictures of a jet engine  
3 striking a cask. We would agree with him since we did  
4 the work for Utah a jet engine would not penetrate a  
5 transportation cask.

6 Furthermore, it's an almost impossibly low  
7 probability. The horizon is low to have a jet plane  
8 hitting a cask car that is horizontal. It is almost  
9 impossible to hit the Pentagon without the plane  
10 hitting the ground first and then hitting the  
11 Pentagon.

12 So think of a horizontal car. It is  
13 almost impossible. But it is important to consider  
14 anti-tank missiles and bridge. That is an important  
15 issue. This is not an issue that was looked at at the  
16 modal study because there is not an issue that you can  
17 easily assign a probability to. And, therefore, you  
18 cannot easily assign a risk. Nevertheless, it is an  
19 issue that should be investigated by the NRC.

20 VICE-CHAIRMAN LEVENSON: Let me just  
21 comment to both you and the previous speaker. Because  
22 there is nothing on terrorism activities in this  
23 workshop does not mean it is not being looked at. It  
24 means it is being looked at in a classified manner.  
25 There are lots of things underway that can't be

1 discussed in public meetings like this.

2 I want to remind everyone if you still  
3 have some sitability, this workshop will reconvene  
4 here tomorrow at 12:30. We have a conflict with room  
5 and space. And we have other commitments. So  
6 tomorrow morning will be the regular ACNW meeting in  
7 the regular location at 10:00 o'clock, but the  
8 workshop will reconvene here at 12:30.

9 I turn the meeting back to our chairman.

10 CHAIRMAN HORNBERGER: The meeting is  
11 adjourned.

12 (Whereupon, at 5:07 p.m., the foregoing  
13 matter was adjourned.)

CERTIFICATE

This is to certify that the attached proceedings before the United States Nuclear Regulatory Commission in the matter of:

Name of Proceeding: Advisory Committee on  
Nuclear Waste - 138<sup>th</sup>  
Meeting

Docket Number: N/A

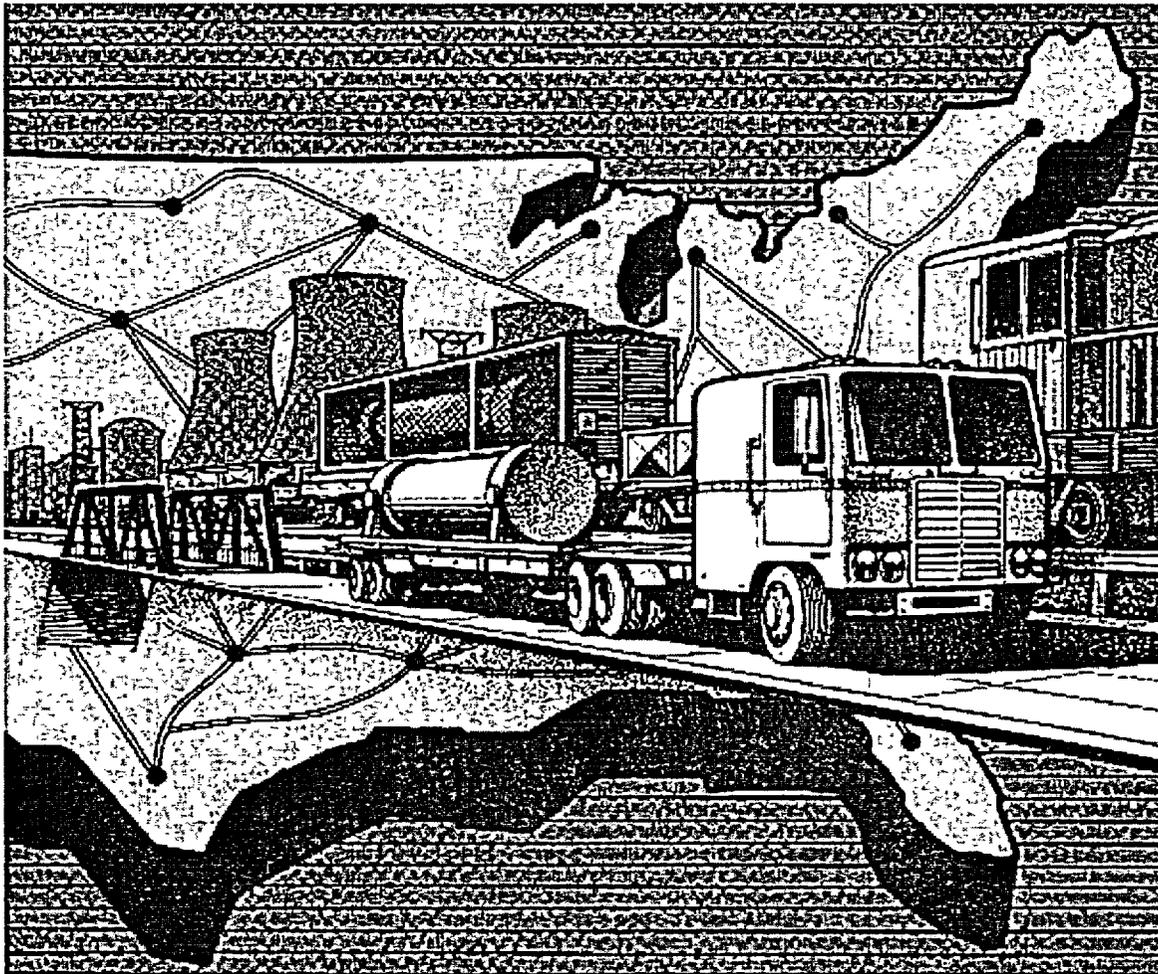

Location: Rockville, Maryland

were held as herein appears, and that this is the original transcript thereof for the file of the United States Nuclear Regulatory Commission taken by me and, thereafter reduced to typewriting by me or under the direction of the court reporting company, and that the transcript is a true and accurate record of the foregoing proceedings.

# Spent Fuel Transportation Package Analysis and Testing

Transportation Working Group  
Workshop  
Session I

November 19, 2002

## TABLE OF CONTENTS

Agenda .....	<u>1</u>
Overview of Research Programs and Objectives (SFPO) .....	<u>3</u>
Summary of Sandia National Laboratories Research .....	<u>8</u>
Summary of Lawrence Livermore National Laboratory Research .....	<u>25</u>
Design Attributes and Structural Characteristics of the HI-STAR Transportation Package (Holtec, Intl.) .....	<u>48</u>
Analysis and Testing Associated with Spent Fuel Transportation Casks (Transnuclear) .....	<u>59</u>
Transportation Cask Analysis and Testing Experience (NAC International) .....	<u>76</u>
Staff Review and Analysis of Baltimore Tunnel Fire July 2001 (SFPO) .....	<u>84</u>
Comparison of Analysis and Testing to Actual Railway Experience (Association of American Railroads) .....	<u>92</u>

ADVISORY COMMITTEE ON NUCLEAR WASTE  
 TRANSPORTATION WORKING GROUP WORKSHOP  
 NOVEMBER 19 & 20, 2002,  
 TWO WHITE FLINT NORTH, AUDITORIUM, ROCKVILLE, MARYLAND

Contact: Tim Kobetz (301-415-8716, tj1@nrc.gov)

**-PROPOSED SCHEDULE-  
 NOVEMBER 19, 2002**

Topics	Presenters	Time
I. <u>Opening Remarks</u>	G. Hornberger, Chairman, ACNW M. Levenson, ACNW	8:30-8:40 a.m. (10 min)
II. <u>Analysis and Testing</u>		
a. Overview of Research Program Objectives	E. William Brach, SFPO	8:40-9:00 a.m. (20 min) Presentation Time 9:00-9:20 a.m. (20 min) Discussion Time
b. Summary of Sandia National Laboratory Research	Doug Ammerman, Sandia	9:20-10:05 a.m. (45 min) Presentation Time 10:05-10:35 a.m. (30 min) Discussion Time
<b>BREAK</b>		
		10:35-10:50 a.m.
c. Summary of Lawrence Livermore Laboratory Research	Larry Fischer, LLNL	10:50-11:35 a.m. (45 min) Presentation Time 11:35 a.m.-12:05 p.m. (30 min) Discussion Time
d. Public Comments		12:05-12:30 (25 min)
<b>LUNCH</b>		
		<b>12:30-1:30 p.m.</b>
e. Vendor Analysis and Testing	Kris Singh, Holtec International Peter Shih, Transnuclear Michael Yaksh, NAC Intl.	1:30-1:50 p.m. (20 min) Presentation Time 1:50-2:10 p.m. (20 min) Presentation Time 2:10-2:30 p.m. (20 min) Presentation Time 2:30-3:15 p.m. (45 min) Discussion Time

11

# Overview of Research Program Objectives

**E. William Brach, Director**  
Spent Fuel Project Office  
U.S. Nuclear Regulatory Commission

## Overview

- SPENT FUEL TRANSPORT SAFETY
- SCOPE OF SPENT FUEL TRANSPORTATION
- ROLE OF RESEARCH - RISK ASSESSMENTS  
AND TRANSPORT STUDIES

## Key Messages

- NRC ENSURES THAT CASKS ARE ROBUST
  - *REGULATES DESIGN AND CONSTRUCTION*
  - *REVIEWS DESIGNS AND INDEPENDENTLY CHECKS ABILITY TO MEET ACCIDENT CONDITIONS*
  - *ENSURES CONTAINERS ARE BUILT, MAINTAINED, AND USED PROPERLY*
- EXEMPLARY INDUSTRY COMPLIANCE WITH SAFETY REGULATIONS, RESULTING IN STRONG TRANSPORT SAFETY RECORD
- SUPPORTED BY CONFIRMATORY RESEARCH

## NRC Yucca Mt Transport Role

- NUCLEAR WASTE POLICY ACT SECTION 180
  - *DOE MUST USE NRC CERTIFIED CASK*
  - *DOE MUST APPLY NRC ADVANCE NOTIFICATIONS*
  - *DOE MUST PROVIDE TRAINING AND FUNDS TO LOCAL AND TRIBAL GOVERNMENTS ALONG ROUTES*

## Scope of Spent Fuel Transportation

- HISTORICAL/CURRENT:
  - *~1300 SHIPMENTS IN NRC CERTIFIED CASKS IN 20 YRS; 4 ACCIDENTS BUT NO RELEASES*
  - *CURRENTLY ABOUT 10 SNF SHIPMENTS/YR*
- PRIVATE FUEL STORAGE (40,000 MTHM)
  - *~50 rail shipments/yr @ 4 casks each FOR 20 YRS*
- YUCCA MOUNTAIN (63,000 COMM. MTHM)
  - *MOSTLY RAIL SCENARIO (FEIS): ~130 rail shipments/yr @ 3 casks each + 45 truck shipments/yr for 24 yrs*

## Transportation Studies

- NUREG-0170 (FINAL ENVIRONMENTAL STATEMENT, 1977)
  - *ALL RADIOACTIVE MATERIALS BY ALL MODES*
  - *NEPA BASIS FOR PART 71 & 49 CFR*
  - *RESULTED IN 1981 COMMISSION POLICY FINDING: TRANSPORT REGULATIONS ADEQUATE, SUBJECT TO CLOSE AND CONTINUING REVIEW*
- MODAL STUDY (NUREG/CR-4829, 1987)
  - *FIRST INCORPORATION OF CASK FINITE ELEMENT ANALYSES & DETAILED THERMAL/IMPACT RESPONSE*

## Transportation Studies (cont'd)

- NUREG/CR-6672 (2000)
  - *FIRST INCORPORATION OF SAMPLED RANGES FOR INPUT PARAMETERS*
  - *UPDATED ASSUMPTIONS*
- PACKAGE PERFORMANCE STUDY (1999-2005)
  - *FIRST INCORPORATION OF CONFIRMATORY TESTING, MODEL VALIDATION*
  - *PUBLIC PARTICIPATORY PROCESS*

## Transportation Studies (cont'd)

- BALTIMORE TUNNEL FIRE STUDY (2002)
  - *ASSESS HYPOTHETICAL PERFORMANCE OF SPENT FUEL CASK IN REAL-WORLD ACCIDENT*
  - *COORDINATED WITH NIST AND NTSB*
- NATIONAL ACADEMY OF SCIENCES STUDY
  - *EXPERT PANEL REVIEW OF SOCIETAL AND HEALTH RISKS OF SPENT FUEL TRANSPORT*
- NON-NRC SPONSORED STUDIES & TESTS
  - *1970s SANDIA DEMONSTRATIONS*
  - *1980s U.K. OPERATION SMASH HIT*

## Conclusion

- HIGH CONFIDENCE IN SAFETY PROVIDED BY TRANSPORTATION REGULATIONS
- TRANSPORTATION RESEARCH PROGRAMS
  - *CONFIRMATORY IN NATURE*
  - *CONSISTENT WITH COMMISSION DIRECTION*
  - *VALUABLE INSIGHTS INTO CASK PERFORMANCE & RELEASE ESTIMATES*
  - *DEVELOPED THE APPROACHES USED FOR KEY ENVIRONMENTAL REVIEWS FOR LICENSING*
  - *SUPPORT PUBLIC CONFIDENCE*

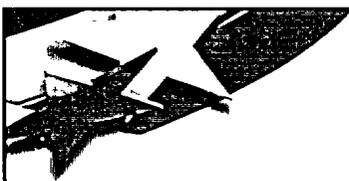

# Summary of Sandia National Laboratories Research

Presented at:

*Advisory Committee on Nuclear Waste  
Transportation Working Group Workshop*

Doug Ammerman  
Sandia National Laboratories  
November 19, 2002

Slide 1 ACNW/TWGW/Nov 19 2002

# Outline

- Review Past Significant Test Programs at Sandia
  - 1970s Crash Test Program
  - Defense High Level Waste (DHLW) 1/2-Scale Cask Testing
  - TRUPACT-II Full-Scale Tests
- Analysis Methodology
  - Structural Modeling/Analysis Codes
  - Thermal Modeling/Analysis Codes
- Linking Analysis to Testing
  - Code Verification and Validation
  - Examples of Analysis vs. Testing
- Conclusions - Where are the Gaps?

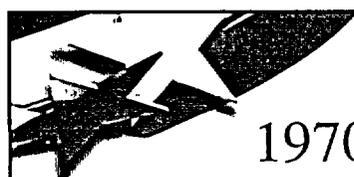

Slide 2 ACNW/TWGW/Nov 19 2002

## Past Test Programs at Sandia

- Sandia has, since its beginning, been involved in systems level testing.
- Transportation package testing has been going on for over 30 years.
- Different test programs had different purposes and goals.
- The goals define the way the tests are conducted.

Slide 3 ACNW/TWGW/Nov 19 2002

## 1970s Crash Test Program

- Purpose
  - Assess and demonstrate the validity of analytical tools and scale modeling techniques for predicting damage in accident environments by comparing predicted results with actual test results
  - To gain quantitative knowledge regarding extreme accident environments by measuring the response of full scale hardware under actual crash conditions
- Approach
  - Mathematical analyses, scale model testing and full scale tests

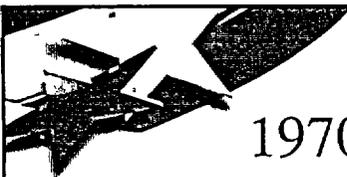

Slide 4 ACNW/TWGW/Nov 19 2002

## 1970s Crash Test Program

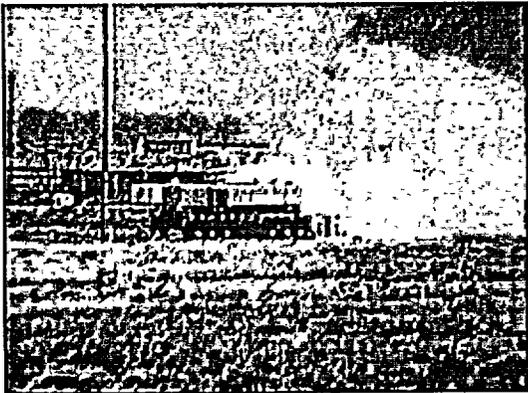

- Extent of instrumentation on scale model and full scale hardware
  - Accelerometers – measure accelerations of the package and transport system
  - Strain gages – measure strains on various cask and transport system components
  - High-speed photography – record cask and transport system response

Slide 5 ACNWTWGW/Nov 19 2002

## 1970s Crash Test Program

- Truck cask impacted by a locomotive

Slide 6 ACNWTWGW/Nov 19 2002

## 1970s Crash Test Program

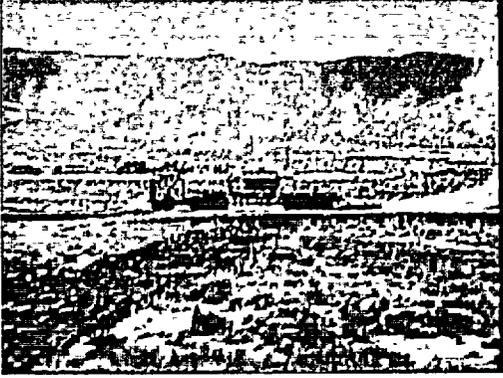

- 80 mph grade crossing impact
  - Truck cask impacted by a locomotive (SAND79-2291)
  - Utilized 18 high-speed (400-2500 fps) cameras
  - Seven strain gages on cask body
  - Four piezoresistive accelerometers
  - An accelerometer on the locomotive
  - Data was acquired via a telemetry system

Slide 7 ACNW/TWGW/Nov 19 2002

## 1970s Crash Test Program

- Truck with cask impacting a concrete barrier

Slide 8 ACNW/TWGW/Nov 19 2002

## 1970s Crash Test Program

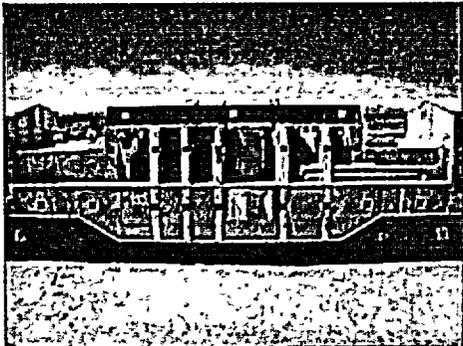

- 60 and 84 mph truck cask impact tests
  - Truck with cask impacting a concrete barrier (SAND77-0270)
  - Test was monitored with about 14 high speed cameras (framing rates between 400 and 3000 fps)
  - Five active accelerometers were placed on the cask body
  - Strain gages were placed on the cask head
  - Pressure transducers were placed inside the cask cavity

Slide 9 ACNW/TWGW/Nov 19 2002

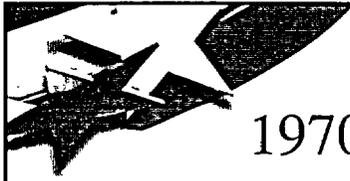

## 1970s Crash Test Program

- Rail car with cask impacting a concrete barrier

Slide 10 ACNW/TWGW/Nov 19 2002

12

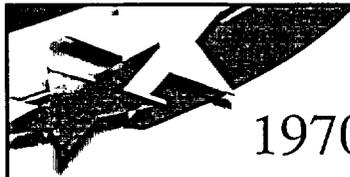

## 1970s Crash Test Program

- 80 mph impact of special railcar
  - Rail car with cask impacting a concrete barrier (SAND78-0458)
  - Monitored with numerous high-speed cameras (up to 3000 fps) placed above, on the sides, and at various angles
  - Active accelerometers were placed on the rail car frame, rail car cage cover, and on the cask, as well as on the target
  - Strain gages were installed on the railcar frame, the cask body, and on two fuel rods inside the cask

Slide 11

ACNW/TWGW/Nov 19 2002

## 1970s Crash Test Program

- Rail car with cask in a fully engulfing fire

Slide 12

ACNW/TWGW/Nov 19 2002

## 1970s Crash Test Program

- Rail car with cask in a fully engulfing fire
  - Instrumented with numerous thermocouples to measure thermal response of cask exterior and interior

Slide 13 ACNW/TWGW/Nov 19 2002

## 1970s Crash Test Program

- Results
  - Indicated that current (at the time of the tests) analytical and scale modeling techniques could predict vehicular and cask damage in extremely severe accident environments with reasonably good accuracy
  - Much data was collected on response of transport systems in accident environments
  - Tests indicated that spent fuel casks are extremely rugged containers capable of surviving very severe accidents

Slide 14 ACNW/TWGW/Nov 19 2002

## 1970s Crash Test Program

- Is there any additional information that can be gleaned from these tests?
  - The 3D finite analysis computer codes and computational hardware available today provide more detailed information about the response of packages and transport systems than the lumped parameter and 2D finite element models of the late 1970s. Some of this data could be used in benchmarking present day codes, for example, locomotive-cask impact test.
  - There have been tremendous improvements in data collection instrumentation and sensors since these tests were performed. Future full-scale tests would be better documented.

Slide 15 ACNWTWGW/Nov 19 2002

## DHLW Cask Tests (1986)

- Purpose
  - Certification impact and puncture test sequence
  - Provide test data on accelerations and strains to compare with analysis results
  - Define the damage state to use as an initial condition for the hypothetical fire analysis
  - Test sequence included 5 drops and 2 punctures

Slide 16 ACNWTWGW/Nov 19 2002

## DHLW Cask Tests

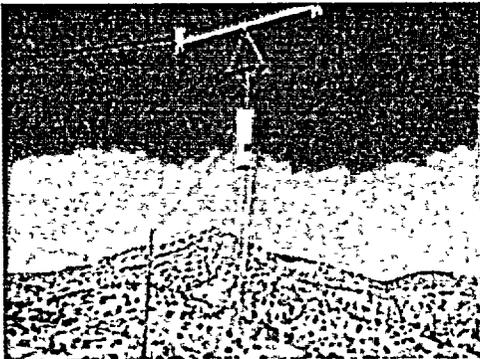

- Extent of instrumentation
  - Accelerometers - varied from 6 to 15, depending on test orientation
  - Strain gages - varied from 4 to 24, depending on test orientation
  - Strain gage bolts - varied from 0 to 8, depending on test orientation
  - LVDTs - varied from 0 to 6, depending on test orientation

Slide 17 ACNW/TWGW/Nov 19 2002

## DHLW Cask Tests

- End drop test at -31°C

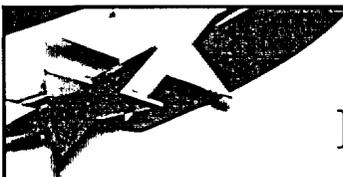

Slide 18 ACNW/TWGW/Nov 19 2002

## DHLW Cask Tests

- Results
  - Package was leak-tight after each test
  - Closure deformations were very small ( $< 0.004$  in)
  - Peak strain measured was 0.0033
  - Peak acceleration measured was 2200 Gs
  - Analysis results were generally conservative

Slide 19 ACNW/TWGW/Nov 19 2002

## DHLW Cask Tests

- Is there any additional information that can be gleaned from these tests?
  - This test series was very thorough and can be used as a demonstration of the types of information that can be obtained from a drop test.
  - The tests were performed in 1986, and it would be difficult to resurrect any of the digital data from the tests.
  - The test results could be compared to modern analysis results.

Slide 20 ACNW/TWGW/Nov 19 2002

## TRUPACT-II Full-Scale Tests (1989)

- Purpose
  - Certification test sequence - drop, puncture, fire
  - Multiple tests of each type performed
  - Package certified by full-scale testing

Slide 21 ACNWTWGW/Nov 19 2002

## TRUPACT-II Full-Scale Tests

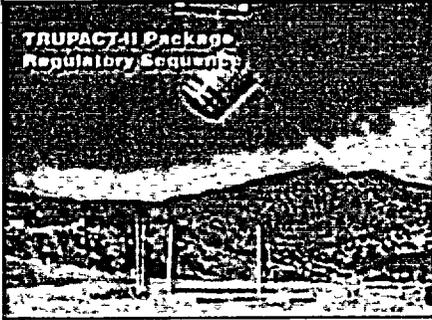

- Extent of instrumentation
  - Very little dynamic data taken
  - Post-test leak checks were performed
  - Photometric coverage

Slide 22 ACNWTWGW/Nov 19 2002

## TRUPACT-II Full-Scale Tests

- Regulatory test sequence was performed

Slide 23 ACN/TWGW/Nov 19 2002

## TRUPACT-II Full-Scale Tests

- Results
  - Package remained leak-tight following all tests
  - The relatively flexible package experienced visible deformations

Slide 24 ACN/TWGW/Nov 19 2002

## TRUPACT-II Full-Scale Tests

- Is there any additional information that can be gleaned from these tests?
  - The lack of instrumentation during this test sequence makes it difficult to compare the test results to analyses.
  - Extent of test sequence demonstrates the expense of relying on testing to demonstrate regulatory compliance.

Slide 25 ACNW/TWGW/Nov 19 2002

## Analysis Methodology

- Cask vendors rely on analyses to some extent to demonstrate package response to the hypothetical accident tests.
- Conservatism introduced into analysis methods (or assumptions) for design certification are not always applicable for test predictions.

Slide 26 ACNW/TWGW/Nov 19 2002

## Structural Modeling/Analysis Codes

- Sandia uses transient dynamic finite element codes with explicit integration of the equations of motion.
  - **HONDO** - 1st code of this type, developed at Sandia
  - **DYNA** - developed at LLNL, available commercially
  - **PRONTO** - developed at Sandia
  - **ABAQUS/Explicit** - commercially available
  - **PRESTO** - Newest Sandia code in this family

Slide 27

ACNW/TWGW/Nov 19 2002

## Thermal Modeling/Analysis Codes

- Sandia uses CFD and finite element codes to solve fire dynamics and heat transfer problems.
  - **CAFE** - developed at Sandia; designed to model large fires engulfing a package, coupled to P/Thermal
  - **MSC P/Thermal** - commercially available, FE code used to solve heat transfer problems
  - **SODDIT** – a Sandia developed one-dimensional direct and inverse heat transfer code
  - **Vulcan** - CFD code developed at Sandia used to solve a broad range of fire problems
  - **COYOTE** - FE code developed at Sandia used to solve a broad range of heat transfer problems
  - **CALORE** - Newest Sandia FE heat transfer code

Slide 28

ACNW/TWGW/Nov 19 2002

## Linking Analysis to Testing

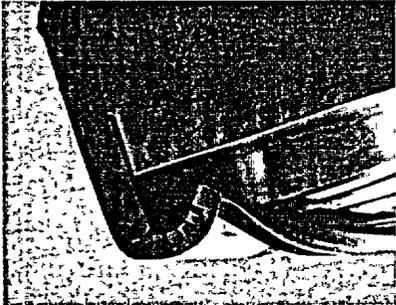

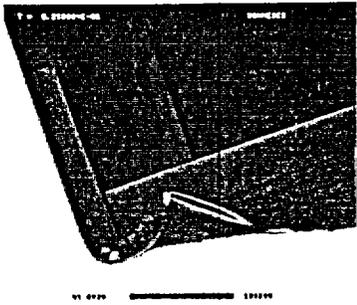

- Code verification and validation
  - Verification and validation provide high confidence in the computational accuracy of simulations, demonstrating the predictive capability of the codes and their underlying models.
  - Verification is the process of determining that a computational software implementation correctly represents a model of a physical process.
  - Validation is the process of determining the degree to which a computer model is an accurate representation of the real world from the perspective of the intended model applications. Validation makes use of physical data and results from previously validated computer codes.

Slide 29 ACNW/TWGW/Nov 19 2002

## Linking Analysis to Testing

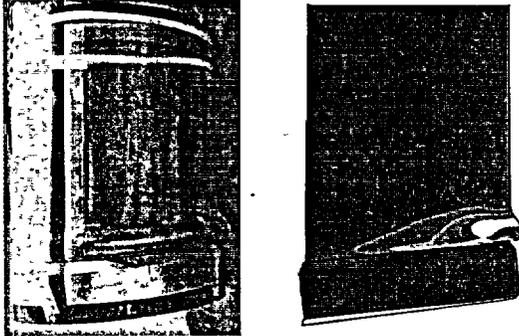

- Comparison of analysis to testing
  - DHLW notched impact limiter

Slide 30 ACNW/TWGW/Nov 19 2002

## Linking Analysis to Testing

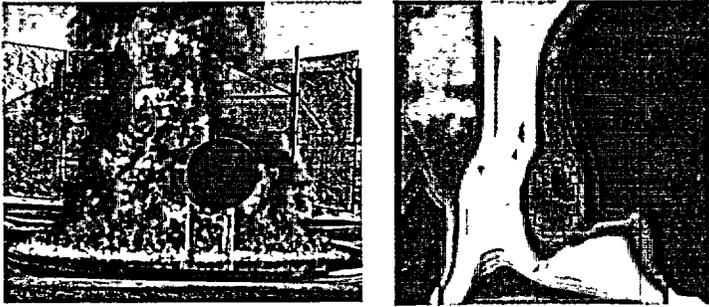

- Comparison of analysis to testing
  - SETU 60-MPH corner impact

Slide 31 ACNWTWGW/Nov 19 2002

## Linking Analysis to Testing

- Comparison of analysis to testing
  - Truck-Cask-Size Calorimeter

Slide 32 ACNWTWGW/Nov 19 2002

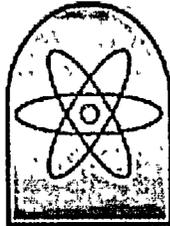

## Conclusions - Where are the Gaps?

- Certification tests (e.g. DHLW, TRUPACT-II) do not involve significant plastic deformation in the closure region.
- SETU tests were not full-scale and did not involve a complete cask system.
- Crash Test Program had little instrumentation to compare to analysis results and used casks that were obsolete in the 1970s.
- There is no data on surface heat flux incipient onto a rail-cask like object in an open pool fire.
- There is no data available on the response of spent fuel to severe transportation environments.
- There is no demonstrated comparison between the analyses used in risk assessments and full-scale high-speed-impact and fire tests.

# Summary of Lawrence Livermore National Laboratory Research on Transportation

---

**Presented to:  
Advisory Committee on Nuclear Waste  
Transportation Working Group**

**Larry Fischer  
November 19, 2002**

Lawrence Livermore  
National Laboratory

■  
*Making History  
Making a Difference*

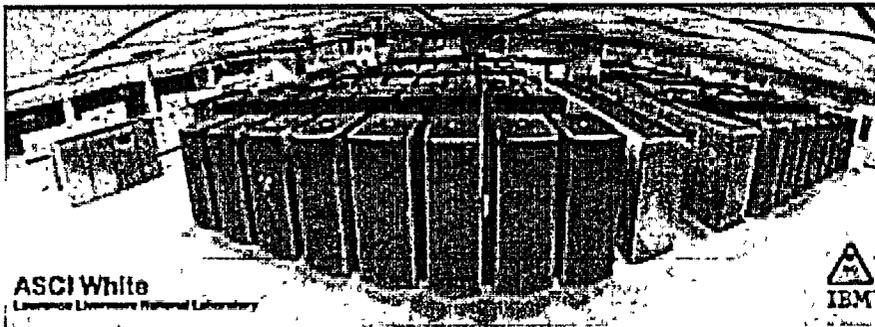

■  
**1952-2002**

This work was performed under the auspices of the U.S. Department of Energy by the University of California, Lawrence Livermore National Laboratory under Contract No. W-7405-Eng-48.

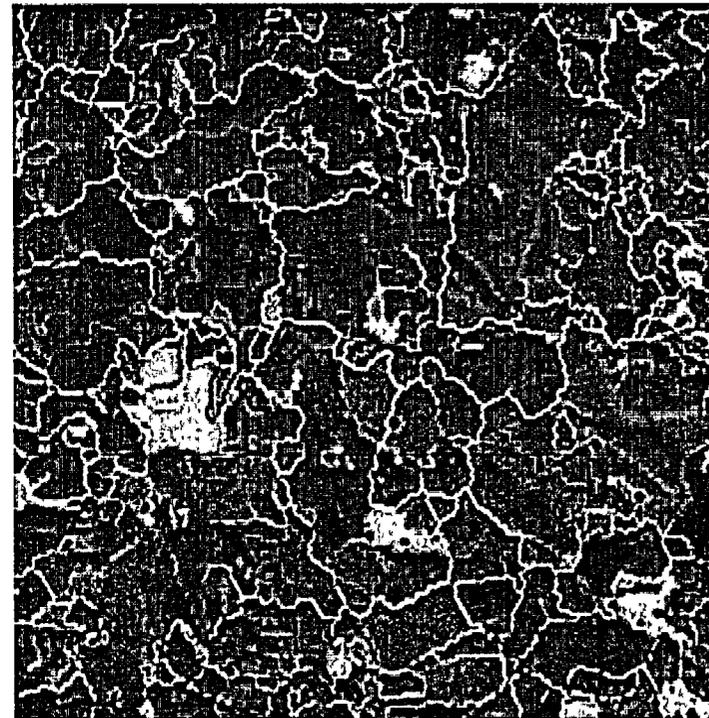

# LLNL's stockpile stewardship programs resulted in state-of-the-art computational models

When underground nuclear testing was suspended in 1991, the stockpile stewardship program emerged. One of the cornerstones of the program was the development of high speed computing, greatly expanded memory, and multi-scale, multi-physics computer modeling.

High Speed Computer  
with Expanded Memory

Multi-scale, Multi-physics  
Modeling

2/6

# Outline

---

- **Background**
- **Shipping container response to severe highway and railway accident conditions – (Modal Study) – 1986/1987**
- **Shippingport reactor shipment – 1988**
- **Plutonium Air Transport Certification (PATC) – 1992**
- **Low velocity impact tests of solid steel billet onto concrete pads – 1998**
- **Summary and conclusions**

27

# Background

---

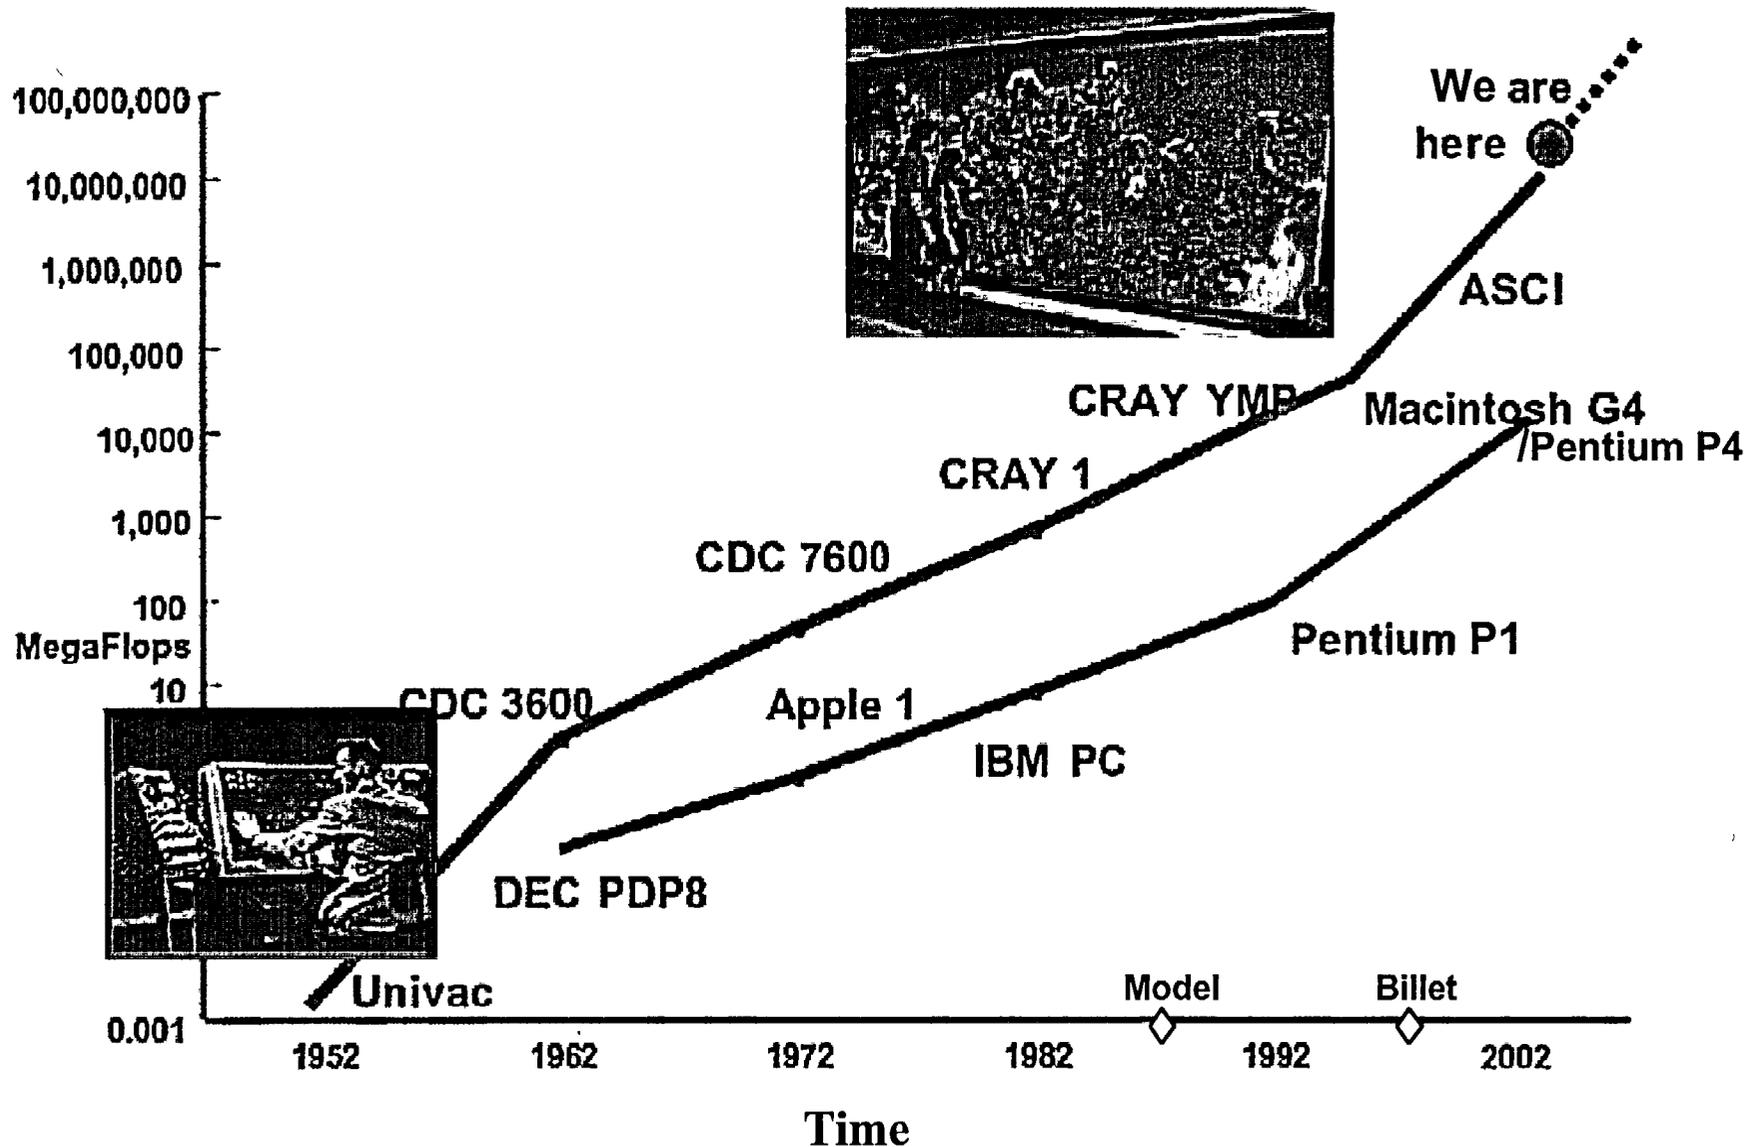

**LLNL has used computational analysis combined with testing for over fifty years to evaluate and understand physical phenomena**

- **Developed in the late 1960's and early 1970's computer codes for structural, thermal, and nuclear transport analyses**
- **Combined test and analysis to benchmark computer codes in order to use to evaluate system performance, postulated accidents, natural phenomena, and sabotage**
- **Recent exploration of massively parallel processing and multi-scale, multi-physics modeling has led to unprecedented computer simulation capabilities and has reduced the need for large scale expensive testing**

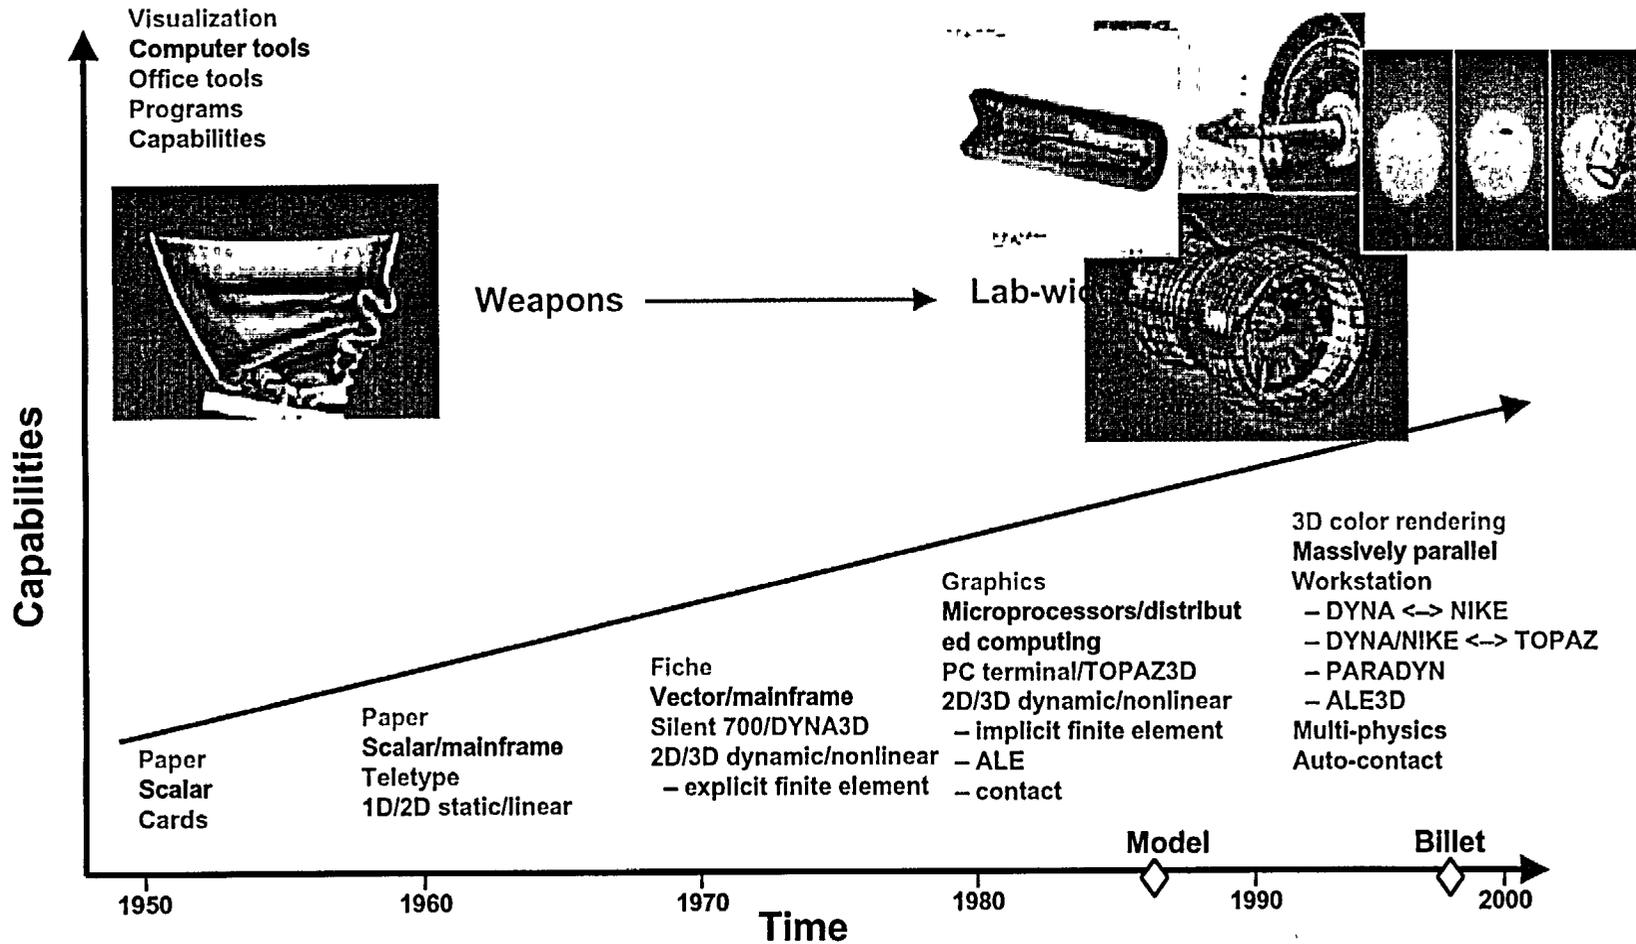

28

# 1980s: Exploration of massively parallel processing has led to unprecedented simulation capabilities

68

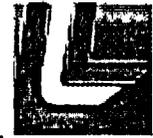

# Computer code modeling and graphics capabilities also increased dramatically

30

# **Modal study was performed in 1986 using the Cray 1**

---

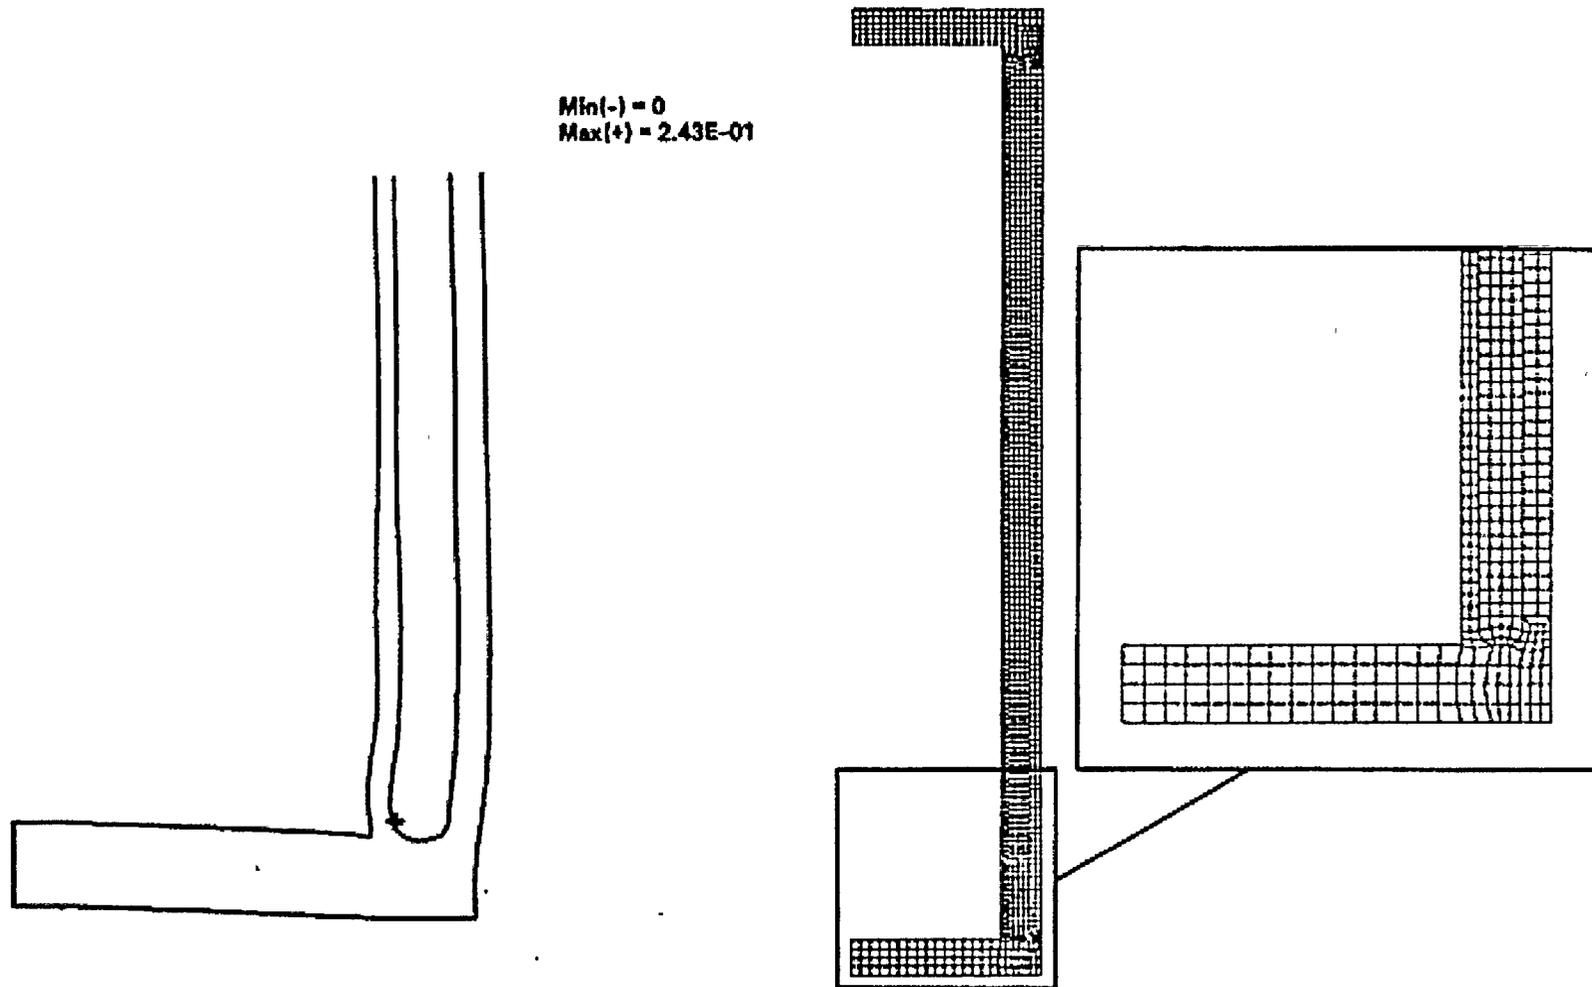

**The Modal Study was performed for the NRC to evaluate the level of safety provided under severe accident conditions for spent fuel casks**

- **Used quantitative computational modeling and analysis to evaluate responses of representative casks to severe accident condition to estimate radiological releases**
- **Used Cray 1 machine (1 Gigaflop) to perform primarily 1D and 2D analyses and a single 3-D analysis to reduce computational time and costs. Most analysis were performed for unyielding surfaces (consistent with 10 CFR 71 requirements).**
- **Benchmark of computer codes were limited primarily to weapons components and closed form solutions**

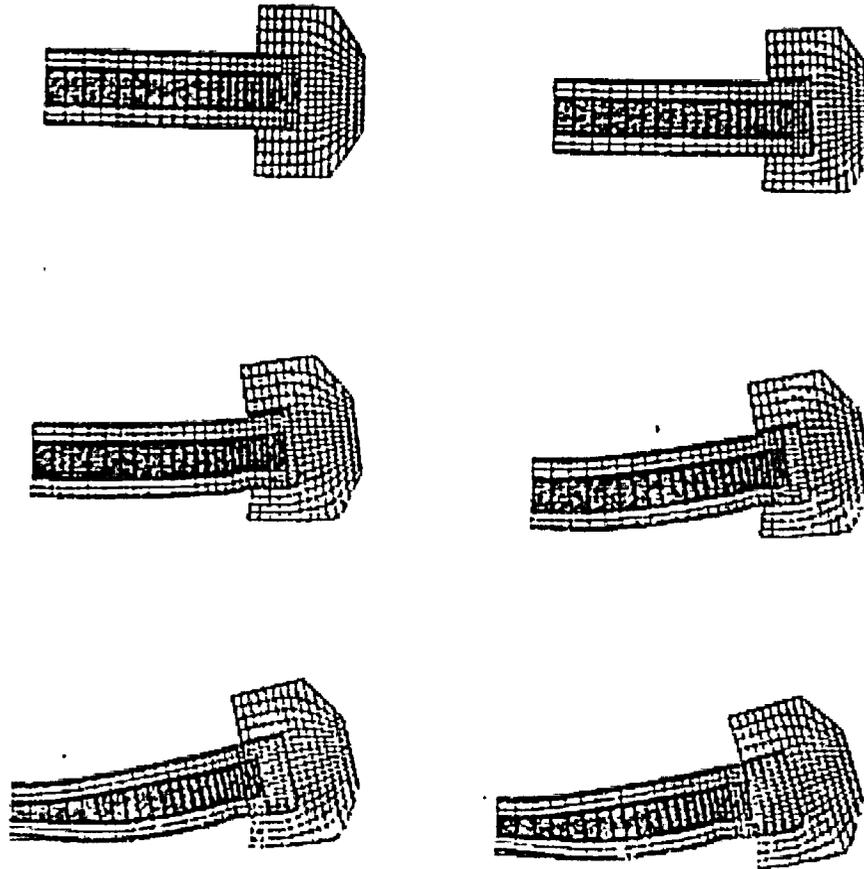

16

# Rail cask finite element 2D model and strain results for cask impact at 90 mph

32

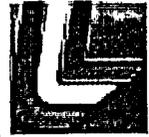

# Truck cask finite element 3D model and deformation results for cask impact at 60 mph

33

# Shippingport analyses were performed with the Cray-YMP in 1988

---

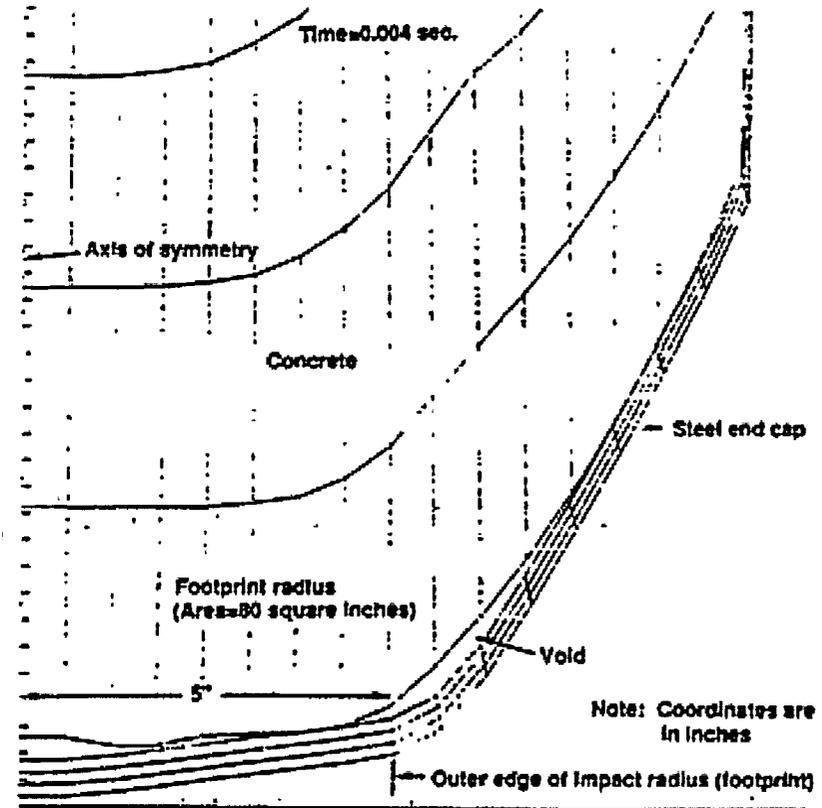

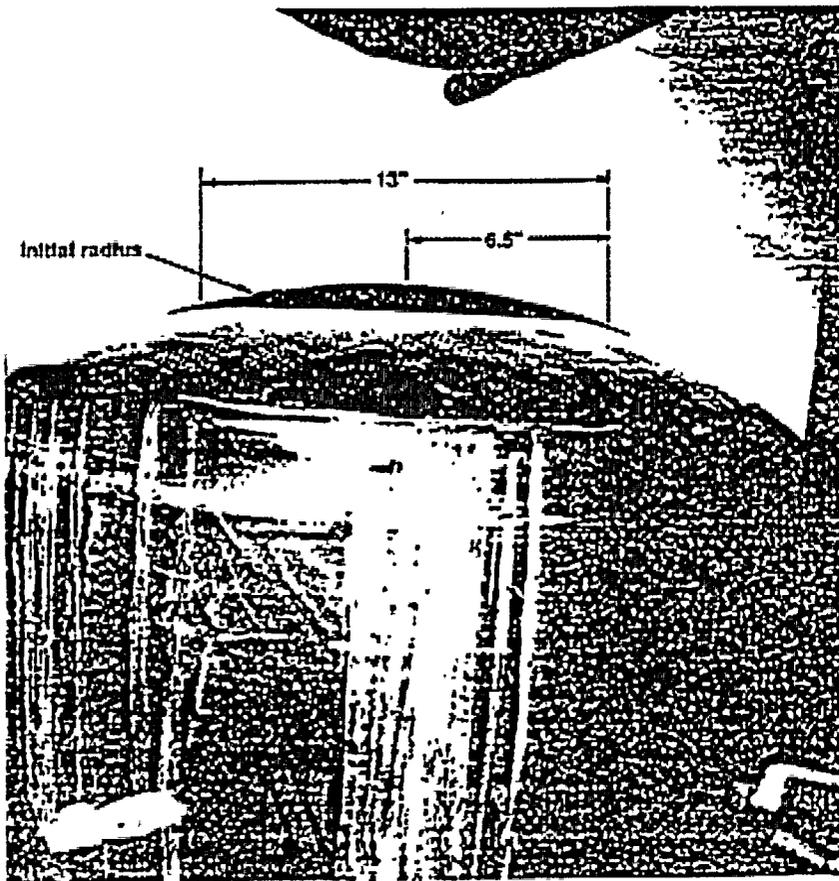

**Computational analysis with scale model testing was used to obtain certification of the Shippingport reactor package for shipment**

- Important package features were included in 1/10 scale model for drop and puncture bar tests
- Fair agreement (~30%) was demonstrated between scale model testing and computational analysis
- Using the benchmarked Dyna 3D code, the reactor vessel package was shown to meet regulatory drop requirements with good safety margins

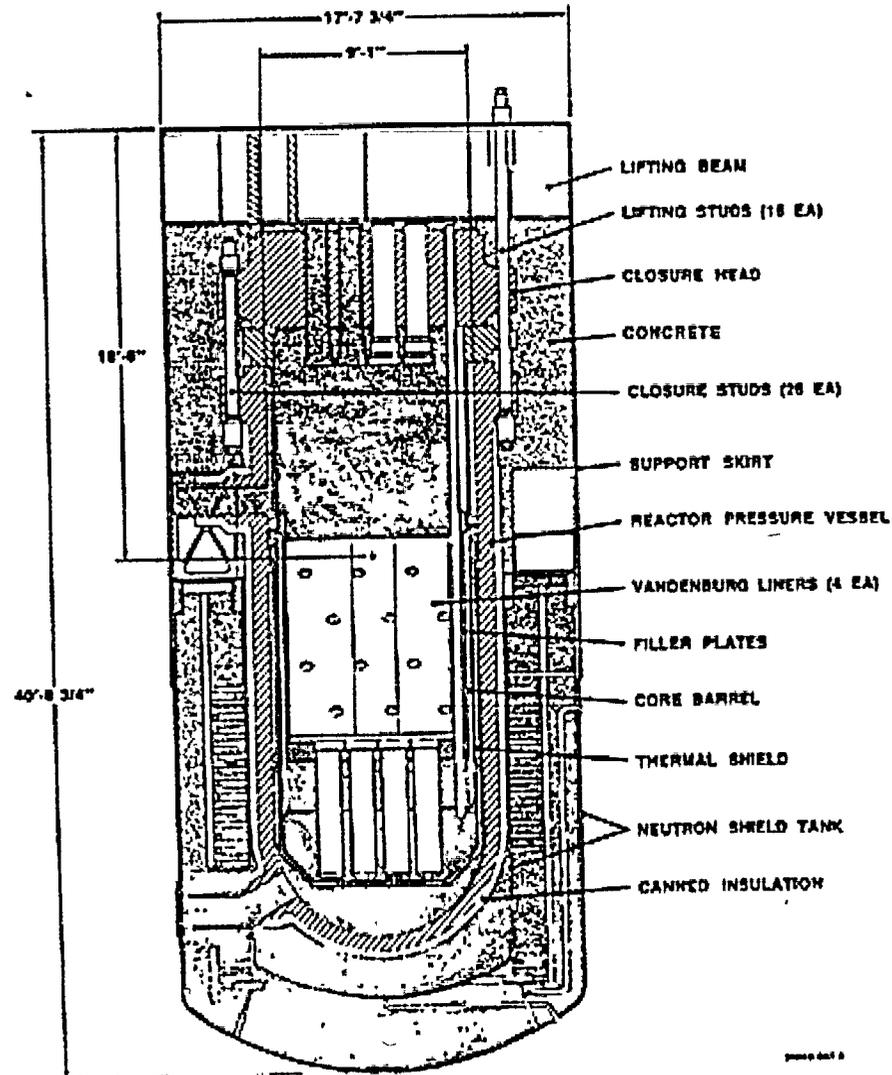

34

# Shippingport forty-five foot drop test and analysis of 1/10 scale model

13  
5

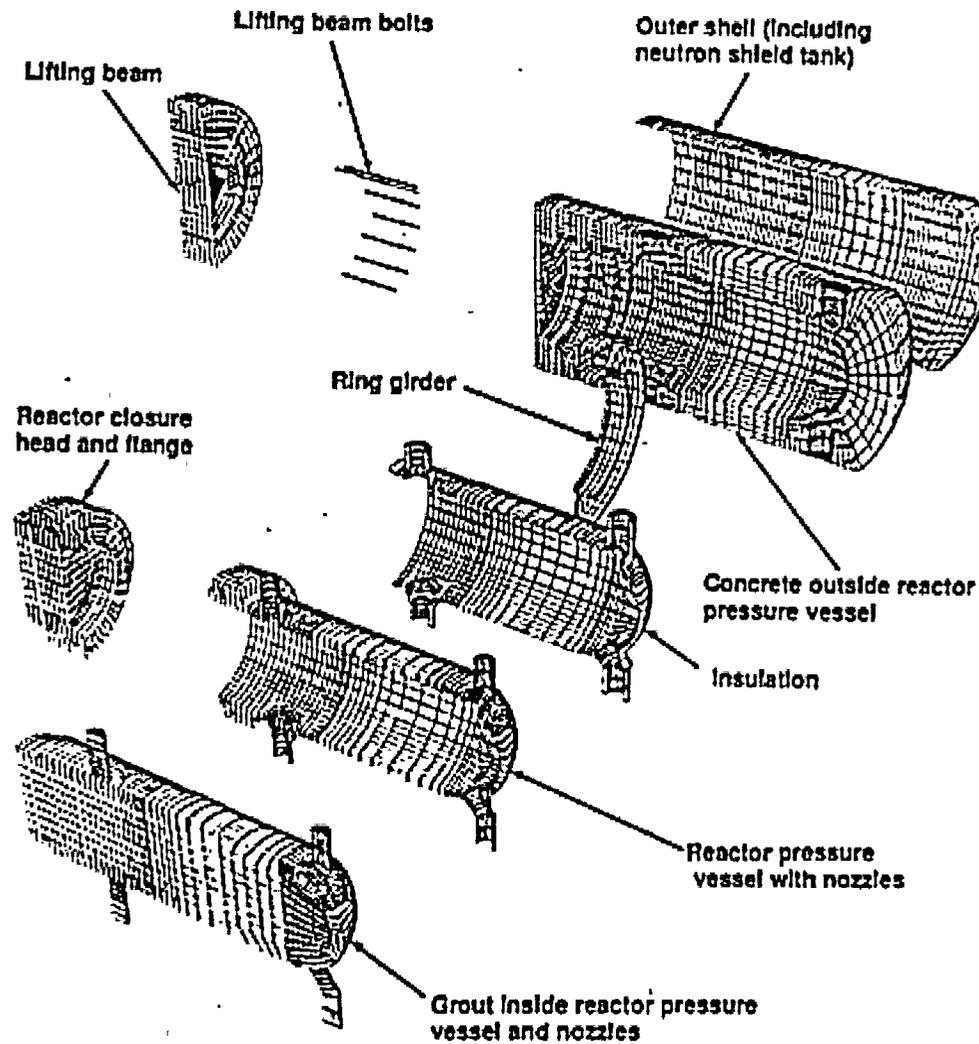

# Shippingport reactor package

36

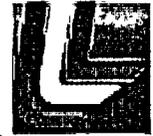

# Shippingport Dyna 3D finite element model

37

## **PATC tests – 1992 SGI workstation**

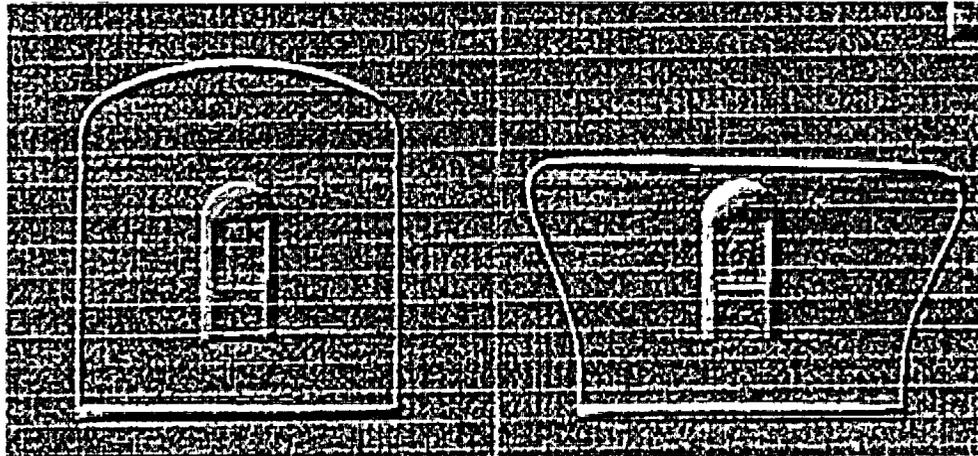

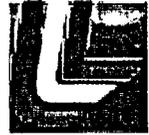

**High velocity impact tests of a 1/6 scale air transport package were performed to benchmark a computer code to be used to evaluate impacts on real surfaces**

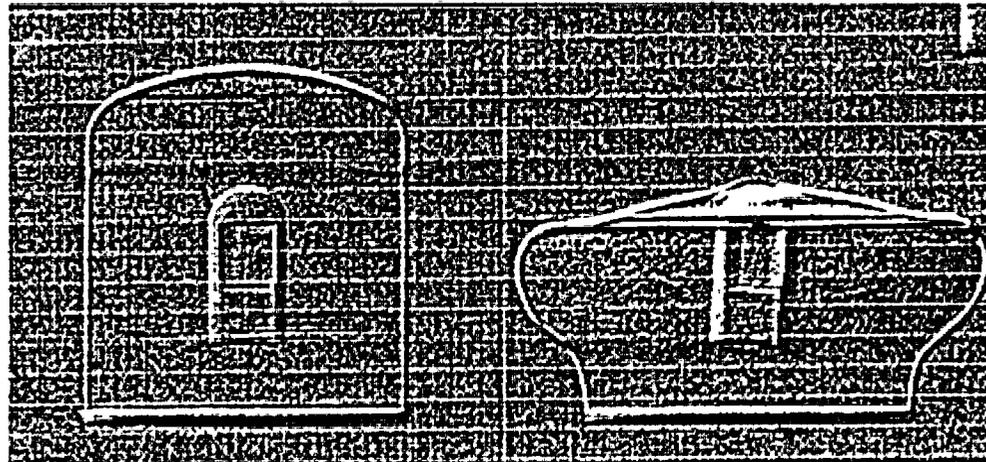

- **Package used grout as impact limiter material and a high strength containment system. An aluminum ball was used to measure peak g forces.**
- **The test impact velocities varied from 17 to 157 m/s on steel surface and 206-208 m/s on concrete surface**
- **Good agreement with impact limiter deformation was demonstrated between scale model testing and computational analysis**

38

# High velocity impact tests

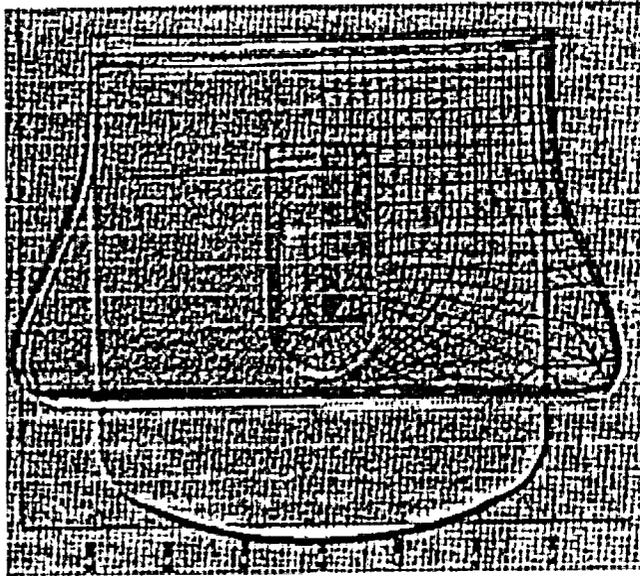

Radiograph of test model after impact on steel plate at 167 m/s (516 ft/s)

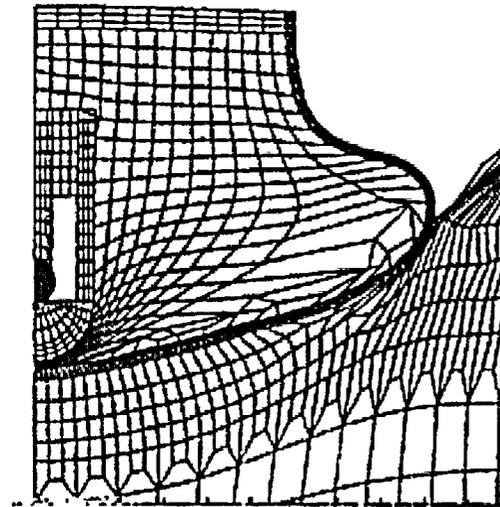

Radiograph of test model after impact on grout block at 288 m/s (945 ft/s)

39

# High velocity impact tests (cont.)

Overlay of computer simulation on radiograph results of test package, impact on unyielding surface at 143.6 m/s

Simulated test package deformed shape with grout damage curve invoked, 288 m/s impact on soft rock

140

## **Billet testing performed in 1998 on an SGI workstation**

---

**Low velocity impact tests of a solid steel billet were performed to develop a method to use finite element analysis of storage cask drop and tipover onto a concrete pad.**

- Impact onto an unyielding surface required the use of impact limiter on top of storage cask. Concrete can absorb energy and may eliminate need for impact limiter.**
- Used 1/3 scale model of storage cask (steel billet) and reinforced-concrete pad.**
- Used precision accelerometers and developed method for determining cut off frequency for them. Computational analysis was used to benchmark the Dyna 3D code.**
- Good to excellent agreement was demonstrated between scale model testing and computational analysis.**
- Using the benchmarked Dyna 3D code, a typical storage cask impacting concrete did not need an impact limiter to meet drop and tipover structural integrity requirements.**

41

# Billet testing

### Maximum Billet End Drop Deceleration Test vs. Simulation

Test # / Channel #	Test data, filtered at 450 Hz	Finite element analysis simulation, filtered at 450 Hz
Test #1 / Channel A1	70.8 g	99.5g
Test #2 / Channel A1	78.7 g	
Test #1 / Channel A5	103.8 g	
Test #2 / Channel A5	88.0 g	

### Maximum Billet Side Drop Deceleration Test vs. Simulation

Billet drop height / (Test #)	Test data from channel A3, filtered at 450 Hz	Finite element analysis simulation, filtered at 450 Hz
45.7 cm (18 inches) (Test #3)	103.2 g	105.0 g
45.7 cm (18 inches) (Test #5)	86.0 g	
45.7 cm (18 inches) (Test #10)	125.5 g	
91.4 cm (36 inches) (Test #4)	110.0 g	142.7 g
91.4 cm (36 inches) (Test #7)	not available	
91.4 cm (36 inches) (Test #9)	125.2 g	
1.83 m (72 inches) (Test #6)	206.7	150.1 g
1.83 m (72 inches) (Test #8)	197.0	

42

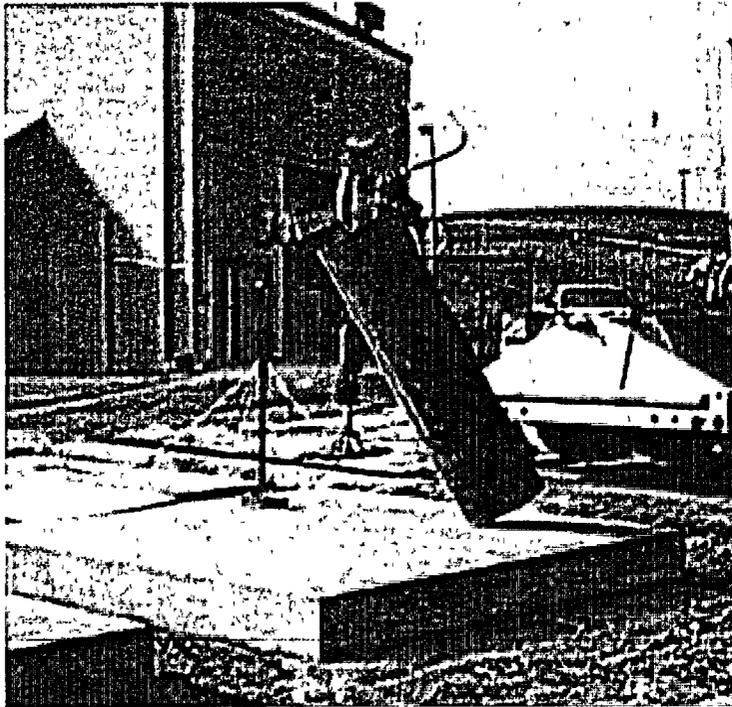

# Billet testing (cont.)

Maximum Billet Tipover Deceleration Test vs. Simulation

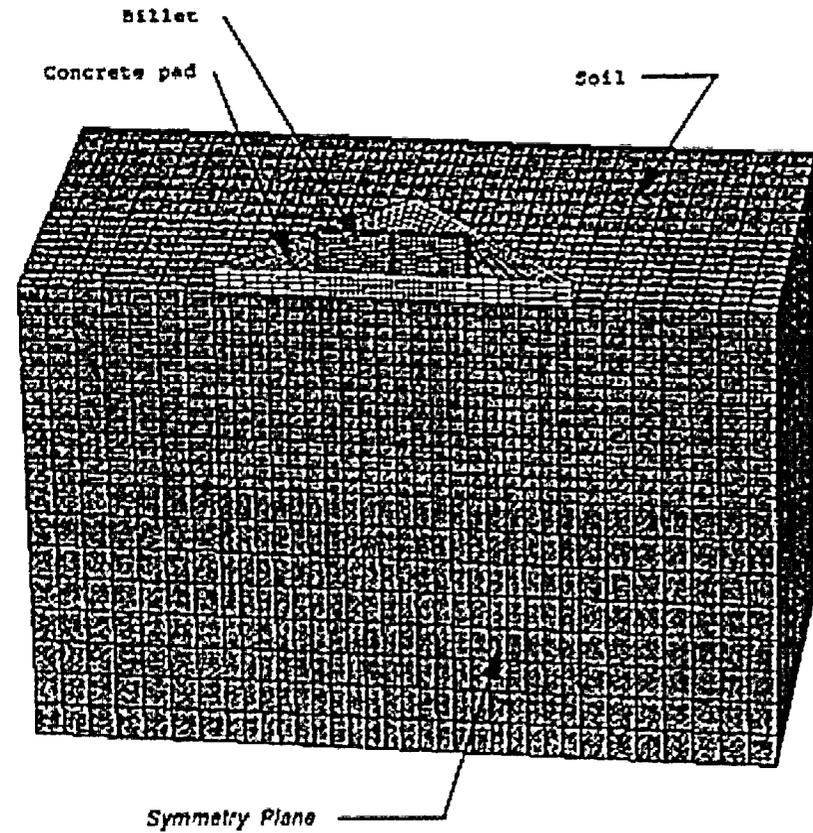

Test # / Channel #	Test data, filtered at 450 Hz	Finite element analysis simulation, filtered at 450 Hz
Test #11 / Channel A1	237.5 g	244.7 g
Test #12 / Channel A1	213.6 g	
Test #11 / Channel A5	231.5 g	
Test #12 / Channel A5	213.0 g

157

# **Today's analytical capabilities allow more comprehensive analyses of shipping packages**

---

**To understand the package design margin, additional analyses are needed**

- **Residual stresses are created during cask fabrication**
  - **Metal bending**
  - **Machining**
  - **Welding**
  - **Lead/depleted uranium pouring**
  - **Annealing**
- **Detailed analysis of bolted closures requires large, complex computer models**
- **Contemporary high speed computers allow many analyses of a shipping package**
- **State of the art visualization tools allow engineers and members of the public to understand computer simulations**

4/10

# Recommendations

---

- **Perform drop and thermal tests on a typical transportation cask per 10 CFR 71 hypothetical accident requirements**
- **Use state of the art instrumentation to record cask response, particularly in the closure and weld regions**
- **Benchmark at least one finite element code against the tests recordings**
- **Drop and thermal testing can use scaled cask models of at least 1/3 scale**
- **Perform drop and thermal testing simulations for full size cask**
- **Use high speed advanced computer system and physics codes for analyses**
- **Provide methodology and data such that applicants can benchmark their own finite element codes and perform analyses for their casks**

# **DESIGN ATTRIBUTES AND STRUCTURAL CHARACTERISTICS OF THE HI-STAR TRANSPORT PACKAGE**

by

**Dr. K.P. Singh**  
President and CEO  
Holtec International  
555 Lincoln Drive West  
Marlton, NJ 08053

A presentation to Advisory Council on Nuclear Waste  
White Flint, MD  
November 19, 2002

## **Components of the Transport Package**

1. The HI-STAR dual purpose overpack
2. The Multi-purpose canister (MPC)
3. A set of two impact limiters
4. Transport cradle
5. Rail car
6. Personnel barrier (non-structural)

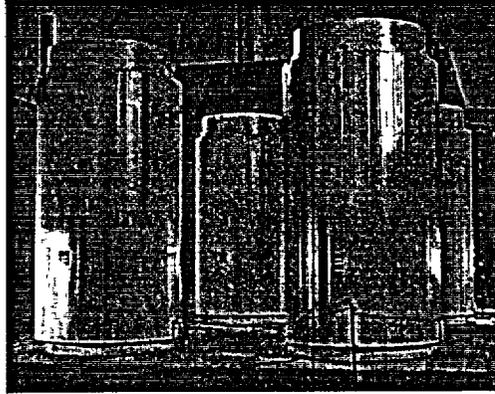

## The HI-STAR Dual Purpose Overpack

- Storage (10 CFR 72) docket No.: 72-1008
- Transport (10 CFR 71) docket No.: 71-9261

### Performance Mission:

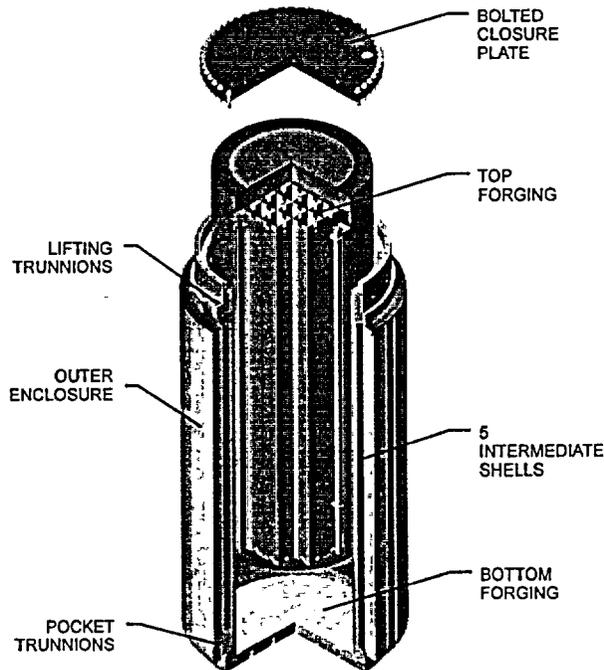

- Provide a virtually impregnable physical barrier to protect the stored MPC.
- Ready to transport on railcar at as low as -40°F ambient temperature.
- Capable of being stored on an ISFSI pad free-standing or anchored.
- Gross Weight  $\leq$  125 tons.

**HOLTEC**  
INTERNATIONAL

3

## **HI-STAR 100 Overpack with MPC Partially Inserted**

**HOLTEC**  
INTERNATIONAL

49

## HI-STAR Design Features

Diameter:

Bottom (footprint) - 83 1/4 inches

Top (top lid) - 77 3/8 inches

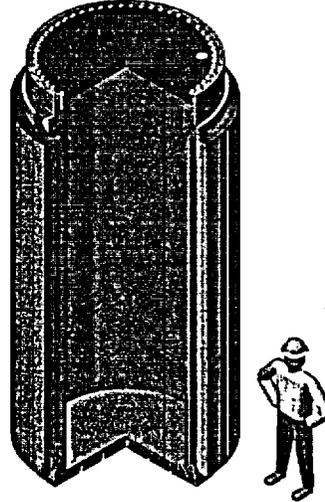

Mid-height - 96 inches

Weight:

Empty - 154,000 lbs

loaded w/MPC-32 - 243,000 lbs

Height: - 203 1/4 inches

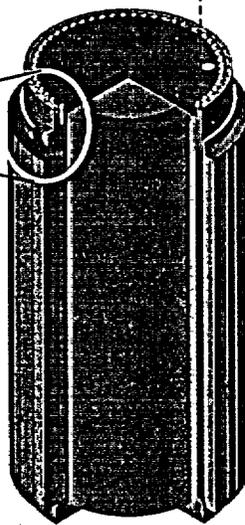

5

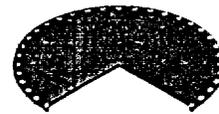

## Design Features to Protect Against Accidents

Detail next slide

Buttress Plate

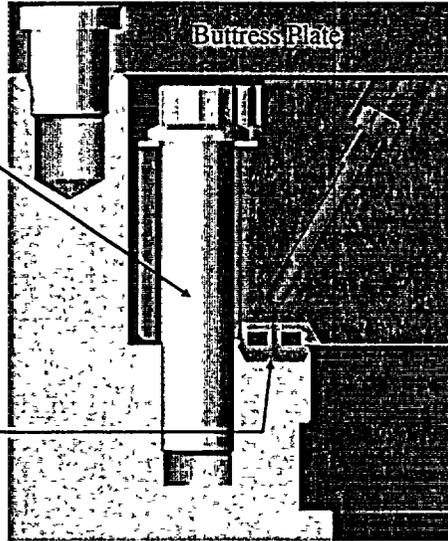

6

## Design Features to Protect Against Accidents

- Lid bolts are protected against lateral impact

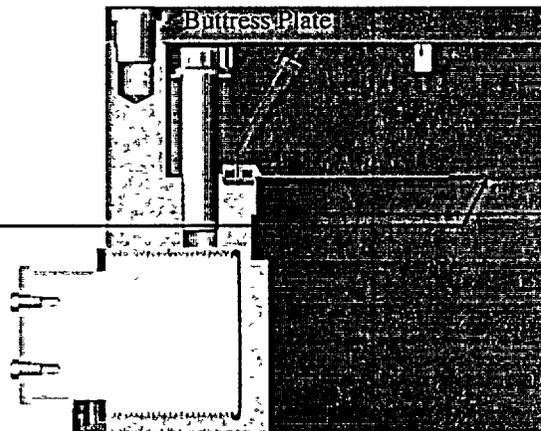

- Dual gasket closure

HOLTEC  
INTERNATIONAL

## Design Features to Protect Against Accidents

- Top Lid Recessed to mitigate effect of a massive impact.

HOLTEC  
INTERNATIONAL

8

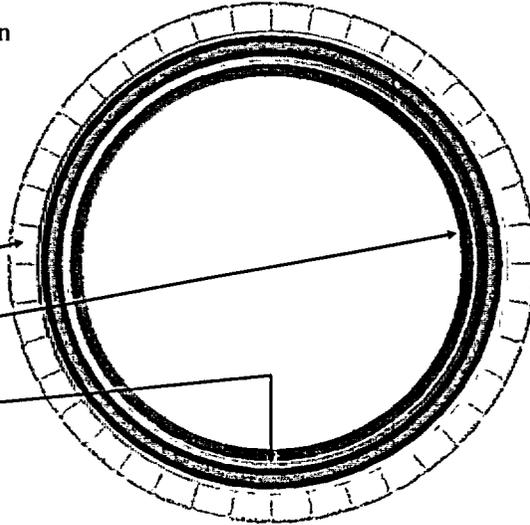

## Design Features to Protect Against Accidents

- Multi-layered shell construction prevents propagation of cracks and provides a natural barrier against fuel heat-up under fire.  
(cross section shown at mid-height)

Holtite  
(Neutron Shield)

Inner Shell

Layered Shell  
(Five Layers)

 HOLTEC  
INTERNATIONAL

9

## HI-STAR Materials

Part	Material	Thickness
Bottom forging	Ni - steel	6 inches
Top lid	Ni - steel	6 inches
Containment (inner-most shell)	Ni - steel	2.5 inches
Gamma shells (4 total)	Carbon steel	1 1/4 inches each
Outer shell	Carbon steel	1 inch

 HOLTEC  
INTERNATIONAL

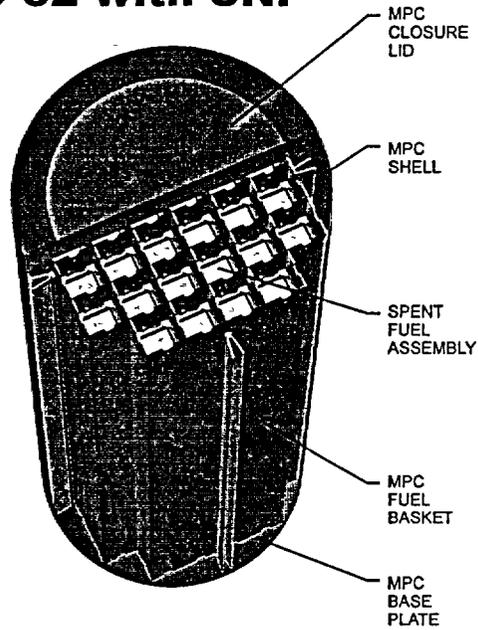

All HI-STAR load bearing materials qualified  
to remain fracture resistant @ < 40°F

10

## MPC-32 with SNF

- The fuel is protected by the MPC enclosure vessel; the MPC is protected by the HI-STAR overpack.

- The MPC Enclosure Vessel is an all-welded, stainless steel pressure vessel.

  
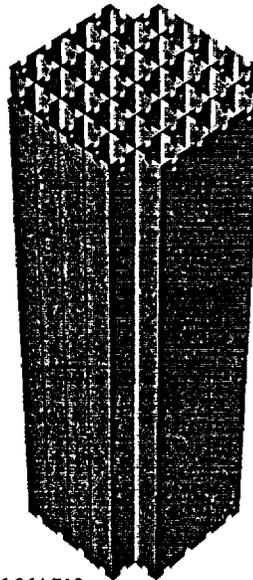

HOLTEC  
INTERNATIONAL

11

## MPC-32 Basket

- The fuel basket, an egg-crate of stainless steel plates, orthogonally arrayed and full-length welds at all plate-to-plate intersections.

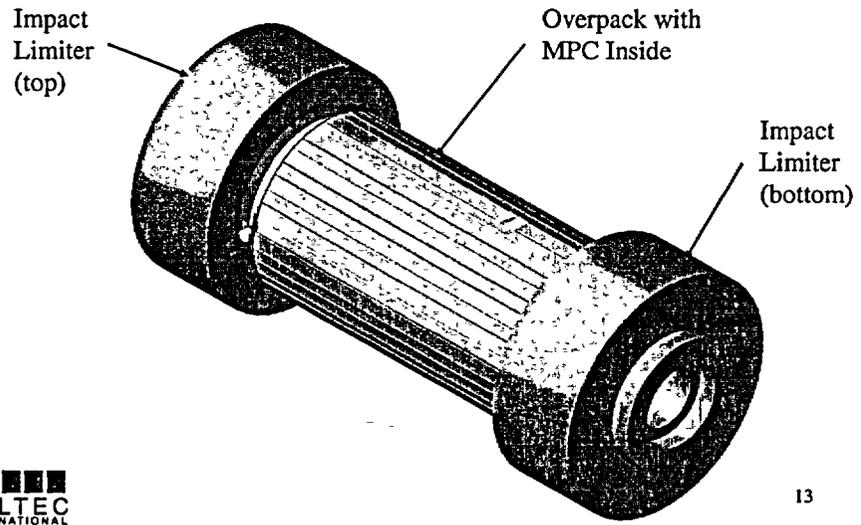

- The fuel basket is engineered to withstand impact freefall without exceeding ASME code stress limits.

  
HOLTEC  
INTERNATIONAL

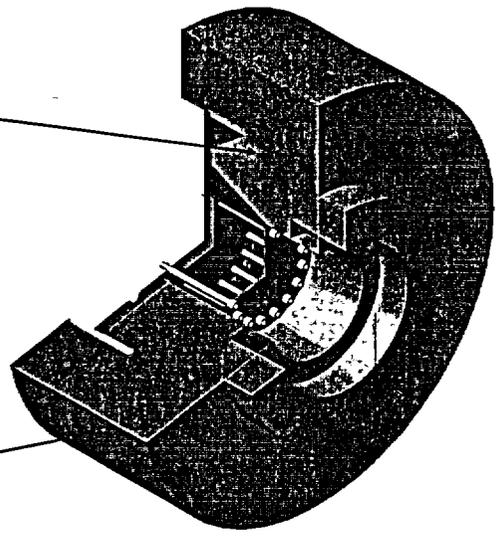

HOLTEC Patent Nos 5,898,747 and 6,064,710

## HI-STAR Package with Impact Limiters Installed

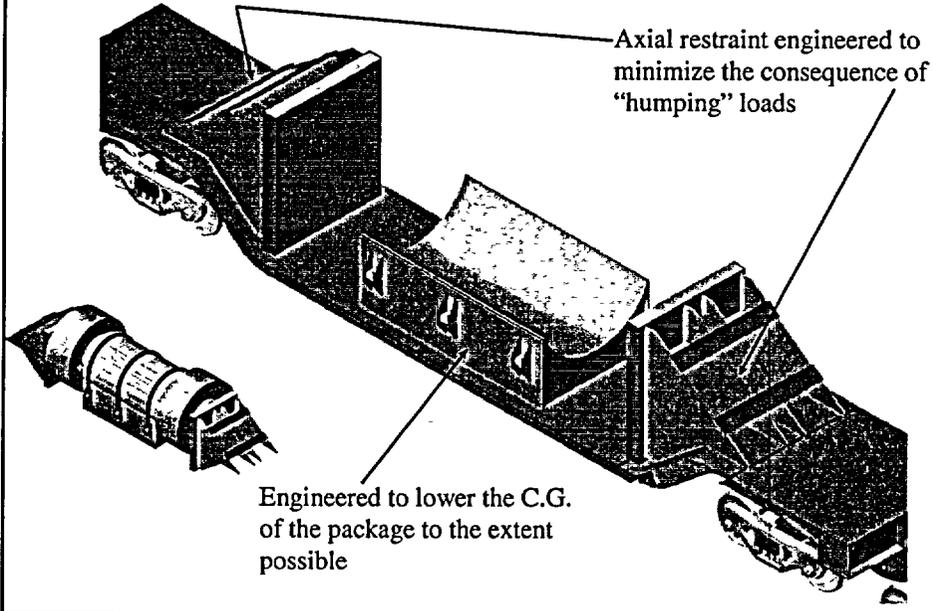

## Impact Limiter Design Features

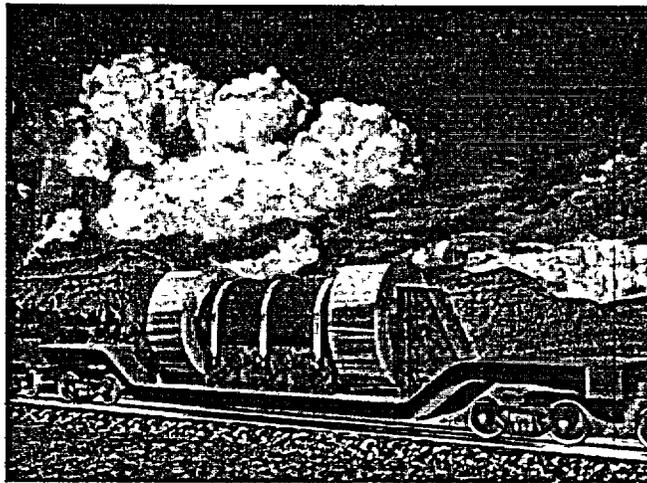

- Made of aluminum honeycomb
  - All-aluminum impact material eliminates weather (humidity and temperature) concerns
- Outer skin made of stainless steel

## HI-STAR 100 Transport Cradle

## The HI-STAR Transport Package (shown without Personnel Barrier)

  
HOLTEC  
INTERNATIONAL

16

## **Availability & Use**

Thus far, eight HI-STARs have been manufactured.

- 4 HI-STAR 100 casks are in use to store MPC-68 (BWR) fuel at Exelon's Dresden Station.
- 3 HI-STAR 100 casks are in similar use at Southern Nuclear's Plant Hatch.
- 1 HI-STAR 100 overpack was built as a full size prototype; similar in all respects to its production unit, available from Exelon for testing purposes.

*Exelon Executive responsible for the sale of HI-STAR is V.P. Kevin Yessian  
(630-657-3650, kevin.yessian@exeloncorp.com)*

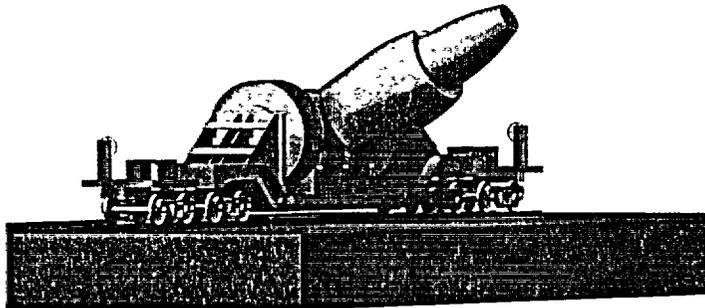

17

## **GLOBAL DYNAMIC MODEL OF IMPACT**

- TRANSPORT PACKAGE, SUPPORTS, RAIL CAR, IMPACTOR SIMULATED FOR DYNAMIC ANALYSIS.
- IMPACTOR - 767 ENGINE AT 500 OR 250 MPH AT 30 DEGREE ANGLE WITH HORIZONTAL; ENGINE WEIGHT = 13,000 LB.
- TARGET - TOTAL ROLLING WEIGHT ON RAILS ~ 475,500 LB.
- ASSUMPTIONS:
  - PACKAGE; RR CAR (with package support saddles, trucks); ENGINE SIMULATED AS 3 RIGID BODIES
  - DAMAGE AT IMPACT LOCATION SIMULATED BY "COEFFICIENT OF RESTITUTION" (COR) - KINETIC ENERGY TRANSFERRED TO PACKAGE (COR = 0.25 OR 0.0).
  - COEFFICIENT OF FRICTION = 0.5 SPECIFIED AT WHEEL/GROUND OR WHEEL/RAIL INTERFACE
  - PACKAGE HELD TO RR CAR SUPPORTS ONLY BY FRICTION FORCES; PACKAGE TIE-DOWNS CONSERVATIVELY NEGLECTED.
- OBJECTIVE: DOES THE PACKAGE REMAIN WITH THE RAIL CAR??
- NEXT SLIDES SHOW MODEL AND TWO "MOVIES" CONSTRUCTED DIRECTLY FROM RESULTS OF SLIGHTLY DIFFERENT DYNAMIC SIMULATIONS.

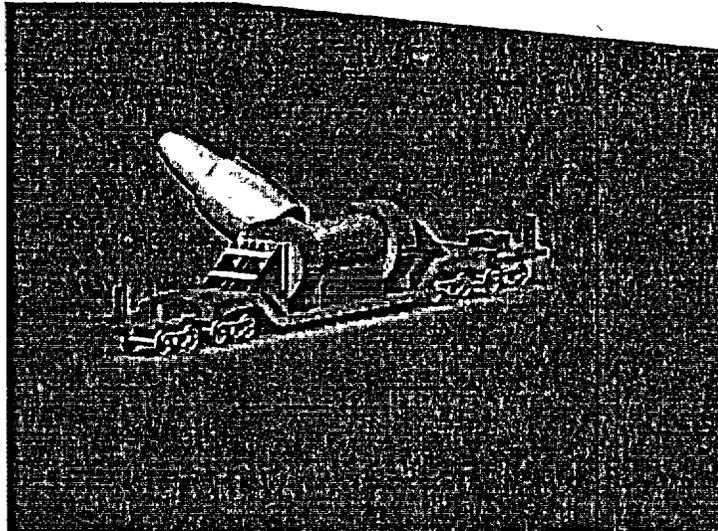

18

**HOLTEC**  
INTERNATIONAL

19

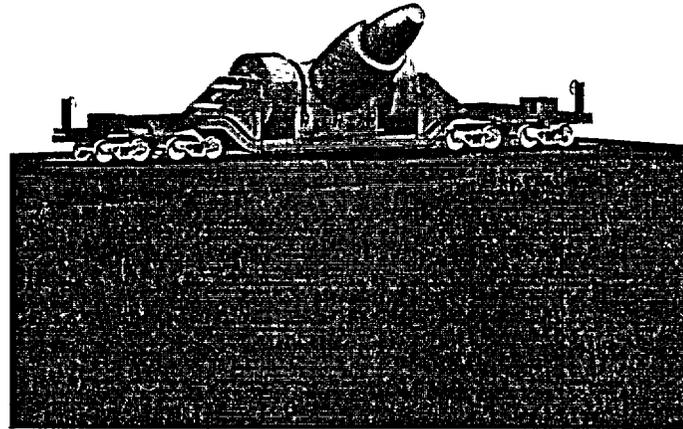

**RAIL NOT INCLUDED - IMPACT SPEED 500 MPH; COR=0.25  
AT IMPACT LOCATION; COF =0.5 AT WHEEL/GROUND  
INTERFACE**

**HOLTEC**  
INTERNATIONAL

20

**RAIL INCLUDED, 250 MPH SPEED; COR=0.0 AT IMPACT  
LOCATION; COF=0.5 AT WHEEL/RAIL INTERFACE -TIE  
DOWNS INCLUDED BUT DEACTIVATED**

**HOLTEC**  
INTERNATIONAL

### **Post Impact Responses**

- Package remains with vehicle during rollover for specified engine impact angle, speeds, and "cor" values.
- Adding different contact algorithms, adding interfaces (Engine/Package, Car Body/Trucks, Wheel/Rail, Rail/Ground), and separating connected rigid bodies, would permit simulation of local energy absorption without significantly adding to simulation times.
- Companion LS-DYNA3D model of complete system(engine is approximated) has been developed to include local deformation.

TRANSPORTATION WORKING GROUP WORKSHOP NOVEMBER 19 & 20, 2002

## INTRODUCTION

**Over Thirty Years Experience in:**

**Design, Licensing, Fabrication and Operation of Packaging for Both Storage and Shipping of Spent Fuel, Radioactive Waste and Other Radioactive Material.**

**Experience Includes:**

- ◆ Design
- ◆ Analysis
- ◆ Testing
- ◆ Fabrication
- ◆ Certification
- ◆ Operation

COGEMA GROUP

TRANSPORTATION WORKING GROUP WORKSHOP NOVEMBER 19 & 20, 1992

TRANSNUCLEAR

## US Transport Cask Design Criteria

**Design Basis:**

- 10CFR Part 71
- Regulatory Guide 7.6
- Regulatory Guide 7.8
- ASME Section III, Subsections NB and NG
- ASME Section III, Subsection WB
- NUREG/CR-6007, Stress Analysis of Closure Bolts for Shipping Casks

COGEMA GROUP

TRANSPORTATION WORKING GROUP WORKSHOP NOVEMBER 19 & 20, 1992

TRANSNUCLEAR

## European Transport Cask Design Criteria

### Design Basis:

- IAEA Regulations as Adopted into Law by Specific Countries
- ASME Section III, Subsection NB and NG (as Applicable)
- European Transportation Constraints

TRANSPORTATION WORKING GROUP WORKSHOP NOVEMBER 13 & 14, 1992

## US Transport Cask Design Criteria

### Acceptance Criteria:

- Normal Conditions
  - Meet ASME Section III, Service Level A Allowables
  - Maintain Containment
- Accident Conditions
  - Meet ASME Section III, Service Level D Allowables
  - Maintain Containment

TRANSPORTATION WORKING GROUP WORKSHOP NOVEMBER 13 & 14, 1992

## US Transport Cask Analysis Methods

- > Structure and Thermal
  - Finite Element Analysis Using ANSYS
  - Accepted Analytical Methods
- > Criticality
  - Evaluated Using KENO-Va Within Scale 4.4 System
- > Containment
  - Leakage Calculations in Accordance with ANSI 14.5
- > Shielding
  - Gamma Dose Rate (MCMP)
  - Neutron Dose Rate (MCMP)

COGEMA GROUP

TRANSPORTATION WORKING GROUP WORKSHOP NOVEMBER 19 & 20, 2002

TRANSNUCLEAR

## Acceptance Testing (Fabrication)

- > Pressure and Structural Tests
  - ASME Code Hydrostatic Test (1.5 Times MNOP)
  - Trunnion Load Test (ANSI N14.6)
- > Containment Test
  - ANSI N14.5 Leakage Test
  - Helium Mass Spectrometer (for leak tight or near leak tight requirements)
- > Shielding Test (Optional)
  - Neutron Shield Test
  - Gamma Shield Test
- > Neutron Absorber Test
  - Thermal Conductivity Testing
  - B10 Areal Density Testing
- > Functional Test

COGEMA GROUP

TRANSPORTATION WORKING GROUP WORKSHOP NOVEMBER 19 & 20, 2002

TRANSNUCLEAR

62

## Scale Model Testing

- > Validate the G Value Predicted by Computer Analysis
- > Demonstrate That Crush Depths are Acceptable
- > Demonstrate Confinement of the Energy Absorption Material After Drop
- > Demonstrate Adequacy of the Impact Limiter Attachment Design
- > Evaluate the Effect of Low Temperature on the Crush Strength and Dynamic Performance of the Impact Limiter
- > Evaluate the Effect of a 40 inch Drop onto a Scaled Six inch Diameter Puncture Bar on a Previously Crushed Impact Limiter

COGEMA GROUP

TRANSPORTATION WORKING GROUP WORKSHOP NOVEMBER 19 & 20, 2002

TRANSNUCLEAR

## Scaling Relationships

Length	$L_{scale} = (1/\lambda) L_{full}$
Weight	$W_{scale} = (1/\lambda^3) W_{full}$
Energy Absorbed During Drop	$E_{scale} = (1/\lambda^3) E_{full}$
Velocity at Beginning of Impact	$V_{scale} = V_{full}$
Force During Impact	$F_{scale} = (1/\lambda^2) F_{full}$
Deformation	$D_{scale} = (1/\lambda) D_{full}$
Impact Duration (Time)	$T_{scale} = (1/\lambda) T_{full}$
Impact Deceleration	$G_{scale} = (\lambda) G_{full}$

COGEMA GROUP

TRANSPORTATION WORKING GROUP WORKSHOP NOVEMBER 19 & 20, 2002

TRANSNUCLEAR

## Scale Model Drop Tests

### > Justification

- **The Validity of the Scale Model Test and the Scaling Relationships Have been Studied Extensively by Several Experts**
  - "Drop Testing of Package Using Scale Model" (LLNL)
  - "Design and Testing of Scale Model Transport System" (Sandia)
  - "Study of Mechanical Strength of Cask with Scale Model" (Ecole Polytechnique)
- **Scale Model Testing is Authorized by IAEA and Historically Accepted by USNRC**
- **Scale Model Testing is Widely used for the Qualification of Type B Packages Throughout the World (USA, France, Germany, UK, and Japan....)**

### > Advantages

- Reduce Fabrication Cost
- Reduce Cost and Potential Difficulties on Schedule due to Availability of the Target
- Reduce the Potential Difficulties of Performing the Test

## CEGB Full Scale Test

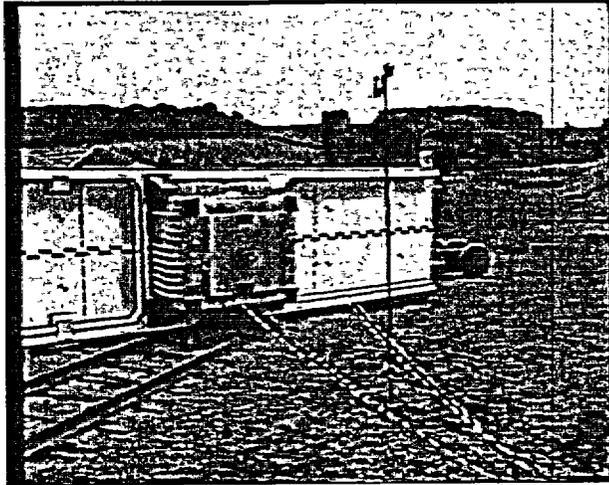

- > Test on a 50T MAGNOX Spent Fuel Cask in 1984
- > Test Program Used a Production Cask and Included 30 ft Drop (Identical to Regulatory Conditions)
- > Regulatory 30 ft Drop Confirmed the SAR Results which were Based on Scale Model Tests
- > A 240T Locomotive Traveling at 100 mph was Crashed into a Full Scale Cask Placed on Railtracks
- > The Cask Survived the Train Crash Without Leakage
- > Impact Forces From the Train Crash were Less Than the 30 ft Drop Test
- > Full Scale Testing Gave Public Confidence and Confirmed That Regulatory Tests are Realistic when Compared to Real Accidents

## Transnuclear Experience in High Speed Impact Testing (Aircraft Crash Test Results)

### > Test Results

- The Part of the Cask Outer Shell Struck by the Missile was Locally Deformed but There was no Significant Loss of Shielding
- No Deformation of the Forged Containment Vessel or the Closure lid
- Leak Tightness was Unchanged After the Impact

### > Conclusion

- Dual Purpose Casks can Survive Very Severe Impacts

COGEMA GROUP

## Conclusion

**Transnuclear's World-Wide Experience in Cask Licensing Including Regulation Scale Model Testing and High Speed Impact Testing Has Shown That :**

- **Analytical Method can Accurately Predict Cask Behavior**
- **Scale Model Test Results Provide Valuable Benchmarking Data**
- **Reduced Scale Model Testing is Fully Justified, Scale One Test on Large Package is Unnecessary**
- **Full Size Cask Public Demonstration Tests Prove That the Current Regulations Give Adequate Safety Margins Under Real Accident Conditions**

# NAC International Transport Cask Analysis and Testing Experience

Dr. Michael C. Yaksh

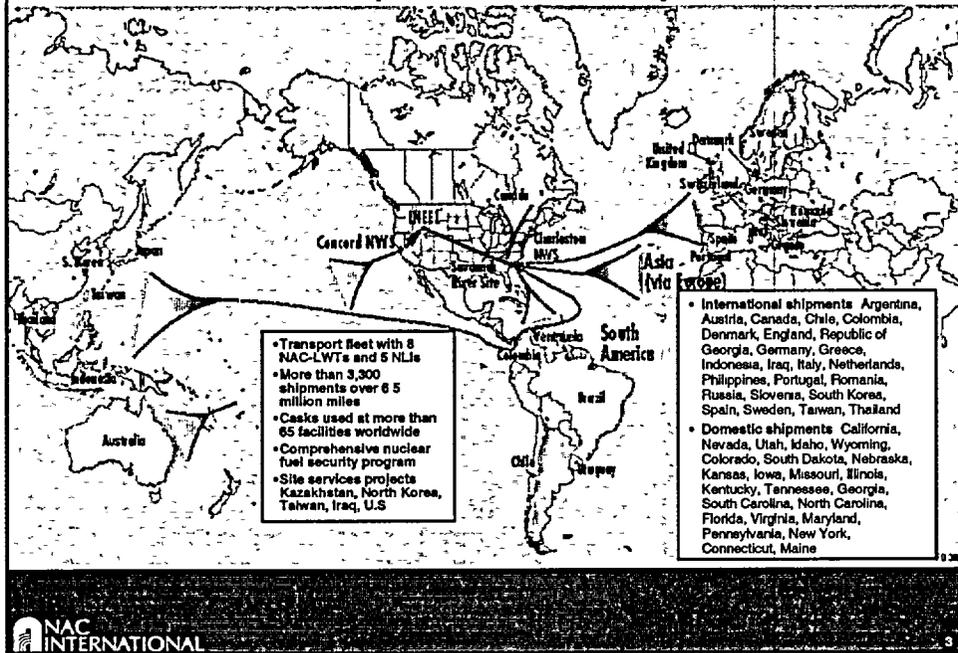

November 19, 2002

Atlanta Corporate Headquarters 3930 East Jones Bridge Road Norcross, GA 30092 -770-447-1144 Fax 770-447-1787 www.nacintl.com

## NAC Transport Cask Licensing Experience

Cask Designation	CoC No.	No. of CoC Rev./Application	NRC or IAEA Approval
NLI-1/2	71-9010	39/Transport	NRC/IAEA
NAC-1	71-9183	13/Transport	NRC/IAEA
NLI-10/24	71-9023	8/Transport	NRC/IAEA
NAC-LWT	71-9225	23/Transport	NRC/IAEA
NAC-STC	71-9235	2/Transport	NRC/IAEA
NAC-MPC	71-9235	2/Transport	NRC/IAEA
UMS <sup>®</sup>	71-9270	Transport	NRC/IAEA
Advanced UMS <sup>®</sup>	Pending	Transport	NRC/IAEA

## NAC Transportation Experience

## Overview

- NAC does not perform 10CFR71 cask licensing by testing, but by analysis with confirmatory testing
- Demonstration of integrity of the cask system uses both testing and analysis
  - Testing confirms required structural response where analysis methods may need validation
  - Analysis allows loading conditions to be examined in which testing is not practical
- Testing confirms analysis methodology

## Overview (continued)

- A number of systems are required for maintaining cask integrity, which may involve more than a containment requirement
  - Impact limiter to absorb energy due to impact with a rigid surface
  - Robust cask body shells, lids, bolts and seals to maintain containment
  - Robust internal structure to maintain geometrical location of the fuel for criticality control
- NAC history of designs / testing / usage for transport applications is extensive

## NAC Cask Testing Experience

System	Design Weight (lb)	Impact Limiters	Test Type *	Test Location
NAC-UMS	260,000	Redwood/balsa	1, 2	Naval Surface Warfare Center; Oak Ridge National Lab; Sandia National Lab
CY-STC	260,000	Redwood/balsa	1, 2	Naval Surface Warfare Center; Oak Ridge National Lab; Sandia National Lab
NAC-STC	250,000	Redwood/balsa	1, 2, 3	NAC International; AEA, Winfrith, UK
NAC LWT	52,000	Honey comb	1, 2, 3	Hexcell; Oak Ridge National Lab
NLI 1 / 2	52,000	Balsa	None	None
Californium	52,000	Foam	1 (NS-4-FR)	NAC International

- (\*) 1. Materials testing.  
 2. Scaled cask body and impact limiters.  
 3. Scaled basket within scaled cask body.

# Typical Methodology for Impact Limiter Energy Absorbing Materials (continued)

- Material Testing (continued)
  - The testing is used to define the extent of variability of parameters associated with material
  - Material testing is required to produce accurate analysis results required by NRC
  - Maximum acceleration agreement between analysis and testing
  - Agreement of acceleration time histories between analysis and testing

# Typical Methodology for Impact Limiter Energy Absorbing Materials

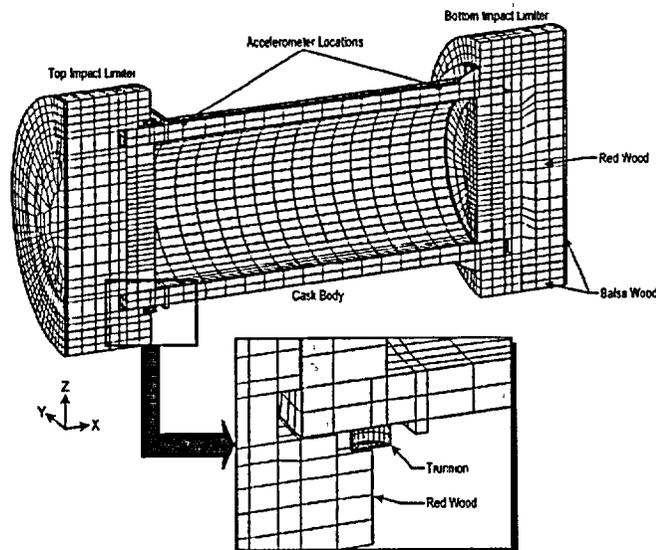

- Material Testing
  - Material testing is performed on samples to define the stress-strain curves
    - For a range of strain rates to be expected in the impact
    - Temperature variation is from -40°F to 200°F
    - Multiple directions of material orientations
    - Multiple tests to observe variability of the properties
    - Material tested by NAC: redwood, balsa, foam, aluminum honeycomb, NS4FR neutron shielding

# Analysis Methodology

- Objective of the analyses
  - Full scale cask analysis: to ensure that the design objectives are met
    - Acceleration limitations are specified to allow limited decoupling of the evaluations
    - Evaluation using the maximum temperature ranges is performed
    - Cask drop orientation is varied
    - Sensitivity studies are performed
  - Scale model cask analysis: to permit the methodologies to be benchmarked for scale model testing
    - Analytical methods
    - Manufacturing methods

## Analysis Methodology (continued)

NAC uses LS-DYNA to perform the evaluation of the full-scale and scale-model cask response

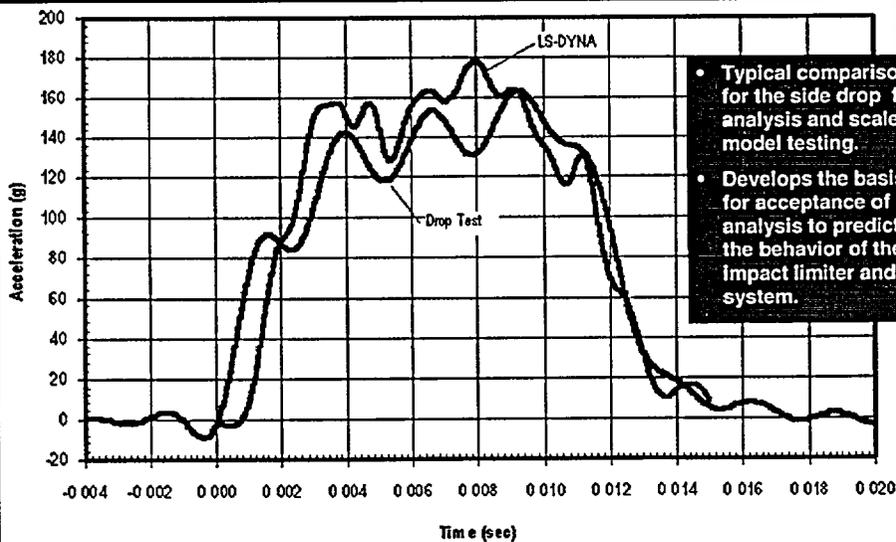

# Scale Model Testing

- Scale model manufacturing employs the same procedures and methods as required for the full scale design
  - Material requirements
  - Material orientation
  - Assembly of the components
  - Acceptance criteria for the material
- Scale model testing produces data for comparison with analytical predictions
  - Extent of crush of the impact limiter
  - Maximum accelerations
  - Overall acceleration response of the system
  - NRC requires conformance of testing to maximum accelerations and time history of cask accelerations predicted by analysis

# Scale Model Testing (continued)

Comparison of Quarter Scale Analysis and Test Results for the Side Drop (bottom accelerometer)

## Inherit Conservatism and Margins in the Design

- Drop testing uses a rigid surface backed by a semi-infinite mass
- Loading is concentrated at the ends and not along the cask
- Force deflection curves from the scale model testing show 20-30% more capacity than required for the full-scale cask design
- Stress analyses of the system use accelerations which are larger than those obtained in the test and predictions
- Most analyses employ ASME Code methodology for the accident evaluation for the basket and for the containment
  - Neglects ductility of stainless steel
  - Uses Code acceptance criteria (very conservative with respect to "failure")

## Inherit Conservatism and Margins in the Design (continued)

- Conservatism of NAC's approach has been demonstrated in one side drop test of the NAC-STC at Winfrith, U.K.
  - Cask body and basket model was a quarter scale of the full scale design
  - Cask body and basket were subjected to 5 times the design accelerations (300g full scale)
  - Basket at point of impact showed minor deformation
  - Basket outside the point of impact showed no permanent set
  - No cask body containment welds exceeded yield
  - No lid bolts failed; cavity environment was maintained
  - Criticality configuration was maintained

# Summary

- Analysis methodologies have been shown to adequately and conservatively predict the impact limiter response
- Inherent conservatism exists in the methodologies
  - ASME Code methodologies
  - Impact limiter margin
  - Inherent conservatism in the structural evaluation
  - Drop testing on essentially unyielding surface
- Design and testing methodologies demonstrate that current NAC cask designs provide large margins of safety during transport

6/96; 12/97) (Report #1)
- "Railroad Transport of SNF," James Rock,  
et.al, May 27, 1998 (Report #2)

Sent to NRC January 2000

3

**Report Conclusions**

Association  
of American  
Railroads

---

Conclusion Report 1:

- SNF Casks might not be able to withstand forces  
conceivable in all railroad accidents.

Conclusion Report 2:

- Agreed with 1<sup>st</sup> report but, determined that public  
health would not be affected in the event of an accident.

4

Association  
of American  
Railroads

## Issues Raised in Report 1

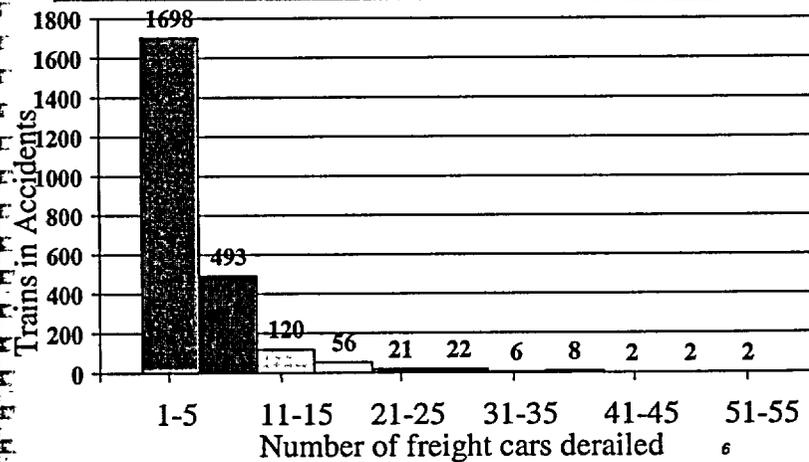

- **Crush loads:**
  - Not required for large packages (only if mass less than 227#)
  - Rail cask = 125 tons (250,000#)
  - Real probability in rail accidents
    - By definition, rail transport involved multiple vehicles
- **Modal Study:**
  - Frequency of incidence of crush loading was assessed as one-tenth that of impact loading
  - Only 0.8% experience impact with a coupler or significant frame member of other vehicles.

5

Association  
of American  
Railroads

## 30% of Trains in Accidents in 2001 Derailed More Than 5 Cars

6

94

Association  
of American  
Railroads

## Sources of Information

- FRA database includes the number of cars involved in derailments
- AAR-RPI Tank Car Safety Research and Test Project
  - Over 30,000 damaged tank cars in database (over 30 years of data)
  - Could be used to determine percentage subject to crush loads
  - Will require manual search of records

7

Association  
of American  
Railroads

## Collision with Structures and Falls

- Modal study used highway data to evaluate impacts with structures and falls
  - Railroads different (more cuts and fills)
  - Underestimates:
    - Frequency of rock cuts,
    - Frequency of embankments,
    - Frequency of water crossings and
    - Possibly the frequency of large structures

8

95

Association  
of American  
Railroads

## Thermal Event Frequencies

- Should evaluate thermal event frequencies more closely
- Modal Study
  - 81% fires < 1 hour
  - 99% fires < 7 hours
- Eggers
  - 50% fires < 11 hours
  - 99% fires < 130 hours
- Eggers would have been the more conservative choice
- Weyauwega WI 1996 fire lasted 18 days (360 hours)

Association  
of American  
Railroads

## Structural Strength of Railcars

- Underestimated in Modal Study
  - 100,000 lb / foot
  - 1 million lb for a 10 ft-wide locomotive
  - 1.6 million lb for a 16 ft long cask
- Locomotives designed to withstand 1 million lb force at the coupler without permanent deformation
- Finite element analysis indicates that:
  - 3 million lb if applied at coupler height
  - 10 million lb if applied at the frame's neutral axis

10

Association  
of American  
Railroads

## Performance Standard for Spent Nuclear Fuel Trains

- Includes all cars in the trains including buffer cars, security cars
- Requires static and dynamic modeling before construction
- Requires full scale characterization, static, and dynamic testing of each car and the train
- 100,000 mile evaluation period

11

Association  
of American  
Railroads

## Performance Standard for SNF Trains (cont.)

- Roadworthiness exceeds standard freight car requirements
  - Enhanced performance trucks
- Requires Electronically Controlled Pneumatic (ECP) Brakes
  - Reduced stopping distance
  - Provides conduit for on-board defect detection

12

Association of American Railroads

# System Safety Monitoring

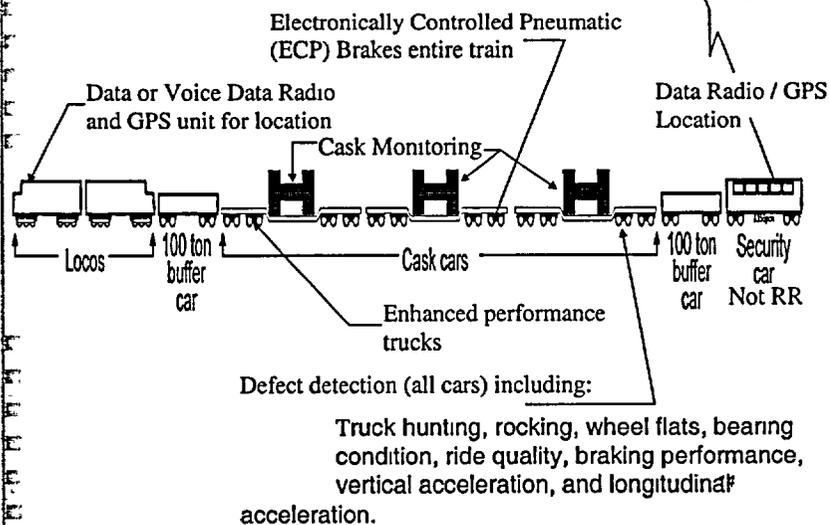

- **On-Board Monitoring Systems**
  - Location Determination
  - Truck Hunting
  - Wheel Flats
  - Braking Performance
  - Vertical, Lateral, Longitudinal acceleration
  - Bearing Condition
  - Speed, Ride Quality

13

Association of American Railroads

# Diagram of SNF Train

## Other Enhanced Safety Actions Affecting SNF Transportation

Association  
of American  
Railroads

- AAR OT-55-D
  - Track and Equipment Inspection
  - Defect Monitoring
  - Increased Maintenance Frequency
  - Increased Employee Training
  - Maximum Speed Limit (50 MPH)
- FRA Safety Compliance Oversight Plan Policy for HLRW and SNF Shipments

15

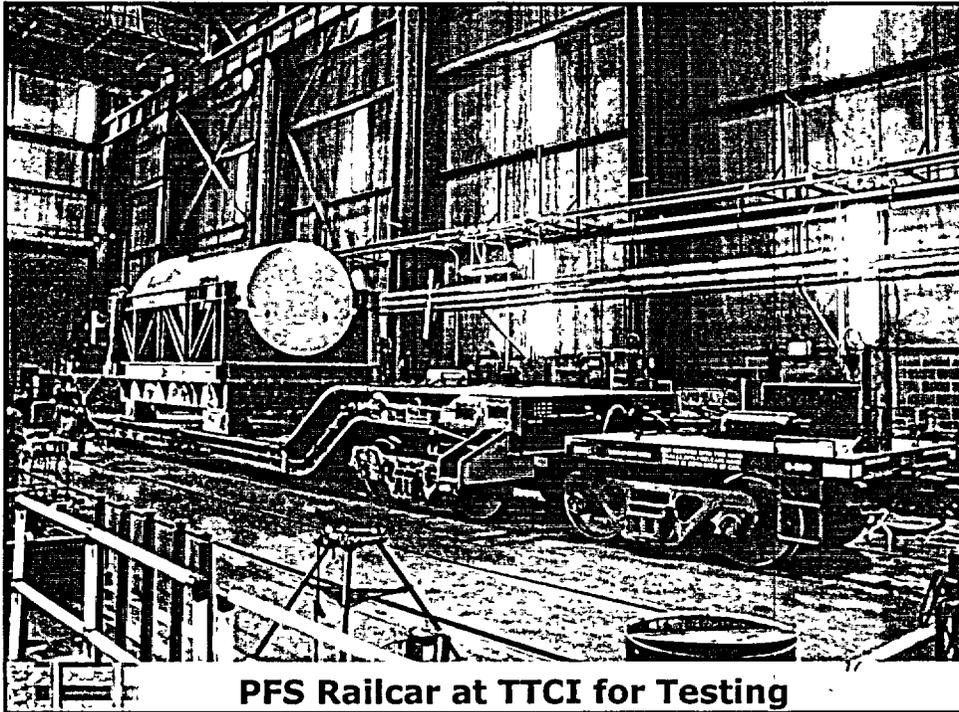

## Private Fuel Storage LLC

Association  
of American  
Railroads

- First Shipper to Build SNF Equipment to AAR's New Performance Standard
- Cask Car Manufactured by Trinity Industries
- Overall Weight of Car, Cask, Cradle, and Impact Limiters is Approx. 476,200 lb.
- Modeling and Characterization Testing Complete
- Static and Dynamic Tests Planned for 2002

16

**PFS Railcar at TTCI for Testing**

## Summary...

Association  
of American  
Railroads

- There are testing issues that should be addressed:
  - Crush loads
  - Collisions with structures & falls
  - Thermal event frequencies
  - Structural strength of railcars
- AAR is Committed to Incorporate Technological Improvements in Rail Transportation Designed to Enhance the Safety of SNF Shipments

# Staff Review and Analysis of the July 2001 Baltimore Tunnel Fire Accident

---

CHRISTOPHER S. BAJWA

SPENT FUEL PROJECT OFFICE, NMSS

U.S. NUCLEAR REGULATORY COMMISSION

PRESENTATION TO THE ADVISORY COMMITTEE ON NUCLEAR WASTE

NOVEMBER 19, 2002

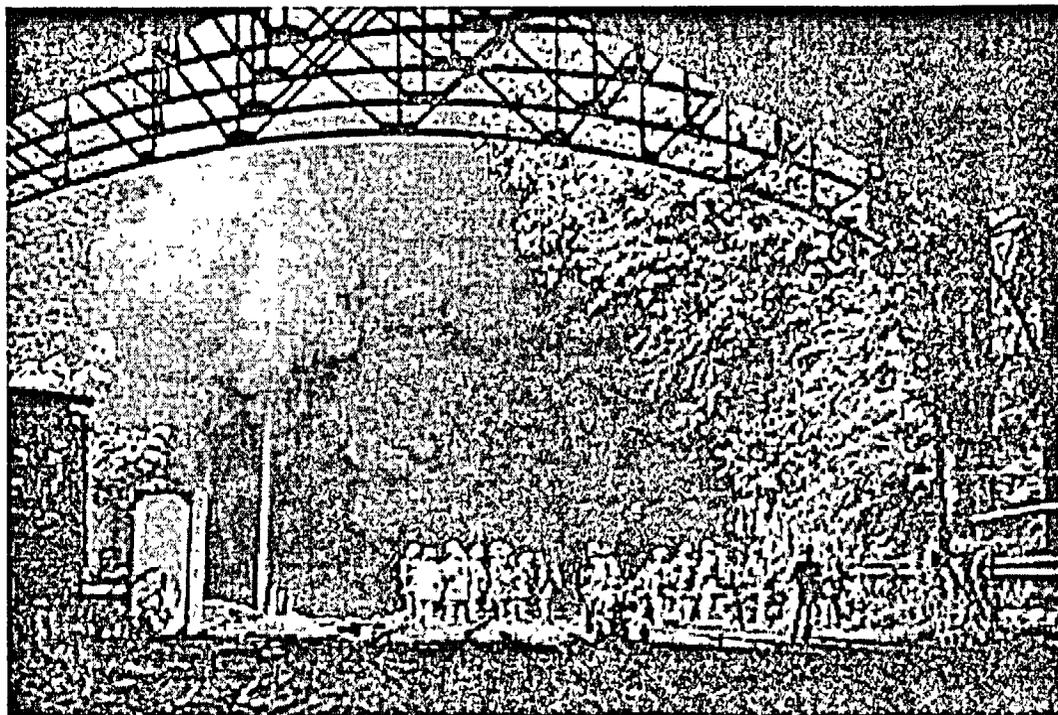

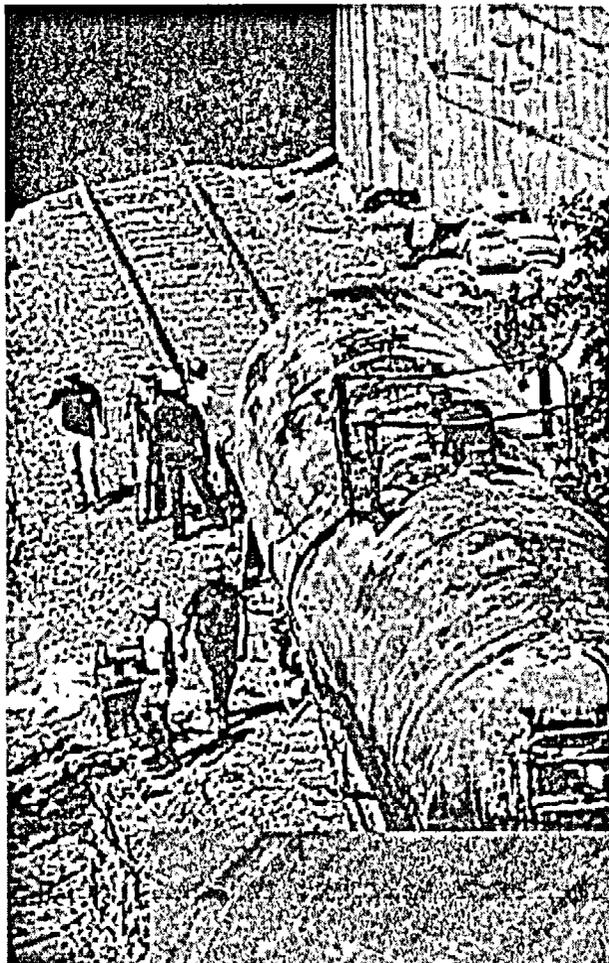

ROCKVILLE, MD

# INTRODUCTION

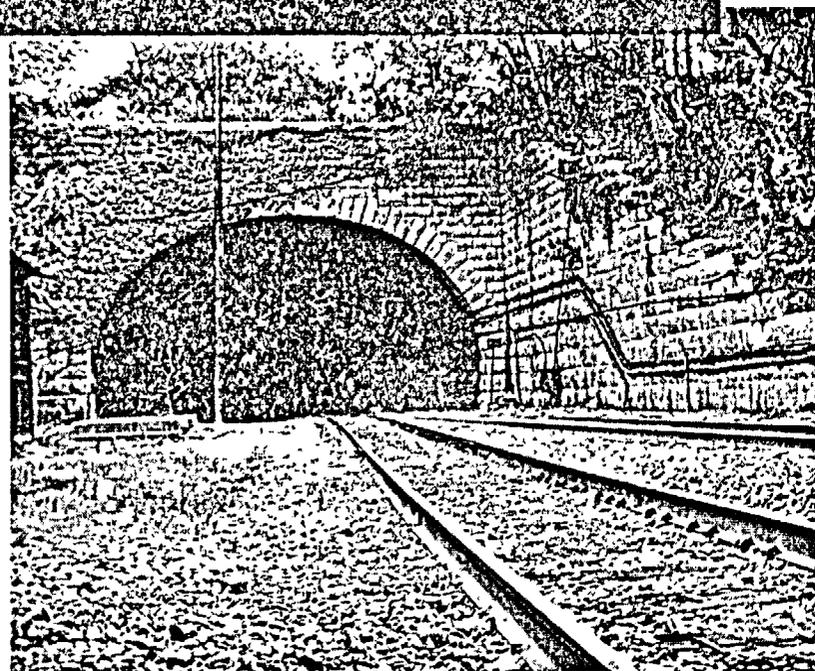

---

- BALTIMORE TUNNEL FIRE ACCIDENT
- COORDINATION WITH NTSB
- PRELIMINARY SCOPING ANALYSIS
- NIST TUNNEL FIRE MODEL
- VALIDATION OF NIST FIRE MODEL
- REFINED CASK ANALYTIC MODEL
- CONCLUSIONS

# BALTIMORE TUNNEL FIRE

HOLE IN TANKER CAR

# COORDINATION WITH NTSB

---

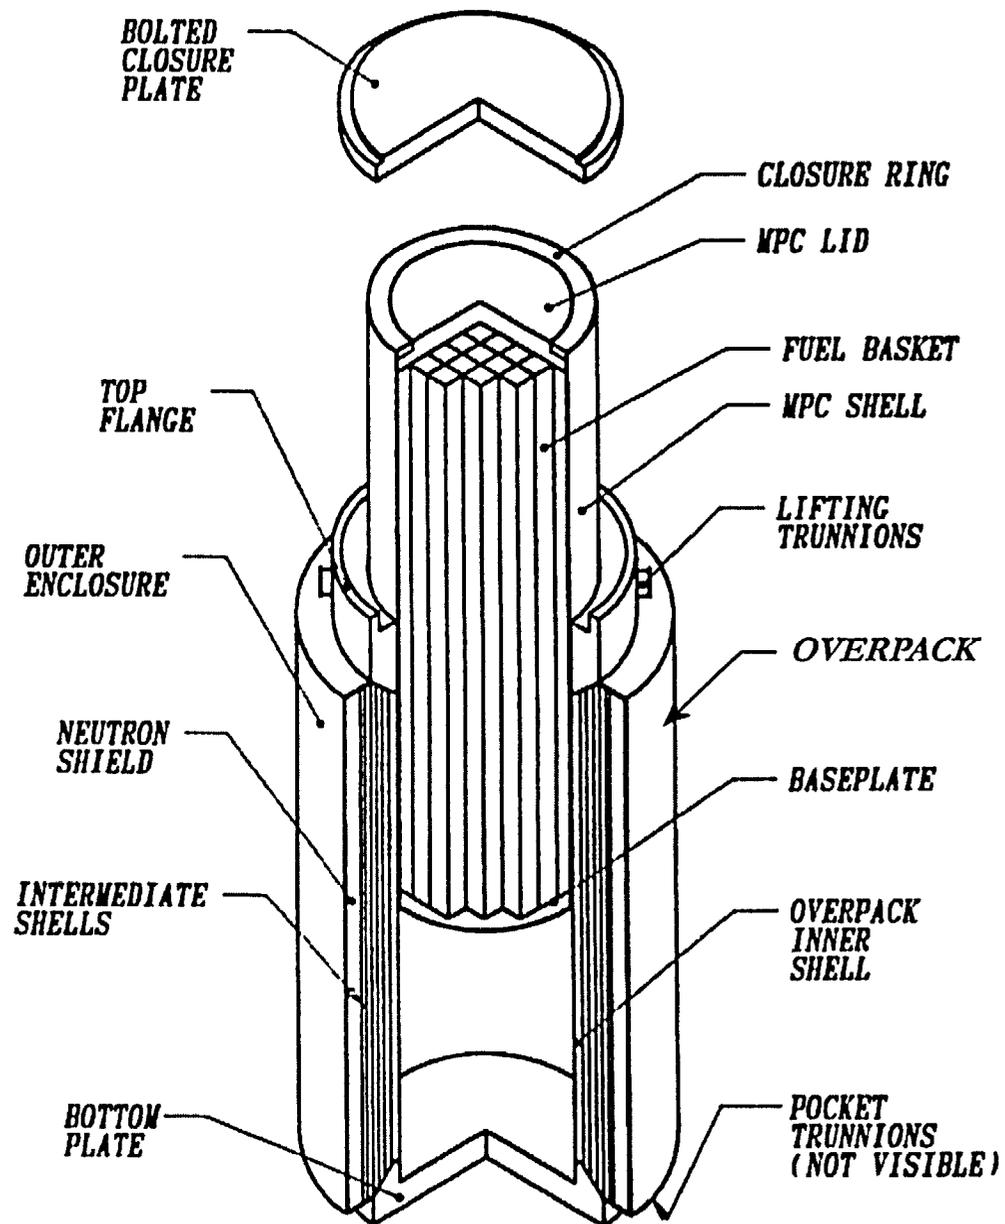

- NTSB – LEAD INVESTIGATIVE AGENCY
- DERAILMENT WAS PRIMARY CONCERN
- NTSB PROVIDED INFORMATION, DATA AND TECHNICAL EXPERTISE ON RAIL EVENTS
- PROVIDED ACCESS, THROUGH CSX, TO RAIL CARS & TUNNEL

# PRELIMINARY SCOPING ANALYSIS

---

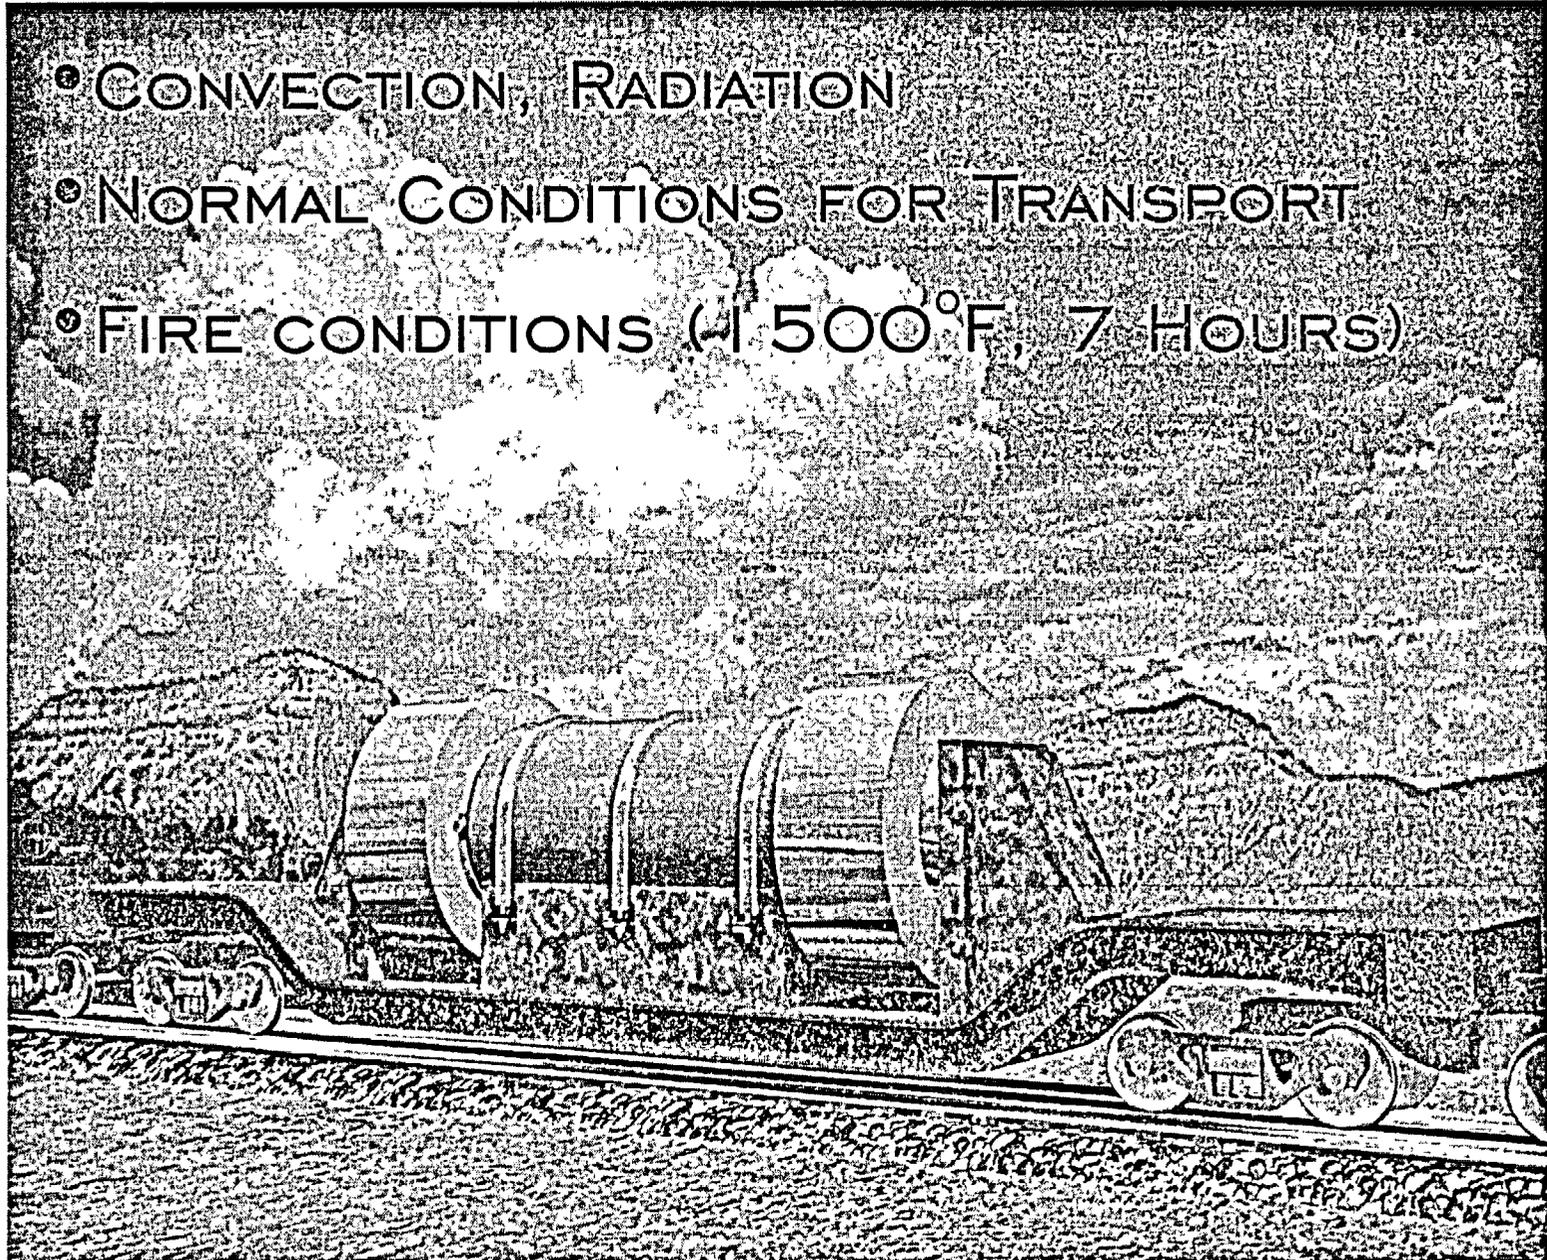

- SELECTION OF A SPENT FUEL  
TRANSPORTATION CASK
- FINITE ELEMENT (ANSYS®) MODEL
- 10 CFR 71.73 REQUIREMENTS
- 7-HOUR BOUNDING ANALYSIS

# SPENT FUEL TRANSPORTATION CASK

# BOUNDARY CONDITIONS

- CONVECTION, RADIATION
- NORMAL CONDITIONS FOR TRANSPORT
- FIRE CONDITIONS (1500°F, 7 HOURS)

# PRELIMINARY RESULTS

---

- NO CLADDING FAILURE (BASED ON TEMPERATURE)
- NO CANISTER FAILURE (BASED ON STRESSES AT TEMPERATURE AND ON CREEP CRITERIA)
- NO RADIOACTIVE RELEASE

# NIST TUNNEL FIRE MODEL

---

- FIRE DYNAMICS SIMULATOR (FDS)
- VALIDATED WITH MEMORIAL TUNNEL  
FIRE TEST PROGRAM DATA
- RESULTS USED AS INPUT TO REVISED  
ANALYSIS

# HOWARD STREET TUNNEL FIRE MODEL

---

- RAILCARS IN DERAILED POSITION
- GRADE OF TUNNEL MODELED
- TRIPROPYLENE POOL USED AS FUEL
- NO VENTILATION IN MODEL
- STEADY STATE CONDITIONS REACHED 30 MINUTES INTO SIMULATION

# NIST HOWARD STREET TUNNEL FIRE MODEL

# ANALYSIS OF PHYSICAL EVIDENCE

---

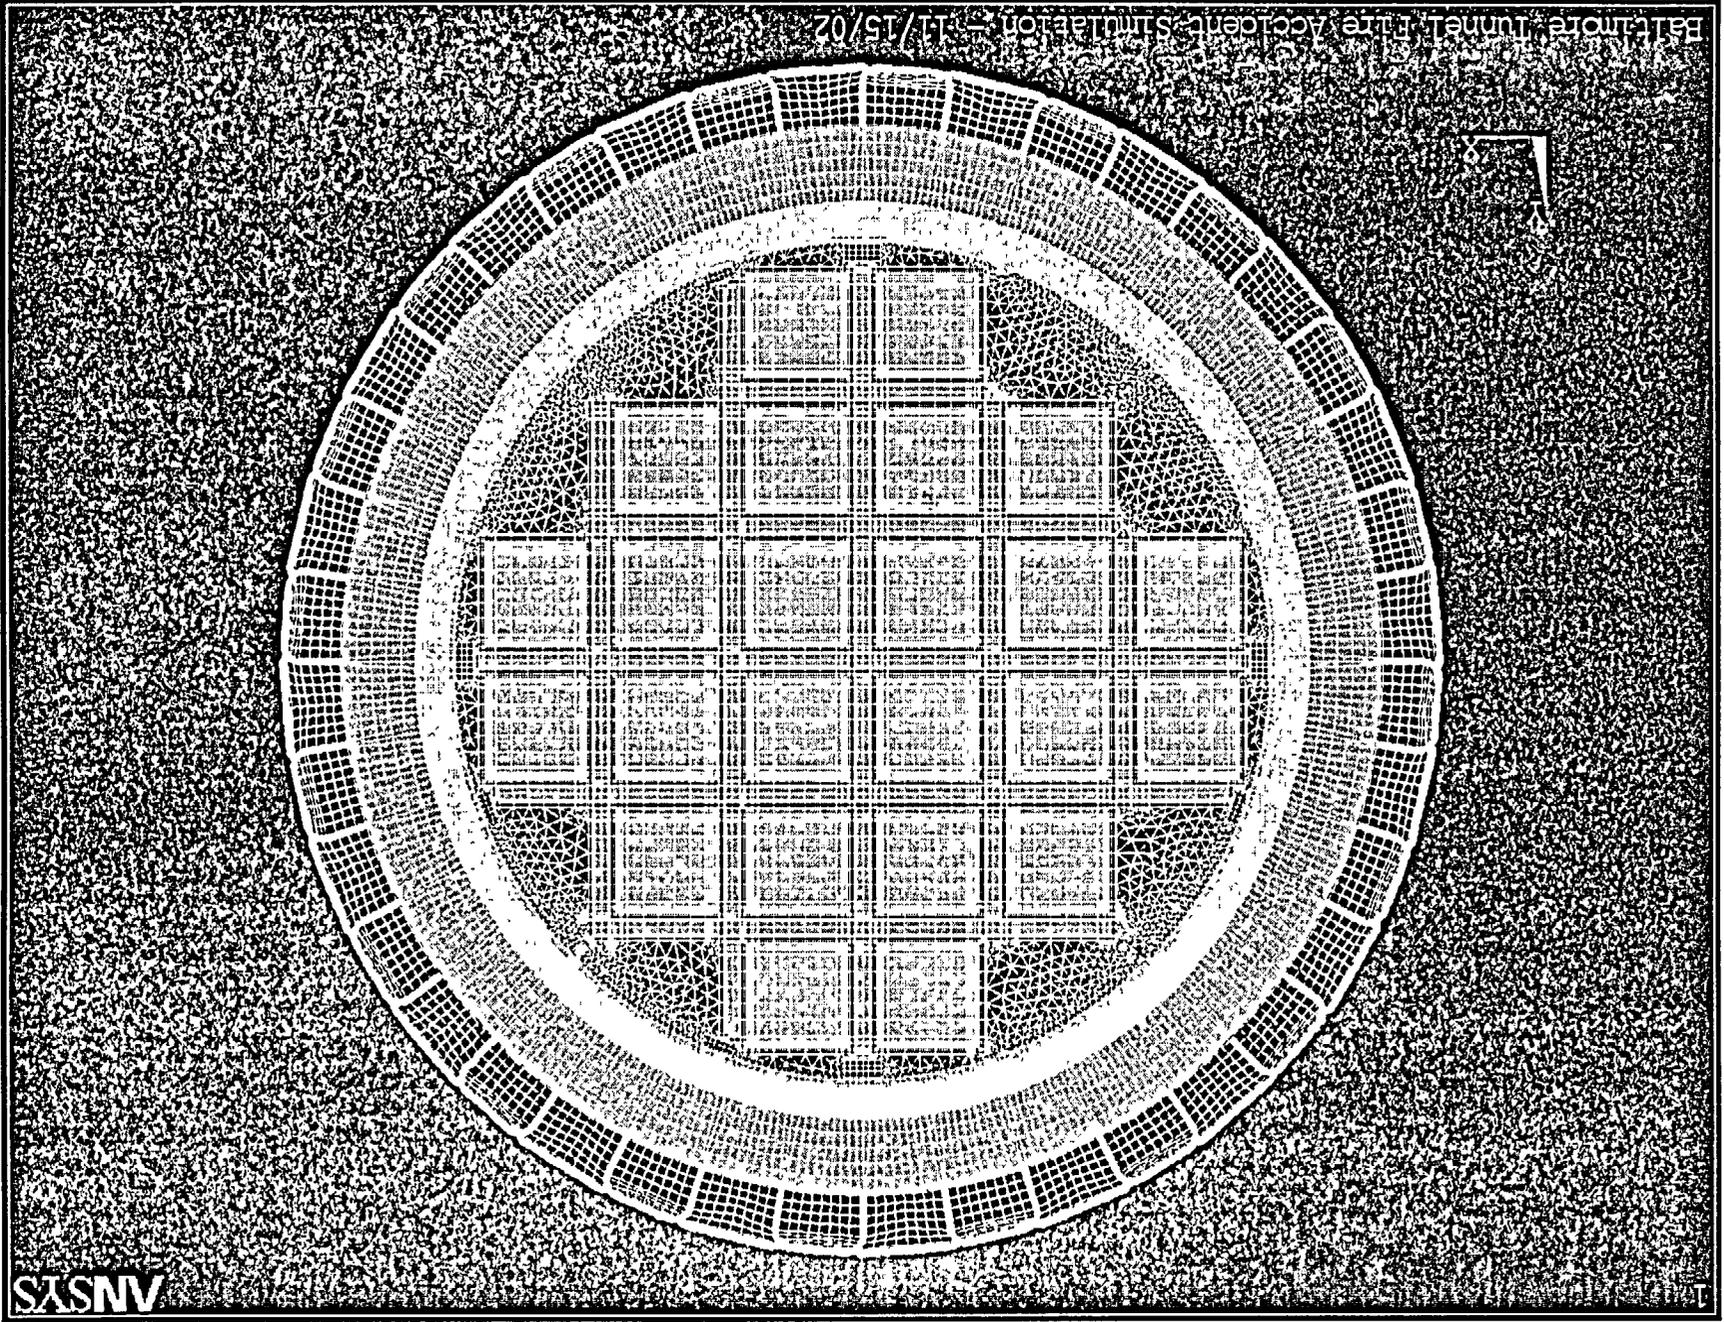

- FURTHER DATA TO SUPPORT NIST RESULTS
- CNWRA MATERIAL AND FIRE EXPERTS
- SAMPLES OBTAINED FROM RAIL CARS
- METALLURGICAL ANALYSES CONDUCTED
- RESULTS REPORTED BY CNWRA CONSISTENT WITH NIST TEMPERATURE RESULTS

# REVISED ANALYSIS BASED ON NIST DATA

---

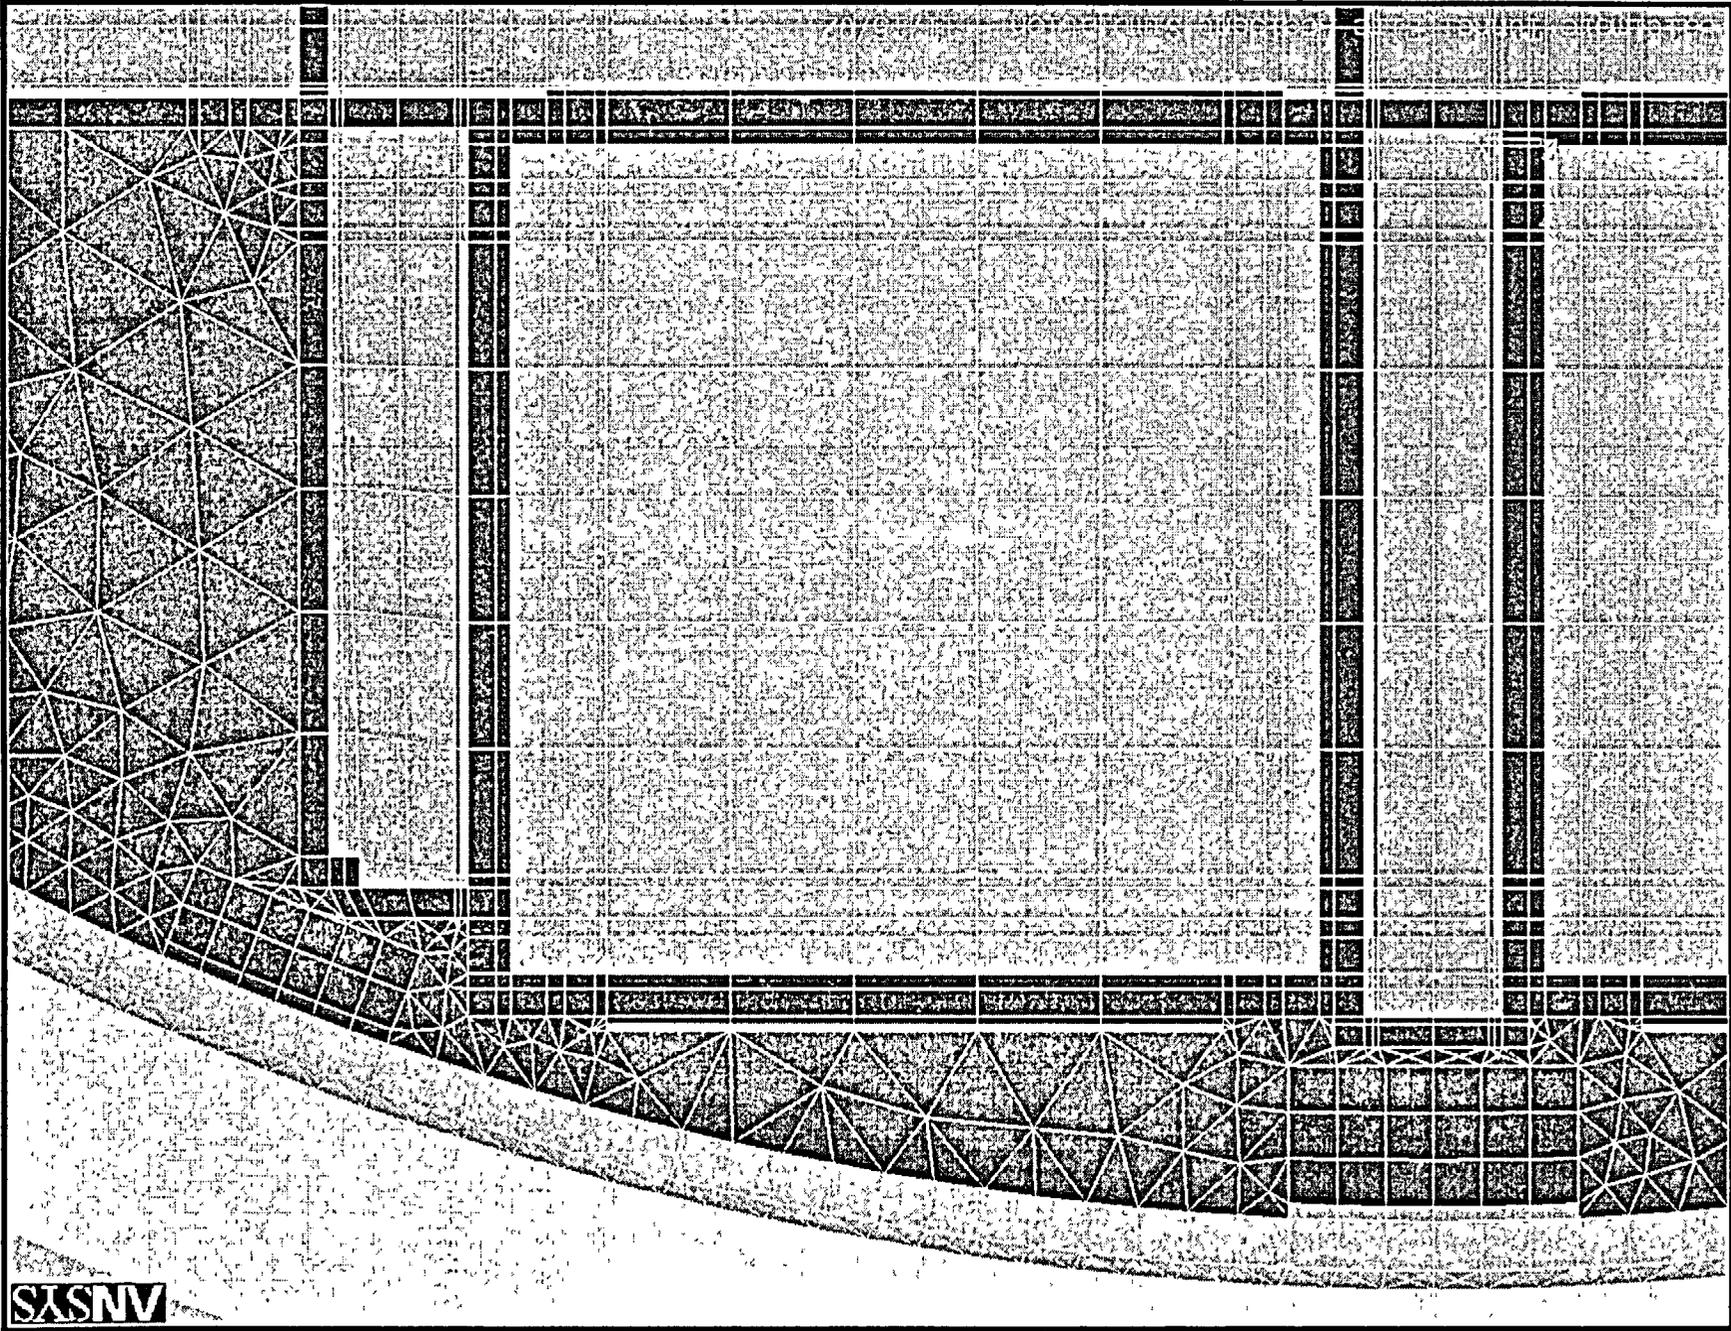

- ASSESSMENTS APPLIED NIST DATA  
(TEMPERATURE AND FLOW)
- ASSESSMENT – 1 : CASK CENTER 20 METERS  
(ONE RAIL CAR LENGTH) FROM FIRE PER  
FEDERAL REGULATIONS (49 CFR 174.85)
- ASSESSMENT – 2: CASK LOCATED ADJACENT  
TO FIRE (5 METERS FROM FIRE TO CENTER)
- 2D CROSS-SECTION WITH SUPPORT CRADLE
- 3D MODEL UNDER DEVELOPMENT

# REFINED CASK MODEL

Baltimore Tunnel Fire Accident Simulation - 11/15/02

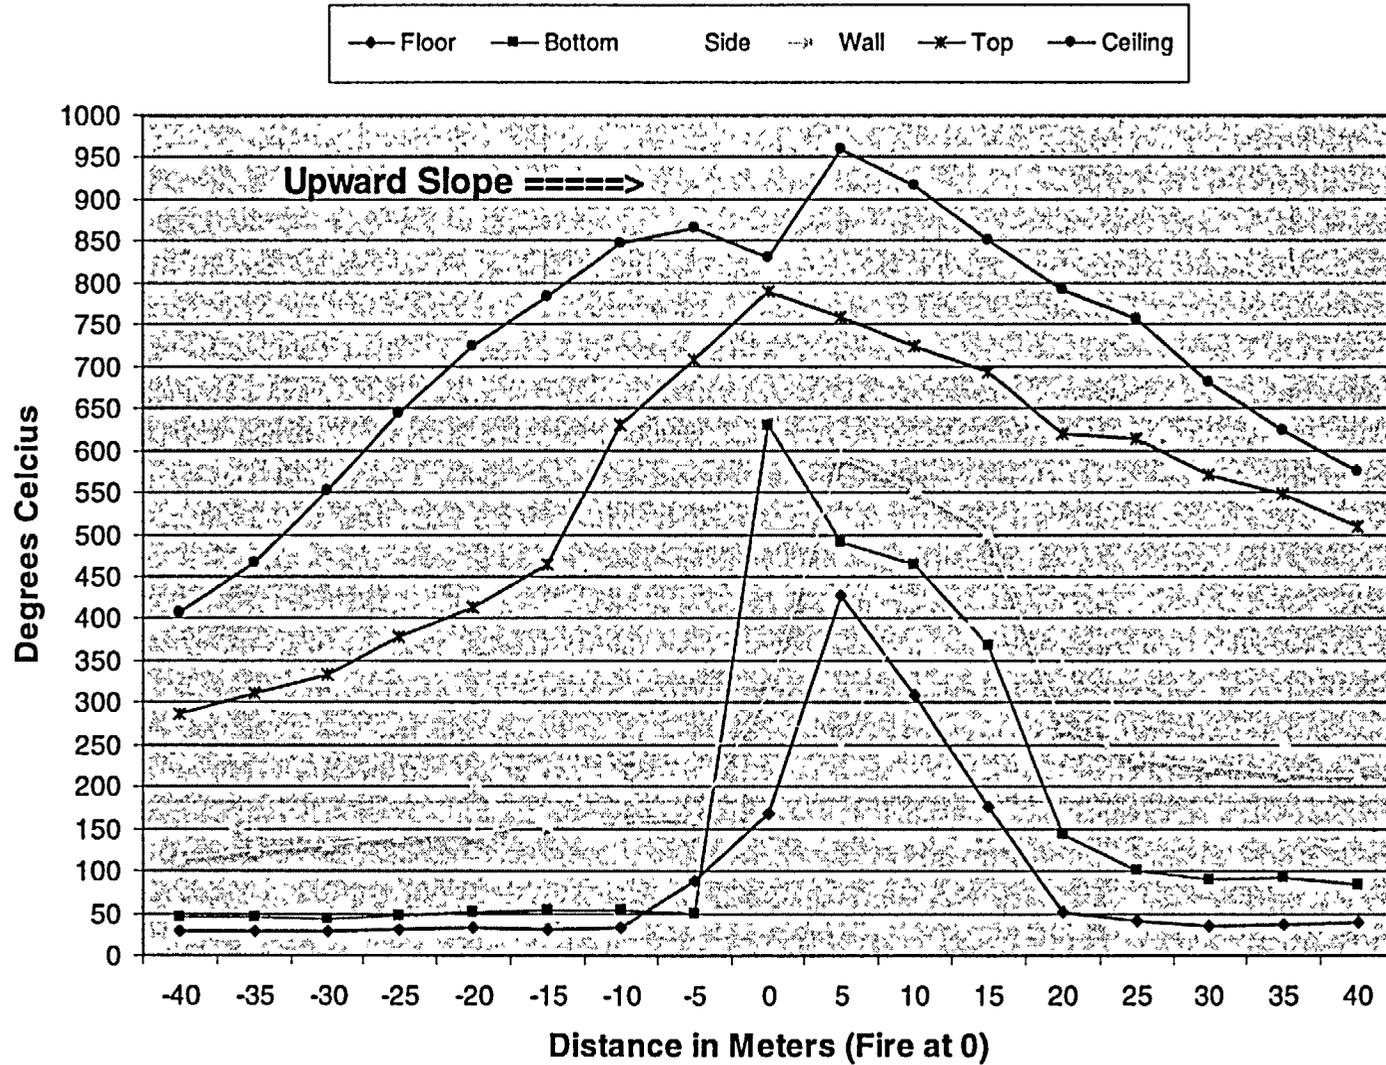

ANSYS

REFINED CASK MODEL

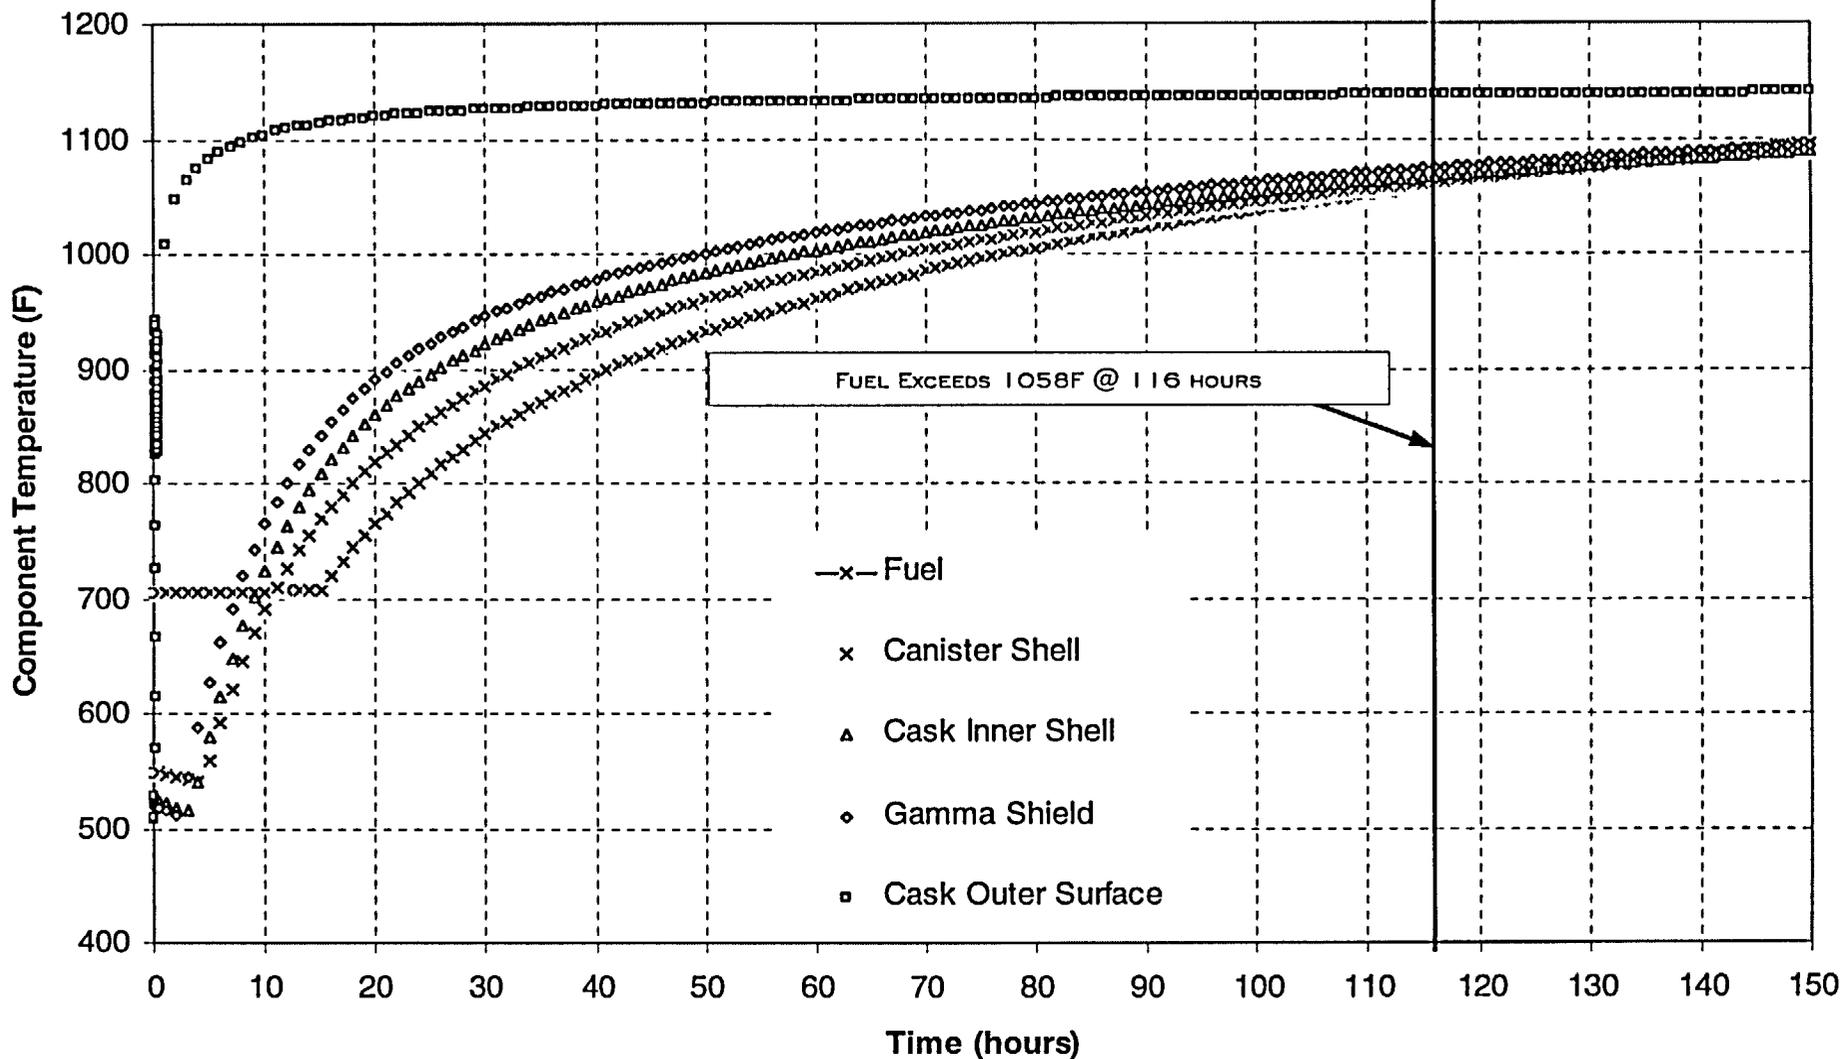

# NIST TEMPERATURE DATA

## Tunnel Temperatures

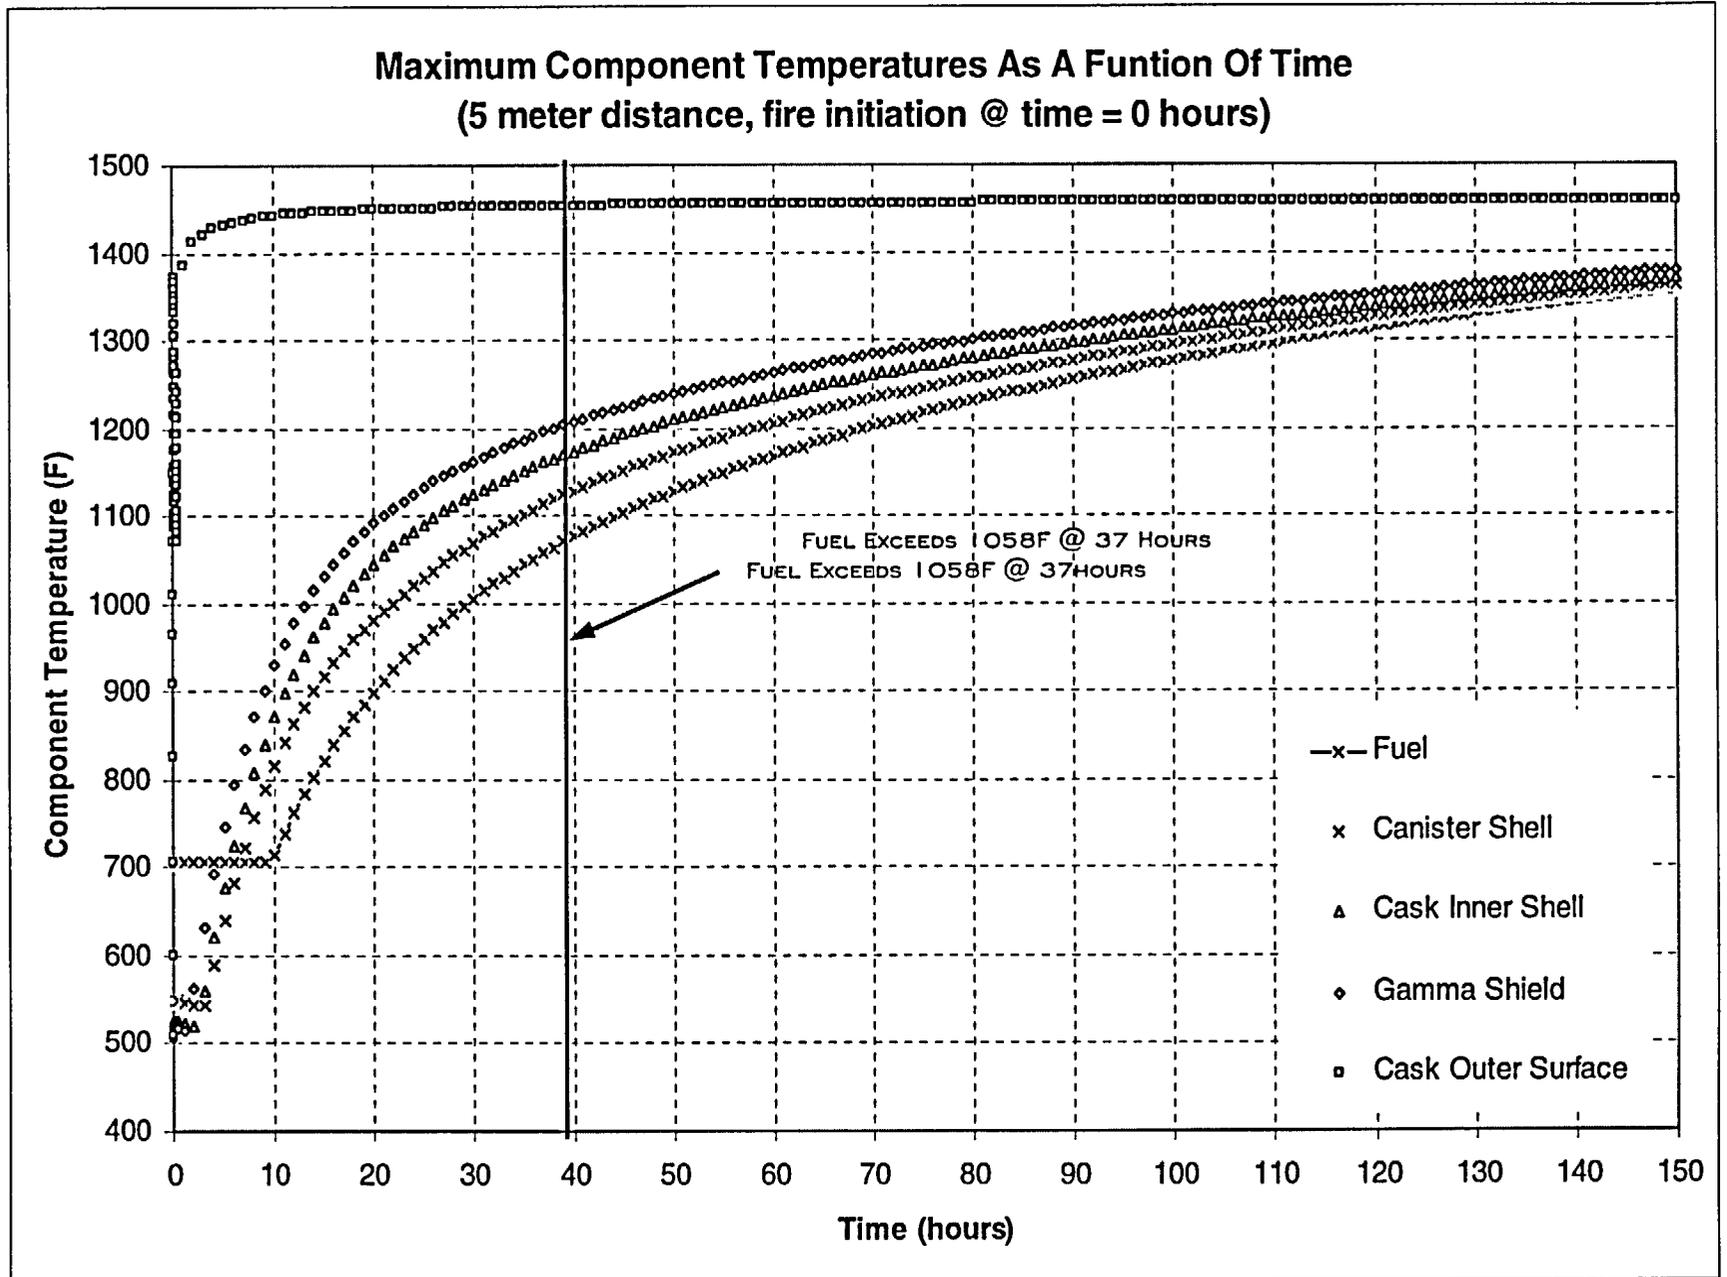

# 20 M RESULTS FROM REVISED ANALYSIS

Maximum Component Temperatures As A Function Of Time  
(20 meter distance, fire initiation @ time = 0 hours)

# 5 M RESULTS FROM REVISED ANALYSIS

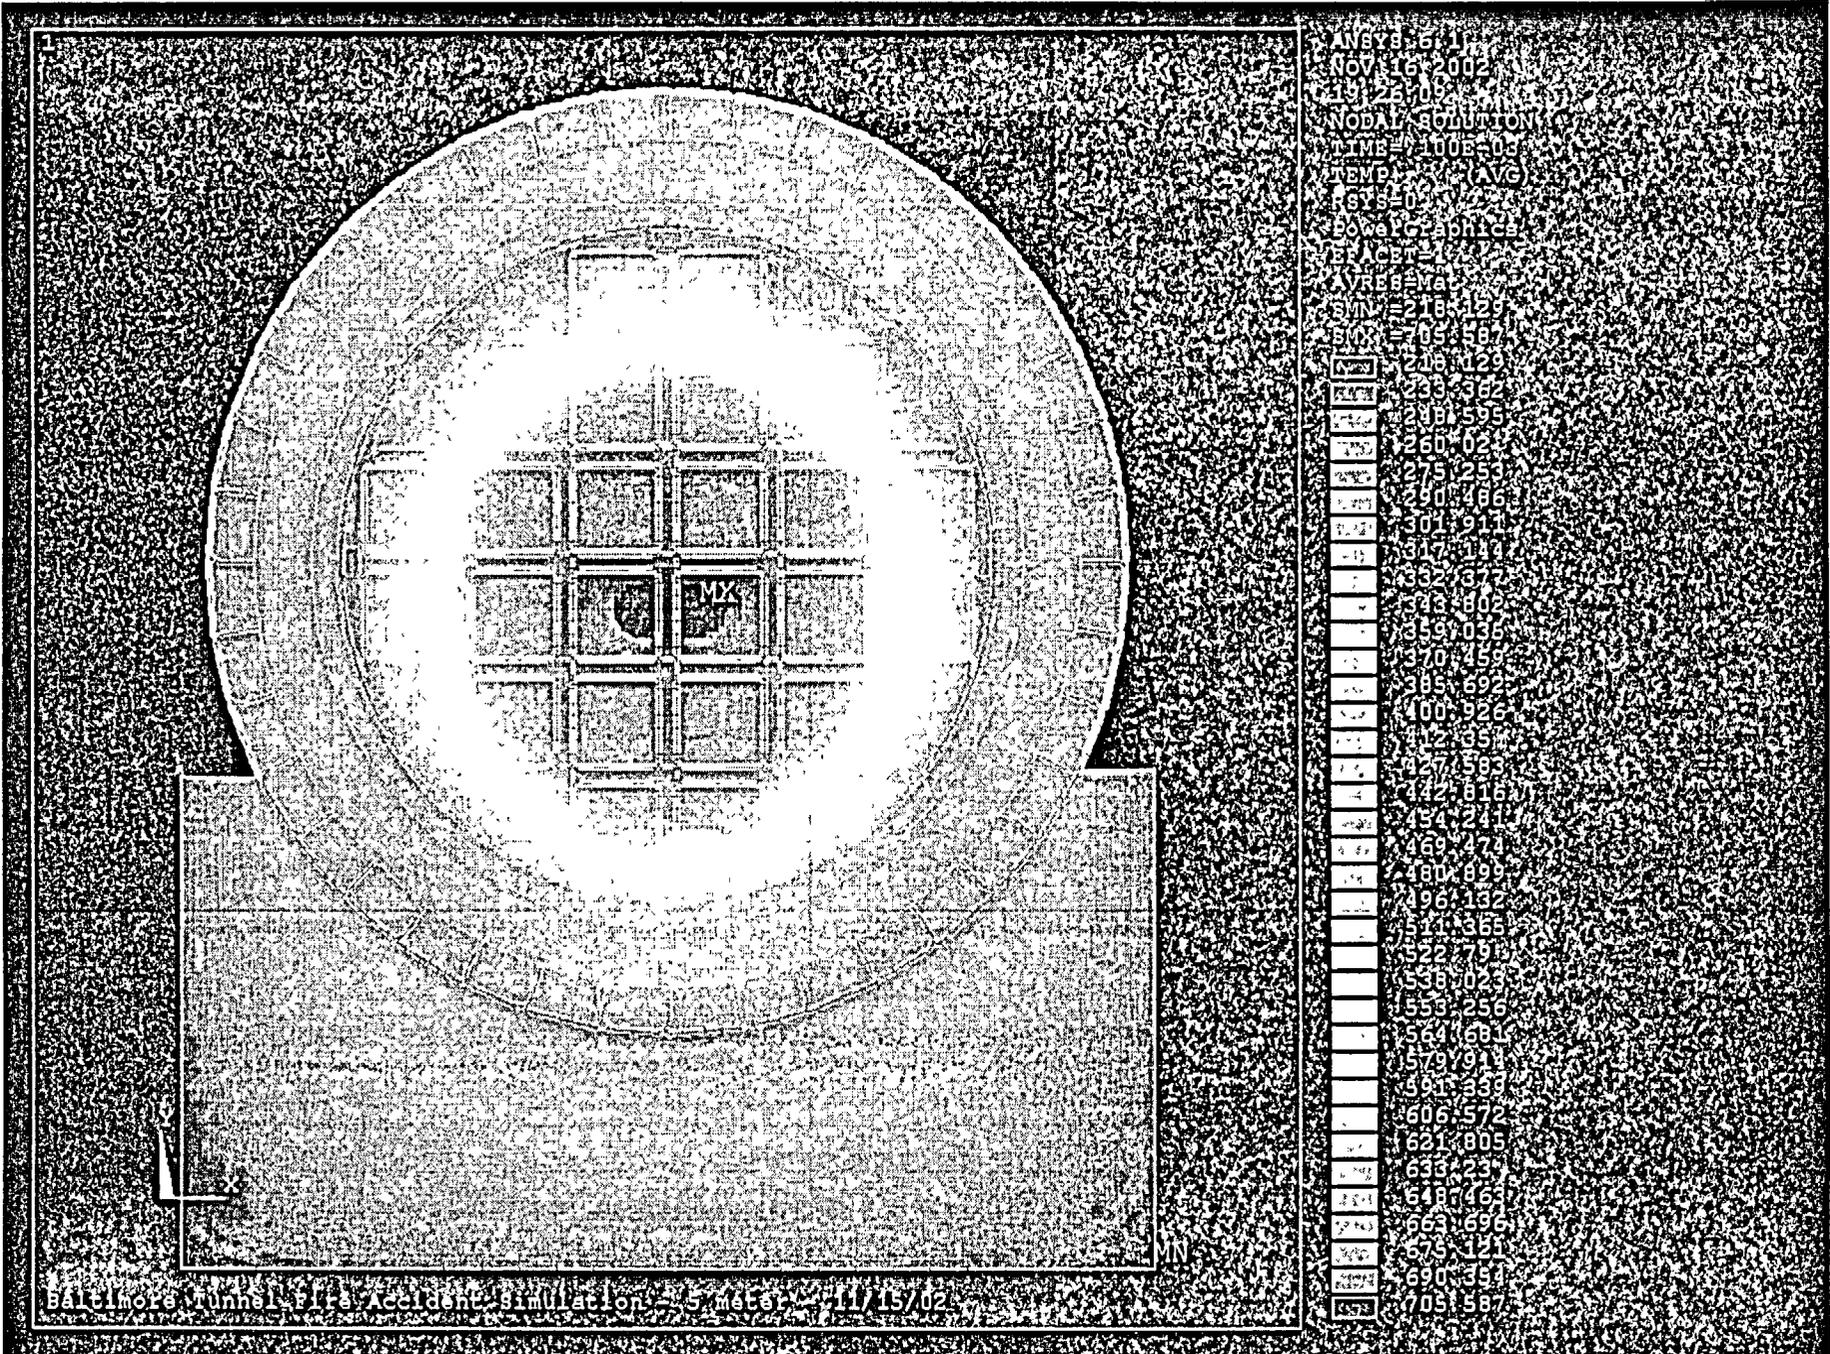

# RESULTS FROM REVISED ANALYSIS

---

- TIME TO EXCEED SHORT TERM FUEL TEMPERATURE LIMITS (1058°F)
  - FOR 20 METERS OVER 100 HOURS
  - FOR 5 METERS OVER 30 HOURS
- TIME TO CANISTER FAILURE
  - FOR 20 METERS OVER 30 YEARS
  - FOR 5 METERS OVER 30 YEARS

# ANIMATION OF 5 METER RESULTS

Baltimore Tunnel Fire Accident Simulation - 5 meter - 11/15/02

# CONCLUSIONS

---

- CASK PERFORMANCE
- CONSEQUENCES OF FIRES
- HEALTH AND SAFETY OF THE PUBLIC PROTECTED
- AAR PERFORMANCE STANDARD FOR TRANSPORTING SPENT FUEL BY RAIL
- PRELIMINARY CONCLUSION: ADDITIONAL REGULATORY REQUIREMENTS NOT NECESSARY IF CURRENT REGULATIONS AND AAR PERFORMANCE STANDARDS ARE FOLLOWED

# ACKNOWLEDGEMENTS

---
