EXECUTIVE SUMMARY

This Annual Radiological Environmental Operating Report describes the V.C. Summer Environmental Monitoring Program and the program results for the calendar year 2000.

Included are the identification of sample locations, descriptions of environmental sampling and type of analysis, comparisons of present environmental radioactivity levels and pre-operational environmental data, land use census comparisons of doses calculated from environmental measurements, and a summary of environmental radiological sampling results. Quality assurance practices, sampling deviations, and unavailable samples are also discussed.

Sampling activities were conducted as prescribed by the Offsite Dose Calculation manual for V.C. Summer Nuclear Station (ODCM) and applicable Health Physics Procedures. Required analyses were performed and detection limits were met for all required samples as required by the ODCM. Supplemental analyses were performed on some media for additional information. Nine hundred forty two samples were collected comprising eleven hundred thirty-four analyses performed to compile data for the 2000 Environmental Report. Based on the results from the annual land use census, the current number of sampling sites for V.C. Summer Nuclear Station is sufficient.

Concentrations observed in the environment in 2000 for V.C. Summer related radionuclide concentrations were within the range of concentrations observed in the past. Review of the data showed that radioactivity concentrations in shoreline sediment was the only indicator with activity slightly greater than the detection LLD. This concentration is less than the level reported in the past and within the limits of the ODCM. The total body dose calculated to the maximum exposed member of the public, excluding TLD data, calculated from shoreline sediment sample data was 3.85E-2 mrem/yr for 2000. It is therefore concluded that V.C. Summer Nuclear Station's operations have no significant radiological impact on the health and safety to the public or the environment.

LIST OF FIGURES

INTRODUCTION

Virgil C. Summer Nuclear Station (VCSNS) utilizes a pressurized water reactor rated at 2900 MWt (990 MWe gross). The station is located adjacent to the Monticello Reservoir near Jenkinsville, South Carolina and approximately 26 miles northwest of Columbia. VCSNS achieved initial criticality on October 22, 1982, reached 50% power December 12, 1982 and 100% power June 10, 1983 following steam generator feedwater modifications. Steam generators were replaced in the fall of 1994. During the ninth refuel the plant was uprated to 2900 MWt (990 MWe gross). VCSNS is currently operating in the 13^{th} fuel cycle.

VCSNS is operating in conjunction with the adjacent Fairfield Pump Storage Facility (FPSF) which consists of eight reversible pump-turbine units of 60 MWe capacity each. During periods of off-peak power demand, base load generating capacity is used to pump water from Parr Reservoir to Monticello Reservoir. Monticello Reservoir has a surface area of approximately 6800 acres and lies about 150 feet above Parr Reservoir whose full pool area is approximately 4400 acres. The pump-turbine units operate in the generating mode to meet peak system loads while Monticello Reservoir also provides condenser cooling water for VCSNS. Cooling water intake and discharge structures are separated by a jetty to ensure adequate circulation within the reservoir.

VCSNS is located in Fairfield County which, along with Newberry County, makes up the principle area within a 10 mile radius of the plant. This area is mainly forest with only about 30% devoted to small farming activities principally producing small grains, feed crops and beef cattle. Significant portions of Lexington and Richland Counties are encompassed within the 20 mile radius of the plant and exhibit similar agricultural activities. Columbia, the state capital, is the only large city within the 50 mile radius of the plant. Small agricultural concerns are predominant, but make up less than 50% of the land area. The main industrial activity is concentrated around Columbia and is generally greater than 20 miles from the VCSNS.

Liquid effluents from VCSNS are released into the Monticello/Parr Reservoirs at two discharge points: the Circulating Water Discharge Canal (CWDC) and the FPSF Penstocks. Nonnuclear drains are released to the CWDC. Effluent from the liquid waste processing system and processed steam generator blowdown are released through the penstocks. Radioactive gaseous effluents from VCSNS are released from three points: the Main Plant Vent, the Reactor Building Purge Exhaust and the Oil Incineration Facility, all considered to be ground level releases.

Radioactive liquid and gaseous releases from the facility and their potential influence on the surrounding biota and man are the primary concern of the Radiological Environmental Monitoring Program at VCSNS. This report summarizes the results of the Radiological Environmental Monitoring Program conducted during 2000. Data trends, control/indicator and preoperational/operational data intercomparisons and other data interpretations are presented.

DESCRIPTION OF THE RADIOLOGICAL ENVIRONMENTAL MONITORING PROGRAM

The Radiological Environmental Monitoring Program is carried out in its entirety by South Carolina Electric and Gas Company. The program has been designed to meet the following general commitments:

1. To analyze selected samples in important anticipated pathways for the qualification and quantification of radionuclides released to the environment surrounding VCSNS.

2. To establish correlations between levels of environmental radioactivity and radioactive effluents from VCSNS operation.

The program utilizes the concepts of control/indicator and preoperational/operational intercomparisons in order to establish the adequacy of radioactivity source control and to realistically verify the assessment of environmental radioactivity levels and subsequent radiation dose to man.

Sample media and analysis sensitivity requirements have been established to ensure that the maximum dose pathways are monitored and sensitivities represent a small fraction of annual release limits. Effluent dispersion characteristics, demography, hydrology and land use have been considered in selection of environmental sampling locations. These criteria were used to establish both the preoperational and operational phases of the Radiological Environmental Monitoring Program. Elements of the program monitor the impact of gaseous and liquid effluents released from VCSNS.

Specific methods used in monitoring the pathways of these effluents which may lead to radiation exposure of the public, based on existing demography, are summarized below in Table 1. Requirements of the Radiological Environmental Monitoring Program are specified in the VCSNS Offsite Dose Calculation Manual (ODCM). Elements of the program monitor the impact of gaseous and liquid effluents released from VCSNS.

Table 1 - Monitoring Methods for Critical Radiation Exposure Pathways

Effluent Release Type	Exposure Pathway	Monitoring Media
Gaseous	Immersion Dose and other External Dose	Thermoluminescent Dosimetry (TLD), Area Monitoring, Air Sampling
	Vegetation (Ingestion)	Vegetation and Food Crop Sampling,
	Milk (Ingestion)	Milk Sampling, Grass (Forage) Sampling
Liquid	Fish (Ingestion)	Fish Sampling
	Water & Shoreline Exposure (Ingestion and Immersion)	Surface Water Sampling, Ground Water Sampling, Shoreline and Bottom Sediment Sampling
	Drinking Water (Ingestion)	Drinking Water Sampling

Monitoring sites indicative of plant operating conditions are generally located within a 5 mile radius of the plant. Table 8 provides a list of ODCM required sampling locations. Table 9 provides a list of supplemental sampling locations. Maps showing radiological environmental sampling locations within a radius of approximately 5 miles from VCSNS are presented as Figures 1-2 and 1-3. Figure 1-1 shows monitoring sites at distances greater than 10 miles from the plant. These locations indicate regional fluctuations in background radiation levels.

In addition to preoperational/operational data intercomparisons, control/indicator data intercomparisons are utilized. This is done to assess the probability that any observed abnormal measurement of radioactivity concentration is due to random or regional fluctuations rather than to a true increase in local environmental radioactivity concentration.

Environmental data is gathered through multiple types of sampling and measurements at specific locations. Several multiple sampling combinations are in use around the VCSNS. For example, all air sampling locations serve as environmental dosimetry monitoring locations. At these locations, airborne plant effluents are monitored for gamma immersion dose (noble gases), in addition to air contaminants. Three of these locations have additional complementary sampling/measurement pathways for monitoring plant effluents. Sampling locations 6 (1.0 mi ESE) and 7 (1.0 mi E) have broadleaf vegetation gardens for monitoring gaseous effluent deposition (ingestion pathway) in the two sectors having the highest deposition coefficients (D/Q) with real potential for exposure. Sampling location 18 (16.5 mi S) serves as a control location for direct radiation and garden monitoring.

Liquid effluents are monitored using three different monitoring media (fish, bottom sediment and surface water) at the two most probable affected bodies of water around the plant: Site 21, Parr Reservoir (2.7 mi SSW) and Site 23, Monticello Reservoir (0.5 mi ESE). The control location for liquid effluent comparisons is at Site 22, Neal Shoals (26.0 mi NNW) on the Broad River.

Quality of analytical measurements is demonstrated by participation in a laboratory intercomparison program. Results of the intercomparison program with an outside vendor and VCSNS Count Room are included in Table 4 and Table 5. The intercomparison program with South Carolina Department of Health and Environmental Control (SCDHEC) is outlined in Table 6. Results are reported by SCDHEC. The results of each of these three quality control checks of the Radiological Environmental Monitoring program verify the technical credibility of analytical data generated and reported by the program.

The Radiological Environmental Monitoring Program described in Tables 8 and 9 incorporates all the elements of the VCSNS ODCM and includes numerous supplemental sampling locations.

LAND USE CENSUS

Annually a land use census is performed within a 5 mile radius of VCSNS to verify the adequacy of sample locations. In addition, the location of the maximum exposed individual (MEI) is identified. The results of the land use census performed in 2000 are included in Table 7. A verification of the maximum exposed individual location is presented in Table 7a. Identification of the highest offsite dose locations was performed by calculating a hypothetical dose based on predicted VCSNS source term (Operating License Environmental Report) and 5 year average meteorological data. Exposure pathways used in the analysis were those identified during the land use census.

During the 2000 land use census, the location and pathway presently used in the ODCM for offsite organ dose calculations (E 1.1 miles - residence/garden - beef - goat) was found to have a calculated dose of 2.90 mrem/yr. In addition, the ODCM required environmental gardens (E 1.0 and ESE 1.0 miles) were found to have a calculated dose of 3.71 and 2.34 mrem/year which are higher calculated doses than garden locations of all real individuals. Potential cumulative calculated annual dose reported in the 2000 Annual Effluent and Waste Disposal Report was 4.56E-5 mrad, 2.63E-5 mrad and 1.97E-3 mrem for gamma, beta, and organ dose respectively. There were no milking animals or dairy activity found within 5 miles of VCSNS. Therefore, changes to the ODCM gaseous effluent calculations or garden sample locations are not indicated.

MONITORING RESULTS AND DISCUSSION

The results of the Radiological Environmental Monitoring Program for 2000 are summarized in Table 10. For comparison, preoperational data are summarized in Table 11. During 2000, the Radiological Environmental Program attained a program compliance rate of approximately 96.6%. A listing of program exceptions and their respective causes are included in Table 12. Analysis of the impact of these omissions verified that program quality has not been affecte

Airborne gross beta activity measured in air particulate samples collected at indicator locations around VCSNS were consistent with preoperational levels and not statistically different from control locations. Mean preoperational control and all indicator levels were 2.8E-2 and 2.7E-2 pCi/m^3, respectively. Mean indicator and control location measurements during 2000 were 2.35E-2 and 2.31E-2 pCi/m^3, respectively. The highest site specific mean activity (2.53E-2 pCi/m^3) was measured at indicator location no. 6 (Env.

Lab Garden 1.0 ESE). A comparison was performed between the 2000 results and the mean for the previous operational results. No statistically significant trends were observed. The results indicate that operation of VCSNS has not resulted in detectable increases of airborne gross beta activity in the environment.

Gamma spectroscopy measurements of air particulate samples and activated charcoal cartridges support the gross beta activity trend. Only natural background activities of ^{7}Be, ^{226}Ra and ^{40}K were detected. The highest minimum detectable activity (MDA) levels for ^{134}Cs, ^{137}Cs and ^{131}I were 2.22E-3, 2.83E-3 and 2.19E-2 pCi/m^3, respectively. The average maximum results support the gaseous effluent release data reported in the 2000 Annual Effluent and Waste Disposal Reports for VCSNS. No measurable iodine or particulate were released.

Environmental dosimetry measurements during 2000 did not differ significantly from preoperational measurements. Indicator and control dosimetry measurements also showed no appreciable differences during 2000. Comparison with other operational years shows no statistically significant difference. Sampling location no. 55, St. Barnabas Church (2.8 miles E), was the indicator location showing the highest mean exposure rate of 1.16E+1 μR/hr. This value is slightly higher than in 1999 of 1.08E+01 μR/hr and consistent with the highest mean exposure rate of 1.4E+1 μR/hr measured during the preoperational period. Gaseous effluent release data reported indicated that no measurable fission and activation gases were released from VCSNS in 2000.

Gamma spectroscopy measurements of surface water samples did not indicate the presence of activated corrosion or fission products above the respective MDA's (MDA's are maintained below required LLD's). Liquid effluent release data reported for 2000 in the Annual Effluent and Waste Disposal Report indicated a total of 6.28E-2 Ci of measurable fission and activated corrosion product activity were released from VCSNS; a level not discernible in surface water due to dilution available during the releases and the detection limits of analytical methods used during gamma spectroscopy analysis.

Surface water tritium was detected in 4 of 24 indicator samples with concentrations ranging from 4.80E+2 to 1.26E+3 pCi/liter. The highest concentration was detected at site 21 (Parr Res 2.7 mi. SSW). This activity is less than the preoperational indicator mean of 1.6E+3 pCi/liter. Total tritium release in liquid effluents during 2000 was reported to be 6.33+2 Ci; a level not usually discernible in surface water due to dilution available during the releases and the detection limitations of analytical equipment used for tritium analysis.

Gamma spectroscopy measurements of ground water samples did not indicate the presence of activated corrosion or fission products above the MDA's for the respective radionuclides. Tritium analysis did not indicate the presence of any tritium above the detectable levels. The maximum MDA level for tritium at all indicator and control sites was 4.86E+2 pCi/l.

Gamma spectroscopy measurements of drinking water samples collected from the Jenkinsville and Columbia water supplies did not indicate the presence of activated corrosion or fission product activity above the MDA's of the respective radionuclides.

Naturally occurring radionuclides, ^{226}Ra, ^{214}Pb and ^{214}Bi, were observed in the Jenkinsville water supply (site #28) at levels above those found in surface water. These elevated activity levels were also observed in the preoperational program and are attributed to several deep water wells. The supply for Jenkinsville community water is located more than 5 miles from VCSNS.

The highest mean gross beta activity in drinking water was measured at site 28 (Jenkinsville) at a level of 9.29E+0 pCi/liter, slightly higher than last year. Jenkinsville drinking water originates from various deep wells located in Fairfield County and is the only municipal drinking water from wells. There was no detectable tritium in drinking water samples. The maximum tritium MDA value is 5.99E+2 pCi/liter. The result compares to a preoperational mean of 7.8E+2 pCi/liter.

There were no milk samples collected in 2000. Milk sampling is required to be performed at the three highest dose locations (> 1 mrem/year) within 5 miles of the plant. Presently there are no locations meeting the criteria for indicator dairies. This reflects the reduction of control/indicator locations. Controls are in place where milk samples will be obtained if gaseous releases from the plant exceed 5% of quarterly organ dose limits or radionuclides (attributed to VCSNS operations) are detected in broadleaf vegetation, grass, or air samples at concentrations greater than required LLD's.

Grass samples collected from indicator sites 2 and 7, with control site 18. Site 2 indicated ^{137}Cs in 10 of 12 samples at concentrations ranging from 2.07E+1 to 4.32E+1 pCi/kg, below the maximum preoperational control activity of 3.4E+2 pCi/kg. A review of site #2 air sample results indicated that no ^{137}Cs was detected during 2000.

Broadleaf vegetation collected from gardens at location numbers 6, 7 and 18 were the principal food products analyzed during 2000. The highest minimum detectable activity (MDA) levels for ^{134}Cs, ^{137}Cs and ^{131}I were 1.67E+1, 1.91E+1 and 2.15E+1 pCi/kg, respectively. No activation or fission products detected.

Other vegetation sampled in 2000 included corn, tomatoes and turnips representing the non-leafy vegetation group. No radionuclides were detected other than naturally occurring. Naturally occurring nuclides were observed in all samples at concentrations consistent with those observed during the preoperational period.

Fish species sampled at two indicator and one control location included bass, bream, catfish and carp. ^{137}Cs was detected in 0 of 12 samples collected at indicator locations and 1 of 6 at the control location. At the control location (Neal Shoals, 26 mi, NNW) the maximum ^{137}Cs concentration was 1.43E+1 pCi/kg. Since the levels of ^{137}Cs in fish at control location and indicator locations are about the same but less than preoperational concentrations, the ^{137}Cs radioactivity is attributed to residual fallout.

Gamma spectroscopy measurements of sediment samples collected during 2000 resulted in detection of ^{60}Co that is attributed to VCSNS operation. ^{60}Co was detected in two samples taken at the Discharge Canal at Lake Monticello (Site 23) and one sample at Parr Res. (site 21) at mean concentrations of 3.18E+1 and 2.77E+1 pCi/kg, respectively. ^{137}Cs was detected in all four indicator samples at an average concentration of 2.43E+2 pCi/kg. The mean ^{137}Cs concentration at the control location (site 22) is 1.75E+2 pCi/kg, which is about the same as the average indicator activity. Since the levels of ^{137}Cs at the

control location are about the same as the indicator locations, the ^{137}Cs radioactivity is attributed to residual fallout. Note that preoperational mean level at control locations was 4.2E+2 pCi/kg.

Radiation doses to man, corresponding to the concentrations of activity in bottom sediments, was calculated using Regulatory Guide 1.109 Doses from Shoreline Deposit Methodology. A 500-hour/year exposure to shoreline sediment containing maximum and mean concentrations of ^{60}Co, and ^{137}Cs, a shoreline width factor of 1 and a sediment mass of 40 kg/m^2 were assumed. The results are included in Table 2 and show a maximum dose to the public from contaminated sediment to be 3.85 E-2 mrem (^{60}Co and ^{137}Cs) for 2000 based on sediment samples from Parr Reservoir. This dose is conservative because ^{137}Cs is used in the dose calculation when actually only 7.75E-3 mrem/yr (^{60}Co) is from VCSNS and historically bottom sediment has higher radionuclide concentrations than shoreline sediments.

Table 2 - 2000 Fission and Activated Corrosion Product Activity in Sediment

Location	Radionuclide	Activity (pCi/kg)		Corresponding Calculated Annual Dose Equivalent (mrem/yr)	
				Total Body	
		Maximum	Mean	Maximum	Mean
Monticello Reservoir (Site 23)	^{60}Co	3.18E+1	2.91E+1	1.08E-2	9.89E-3
	^{137}Cs	2.13E+2	2.09E+2	1.79E-2	1.76E-2
	Total	--	---	2.87E-2	2.75E-2
Parr Reservoir (Site 21)	^{60}Co	2.28E+1	2.28E+1	7.75E-3	7.75E-3
	^{137}Cs	3.66E+2	2.77E+2	3.07E-2	2.33E-2
	Total	--	---	3.85E-2	3.11E-2

CONCLUSION

As in previous years of VCSNS operation, the presence of fission product activity attributed to residual fallout from atmospheric weapons testing and the Chernobyl accident were detected in environmental media including fish and sediment.

No detectable fission or activation product activity attributed to VCSNS operation was observed in environmental media except for sediment samples from Lake Monticello and Parr Reservoir. The dose from sediment represents a small fraction of the observed variation in natural background and a small fraction of VCSNS effluent dose limits. The reported whole body and organ dose for liquid effluents during 2000 was 5.16E-3 and 5.47E-3 mrem respectively (VCSNS Annual Effluent Release Report, 2000). The absence of an impact was expected since, historically, releases from VCSNS have been a small fraction of ODCM Specification limits. The dose calculated for the maximally exposed individual will not result in observable effect on the ecosystem or general public. The results of the Radiological Environmental Monitoring Program, therefore, substantiate the continuing adequacy of source control at VCSNS and conformance of station operation to 10 CFR 50, Appendix I design objectives.

Footnotes

1. Distance given is the distance between the site location and the VCSNS reactor containment building.

2. Direction given in degrees from true north-south line through center of reactor containment building.

3. Sample Types:

AP = Air Particulate	GW = Ground Water	GA = Garden
RI = Air Radioiodine	DW = Drinking Water	FH = Fish
DQ = Quarterly TLD	MK = Milk	BS = Bottom Sediment
SW = Surface Water	GR = Grass (Forage)	

4. Site 14 and 16 are not presently in use. If conditions change, requiring a renewal of dairy sampling these sites will be reactivated.

5. Site 18 consists of 2 locations in close proximity to Lake Murray. Garden product samples are taken at the Wyse residence. The TLD is located on Pine Island.

6. Site 28 for drinking water and site 59 for quarterly TLD measurements are co-located at the location of the SCE&G Nuclear Training Center which also serves as the Virgil C. Summer Station Emergency Offsite Facility.

7. Site 30 air sampler and TLD though not in line of sight are located in the same sector.

Table 4 (Cont.) Results of 2000 Environmental Intercomparison Program with Independent Lab, Analytics, Inc.

Comparison Study (Measurement Unit)	Date	Nuclides	Vendor Lab Results	Env Lab Results	Agreement
Gamma Isotopic Rock Density =1.5 gm/cc pCi/kg	12/24	^{141}Ce	649	510	Yes[1]
		^{51}Cr	917	685	Yes
		^{134}Cs	155	116	Yes
		^{137}Cs	490	399	Yes
		^{58}Co	139	111	Yes
		^{54}Mn	278	230	Yes
		^{59}Fe	149	118	Yes
		^{65}Zn	269	223	Yes
		^{60}Co	336	269	Yes
Beta Filter (pCi)	12/19	N/A	66	61	Yes
Gamma Isotopic Composite Air Filters (pCi)	12/27	^{141}Ce	287	258	Yes
		^{51}Cr	406	365	Yes
		^{134}Cs	69	51	No[2]
		^{137}Cs	161	153	Yes
		^{58}Co	62	62	Yes
		^{54}Mn	123	127	Yes
		^{59}Fe	66	67	Yes
		^{65}Zn	119	142	Yes
		^{60}Co	149	149	Yes
Charcoal Cartridge (pCi)	12/19	^{131}I	63	68	Yes

1 Vendor sent the wrong amount of sample. Requested 600cc at density of 1.5 gms/cc to equal 900 gms. Vendor sent 900 cc at density of 1.5 gms/cc to equal 1350 gms

2 Low due to coincidence summing. Note that ^{134}Cs in 4 liter sample is affected less by coincidence summing than in smaller close samples.

1 The Second (Independent) Laboratory was Analytics, Inc. for 2000.

2 Wrong sample volume used during calculation. Total volume of 13 ml was split into two samples and 13 ml instead of 6.5 ml was used. Factor of 2 brings results into agreement.

Table 5 - Results of the 2000 Intercomparison Program with Independent Lab

Comparison Study (Measurement Unit)	Qtr.	Nuclides	Env Lab Results	Second Lab Results[1]	Agreement

Pathways:
Res = Residence
Gar = Garden
B = Beef
C/M = Cow/Milk (Infant)
G= Goat

Footnotes:
1 Maximum exposed individual.
* Hypothetical dose based on Operating License Environmental Report Source Term. X/Q and D/Q were derived from ODCM 5-year average meteorological data
** ODCM required environmental gardens.

Table 8 – Radiological Environmental Monitoring Program Specifications

Exposure Pathway and/or Sample	Criteria for Selection of Sample Number & Location	Sampling and Collection Frequency	Sample Location	Type & Frequency of Analysis
AIRBORNE:				
I. Particulate	A) 3 Indicator samples to be taken at locations (in different sectors) beyond but as close to the exclusion boundary as practicable where the highest offsite sectorial ground level concentrations are anticipated.[2]	Continuous sampler operation with weekly collection.	2 7 30	Gross beta following filter change; Quarterly composite (by location) for gamma isotopic.
	B) 1 Indicator sample to be taken in the sector beyond but as close to the exclusion boundary as practicable corresponding to the residence having the highest anticipated offsite ground level concentration or dose.[2]	Continuous sampler operation with weekly collection.	6	Gross beta following filter change; Quarterly composite (by location) for gamma isotopic.
	C) 1 Indicator sample to be taken at the location of one of the dairies being sampled meeting the criteria of VII(A).[2,4]	Continuous sampler operation with weekly collection.	N/A	Gross beta following filter change; Quarterly composite (by location) for gamma isotopic.
	D) 1 Control sample to be taken at a location at least 10 air miles from the site and not in the most prevalent wind directions.[2]	Continuous sampler operation with weekly collection.	17	Gross beta following filter change; Quarterly composite (by location) for gamma isotopic.
II. Radioiodine	A) 3 Indicator samples to be taken at two locations as given in I(A) above	Continuous sampler operation with weekly canister collection.	2 7 30	Gamma Isotopic for Iodine 131 weekly.
	B) 1 Indicator sample to be taken at the location as given in 1(B) above.	Continuous sampler operation with weekly canister collection.	6	Gamma Isotopic for Iodine 131 weekly.
	C) 1 Indicator sample to be taken at the location as given in I(C) above.	Continuous sampler operation with weekly canister collection.	N/A	Gamma Isotopic for Iodine 131 weekly.
	D) 1 Control sample to be taken at a location similar in nature to I(D) above.	Continuous sampler operation with weekly canister collection.	17	Gamma Isotopic for Iodine 131 weekly.
III. Direct	A) 13 Indicator stations to form and inner ring of stations in the 13 accessible sectors within 1 to 2 miles of the plant.	Monthly or quarterly exchange[5,7] two or more dosimeters at each location.	1,2,3,4,5,6, 7,8,9,10,29, 30,47	Gamma dose monthly or quarterly
	B) 16 indicator stations to form an inner ring of stations in the 16 accessible sectors within 3 to 5 miles of the plant	Monthly or quarterly exchange[5,7] two or more dosimeters at each location.	12,13,32,33, 34,35,36,37, 41,42,43,44, 46,53,55,60	Gamma dose monthly or quarterly

Table 8 (Cont.) - Radiological Environmental Monitoring Program Specifications

Exposure Pathway and/or Sample	Criteria for Selection of Sample Number & Location	Sampling and Collection Frequency	Sample Location	Type & Frequency of Analysis
WATERBORNE IV. Surface Water	A) 1 Indicator sample downstream to be taken at a location which allows for mixing a dilution in the ultimate receiving river.	Time composite samples with collection every month[5]	21[3,6]	Gamma isotopic monthly with quarterly composite (by location) to be analyzed for tritium[7]
	B) 1 Control sample to be taken at a location on the receiving river sufficiently far upstream such that no effects of pumped storage operation are anticipated.	Time composite samples with collection every month[5]	22[3]	Gamma isotopic monthly with quarterly composite (by location) to be analyzed for tritium[7].
	C) 1 Indicator sample to be taken in the upper reservoir of the pumped storage facility at the plant discharge canal.	Time composite samples with collection every month[5]	23[3]	Gamma isotopic monthly with quarterly composite (by location) to be analyzed for tritium[7].
V. Ground Water	A) 2 Indicator samples to be taken within the exclusion boundary and in the direction of potentially affected ground water supplies.	Quarterly grab sampling[7]	26 27	Gamma isotopic and tritium analyses quarterly[7].
	B) 1 Control sample from unaffected location	Quarterly grab sampling[7]	59	Gamma isotopic and tritium analyses quarterly[7].
VI. Drinking Water	A) 1 Indicator sample from a nearby public ground water supply source.	Monthly grab sampling[5].	28	Monthly[5] gamma isotopic, gross beta and quarterly[7] composite for tritium analyses.
	B) 1 Indicator (finished water) sample from the nearest downstream water supply.	Monthly composite sampling.	17	Monthly[5] gamma isotopic, and gross beta and quarterly[7] composite for tritium analyses.
	C) 1 Control (finished water) sample from an unaffected water supply.	Monthly composite sampling.	39	Monthly[5] gamma isotopic, and gross beta and quarterly[7] composite for tritium analyses

Table 8 (cont.) - Radiological Environmental Monitoring Program Specifications

Exposure Pathway and/or Sample	Criteria for Selection of Sample Number & Location	Sampling and Collection Frequency	Sample Location	Type & Frequency of Analysis
INGESTION:				
VII. Milk[4]	A) Samples from milking animals in 3 locations within 5 km having the highest dose potential. If there are none then 1 sample from milking animals in each of 3 areas between 5 to 8 km distance where doses are calculated to be greater than 1 mrem per year.[10]	Semimonthly when animals are on pasture[6]; monthly other times[5]	To be supplied when milk animals are found in accordance with criteria VII.A.	Gamma isotopic and I-131 analysis semimonthly[6] when animals are on pasture, monthly other times[5]
	B) 1 Control sample to be taken at the location of a dairy > 20 miles distance and not in the most prevalent wind direction[2].	Semimonthly when animals are on pasture[6]; monthly other times[5,11]	16	Gamma isotopic and I-131 analysis semimonthly[6] when animals are on pasture, monthly other times[5]
	C) 1 Indicator grass (forage) sample to be taken at the location of one of the dairies being sampled meeting the criteria of VII(A),above, when animals are on pasture	Monthly when available[5]	To be supplied when milk animals are found in accordance with criteria VII.A.	Gamma isotopic.
	D) 1 Control grass (forage) sample to be taken at the location of VII(B) above.	Monthly when available[5,11]	16	Gamma isotopic.
VIII. Food Products	A) 2 Samples of broadleaf vegetation grown in the 2 nearest offsite location of highest calculated annual average ground level D/Q if milk sampling is not performed within 3 km or if milk sampling is not performed at a location within 5-8 km where the doses are calculated to be greater than 1 mrem/yr[10].	Monthly when available[5].	6 7	Gamma isotopic on edible portion.
	B) 1 Control sample for the same foods taken at least 10 miles distance and not in the most prevalent wind direction if milk sampling is not performed within 3 km or if milk sampling is not performed at a location within 5 to 8 km where the doses are calculated to be greater than 1 mrem/yr[10]	Monthly when available[5].	18	Gamma isotopic on edible portion.

Table 8 (cont.) - Radiological Environmental Monitoring Program Specifications

Exposure Pathway and/or Sample	Criteria for Selection of Sample Number & Location	Sampling and Collection Frequency	Sample Location	Type & Frequency of Analysis
IX. Fish	A) 1 Indicator sample to be taken at a location in the upper reservoir.	Semiannual[9] collection of the following specie types if available: bass; bream, crappie; catfish, carp.	23[3]	Gamma isotopic on edible portions semiannually[9].
	B) 1 Indicator sample to be taken at a location in the lower reservoir.	Semiannual[9] collection of the following specie types if available: bass; bream, crappie; catfish, carp.	21[3]	Gamma isotopic on edible portions semiannually[9].
	C) 1 Control sample to be taken at a location on the receiving river sufficiently far upstream such that no effects of pumped storage operation are anticipated	Semiannual[9] collection of the following specie types if available: bass; bream, crappie; catfish, carp.	22[3]	Gamma isotopic on edible portions semiannually[9].
AQUATIC: X. Sediment	A) 1 Indicator sample to be taken at a location in the upper reservoir.	Semiannual grab sample.[9]	23[3]	Gamma isotopic.
	B) 1 Indicator sample to be taken on or near the shoreline of the lower reservoir.	Semiannual grab sample.[9]	21[3]	Gamma isotopic.
	C) 1 Control sample to be taken at a location on the receiving river sufficiently far upstream such that no effects of pumped storage operation are anticipated.	Semiannual grab sample.[9]	22[3]	Gamma isotopic.

FOOTNOTES

1. Reserved for future use.
2. Sample site locations are based on 5 year average meteorological analysis.
3. Though generalized areas are noted for simplicity of sample site enumeration, airborne, water and sediment sampling is done at the same location whereas biological sampling sites are generalized areas in order to reasonably assure availability of samples.
4. Milking animal and garden survey results will be analyzed annually. Should the survey indicate new dairying activity the owners shall be contacted with regard to a contract for supplying sufficient samples. If contractual arrangements can be made, site(s) will be added for additional milk sampling up to a total of 3 Indicator Locations.
5. Not to exceed 35 days.
6. Time composite samples are samples which are collected with equipment capable of collecting an aliquot at time intervals which are short (e.g. hourly) relative to the compositing period.
7. At least once per 100 days.
8. At least once per 18 days.
9. At least once per 200 days.
10. The dose shall be calculated for the maximum organ and age group, using the guidance/methodology contained in Regulatory Guide 1.109, Rev. 1 and the parameters particular to the site.
11. Milk and forage sampling at the control location is only required when locations meeting the criteria of VII(A)are being sampled.

Table 9 – Supplemental Radiological Environmental Monitoring

Exposure Pathway and/or Sample	Criteria for Selection of Sample Number & Location	Sampling and Collection Frequency	Sample Location	Type & Frequency of Analysis
AIRBORNE: S-I. Particulate	A) 1 Indicator sample monitoring the nearest community with the highest anticipated dose or ground level concentration.	Continuous sampler operation with weekly collection.	8	Gross beta following filter change; Monthly[†] Composite (by location) for gamma isotopic.
S-II. Radioiodine	A) 1 Indicator sample to be taken from the location of S-1(A) above.	Continuous sampler operation with weekly collection.	8	Gamma isotopic for I-131 weekly.
S-III. Direct	A) 5 stations to be placed within the exclusion boundary.	Quarterly exchange[7]; two or more dosimeters at each location.	61,62,63, 68 & 99	Gamma dose quarterly.
	B) 2 stations to be placed around VCSNS sludge lagoons.	Quarterly exchange[7]; two or more dosimeters at each location.	94,97	Gamma dose quarterly.
WATERBORNE: S-IV. Surface Water	A) 1 indicator sample to be taken of the combined wastewater discharge.	Composite samples with monthly collection.[13,5]	77	Gamma isotopic and tritium.
	B) 1 Indicator sample taken at each storm drain outfall.	Daily sample with monthly composite.	72,73	Gamma isotopic and tritium.
S-V. Groundwater	A) 4 Indicator samples to be taken at NPDES monitoring wells.	Semiannual[9]	GW-9, GW-12, GW-13A, GW15	Gamma isotopic, tritium and other as directed.
	B) 1 Control sample to be taken at NPDES monitoring wells.	Semiannual[9]	GW-8	Gamma isotopic, tritium and other as directed.

Table 9 - Supplemental Radiological Environmental Monitoring

Exposure Pathway and/or Sample	Criteria for Selection of Sample Number & Location	Sampling and Collection Frequency	Sample Location	Type & Frequency of Analysis
INGESTION: S-VII. Milk[4]	A) 1 Sample from one of the nearest affected dairies at or beyond 5 miles.	Biweekly grab sample.[8,14,+]	14	Gamma isotopic and I-131 analysis biweekly.
	B) 1 Control sample to be taken at the location of a dairy greater than 20 miles distance and not in the most prevalent wind direction.	Biweekly grab sample.[8,14,+]	16	Gamma isotopic and I-131 analysis biweekly.
	C) 1 Indicator grass (forage) sample to be taken at the location of S-VII(A) above.	Monthly when available.[14]	14	Gamma isotopic.
S-VII. Milk[4]	D) 1 Control grass (forage) sample to be taken at the location of S-VII(B) above.	Monthly when available.[14]	16	Gamma isotopic.
	E) 2 Indicator grass (forage) samples to be taken at 2 of the locations beyond but as close to the exclusion boundary as practical where the highest offsite sectorial ground level concentrations are anticipated.	Monthly when available.	2,7	Gamma isotopic.
	F) 1 Control grass (forage) sample to be used for routine monitoring along with S-IV(E) above.	Monthly when available.	18	Gamma isotopic.
S-VIII. Food Products	A) 1 Indicator sample of various types of foods grown in the area surrounding the plant (root, fruit, grain).	Annually during growing season.[11]	6,7	Gamma isotopic on edible portion.

FOOTNOTES

1. Reserved for future use.

2. Reserved for future use.

3. Reserved for future use.

Table 9 (cont) - Supplemental Radiological Environmental Monitoring

4. Milking animal and garden survey results will be analyzed annually. Should the survey indicate new activity the owners shall be contacted with regard to a contract for supplying sufficient samples. If contractual arrangements can be made, site(s) will be added for additional milk sampling up to a total of 3 Indicator Locations.

5. Not to exceed 35 days.

6. Reserved for future use.

7. At least once per 100 days.

8. At least once per 18 days.

9. At least once per 200 days.

10. Reserved for future use.

11. At least once per 400 days.

12. Reserved for future use.

13. Weekly, when circulating water is not operational.

14. Milk and grass (forage) sampling is not required unless VCSNS gaseous releases exceed 5% of quarterly organ dose limits or radionuclides (attributed to VCSNS operation) are detected in broadleaf vegetation, grass or air samples at concentrations greater than required LLD. Sampling should continue for 2 months after plant releases are reduced to less than trigger levels and milk contamination levels have returned to background levels.

† Reserved for future use.

‡ The ODCM requires semimonthly sampling when animals are on pasture, monthly at other times.

Table 10 (cont) - Radiological Environmental Monitoring Program Summary for 2000

Footnotes

1. Includes indicator and control analyses. Does not include supplemental samples. Site 8 Air Particulate and Air Radioiodines are included as indicators. All supplemental sample results were consistent with the tabulated results shown.

2. Values given are maximum MDA values for indicator locations calculated from the program data analyses with maximum acceptable LLD values allowed from NRC guidelines are given in parentheses.

3. Mean and range are based on detectable measurements only. The fractions of detectable measurements (i.e., number of positive results/total number of measurements) at specific locations are indicated in parentheses.

4. Any confirmed measured level of radioactivity in any environmental medium that exceeds the reporting requirements of ODCM, Section 1.4.1.2.

5. Detection sensitivity is approximately 10 mrem/yr (1.0 μR/hr).

6. Elevated levels of ^{214}Pb and ^{214}Bi were observed in all Jenkinsville drinking water samples. The values are not reported here because they are naturally occurring (do not originate from VCSNS) and furnish no quantifiable information of interest.

7. Fish include 3 groups (Bass, Bream/Crappie, Catfish/Carp).

8. Elevated levels of ^{214}Pb and ^{214}Bi plus other ^{226}Ra daughter products and ^{228}Ac plus other ^{232}Th daughter products were observed in all sediment samples. The values are not reported here because they are naturally occurring (do not originate from VCSNS) and furnish no quantifiable information of interest.

9. Maximum MDA from control location used.

* All measurements had positive results, no MDA values calculated.

	^{131}I	6.3E-1 (1.0E+0)	All < LLD			All < LLD	0
	^{134}Cs	3.3E+0 (1.5E+1)	All < LLD			All < LLD	0
	^{137}Cs	4.6E0 (1.5E+1)	4.1E+0 (8/47) (2.8E+0 to 6.1E+0)	Site 14, Dairy (5.1 mi., W)	4.1E+0 (8/47) (2.8E+0 to 6.1E+0)	5.7E+0 (37/47) (3.7E+0 to 9.2E+0)	0
	^{140}Ba	1.1E+1 (1.5E + 1)	All < LLD			All < LLD	0
	^{140}La	4.4E+0 (1.5E+1)	All < LLD			All < LLD	0
Grass (pCi/kg wet) (1981-1982)	Gamma Spec (82)						
	^{131}I	6.7E+1 (6.0E+1)	All < LLD			All < LLD	0
	^{134}Cs	2.7E+1 (8.0E+1)	All < LLD			All < LLD	0
	^{137}Cs	3.3E+1 (8.0E+1)	5.0E+1 (13/51) (1.6E+1 to 1.6E+2)	Site 14, Dairy (5.1 mi. W)	5.9E+1 (5/29) (1.6E+1 to 1.6E+2)	1.3E+2 (6/31) (1.3E+1 to 3.4E+2)	0
Broadleaf Vegetation (pCi/kg wet) (1980-1982)	Gamma Spec (10)						
	^{131}I	3.7E+1 (6.0E+1)	All < LLD				0
	^{134}Cs	1.9E+1 (8.0E+1)	All < LLD				0
	^{137}Cs	2.1E+1 (8.0E+1)	3.1E+1 (2/7) (1.8E+1 to 3.6E+1)	Site 2, Trans. Line (1.2 mi. SW)	3.6E+1 (1/1) (Single Value)	All < LLD	0

Table 11(Cont.) - Radiological Environmental Program Preoperational (Baseline) Summary

Medium or Pathway Sampled (Unit of Measurement and Reporting Period)	Type and Total Number of Analyses Performed	Lower Limit of Detection[1] Actual (Max.)	All Indicator Locations Mean[2] (#/total #) (Range)	Location with Highest Annual Mean		Control Locations Mean[2] (#/total #) (Range)	Number of Nonroutine Reported[3] Measure-ments
				Name (Distance & Direction)	Mean[2] (#/total #) (Range)		
Other Vegetation (pCi/kg wet) (1980-1982)	Gamma Spec (32)						
	^{134}Cs	8.4E+0 (8.0E+1)	All < LLD			All < LLD	0
	^{137}Cs	1.0E+1 (8.0E+1)	All < LLD			All < LLD	0
Fish (pCi/kg wet) (1980 - 1982)	Gamma Spec (92)						
	^{134}Cs	1.4E+1 (1.3E+2)	All < LLD			All < LLD	0
	^{137}Cs	1.8E+1 (1.3E+2)	2.8E+1 (50/71) (1.1E+1 to 1.0E+2)	Site 24, Recreation Lake (5.5 mi. N)	3.4E+1 (17/23) 1.2E+1 to 1.0E+2)	3.1E+1 (19/21) (1.0E+1 to 7.9E+1)	0
	^{58}Co	2.6E+1 (1.3E+2)	All < LLD			All < LLD	0
	^{54}Mn	1.8E+1 (1.3E+2)	All < LLD			All < LLD	0
	^{59}Fe	9.0E+1 (2.6E+2)	All < LLD			All < LLD	0
	^{65}Zn	4.1E+1 (2.6E+2)	All < LLD			All < LLD	0
	^{60}Co	1.8E+1 (1.3E+2)	All < LLD			All < LLD	0
Sediment (pCi/kg) (1980-1982)	Gamma Spec (24)						
	^{134}Cs	2.3E+1 (1.5E+2)	All < LLD			All < LLD	0
	^{137}Cs	2.4E+1 (1.5E+2)	1.7E+2 (12/18) (2.6E+1 to 4.5E+2)	Site 21, Parr Reservoir (2.7 mi., SSW)	2.6E+2 (6/6) (2.6E+1 to 4.5E+2)	4.2E+2 (6/6) (1.8E+1 to 1.0E+3)	0

Table 11 (Cont.)- Radiological Environmental Program Preoperational (Baseline) Summary

Footnotes

1. Values given are MDA values calculated from the program data analyses with maximum acceptable LLD values allowed from NRC guidelines given in parentheses.

2. Mean and range are based on detectable measurements only. The fractions of detectable measurements at specific locations are indicated in parentheses.

3. A non-routine measurement is any confirmed measured level of radioactivity in an environmental medium that exceeds the reporting requirements of VCSNS ODCM, Section 1.4.1.2.

4. The baseline values are high because of the fallout from the Chinese bomb test in 1980. The first set of data reflects the 1981 baseline. The second set of data reflects the 1982 baseline, essentially free of bomb test fallout. The 1982 data covers the period 1/1/82 - 10/22/82.

5. Detection sensitivity is approximately 5 mrem/yr (0.5 μR/hr) determined from the analyses of five years of preoperational data.

6. No control location was specified for drinking water during the preoperational monitoring period.

7. Inconclusive data.

Table 12 – 2000 Environmental Sampling Program Exceptions

Media	Sample Location	Month (Week No.)	Cause for Exception
Air	6	Feb (5)	Loss of power to site
	7	Mar (10)	Breaker trip
	6	May (19)	Breaker trip
	2	May (22)	Breaker trip
	7	May (22)	Breaker trip
	2	Jun (23)	Breaker trip
	30	Jun (23)	Breaker trip
	7	July (29)	Loss of power to site
	2	Aug (35)	Breaker trip
	2	Sep (36)	Breaker trip
	17	Dec (49)	Breaker trip
	7	Dec (51)	Breaker trip
Air Radioiodine	6	Feb (5)	Loss of power to site
	7	Mar (10)	Breaker trip
	6	May (19)	Breaker trip
	2	May (22)	Breaker trip
	7	May (22)	Breaker trip
	2	Jun (23)	Breaker trip
	30	Jun (23)	Breaker trip
	7	July (29)	Loss of power to site
	2	Aug (35)	Breaker trip
	2	Sep (36)	Breaker trip
	17	Dec (49)	Breaker trip
	7	Dec (51)	Breaker trip
Broadleaf	18	Jan (3)	Sample not available
	18	Feb (7)	Sample not available
	18	Mar (11)	Sample not available
Direct Radiation	16	First Quarter	Missing
	32	First Quarter	Missing
	35	First Quarter	Missing
	44	First Quarter	Missing

Breaker trips at air sample sites due to GFI breakers which were installed during 1999 refurbishment of all sites. These breakers are more likely to trip during power surges.
