APPENDIX D9 - WILDLIFE

1. INTRODUCTION

1.1 Description Of The Study Area

Power Resources Inc. contracted Intermountain Resources to complete wildlife inventories on the Gas Hills Project Area in 1996 and in 1997. Intermountain Resources has previously completed wildlife inventories within the study area in 1992, 1993, and 1994. Results of the previous investigations are incorporated herein. Specific survey dates are referenced throughout this report. These inventories were designed to provide data necessary for the acquisition of in-situ uranium mining permits for the area. Data collection efforts included searches of state and federal agency files and detailed field surveys for selected species. Issues of major concern included threatened and endangered species (T&E), migratory birds of high federal interest (MBHFI), raptors, sage grouse strutting grounds, and important big game ranges.

The type of mining operation proposed will be in situ leaching using a network of injection and recovery wells. This type of mining causes far less disturbance than open pit or strip mining methods. Therefore, environmental impacts on most wildlife species are less. The entire Permit Area covers approximately 8500 acres.

The Gas Hills Project is located in the Gas Hills Mining District, approximately 45 miles east of Riverton, Wyoming. The Permit Area is located in portions of Fremont and Natrona Counties. Specifically, the proposed permit area is located in Sections 21,22,27,28,29,31,32,33, and 34 T33N R89W, Section 6 T32N R89W, and Sections 1,2,3,10,11 and 12 T32N R90W as shown on the attached map. The map also displays the entire study area which includes the Permit Area and an additional one half mile perimeter (one mile for selected species as discussed in the results).

The dominant vegetation type within the study area is sagebrush shrublands interspersed with a mixture of upland grassland. Also included in the study area are rough breaks, rock outcrops, land disturbed by mining and reclaimed mining areas. Elevation ranges from 6700 feet to 7400 feet. Topography is highly variable and ranges from rolling plains to steep hillsides and short cliffs along the Beaver Divide. Numerous small ephemeral drainages dissect the area. Several mature cottonwood trees are found on the upper portion of West Canyon Creek, while scattered junipers, limber pines, and aspen trees occur along the Beaver Divide and in the northeastern portion of the study area.

Perennial water sources within the study area are scarce. Waters associated with mining activities include mine pits and sediment control structures. Cameron Spring Reservoir, located in the Peach area of the study area, was almost dry at the time of the November 1992 field survey, but had water throughout 1993. Water was also observed in this reservoir

Power Resources, Inc. Gas Hills Project WDEQ-LQD Permit to Mine Application

Appendix D9 - Wildlife December 1996 (Revised February, 1998) Page D9 - 1

during late September of 1996. The only perennial stream reach in the study area is within Canyon Creek (See Appendix D6).

Land ownership of the study area is dominated by the BLM. Some small parcels of land under private ownership and others belonging to the State of Wyoming are also found in the area.

1.2 Persons Consulted

All field surveys and reporting specific to this project were completed by Mr. Jim Orpet of Intermountain Resources. Personnel contacted within the Wyoming Game and Fish Department included Bob Luce (1992), Andrea Cerovski (1992), Pat Deibert (1996) and Pat Hnilicka (1996). Art Anderson (1992), Ron Clemonson (1996) and Kim Dickerson (1996) with USDI Fish and Wildlife Service (USFWS) were contacted. Bureau of Land Management personnel interviewed were Jack Welch (1992) and Sue Oberlie (1992, 1996). Wyoming Department of Environmental Quality-Land Quality Division Personnel contacted included Mark Moxley (1992, 1996) and Steve Platt (1992, 1996).

2. HABITAT DESCRIPTION

The Permit Area is predominantly shrublands with a small amount of upland grassland scattered throughout. Other habitat or land use types include, reclaimed mining areas, unreclaimed mine disturbances, small seeps, small rock outcrops and ponds. The shrublands were divided into four different types: mixed sagebrush-grass, rough breaks shrublands, bottomland sagebrush and scattered pine-rough breaks shrublands. Table D9-1 provides acreages for these habitat and land use units. Appendix D8 (Vegetation) discusses the major vegetation types in detail.

The mixed sagebrush-grass habitat is generally found on flat to rolling hills areas. Big sagebrush is the dominant species followed by western wheatgrass and cusick bluegrass.

The rough breaks shrublands are found on areas with relatively steep slopes. This habitat type has significantly less vegetation cover than the mixed sagebrush grass type. Dominant shrub species are big sagebrush and black sagebrush while bluebunch wheatgrass is the most common perennial grass.

The bottomland sagebrush type is found on lowlands and along ephemeral or intermittent drainages. Big sagebrush is the dominant species followed by western wheatgrass and sandberg bluegrass.

Scattered pine-rough break shrubland habitats are found within the rough breaks type on relatively steep slopes. Limber pines are scattered throughout these areas with big sagebrush and black sagebrush as the dominant shrubs and bluebunch wheatgrass the most abundant perennial grass.

Upland grasslands are generally encountered on flat areas or small bench and ridgetops. Dominant plant species are threadleaf sedge, western wheatgrass and birdsfoot sagewort.

Reclaimed areas are generally found in the eastern portion of the permit area (i.e., Buss and Pix areas). These areas are sites of past uranium mining activities, and dominant vegetation established is primarily wheatgrass species.

Disturbed lands are primarily in the eastern portion of the permit area but some sites also existed in the far western portion. These areas have been affected by past uranium mining activities.

Small seeps were generally observed at the base of the Beaver Divide. All of these sites exhibited lush vegetation comprised of rushes and perennial grasses. Two springs were observed which discharge a measureable amount of water. These were Cameron Spring and the upper West Canyon Creek spring. These springs are discussed in greater detail in

Appendix D6 - Hydrology. Surface water discharge, originating from the West Canyon Creek spring, was observed flowing for almost two miles in late September of 1996 as shown on Plate D9-1.

Small rock outcrops were confined to small areas along Beaver Rim as shown on Plate D9-1. These areas were composed primarily of low cliffs or rock ledges.

Ponds within the study area consisted of several stockponds, mine-related sediment control structures, existing mine pits and reclaimed mine pits which have been permitted by WDEQ to remain as postmine reclamation features. Cameron Springs was the only stockpond feature that consistently retained water. Most of the reclaimed mine reservoirs contained water throughout the year.

Details of major habitat/vegetation types and mapping are included in Appendix D8 (Vegetation). Minor habitat type locations not included in that Appendix, are shown on Plate D9-1. No crucial or critical habitats as defined by WG&FD and USFWS respectively, were identified within the permit or adjacent areas.

3. SPECIES LISTS

A list of wildlife species that may potentially occur on the Permit Area is provided in Addendum D9A. All species that were actually observed on the permit or adjacent area are indicated on the list with an asterisk. Representatives of WG&FD have agreed that this level of species documentation is sufficient for their approval. Therefore, WG&FD wildlife observation forms were not required (P. Deibert, WG & FD pers. comm. Oct. 1996).

4. <u>METHODS</u>

File searches and field surveys were the basis of data collection for this inventory. These methods will be described in the following sections.

4.1 File Searches

File searches were the initial sources for data collection. Data regarding raptor nest sites, sage grouse leks, prairie dog towns, big game ranges, and T & E species were obtained from the Lander offices of the BLM and WG&FD. WG&FD publications and computerized Wildlife Observation System were also reviewed. U.S. Fish and Wildlife service publications and field data were also reviewed.

The Wyoming Department of Environmental Quality - Land Quality Division (WDEQ-LQD) was contacted to evaluate available data from existing mine permits and Abandoned Mined Land (AML) studies completed in the area. A copy of an AML study (Mountain West, 1990) completed in 1990 that covered the entire Power Resources study area was obtained form the WDEQ - Abandoned Drill Hole Program. That study was used as an initial survey reference for the area for T&E Plant and Animal species, Migratory Birds of High Federal Interest (MBHFI), and raptor nest sites.

4.2 Field Surveys

Field surveys of the study area were completed from November 2 to 5 of 1992, April 28 to May 1, June 16 to 19, and August 30 to September 1 of 1993. Additional surveys were completed July 7 to 9 and September 17 to 19, 1994 and September 23-25, 1996 primarily to cover the new areas proposed for the permit area and appropriate buffer for those areas. Areas previously inventoried were resurveyed during April and May, 1997. These surveys were designed to locate any T & E species, or habitat for those species (ie: prairie dog towns, nest sites, etc.), MBHFI species, document raptor nest sites, big game, sage grouse strutting grounds and record any wildlife species or their sign observed. These surveys were completed by traversing the area and suitable habitat in a four-wheel drive vehicle, ATV, and on foot. Binoculars (9X35) and a spotting scope (16X48) were used for observations. Specific survey methods for individual species or groups of species are included in the results sections for those species.

5. RESULTS

The following sections provide the results of the file searches and field inventories. Pertinent figures, tables, and maps are included with this report. Addendum D9A provides a list of wildlife species which have the potential for occurring on the study area. Addendum D9B includes a computer printout from the WG&FD Wildlife Observation System of wildlife species that they have recorded on the area. The WG&FD determined that the 1992 computer printout was sufficient, and 1996 update not required.

5.1 Big Game

Specific big game surveys were completed during seasonal survey periods. These surveys were completed on the ground during one day within each survey period by traveling the roads within the study area. Periodic stops were made at appropriate vantage points to scan the terrain with optics in search of big game animals. The survey route is shown on Plate D9-1 and allowed good inspection of the entire permit area and one half mile perimeter. The one half mile perimeter was deemed sufficient by the WG&FD (P. Deibert, Pers. Comm. Oct. 1996). Counts were only made in one direction of travel and not when backtracking to avoid double counts.

Pronghorn and mule deer were the only big game animals recorded for the study area. Field surveys in 1992-1996 and the WG&FD observations in Addendum D9B indicate that pronghorn are the most common species in the area. Results of specific big games surveys on the study area are shown in Table D9-2. Pronghorn generally frequented habitats dominated by big sagebrush while mule deer frequented rough breaks and sagebrush habitats.

Pronghorn use of the area, as determined by the BLM and WG&FD, is shown on Figure D9-1. Most of the proposed permit area is classified as spring-summer-fall range and the remainder is yearlong use. Pronghorn winter-yearlong range and crucial winter ranges are located several miles north and west of the area. Mule deer use of the area is mapped on Figure D9-2. Most of the proposed permit area consists of yearlong range while portions on the north and west boundaries are winter-yearlong and spring-summer-fall range is located in the southeast. Crucial mule deer winter ranges occur several miles north of the area.

The study area is located within portions of the WG&FD Sweetwater Mule Deer Herd Unit (Hunt Areas 96 and 97) and the Beaver Rim Mule Deer Herd Unit (Hunt Area 90). The 1995 post-hunt population estimates were from 7500-9500 and 500-1000 animals for the Sweetwater and Beaver Rim Mule Deer Herd Units, respectively (WG&FD, 1996). All potential surface disturbances will be within the Beaver Rim Male Deer Herd Unit.

The Sweetwater Antelope Herd Unit (Hunt Areas 68,69 and 106) and Fremont Antelope Herd Unit (Hunt Areas 65,66,67, and 74) were represented within the study area. These units

were recently combined into one herd unit with the 1995 post-hunt population estimated at from 14000-16000 animals (WG&FD, 1996). All potential disturbances will be within the Fremont Antelope Herd Unit.

5.2 Other Mammals

Specific surveys for other mammals (i.e. small mammal trapping, lagomorph surveys, predator surveys) were not required for this project as agreed upon with the WG&FD (P. Deibert, WG&FD, pers.comm.oct.1996). However, all mammal species, or their sign, observed during the course of other field work were recorded and are documented with an asterisk on the species list in Addendum D9A. A total of 14 other mammal species were recorded on the study area. The most common species observed were the Wyoming ground squirrel and least chipmunk. The coyote was the most abundant predator while lagomorph populations were still low and had not recovered from the crash in the early 1990's. The entire permit area and one mile perimeter were searched for prairie dog towns but none were found. Searches revealed the nearest prairie dog town was located over one mile north of the permit area and was occupied by white-tailed prairie dogs. The majority of mammal species were observed in the various habitat types dominated by big sagebrush.

5.3 Upland Game Birds

Sage grouse strutting ground surveys were completed at dawn over three mornings on April 29-30 and May 1 of 1993. Additional surveys were completed in April, 1997 covering the entire permit area. Known strutting grounds were inventoried and the entire permit and one half-mile buffer were also searched for additional strutting grounds. Surveys were completed by traversing the area and stopping periodically to glass potential strutting ground sites and listen for strutting birds.

Mourning doves and sage grouse were the only upland game birds noted for the area. Mourning doves are migrants which only inhabit the area from spring into early fall. Sage grouse may inhabit the area year long. A strutting ground has been located north of the Permit Area on the border of Section 3O and Section 19, T33N, R89W (Plate D9-1). This lek was noted in file searches and counts are shown in Table D9-3. The lowest number of birds recorded was three males in 1996. No other leks are known to exist within or adjacent to the study area and the 1993 surveys did not record any new active strutting grounds. Sage grouse were observed during other survey periods but did not appear to be abundant in the area. All sage grouse were recorded in association with sagebrush shrublands.

5.4 Waterfowl and Shorebirds

Specific surveys were not conducted for waterfowl and shorebirds as agreed upon with the WG&FD. All such species recorded during other surveys were designated on the species list. Habitat for these species is not abundant in the study area and consists primarily of ponds

created by mining and several small stockponds. Most of the seeps do not discharge an adequate quantity of water to support waterbird habitat. A total of 10 waterfowl species and five shorebirds were observed during surveys. All species recorded are common to the region.

5.5 Raptors

Raptor nest searches were conducted on the ground over suitable habitats during all survey periods in 1992, 1993, 1994, 1996 and 1997. Searches generally extended at least one mile from the permit boundary. Nesting activities and production were determined in June of 1992 and early July of 1994 for selected nest sites. Nest site activity and production surveys were completed so as not to cause excessive disturbance to nesting birds. In some cases, production could not be determined due to inaccessibility of nest sites and the prolonged disturbance that would have been required to make those determinations. Agency files were also reviewed to obtain additional information regarding raptors inhabiting the area.

File searches identified only five previously documented raptor nests within the study area. These nest sites are identified in Tables D9-4, D9-5, D9-6 and on the attached map as FH-4b, FH-7a, FH-12, FH-14 and GHO-1. Nest site FH-4b was listed in agency files as unknown, with no past history. Based on field surveys completed in 1993, this nest site was used by ferruginous hawks. Nest site GHO-1 is located in a reclaimed area and consists of a manmade pole structure. This site was placed for mitigation of a great horned owl nest removed during reclamation of mining facilities. Site FH-7a was located within a mine disturbance (Pathfinder's Lucky Mc Mine). Site FH-12 is located in a limber pine and FH-14 on a rock outcrop.

A total of 59 new raptor nest sites have been identified by Intermountain Resources during the 1992-1996 field surveys. Overall, nest sites identified included eight red-tailed hawk nests representing six pairs of birds, 49 ferruginous hawk nests representing 17 territories, three golden eagle nests of two pairs, three prairie falcon nests and one great horned owl nest. Tables D9-4, D9-5, D9-6, and D9-7 provide the status of these nest sites for different survey periods as known. Production was recorded for red-tailed hawks and ferruginous hawks, while production of the active prairie falcon aerie was undetermined. The golden eagle and great horned owls failed to produce young.

The golden eagle nest on the highwall of the Buss Pit was caged in 1993 under permits from the USFWS and WG&FD to enable reclamation activities to proceed (nest site GE-2a in the table and on the map). This pair has an alternate nest site (GE-2b) and suitable highwalls were to be left during reclamation. Suitable highwalls are also found on permanently reclaimed areas adjacent to the site.

Several other raptor species were recorded within the study area but nesting was not documented. These species included the Swainson's hawk, rough-legged hawk, bald eagle

and turkey vulture. The marsh hawk and American Kestrel were also recorded and undoubtedly nest in the area, however, specific nest sites were not recorded.

5.6 Passerine Birds

Specific surveys for passerine bird species were not required as agreed upon with the WG&FD (P. Deibert, WG&FD, Pers. Comm. Oct. 1996). However, all such species observed during the course of field work were recorded and are documented with an asterisk on the species list in Addendum D9A. A total of 33 other bird species were recorded during surveys. The most common species were the horned lark, vesper sparrow and meadowlark. Most passerine species were recorded in the various sagebrush shrublands which dominate the permit area. However, the best diversity of bird species was observed in the scattered pine - rough breaks shrublands due to the high diversity of plant species and topography.

5.7 <u>Migratory Birds of High Federal Interest (MBHFI)</u>

MBHFI and other wildlife species surveys were completed during all site visits. This was accomplished by searching all suitable or potentially suitable habitats and recording any species encountered.

Several MBHFI species are known to occur in the region and include the bald eagle, golden eagle, ferruginous hawk, prairie falcon, burrowing owl, mountain plover, and loggerhead shrike. The golden eagle, bald eagle, ferruginous hawk, prairie falcon, and loggerhead shrike have been documented in the study area while the mountain plover and burrowing owl have been noted in adjacent areas.

The bald eagle is a winter resident and migrates through the area but does not nest on the site. The golden eagle, ferruginous hawk and prairie falcon nest on the area and have been discussed in Section D9.5.5. Loggerhead shrikes probably nest in the area but active nest sites were not found.

Additional surveys were completed for mountain pluvers in April and May of 197. These surveys focused on grassland and sparse shrub habitats typically used by this species for nesting.

5.8 Threatened or Endangered Species (T&E) and State-listed Rare Species

T&E species and other wildlife species surveys were completed during all site visits. This was accomplished by searching all suitable habitats and recording any species encountered.

The bald eagle, peregrine falcon, and black-footed ferret are endangered species which may occur in the area. Nesting habitat does not exist within the study area for the bald eagle or peregrine falcon but they may inhabit the area during migration. Although the bald eagle has

been recorded in the study area, winter concentrations and roost areas have not been documented. Golden eagles nest in the area and are also protected along with the bald eagle.

Prairie dog towns provide habitat for black-footed ferrets. Active prairie dog towns were not observed within the study area, although active towns are known to exist within several miles. These towns were inhabited by white-tailed prairie dogs and are located over one mile north of the study area as shown on Plate D9-1. The small size and wide spacing of prairie dog towns in the region would make survival of black-footed ferret populations difficult.

A ferret survey was completed in 1994 on 55O acres of white-tailed prairie dog towns located three to five miles northwest of the permit area. This survey was submitted to, and approved by the USFWS. The survey reported no evidence of ferrets.

No state listed species, other than those species already discussed previously in this report, were recorded on the study area.

5.9 Reptiles and Amphibians

Specific surveys for reptiles and amphibians were not required for this project as agreed upon with the WG&FD (P. Deibert, WG&FD, Pers. Comm. Oct. 1996). Several species were observed as noted in Addendum D9A and included the sagebrush lizard, short-horned lizard, garter snake and leopard frog.

5.10 Fish

Natural habitats for fish species do not exist within the study area.

6. <u>IMPACTS</u>

Crucial or critical wildlife habitats have not been documented on the permit or adjacent areas. A few big game animals may be displaced during mining activities. However, based upon premine density estimates, this would only be 20-30 pronghorn and one or two mule deer. However, based upon long term monitoring at large coal mines, these species readily adapt to mining activities and utilize disturbed sites and newly reclaimed areas.

A sage grouse strutting ground is located about one mile north of the permit area and should not be impacted. Individual birds may be disturbed and a limited amount of nesting and foraging habitat will be affected.

Habitat for waterfowl and shorebirds is limited within the study area. These habitats are not expected to be impacted by mining but increased human activity may affect migrating and feeding birds.

Some nesting raptors will be affected although disturbances should not actually remove nest sites. Mining activities associated with the well fields, road useage and other operations could preclude the use of existing nest sites and force pairs to move or to alter their territories. Prey abundance will also be slightly altered due to removal of vegetation and soils.

Other bird, mammal, reptile and amphibian species will be displaced from areas where vegetation and soils are removed. However, these disturbances will be minor with respect to the entire study area. Also, some of the well fields will be established in areas that have been previously disturbed by past mining activities. Impact to wildlife will also be reduced through the utilization of existing roads.

The only MBHFI species which will probably be impacted by this operation are raptor species and include the ferruginous hawk, prairie falcon and golden eagle. These species are all known to nest in the study area. Although nest sites will not be physically disturbed, surface activities related to in situ mining may impact some of the sites as previously discussed. The ferruginous hawk is the most common nesting MBHFI species while only one pair of golden eagles and one pair of prairie falcons have been recorded nesting on the study area in previous years. The loggerhead shrike generally nests in tall shrubs which are located along ephemeral drainages in the study area. Most of the anticipated disturbances should occur in uplands and not within drainages, so therefore, this species should be minimally impacted. The mountain plover should not be impacted since this species was not observed on site and very little upland grassland or sparse subshrub habitats exist on the area for this species.

T&E or other species of concern should not be impacted by this operation. The only T&E species observed was the bald eagle. This species is only a migrant to the area and should not be affected by the project. Prairie dog towns do not exist within one mile of the permit area,

therefore, habitat for black-footed ferrets is not present. Tall cliffs preferred for nesting peregrine falcons also do not exist on site so this species should not be impacted.

In general, the majority of the anticipated disturbances will occur within the sagebrush-grass habitat areas. Habitat types required by T&E or other species of concern either do not exist within the study area or are limited in extent and will not be disturbed.

7. MITIGATION AND MONITORING

Impacted wildlife habitats will be mitigated following mining by establishing vegetation in accordance with the approved reclamation plan. Rock outcrops, trees, seeps and ponds should not be impacted, therefore, mitigation is not planned for those features. Raptor nest sites will not be removed, however, temporary mitigation will be needed for nest sites where operations are near enough to preclude successful reproduction. Mitigation will be carried out as approved by the USFWS and WG&FD under the appropriate permits obtained from those agencies. Proposed mitigation will include construction of alternate nest sites on natural features (trees, rock outcrops, cliffs), on mine highwalls, or the erection of appropriately sized nesting platforms. Fences, if needed, will be constructed to the required WG&FD standards with approval from the WDEQ and BLM. Minimal fencing, if any, is projected. Controlled speed limits will be implemented to reduce wildlife/vehicle collisions. Employees will be educated about wildlife protection, sensitive species and game laws through use of applicable publications and during safety meetings. The implementation of all of the above commitments will help alleviate impacts to wildlife.

8. <u>CONCLUSION</u>

This report provides wildlife baseline data for the Gas Hills Project Area. Investigated were big game, game birds, raptors, migratory birds of high federal interest, and threatened or endangered species. Threatened or endangered species have not been documented as having important habitat on the area. No crucial or critical wildlife habitats exist in the area. Numerous raptor nests exist on the study area and most of these nest sites belong to migratory birds of high federal interest. One sage grouse strutting ground is located about one mile north of the permit area. The limited amount of disturbance projected by this mining operation will have minimal impacts on most wildlife species. No crucial big game winter ranges or critical endangered species habitats will be affected but raptor nest sites will need to be protected and approved mitigation implemented as approved. Monitoring will be implemented as required by approved permits or at the discretion of the company as discussed in the mine plan.

ADDENDUM D9A

Wildlife Species List

Addendum D9A.

Mammal species which were observed or have the potential for occurring on the Power Resources Gas Hills Study Area.*

	Common Name	Scientific Name	Observed on Site <u>b</u> /
	INSECTIVORES	INSETIVORA	
	Masked shrew	Sorex cinereus	
	Merriam's shrew	Sorex merriami	
	BATS	CHIROPTERA	
	Little brown myotis	Myotis lucifugus	
	Small-footed myotis	Myotis leibii	
	Long-legged myotis	Myotis volans	
	Long-eared myotis	Myotis evotis	
_	Hoary bat	Lasiurus cinereus	
	Silver-haired bat	Lasionycteris noctivagus	
	Big brown bat	Eptesicus fuscus	
	Townsend's bat	Plectos townsendii	
	LAGOMORPHS	LAGOMORPHA	
	Mountain Cottontail	Sylvilagus nuttallii	<u>c</u> /*
	Desert cottontail	Sylvilagus audubonii	*
	White-tailed jackrabbit	Lepus townsendii	*
	RODENTS	RODENTIA	

Addendum D9A (continued)

Name Name On site b/	
Least chipmunk <u>Eutamias minimus</u> *	
Wyoming ground squirrel Spermophilus elegans *	
Thirteen-lined Spermophilus * ground squirrel tridecemlineatus	
White-tailed <u>Cynomys leucurus</u> prairie dog	
Northern pocket gopher Thomomys talpoides *	
Olive-backed pocket mouse Perognathus fasciatus	
Ord's kangaroo rat <u>Dipodomys ordii</u>	
Yellowbellied marmot Marmota flaviventris	
Western harvest mouse Reithrodontomys megalotis	•
Deer mouse <u>Peromyscus maniculatus</u>	
Northen grasshopper mouse Onychomys leucogaster	
Bushy-tailed woodrat Neotoma cinerea *	
Gapper's red-backed vole Clethrionomys gapperi	
Montane vole <u>Microtus montanus</u>	
Long-tailed vole <u>Microtus longicaudus</u>	
Prairie vole <u>Microtus ochrogaster</u>	
Sagebrush vole <u>Lagurus curtatus</u>	
Western jumping mouse Zapus princeps	
Porcupine <u>Erethizon dorsatum</u> *	

Addendum D9A (continued)

Comi Name		Scientific Name	Observed On site b/

Short	t-tailed weasel	Mustela erminea	
Badg	ger	Taxidea taxus	*
Strip	ed skunk	Mephitis mephitis	*
Bobo	eat	Lynx rufus	*
Mou	ntain lion	Felis concolor	
EVE	N-TOED UNGULAT	ES ARTIODACT	YLA
Mule	deer	Odocoileus hemionus	*
Pron	ghorn	Antilocapra americana	*
<u>a/</u>	Compiled from Long (1965), Wyoming Game and Fish (1981), Clark and Stromberg (1987).		
<u>b</u> /	An asterisk indicates that the species itself or distinctive evidence (such as scat, tracks, bones), was observed on site. All other speices listed may occur on the permit area, but no evidence of their occurrence has been found. (Suitable habitat is present on-site and the distribution range overlaps the mine permit area.)		

Cottontails (Sylvilagus spp.) were seen during field surveys. It was

not possible to differentiate between Nuttall's cottontail and the Desert cottontail, both of which could occur on the permit area.

<u>c</u>/

Addendum D9A.

Bird species which were observed or have the potential for occurring on the Power Resources Company Study Area.*

	Common Name	Scientific Name <u>b</u> /	Observed on Site <u>c</u> /
	GREBES	PODICIPEDIFORMES

Proposed In-Situ Uranium Mine
Gas Hills Project Area
Fremont County

MR. JIM ORPET
INTERMOUNTAIN RESOURCES
P.O. BOX 1589
LARAMIE, WY 82070

Dear Jim.

I have reviewed the Appendix D-9 you prepared for the Power Resources, Inc.'s proposed in-situ uranium mine in Fremont County. In general, the Appendix contains the wildlife information necessary to comply with state regulations for a non-coal mine. However, a wildlife monitoring and mitigation plan must be developed for this mine before the Wyoming Game & Fish Department can concur with this permit application. As you indicated in our discussion on October 4, 1996, you will prepare these sections once Power Resources, Inc. has determined the extent of the mining activity and associated disturbances. I am willing to review the monitoring and mitigation plans when they become available. Following are our specific comments on Appendix D-9.

Sitting the transfer of the transfer of the

Contract Contract

- Raptors THE + MBHFI
- 1. Description of Study Area. The written description of wildlife habitats on the study area is sufficient. However, you should also include a tabular summary of acres by habitat type, and amount of the habitat type to be disturbed if that information is available. If this table is included in Appendix D-8, please provide the appropriate reference.
- 2. Big Game Ranges. The Wyoming Game & Fish Department uses the word "crucial", not "critical" for designation of big game ranges vital to the survival of local populations. "Critical" is the U.S. Fish and Wildlife Service term indicating habitat vital to the survival of endangered species. To avoid confusion, critical should be changed to crucial in all appropriate references to big game habitat.

Mr. Jim Orpet October 14, 1996 Page 2 - WER 8435

- 3. Sage Grouse. As per our conversation, the proposed permit expansion area should be surveyed for leks. Please contact the local wildlife biologist (Pat Huilicka) concerning known lek locations in this area. Also, please consult with Pat H. regarding the appropriateness of conducting broad surveys.
- 4. Raptors, Migratory Birds of High Federal Interest, and Threatened and Endangered Species. Please contact the U.S. Fish and Wildlife Service to determine if a monitoring and/or mitigation plan will be necessary for the above species. If so, a letter of plan approval, for each group, from the U.S. Fish and Wildlife Service should be included in the permit application.
- 5. <u>Wildlife Observations</u>. Please provide written acknowledgement that all species observed on the permit area were noted, even if specific surveys for those species were not conducted.
- 6. <u>Population Estimates</u>. The 1991 big game population estimates provided in Appendix D-9 are outdated. More recent estimates are available, and should be included.

Please clarify if the Bureau of Land Management will require an environmental assessment for this activity. If you have any questions don't hesitate to give me a call.

Sincerely,

Pat Deibert Staff Biologist

RE: PRI Gas Hills Project

Dear Mr. Anderson,

Transmitted herewith are the draft Appendix D9 and several Mine Plan sections that pertain to wildlife impacts, monitoring and mitigation. As noted, these are drafts since we have not yet received new maps, detailed disturbance areas with acreages and mine sequence, or vegetation type permit area acreages and disturbance acreages.

Also included is a small scale map showing information that will need to be drafted. This map is only provided for your reference and should not be used for drafting since sites cannot be accurately transferred from this map. We will plot the accurate sites when we receive new maps and will then submit those to you for drafting.

Following receipt of the rest of the information we will also prepare a raptor, MBHFI and T&E monitoring and mitigation plan for submittal to the USFWS for approval.

For your information I will be out of the office from November 16 through November 24 but would like to finish this up prior to then. Please contact me if you have any questions, comments or revisions.

Sincerely,

Jim Orpet

LARAMIE, WY 82070

Dear Jim,

I have reviewed the Appendix D-9 you prepared for the Power Resources, Inc.'s proposed in-situ uranium mine in Fremont County. In general, the Appendix contains the wildlife information necessary to comply with state regulations for a non-coal mine. However, a wildlife monitoring and mitigation plan must be developed for this mine before the Wyoming Game & Fish Department can concur with this permit application. As you indicated in our discussion on October 4, 1996, you will prepare these sections once Power Resources, Inc. has determined the extent of the mining activity and associated disturbances. I am willing to review the monitoring and mitigation plans when they become available. Following are our specific comments on Appendix D-9.

THE +
MBHFI

- 1. <u>Description of Study Area</u>. The written description of wildlife habitats on the study area is sufficient. However, you should also include a tabular summary of acres by habitat type, and amount of the habitat type to be disturbed if that information is available. If this table is included in Appendix D-8, please provide the appropriate reference.
- 2. <u>Big Game Ranges</u>. The Wyoming Game & Fish Department uses the word "crucial", not "critical" for designation of big game ranges vital to the survival of local populations. "Critical" is the U.S. Fish and Wildlife Service term indicating habitat vital to the survival of endangered species. To avoid confusion, critical should be changed to crucial in all appropriate references to big game habitat.

Headquarters: \$400 Bishop Boulevard, Chevenne, WY 82006-0001 FAX (307) 777-4610

- 3. <u>Sage Grouse</u>. As per our conversation, the proposed permit expansion area should be surveyed for leks. Please contact the local wildlife biologist (Pat Hnilicka) concerning known lek locations in this area. Also, please consult with Pat H. regarding the appropriateness of conducting brood surveys.
- 4. Raptors, Migratory Birds of High Federal Interest, and Threatened and Endangered Species. Please contact the U.S. Fish and Wildlife Service to determine if a monitoring and/or mitigation plan will be necessary for the above species. If so, a letter of plan approval, for each group, from the U.S. Fish and Wildlife Service should be included in the permit application.
- 5. <u>Wildlife Observations</u>. Please provide written acknowledgement that all species observed on the permit area were noted, even if specific surveys for those species were not conducted.
- 6. <u>Population Estimates</u>. The 1991 big game population estimates provided in Appendix D-9 are outdated. More recent estimates are available, and should be included.

Please clarify if the Bureau of Land Management will require an environmental assessment for this activity. If you have any questions don't hesitate to give me a call.

Sincerely,

Pat Deibert Staff Biologist

APPENDIX D11 - WETLANDS

1.0 INTRODUCTION

Potential wetlands which occur within the study area and are delineated, based on vegetative characteristics, on Plate D8-1 (East and West). The purpose of this initial survey was to identify all areas of potential wetlands within the proposed permit area. Specifically areas within drainages and lowlands were targeted for field investigation based on aerial photo interpretation and general field observation by BKS personnel. In addition to these area surface and/or ground water reservoirs in the area may represent wetlands. These include the A-8, VECA, PC pits (AML projects) and the Buss I pit (PRI Permit 438). These reservoirs are shown on Plates D1-1E and D1-1W.

Prior to disturbance a jurisdictional determination of wetlands will be completed in cooperation with the U. S. Army Corps of Engineers (COE). As discussed in Section 4.0, Mitigation Measures, disturbance of wetland areas by wellfield development is unlikely and the migration measure will be avoidance. In some cases crossing either with an access road or pipe line will be necessary and permitting under the COE Nationwide program will be required.

2.0 METHODOLOGY

The 1996 potential wetland survey was conducted by BKS Environmental Associates, Inc. Although the three characteristics of jurisdictional "wetlands" include hydrophytic vegetation, hydric soils, and wetland hydrology and are outlined in the 1987 Corps of Engineers Wetlands Delineation Manual, Technical Report Y-87_1. Potential wetland areas within the Permit Area were identified primarily on vegetation characteristics. Should a jurisdictional determination of wetlands be necessary, it is likely that some of the areas delineated by vegetative characteristics will not meet jurisdictional criteria.

Potential areas were delineated by map topographic features and generally consisted of pockets within wet draws and drainages outlined on the 1"=500' scale proposed permit vegetation maps (Plates D8-1E and D8-1W). The delineated areas were then targeted for further field investigation and surveyed for the presence of hydrophytic vegetation.

3.0 RESULTS AND DISCUSSION

In addition to mine pit reservoirs, potential jurisdictional wetlands on the Permit Area are located in ephemeral drainages and near seeps or springs which have consistently high water tables throughout the growing season. The following vegetation subtypes, tentatively identified by BKS, include: sedge meadows near Cameron Spring and the lower reaches of West Canyon Creek; willow thickets in the upper reaches of West Canyon Creek near the Beaver Rim; and relatively small pockets of sedge meadow and/or salt tolerant vegetation within ephemeral pools located in small drainages. Within the smaller ephemeral drainages, pockets of potential wetlands are generally small and confined within definite narrow channels.

A small amount of flowing water was evident in the West Canyon Creek Drainage and at Cameron Spring. Otherwise, little or no flow is evident within ephemeral channels. *Juncus* sp. is the most common species near dried pools within channels. Various *Carex* spp. are dominant in the sedge meadows. *Salix* spp. dominate the overstory in the willow thicket areas.

Topography is important in this area to the development of potential wetlands. Proximity to the Beaver Rim or incised drainages within the Bottomland Sagebrush allow the collection of water at or near the surface necessary for the development of wetlands.

4.0 MITIGATION MEASURES

Although the limits for the general mine units cross some potential wetland areas, these areas are generally narrow and can be avoided during wellfield development. As an example Mine Unit No. 4 crosses portions of the West Canyon Creek Drainage. Following completion of delineation drilling in this area, wellfield design will locate injection and recovery wells outside the boundary of the wetlands. However, it may be necessary to cross the wetland areas with access roads and pipe lines. In this event, a mitigation plan and 404 permit will be developed for approval by WDEQ and the COE prior to any disturbance.
