1
2
3 CO-CHAIRMAN SIEBER: Good morning. The
4 meeting will now come to order. This is a meeting of
5 the ACRS Subcommittees on Plant Operation, and I am
6 John Sieber, Chairman of the Plant Operation
7 Subcommittee, and of the Reliability and PRA
8 Subcommittee, of which George Apostolakis is Chairman.
9 Other members present today are Mario Bonaca, Peter
10 Ford, Thomas Kress, Graham Leitch, Steven Rosen, and
11 Bill Shack.

12 The purpose of this meeting is to discuss
13 the reactor oversight process as it relates to the
14 Staff Requirements Memorandum, SRM, which directed
15 that the NRC Staff, with input from the ACRS, resolve
16 the apparent conflicts and discrepancies between
17 aspects of the ROP that are risk-informed; for
18 example, significance determination process, and those
19 that are performance-based; for example, those that
20 are based on the performance indicators. Maggalean
21 Weston is the Cognizant ACRS Staff Engineer for this
22 meeting.

23 The rules for participation in today's
24 meeting have been announced as part of the notice of
25 this meeting published in the Federal Register on

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 December 27th, 2002. A transcript of the meeting is
2 being kept and will be made available as stated in the
3 Federal Register notice. It is requested that
4 speakers use one of the microphones available,
5 identify themselves and speak with sufficient clarity
6 and volume so that they may be readily heard. We have
7 received no written comments from members of the
8 public regarding today's meeting.

9 George, do you have any comments?

10 CO-CHAIRMAN APOSTOLAKIS: No, thank you.

11 CO-CHAIRMAN SIEBER: Okay. So now we will
12 then proceed with the meeting, and Ron Frahm of the
13 Staff from NRR may begin.

14 MR. FRAHM: Thank you, John. Good
15 morning. As John mentioned, I'm Ron Frahm from the
16 Inspection Program Branch within the Office of Nuclear
17 Reactor Regulation. Also, as John said, we're here
18 today to discuss the SRM dated December 20th, 2001,
19 and to go over specific concerns that the ACRS
20 identified during our previous briefing on September
21 9th.

22 I hope everybody has a copy of the agenda.
23 And if you notice on the agenda, I'm not here alone
24 today. We have several staff members, cognizant
25 experts in their areas, to join me in my briefing

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 today. These important members of the ROP team
2 include Don Hickman. He'll discuss the Reactor Safety
3 PIs. Mr. Doug Coe will discuss the Reactor Safety
4 Significance Determination process issues. We also
5 have Roger Pedersen to discuss Occupational Radiation
6 Safety. Steve Kelementowicz to discuss Public
7 Radiation Safety, and Randy Sullivan to discuss
8 Emergency Preparedness issues.

9 I'd like to point out that in the interest
10 of improving the ROP, we actually have an all day
11 Mitigating Systems Performance Index Pilot Program
12 Workshop going on today, as well, downstairs in the
13 Two White Flint auditorium, and it poses a little bit
14 of a problem for us in balancing staff between this
15 briefing and that meeting. And one of the key players
16 is Don Hickman, who I've convinced to stay with us
17 until 10 or 11 today to support all the PI questions,
18 but after that he'll need to go to support the MSPI
19 Workshop, so if we could focus on the PIs as soon as
20 I'm done with my briefing, that would help.

21 Going to the first slide, we've identified
22 four specific issues from the September 9th briefing
23 that we'd like to focus our discussion on today.
24 First, we'd like to summarize our approach for
25 addressing the SRM that John quoted regarding risk-

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 informed and performance-based elements, and I will
2 discuss that first this morning. The second and third
3 issues on this slide were specifically identified
4 during -- I'm sorry, not in the briefing, but in the
5 February letter 2002. The risk-informed performance
6 indicator thresholds for the initiating events and
7 mitigating systems cornerstones will be discussed by
8 Don Hickman during the Reactor Safety PI discussion,
9 and the assessment of concurrence findings issue will
10 be discussed by Doug Coe during the Reactor Safety
11 Significance Determination Process discussion.

12 You had emphasized on September 9th that
13 you'd like to see actual examples presented to you by
14 the cognizant staff members in these areas of greater-
15 than-green findings, and that's why we've presented
16 the agenda the way we have, to have the right people
17 here to address the questions in their areas, so a
18 significant portion of today's presentation is to
19 discuss these greater-than-green examples and their
20 bases across several cornerstones. And we are
21 prepared to discuss the seven examples that were
22 attached to our December 19th paper, and a few others
23 to help demonstrate the basis for their thresholds and
24 our resultant regulatory response.

25 CO-CHAIRMAN APOSTOLAKIS: Are we going to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 discuss the inspection manual that was sent to us a
2 couple of months ago?

3 MR. FRAHM: Would that be the draft ROP-
4 basis document?

5 CO-CHAIRMAN APOSTOLAKIS: Yeah.

6 MR. FRAHM: We're prepared to discuss it.
7 We weren't specifically going to go through item by
8 item, but as issues come up, we'll --

9 CO-CHAIRMAN APOSTOLAKIS: Because I have
10 a few questions.

11 MR. FRAHM: Okay. If you could hold those
12 off, I'd appreciate it.

13 CO-CHAIRMAN APOSTOLAKIS: Sure.

14 MR. FRAHM: And I actually do have
15 additional copies of several of the documents that we
16 have sent over. We sent over the draft ROP-basis
17 document, and I believe we handed several of those out
18 again this morning. I don't have any more copies of
19 those, so I hope everybody has one.

20 Second was the NEI 99-02 Performance
21 Indicator Guidance. I have several additional copies
22 here, as well. And probably most importantly was our
23 letter on December 19th that summarized all the
24 issues, and gave our response to you all in writing.
25 And that's essentially -- the briefing today is pretty

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 much designed after this paper.

2 Moving along to the staff approach and
3 plans to address the SRM, I actually have a backup
4 slide in your package that has the direct quote from
5 the SRM in case we need to go back to that during the
6 briefing to clarify our discussions today. And I
7 wanted to point out that we intend to address this SRM
8 in our upcoming Annual ROP Self-Assessment SECY paper
9 that's due to be issued by the end of March.

10 I'd like to reiterate some of the key
11 discussion points provided in our December 19th
12 response. In the development of and the continued
13 refinement of the ROP, we've used performance-based
14 thresholds based on appropriate regulatory response,
15 and we've incorporated risk insights to the extent
16 they were available and applicable. The ROP
17 regulatory framework includes seven cornerstones of
18 safety, and our regulatory response is based on the
19 action matrix with equal weighting to PIs and
20 inspection findings across all seven of these
21 cornerstones. In other words, we treat a white as a
22 white, and yellow as a yellow, regardless of which
23 cornerstone those issues came out of, and whether they
24 were PIs or inspection findings. We perform
25 assessment reviews on a continuous quarterly and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 annual basis for all plants and regulatory actions are
2 taken on performance deficiencies as they are
3 identified.

4 We recognize from the start that these
5 thresholds would likely need to be adjusted as we
6 learn lessons after some run time of the ROP. We
7 continue to adjust these PI and SDP thresholds to
8 ensure a consistent regulatory response, and several
9 of the examples we're going to discuss today
10 demonstrate that.

11 We also face the continuous challenge to
12 assure that the ROP meets the competing objectives of
13 remaining predictable, understandable, risk-informed
14 and objective in meeting the four strategic
15 performance goals of maintaining safety, increasing
16 public confidence, increasing efficiency and
17 effectiveness, and reducing unnecessary regulatory
18 burden.

19 MEMBER FORD: Your continuing adjustment.

20 MR. FRAHM: Right.

21 MEMBER FORD: Do you review these PIs on
22 a regular basis like quarterly or yearly, and then see
23 if they need changing?

24 MR. FRAHM: We essentially review the
25 program continuously, and we do an annual wrap-up of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Lessons Learned throughout the year, so we do an in-
2 depth review every year, and we publish an annual SECY
3 paper.

4 MR. FRAHM: Okay. How is it decided when
5 you look at these whether there is a consistent
6 regulatory response? I'm not quite sure what you mean
7 by "consistent" here. Is it consistency between the
8 ROP and the SDP, or is it consistency among the
9 various colors? I'm not sure what --

10 MR. FRAHM: It's both.

11 MEMBER FORD: It's both those things.

12 MR. FRAHM: The goal being, when you get
13 to the action matrix, you want to treat a white as a
14 white, and a yellow as a yellow. They're all treated
15 equally regardless of where it's coming from, so
16 that's the balance we're trying to maintain.

17 MEMBER FORD: And how is it you decide
18 whether they're inconsistent or not? Do you have some
19 criteria?

20 MR. FRAHM: I don't know that we have any
21 specific criteria, but you can identify outliers --

22 MEMBER FORD: So it's an expert judgment
23 kind of thing.

24 MR. FRAHM: It's an expert judgment, and
25 there are a few outliers in certain areas, and we'll

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 actually be discussing some specific outliers we've
2 identified, and what we plan on doing about it later
3 today.

4 MEMBER FORD: Okay.

5 MR. COE: I could add to that just a bit.
6 Consistency, another way of talking about consistency
7 of our response is that a 95-001 inspection, which is
8 prompted in the licensee or the regulatory response
9 column of the action matrix is typically between 16
10 and 40 hours of additional supplemental inspection.

11 MEMBER FORD: Okay.

12 MR. COE: Okay. A 95-002, which is
13 prompted by the next column over, is typically between
14 40 to 240 hours of additional inspection. That's a
15 fairly wide band, but there's that kind of
16 flexibility. And then the 95-003 inspection is
17 typically, in our experience has been anywhere from
18 1,500 to 2,000 hours of supplemental inspection. That
19 is, of course, the most substantial of the
20 supplemental inspection procedures, so regardless of
21 whether the licensee arrives at that column of the
22 action matrix by either PIs or SDP results, those are
23 the responses that we give, and that's one measure of
24 the consistency that we try to give.

25 MEMBER FORD: Thank you.

1 MR. FRAHM: It's a way to focus our
2 resources on the most safety significant issues in the
3 plants with the most significant problems.

4 MEMBER LEITCH: One thing I noticed in my
5 review of the NRC Web page daily, it turned out that
6 there's announcements of meetings the NRC is going to
7 have with licensees. And on the same day, it just
8 happens, and it just contrasted for me the kind of
9 inconsistent, perceived inconsistency that concerns
10 me. There were two plants, each of whom had two white
11 findings, and the NRC response seemed to be the same.
12 They were setting up to have a meeting with the two
13 plants, and that's what this announcement was about.

14 One of the plants, I think it was Peach
15 Bottom, the area was emergency planning. And there
16 were two issues there, each of which had generated a
17 white finding. One was an inadequate critique of a
18 drill, and the other was a failure to declare the
19 emergency within the required 15 minutes. Each of
20 those generated a white finding. That was one plant
21 and one reaction.

22 The other plant I think was Braidwood, and
23 exactly the same reaction, two white findings, same
24 NRC response. But at Braidwood, the problem was an
25 auxiliary feed-water pump that failed to operate under

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 certain circumstances, and the other was a failure of
2 their corrective action program to properly correct a
3 problem with the safety-related valve. I've forgotten
4 the details of it, but it just seemed to me as I
5 looked at those two cases, and it just happened that
6 they were on the same day so it contrasted them in my
7 mind.

8 Here we have two plants, each with two
9 white findings, and we're saying, I guess, what - that
10 the safety significance of those things is more or
11 less the same? Because in my mind, it didn't seem
12 that they were.

13 MR. COE: I would say that what we're
14 trying to say is that we believe that our level of
15 response to those issues should be approximately the
16 same. And we'll have some more examples like that.
17 And then this, of course -- your point is well taken.
18 It's the crux of the discussion that we're having here
19 today. And we hope, at least I hope that success at
20 the end of the day comes from our ability to give you
21 a better understanding of why we think that those
22 kinds of differences, if you will, are still
23 appropriate in terms of how we respond and react. And
24 also, to acknowledge that we don't think that we have
25 a perfect process yet, and we're going to continue to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 adjust those thresholds, if we see, or if we believe
2 that, you know, our level is not appropriately matched
3 to the significance of the issue.

4 MEMBER LEITCH: I'm not saying that the
5 emergency planning issues are not significant, but it
6 seems to me that -- just in thinking about this, it
7 seems to me that the level of significance there is
8 much less than the level of significance with problems
9 with these safety systems.

10 MR. COE: I understand.

11 MEMBER LEITCH: Particularly one related
12 to, first of all, a drill critique. In other words,
13 I guess the situation -- and I don't understand all
14 the details, but it seemed to me that they had a
15 drill. The licensee performed a critique. The NRC
16 felt that some issues had been missed in the drill
17 critique that the licensee hadn't picked up, so it
18 seems to me it's an important issue, but it's a level
19 or two removed from the safety system not working
20 properly.

21 MR. SULLIVAN: I can speak to that, if
22 you'd like to take the time to do that.

23 MEMBER LEITCH: Yes.

24 MR. SULLIVAN: I'm Randy Sullivan. I'm
25 the Emergency Preparedness guy, I guess. But the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 issue of the critique I suppose is clearer to subject
2 matter experts than it would be to, you know,
3 observers, learned observers. But we changed our
4 process drastically in ROP in emergency preparedness.
5 Perhaps you're aware, but in the previous program, we
6 would make dozens of individual judgments on the
7 performance. We would publish those. We would speak
8 to them in public meetings. It would go in the
9 report. The critique may catch some of them, it may
10 not. We would publish them all.

11 Under the new program, there's a
12 performance indicator system which captures failures
13 and successes of the most risk-significant areas of
14 EP, and that's the number that you see published, the
15 DEP PI. We backed-off on our inspection. We
16 refocused our inspection program to leave individual
17 performance out of our inspection program. That's
18 now the licensee's purview, and we rely on the PI.
19 And we made some other changes that I won't bore you
20 with. So when we see the licensee miscall a PI hit,
21 they declare a success when it was a failure, it has
22 a greater significance than just missing something in
23 a critique as you're relating. So in other words, it
24 brings into question the efficacy of the PI value.

25 MEMBER LEITCH: Okay.

1 MR. SULLIVAN: And that means we have the
2 wrong inspection program. If we can't trust the PI
3 value, then we're doing the wrong inspection, so we
4 ask the licensee to do a root cause analysis to see
5 what went wrong with their critique, so that we can
6 make sure we trust that number, because we look at
7 maybe 10 percent of the opportunities in that PI.
8 Maybe less, it depends on the program. So when we
9 catch a PI being called "wrong", a success when it was
10 a failure, that brings into question the value of it,
11 and hence, we want the root cause analysis on the
12 critique process.

13 Now is that the same PRA significance as
14 a broken valve that was not found? I mean, maybe not,
15 but the issue is, our inspection program isn't looking
16 at what it should be if we can't trust that number, so
17 it's kind of interlinked.

18 MEMBER ROSEN: Well, notwithstanding those
19 useful remarks about the emergency preparedness
20 indicator, I think what Graham's point was, was not
21 really answered by Doug. The question that was really
22 posed is, is it the intent of this program to make
23 similar colors mean the same risk-significance, or is
24 it the intent of this program to make similar colors
25 mean the same action by the NRC? And I think it's the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 latter --

2 MR. FRAHM: Clearly, it's the second.

3 MEMBER ROSEN: -- not the former.

4 MR. FRAHM: Right.

5 MEMBER ROSEN: And since it's not the
6 former, any attempts by us to try and rework the ROP
7 to make the colors equal in risk space will be
8 changing the program, since that's not its intent.
9 And that's the difficulty I've had all along with
10 this, that it is true that a white is a white, and a
11 yellow is a yellow, and all colors are equal
12 regardless of which cornerstone they come from, as you
13 said before. But that's only in action matrix space,
14 not in risk space.

15 MR. FRAHM: Right.

16 MEMBER ROSEN: And we need to keep that in
17 our minds all the time. And this is the confusion you
18 got into, it sounds to me like.

19 CO-CHAIRMAN APOSTOLAKIS: But there is a
20 problem with that. The way I understand it, and from
21 Doug's reply and the discussion that followed, the
22 factor that determines, the element that determines
23 equivalence is the response. Okay? We look at two
24 situations and say well, we would respond the same
25 way. We do some investigation that would take about

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 16 hours or whatever; therefore, they're equivalent.
2 But doesn't that go against the whole idea of risk-
3 informing the regulations?

4 CO-CHAIRMAN SIEBER: Yes, it does.

5 CO-CHAIRMAN APOSTOLAKIS: It preserves
6 responses, prior responses and adjusts the colors.
7 Well, the whole idea of risk-informing the regulations
8 is to have a response that is commensurate to the risk
9 level. And I agree with Mr. Rosen, that has been a
10 problem with me from the beginning, trying to
11 understand why these colors are equivalent. And
12 certainly, failure to critique a drill is not of the
13 same safety significance as unavailabilities of safety
14 systems and so on, so we have a fundamental issue
15 here. Are we going to use the response as the
16 criterion of equivalence, in which case, we are really
17 deviating from the idea of risk-informing the
18 regulations, or are we going to use some other
19 criteria like risk to establish equivalence, and then
20 adjust our responses to the risk level?

21 MEMBER ROSEN: It seems much more
22 intellectually satisfying to me --

23 CO-CHAIRMAN APOSTOLAKIS: And challenging
24 though. This is really a more challenging --

25 MEMBER ROSEN: Yes, it is.

1 MEMBER KRESS: It's extremely challenging
2 because if you're going say from green to white area,
3 it's almost impossible to determine the risk
4 significance of that. Now when you get up to the red
5 area, I'm sure you probably can, but that probably is
6 the only threshold, in my mind, that you can actually
7 establish the risk significance of. So you're stuck
8 with not being able to do what we want to do, and I
9 think you have to then fall back on performance-base
10 in the sense that your thresholds are set by people's
11 judgment. And that's where I think we're having a
12 problem.

13 MEMBER ROSEN: We live in the real world,
14 and being pragmatic is important, but to -- if we are
15 being pragmatic and not -- and thinking that we're
16 really being risk-informed, I think we're confusing
17 ourselves. And I think it's -- the central element
18 that we're discussing here has confused the ACRS for
19 some time. And I think the staff has been pragmatic
20 about trying to run the ROP in the way they're doing
21 it now, but we need to deal with this from a
22 fundamental point of view.

23 MEMBER SHACK: Yeah, I mean I have a
24 fundamental disagreement with you. And I don't think
25 that looking at the risk significance is the right way

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 to look at this. This is a risk-informed process. We
2 are trying to assess licensee performance, you know.
3 That's how we get into this red/yellow threshold at 21
4 scrams. If you only look at the risk significance of
5 that particular performance indicator, you know, you
6 can run it until hell freezes over. It certainly
7 tells you something about the performance and the
8 attitude of that licensee long before you get to the
9 risk significance. And to me, that's what this
10 program is about, is assessing performance. It's not
11 a safety, you know, a safety status thing. We're not,
12 you know, clicking off, okay, this plant is now at
13 five times ten to the minus four, you know, bing,
14 bing, bing. You want to know something about -- and
15 George, of all people, Mr. Safety Culture Himself, I
16 mean, you know, that's really --

17 CO-CHAIRMAN APOSTOLAKIS: And a cultured
18 man, of course.

19 MEMBER SHACK: That's, I think, part of
20 what we're -- you know, we're incorporating things
21 like the EOP. You know, they may not have the same
22 risk significance in the PRA, but they tell you how
23 the licensee's attitudes are, his questioning
24 attitude, his response. There's a lot of these things
25 in the response that I don't think -- you know, that's

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 my problem with setting -- the risk informed, to me,
2 should be in the selection of parameters. I'm not all
3 sure like Tom, that you can really set the thresholds
4 in a meaningful way by looking at the risk
5 significance of the numbers.

6 MEMBER KRESS: And I agree with you
7 completely. And I think you have to fall back on just
8 what is our experience, what is our judgment on
9 setting these thresholds. And I think it's a real
10 mistake to mix in in this matrix, here's the
11 performance-based ones, and here's the risk-based
12 ones. I think that's a mistake, and that's where get
13 these big number scrams. We ought to just stick
14 strictly with performance.

15 CO-CHAIRMAN APOSTOLAKIS: And I fully
16 agree with both of you. I think I mentioned earlier
17 -
18 - no, I'm serious. If you remember, there were two
19 fundamental problems I had with ROP from the
20 beginning. One was this consistency of colors, and I
21 wrote some comments in the letter. The other one
22 which I proposed here, and of course, it was killed
23 immediately, was that the action matrix mixes
24 indicators that are based on performance with
25 indicators that are based on risk, with indicators

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that are based on regulatory requirements. And I
2 propose that we separate -- now that didn't go very
3 far, but I think we're coming back to it now.

4 I agree that it's a performance issue, so
5 why then should several of these indicators be based
6 on delta CDFs? What kind of performance is that?
7 What does it tell me about performance? Why would the
8 -- you see, on the regulatory limits, maybe there is
9 a point that, you know, if you are above by 25 percent
10 of what the allowed leakage rate is, that tells me
11 something about your performance. But the risk thing
12 with the fundamental program being what we have
13 identified here, that we are changing one parameter at
14 a time, I think we have a problem.

15 Now my experience in similar issues, you
16 know, in another life, trying to formulate decision-
17 making problems, is that the most difficult part of
18 that is assuring consistency among your attributes.
19 And here, we're just going over it and say well, gee,
20 you know, the regulatory response would be the same
21 so, you know, all whites are the same. Okay? So it
22 seems to me that we have two major problems here,
23 maybe three.

24 One is, we have to decide what the
25 criteria will be for equivalence, and it could be some

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 level of performance, deviation from normal
2 performance and so on. And again, as you know, there
3 is the issue of generic versus plant-specific and all
4 that. And second, whether in their action matrix,
5 it's not a completely independent issue, performance
6 and risk should be separate. And the third in my is,
7 you know, Davis-Besse. I'm really disturbed by it.

8 Now maybe there is another study going on,
9 you know, how the Davis-Besse incident would affect
10 the ROP, but I just don't see how we can claim that
11 this is a successful program when I read in the
12 Chairman's speech somewhere recently that Davis-Besse
13 was green before we found out what was going on. I
14 mean, I just don't see how we can say that. Are we
15 looking at the right things? We really have to put
16 the issues on the table.

17 And again, I really have to make this
18 clear. I don't want to sound like I'm criticizing the
19 staff. They have done a tremendous job given the
20 pressures they had to produce something, you know, of
21 this magnitude in the time that was given to them.
22 But it seems to me that it's the role of this Advisory
23 Committee to raise these intellectual issues and the
24 foundational issues. It's not our role to ask, you
25 know, detailed questions, although we do that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 sometimes too.

2 MEMBER BONACA: I think one other problem
3 has been for us that in setting the thresholds, an
4 attempt has been made to give it almost a risk-base.
5 You know, it takes that many trips to come to, you
6 know, degradation from ten to the minus five and on,
7 so I think this took us all in the perspective that
8 this was a complete, you know, risk-informed process,
9 and I think only later when we discussed it that we
10 brought up the issue of it is risk-informed in
11 general, but not specifically. It's not risk-based in
12 any way, and really should be a performance process as
13 is. And I think, you know, maybe that's one thing
14 that should be clarified by the staff, to what extent
15 these thresholds have to be, in fact, quantified. You
16 know, that creates a full confusion, I think, by the
17 time, you know, if we commit to doing so. This
18 quantification of how many scrams it takes to degrade
19 from ten to the minus five to ten to the minus four.
20 I mean, when you attempt to do that, you put us on the
21 road to believe that this is a true risk-informed
22 process, and then we try to apply those kind of
23 criteria everywhere else, and we find these
24 disconnects, of course, because you didn't really mean
25 to do it that way. And I think that clarification

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 would help.

2 MR. FRAHM: Well, that's really what the
3 first bullet on this slide is getting at, is that the
4 thresholds are performance-based, and we use risk
5 insights to the extent that they're available and
6 applicable, so not every -- for instance, emergency
7 preparedness. There's not a quantitative value you
8 can have for those thresholds. It's strictly
9 performance-based, and based on what we've learned
10 over the years. What makes sense to an expert, to a
11 panel of experts.

12 MEMBER ROSEN: It could be quantitative.
13 If all had Level 3 PRAs, could we then not quantify
14 even the EP?

15 CO-CHAIRMAN APOSTOLAKIS: Well, a critique
16 of the drill I don't know.

17 CO-CHAIRMAN SIEBER: First of all, I agree
18 wholeheartedly with the way that Steve described what
19 the issue is. On the other hand, there are other
20 factors that I think come in, you know, when you talk
21 about emergency planning. A lot of that comes -- is
22 a political issue. It comes from local jurisdictions,
23 the states and public confidence. If public
24 confidence says I want out of here, I want you to tell
25 me when we go, and so that becomes -- that gains more

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 significance in the entire scheme of things, as
2 opposed to some pump or some valve that's
3 malfunctioning. Although both are important, one has
4 more risk significance than the other. And if you
5 cast everything in terms of total risk significance,
6 then I think that -- and try to work it as a
7 mathematician or an engineer would work it, I think
8 that's where you come up with the problem.

9 On the other hand, when you say I want the
10 colors and the performance indicators, and
11 significance determination to indicate what I would do
12 under these circumstances. I have a licensee who has
13 done this. How do I respond to that? And use that as
14 the basis to set agency action, then I think that you
15 have a process that satisfies agency goals. But when
16 you go back and say that it's risk-based, you can't.
17 And there we have Bill Shack's argument, there is
18 elements of risk information that are factored in. On
19 the other hand, this is not a risk-based process, in
20 my opinion.

21 CO-CHAIRMAN APOSTOLAKIS: But what you
22 just said I think is not so consistent. You said you
23 are using the action of the agency to determine, you
24 know, what the color should be. And then later on you
25 said, now I will use the ROP to determine my action.

1 I mean, that's a little bit inconsistent.

2 CO-CHAIRMAN SIEBER: Well, but it makes
3 consistency from time one to time infinity

4 CO-CHAIRMAN SIEBER:

5 CO-CHAIRMAN APOSTOLAKIS: Yeah, but the --

6 CO-CHAIRMAN SIEBER: And that's what the
7 process is all about. You know, you wouldn't need an
8 ROP if you had a licensee and only one person
9 committed --

10 MEMBER KRESS: The trouble is that is the
11 thresholds can converge on just about any number.

12 CO-CHAIRMAN SIEBER: That's right.

13 MEMBER KRESS: I mean, you don't have a
14 way for it to converge on what you think is the right
15 number.

16 CO-CHAIRMAN APOSTOLAKIS: I think we all
17 agree, I think, that the thresholds cannot be risk-
18 based. And that the philosophy here is to look for
19 performance issues.

20 MEMBER SHACK: Actually, I think the
21 challenge -- the performance indicators, it seems to
22 me, aren't as much of a problem. You know, we can
23 argue over the yellow/red thresholds, you know.
24 Those, to me, aren't even a practical problem. You
25 know, you're not going to get there. The one I have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the more difficulty with is the inspection process,
2 where you focus everything on the SDP, which is risk-
3 based. And I have a harder time coming up with an
4 alternative way to evaluate, and yet, I don't
5 particularly like the answer that I get to, that I
6 look at each individual element and look at its
7 significance which, you know, seems to me have all the
8 intellectual problems I have when I look at a scram
9 system and I say okay, you can scram until this
10 particular indicator gets me into deep doo-doo in my
11 -
12 - you know, and I don't like that. Yet, when I get to
13 the inspection process, I don't have a good
14 alternative measure of the significance.

15 MEMBER KRESS: I think one thing that
16 would help along that line is to quite looking at each
17 of these things as individual elements and think of
18 them as a whole bunch of things that together make up
19 the performance.

20 CO-CHAIRMAN APOSTOLAKIS: I thought they
21 were doing that.

22 MR. COE: That's what the action matrix
23 purports to do.

24 CO-CHAIRMAN APOSTOLAKIS: They are doing
25 that now.

1 MEMBER KRESS: Yeah, but what you do
2 though, is you go --

3 MEMBER SHACK: It integrates that at a
4 very high level.

5 MEMBER KRESS: Yeah.

6 MEMBER SHACK: You've screened out so much
7 before you get there.

8 MEMBER KRESS: You've screened out a lot
9 before you get there. And the other thing you do is,
10 you go in and you try to decide whether these are
11 common cause findings or not. And that's where I
12 think you're going wrong. That's a lot of judgment
13 involved there, and I think you should automatically
14 almost assume they're common cause, and just treat
15 them all as set things that you look at. And I think
16 that might help. It doesn't solve the whole problem,
17 but that would help.

18 CO-CHAIRMAN APOSTOLAKIS: Well, what's
19 wrong with having a two-pronged approach? One would
20 be based on performance as it is defined by the PIs,
21 and another one will be a natural extension of the
22 accident sequence precursor program to lower levels of
23 risk. The ASP now looks at significant events, and
24 publishes, you know, events that go to core damage
25 frequency of ten to minus three or something

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 thereabout. What this is doing now is extending that
2 to lower levels, and says what we found in this plant
3 creates a delta CDF of ten to the minus five or four,
4 and we may want to do something about it. But let's
5 not mix that with the performance part, which is
6 somewhere else. And I don't see what the compelling
7 reason is for us to have a single action matrix. I
8 just don't see it. And I don't think it's revolution.
9 I think a lot of the work has already been done.

10 MEMBER ROSEN: And in fact, your point
11 about the workshop that's going on contemporaneously
12 with this meeting; there, the risk-informed and the
13 risk-based parts of this program are moving forward
14 with an improvement, in my view, of the main thought
15 about for the performance indicators. We don't have
16 any similar kind of improvements being thought of that
17 I know of in the performance-based side, so these
18 things seem naturally to be moving on separate tracks
19 that we somehow have glued together. And every time
20 we have a problem, it's about this gluing process that
21 doesn't seem to work for us. Its artificiality keeps
22 coming through in our reviews.

23 MR. COE: I'd like to offer just another
24 thought here, because a lot of what we're discussing
25 revolves around a presumption that performance-based

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and risk-informed are somehow really separate and
2 distinct. And what we've tried to do, I think, at a
3 high level kind of philosophically is, you know, the
4 PIs, for example, are measures that are countable. I
5 mean, a good performance indicator is something that's
6 relatively objective, and you can count. That's
7 performance, and when it's possible to do so, we try
8 to set the threshold in a manner which reflects our
9 understanding of the potential risk significance, and
10 that's risk-informed.

11 In the SDP arena, you know, we've got
12 everything that's -- every inspection finding starts
13 with a performance deficiency. That's performance.
14 We make that conclusion that there is a deficient
15 performance aspect that has had some impact on the
16 plant's, you know, ability to function, and to
17 mitigate, so forth. We make that decision right up
18 front, and then we proceed again to risk-inform what
19 the impact has been.

20 Ultimately, it's all trying to become more
21 predictable and more objective, and that was what we
22 were trying to achieve over and above what we had in
23 the earlier program. And the point that was made
24 earlier about risk-based versus risk-informed is an
25 important one, and it's been the subject of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 considerable debate and dialogue within the staff.

2 The Commission has spoken on that, and has
3 laid out a definition, but it hasn't helped very much,
4 and perhaps it can be improved in the future. But
5 what I would offer is that risk-informed is a
6 spectrum, and I don't think there's a clear dividing
7 line. This is a personal view now, that there is no
8 clear dividing line between what's risk-informed and
9 risk-based. I think there is a spectrum of being
10 risk-informed, and much of that variation in risk-
11 informed depends on how well the decision stakeholders
12 understand the assumptions that are built into that
13 risk evaluation, and to the extent that they can
14 accept those assumptions as being legitimate and
15 adequate representatives of the situation that's in
16 front of them. So, you know, at the extreme you could
17 say that a risk-based outcome is one in which a number
18 is produced, and a number is, therefore, used by the
19 decision makers without further exploration of the
20 assumptions that stand behind that number.

21 I would say that that sort of is a
22 definition, a working definition that I would use as
23 risk-based. And I submit that that's not our process
24 in any event, that our process is risk-informed, and
25 we can discuss where we are in the spectrum of being

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 risk-informed, but I would submit that we have a risk-
2 informed and a performance-based process to the extent
3 that we can bring those things together, so I would
4 just offer that as a thought because it gets to some
5 of the points that are being made.

6 MEMBER SHACK: It seems to me part of what
7 we're trying to do with this process is to pick up
8 what the PRA misses. And the PRA is very good at
9 looking at the effect of the design, and what happens
10 when equipment goes out of order, the effectiveness of
11 procedures. It's not very good in telling you is the
12 organization prone to having latent errors. You know,
13 does it have a questioning attitude when things aren't
14 exactly the way they are, and you're trying to
15 rationalize for why, what happened. And however we
16 risk-inform it or risk-base it, PRA is never going to
17 tell us about those kinds of things, and so focusing
18 our process too much on that I think misses the other
19 part, and that's the part that I'm worried about.

20 MR. COE: As are we. And because the
21 earlier comment about the Davis-Besse lessons learned,
22 indeed are having an impact, or will have an impact to
23 some extent on the reactor oversight process. We've
24 been given a number of things to think about and look
25 at. And the philosophy, of course, was in order to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 become more objective, we look at the things that have
2 actually occurred that we can count, we can measure,
3 we can analyze to some degree, and represent that as
4 some kind of an impact on the public's health and
5 safety risk. And where we can't do that, we establish
6 some commensurate levels of response so that we would
7 react in a way that we think is appropriate, and we
8 acknowledge that there is a difference there. But
9 ultimately, those three crosscutting areas get to the
10 -- one of which is the safety conscious work
11 environment, gets to the point that you're making.

12 The assumption originally was that if
13 there are problems in that area, they will reveal
14 themselves through things that we can see, and the
15 expectation was that we wouldn't get the most
16 significant thing that we see right away.

17 Now perhaps if we, and this is
18 speculative, perhaps if we'd had more opportunity
19 under the reactor oversight process with plants like
20 Davis-Besse, we might have started to accumulate some
21 issues that we were beginning to see at the lower
22 levels before we saw the big one. And I guess we can
23 speculate, but that's all it is.

24 The point is, is that that was an original
25 presumption of the ROP design. It may change over

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 time as we continue to reflect on the lessons learned
2 from Davis-Besse, and we're doing that.

3 MEMBER BONACA: To what extent does the
4 inspection process reviews cause the root cause
5 evaluations at different plants?

6 MR. COE: Well, that is the focus of the
7 supplemental inspections. When you look at the
8 inspection procedures that I referenced earlier,
9 you'll note a strong emphasis on examining the
10 licensee's root cause of failure, and we make a
11 judgment, an assessment of that in those supplemental
12 programs. Since there has been an issue that has
13 risen to some level, some threshold that we believe
14 further involvement on our part is necessary, that
15 involvement goes to the adequacy of the licensee's own
16 corrective action processes.

17 MEMBER BONACA: Because often times, I
18 mean, you know, if you really go through them and you
19 have a degraded process, you find that there are
20 latent issues built right into the -- for the process
21 which are not identified by an adequate root cause
22 process, so I'm trying to understand how you do that
23 linkage, and how much the NRC is looking into that.

24 MR. COE: Yes, sir. That is a focus,
25 supplemental inspection.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. FRAHM: In addition to the
2 supplemental inspection, we have a corrective action
3 look built into our baseline inspection program, as
4 well, at all sites, and that's continuous. That's
5 built into each inspection procedure, and we also do
6 a periodic in-depth review of every licensee's
7 corrective action program.

8 CO-CHAIRMAN APOSTOLAKIS: But the problem
9 with root cause analysis is that there isn't really a
10 universally accepted definition of what is a root
11 cause. And, in fact, it would be interesting to go
12 and pick up some of the AIT reports that the staff has
13 prepared after some serious incident, and where the
14 staff identifies problems with a licensee, and see
15 whether earlier root cause analysis mentioned those.
16 For example, if you read the Davis-Besse investigation
17 report, they talk about I think isolation, of the
18 staff of Davis-Besse not appreciating experience in
19 other facilities. I think the questioning attitude is
20 very astute, but I'm not sure.

21 I just can't imagine that an engineer
22 doing a root cause analysis for a lesser instance
23 would go down to that level, so I don't know how much
24 value these root cause analyses have if we have not
25 identified what the root cause is. Would these go --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 I mean, my colleagues here who have actually worked at
2 the facilities, would these analyses go down to
3 organizational issues? Probably not.

4 MEMBER BONACA: Not necessarily.

5 Sometimes they do, but I think that typically, you
6 know, if you have problems, for example, in
7 maintenance, the way you do things, and they may
8 result in common cause problems because you do the
9 same, you know, kind of maintenance on a reactor
10 coolant pump or some pump, and then you do it on the
11 others, and then you find that you have root cause
12 evaluations that really don't go deep. They'll ask
13 those questions you cannot trace back to the
14 maintenance process what should have been traced at
15 that level. That's really where you begin to see
16 significant problems, and potential cascading effects
17 in common cause, so that's why I was asking --

18 CO-CHAIRMAN APOSTOLAKIS: Somebody ought
19 to look at it.

20 MEMBER BONACA: Yeah, because I mean, when
21 you have then a significant problem at the plant and
22 you get on the root cause process, and you begin to
23 investigate, you find superficiality in so many of
24 them. And you're saying how come you didn't ask this
25 question. And, you know, there is people who are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 becoming specialists in looking at those root cause
2 evaluations and looking at, you know, this staircase
3 as you call it, the why staircase. Why did you stop
4 here? Why didn't you ask the next question and so on?
5 And I think, you know, maybe looking into that process
6 gives you some insight. You'll know ahead of time
7 what the culture organization is what potential late
8 issues are.

9 MR. COE: I agree.

10 MEMBER ROSEN: The disconnect that we have
11 today on the table in front of us is that you said
12 that you did use all our skills in looking at Davis-
13 Besse's corrective action process, and yet
14 presumptively if that had been done, one would say
15 corrective action process at Davis-Besse is not
16 working well. Therefore, we have a problem long
17 before we had the material defects we found on the
18 reactor vessel head. And so that's the part that
19 doesn't work for me, and says yeah, we were looking at
20 Davis-Besse's corrective action process. Well, then
21 it seems like it ought to have found the lack of
22 questioning attitude across the board, and these
23 corrective action documents that weren't acted on, and
24 all the other things that were later, that have become
25 known. So I'm a little troubled by the idea that the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 ROP is okay, we don't have to do anything with it
2 because we did look at corrective action at Davis-
3 Besse. Well, if you did, then we got the wrong
4 answer.

5 MR. FRAHM: I'm sure there will be several
6 lessons learned from the Davis-Besse recommendations
7 from the task force that we'll incorporate over the
8 next year.

9 MR. COE: That's right. We're not saying
10 the ROP is okay necessarily, that it can't sustain
11 continued evolutionary improvement. That's certainly
12 part of our objective, and we will be looking at how
13 we can improve relative to Davis-Besse. And I think
14 that the corrective action, or I should say the
15 problem identification and reporting inspections that
16 we do at plants can continue to improve, and the
17 manner in which we can seek out and find these more
18 pervasive problems in licensee corrective action
19 programs, I think there's more to do in that area.

20 CO-CHAIRMAN APOSTOLAKIS: Are we at some
21 point going to address the issue of performance versus
22 risk? I mean, we raised the issue, but I don't hear
23 any response.

24 MEMBER ROSEN: I think we should in the
25 letter, if we write a letter --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CO-CHAIRMAN APOSTOLAKIS: Well, I'm asking
2 the staff whether they plan to say anything about it.

3 MR. COE: The point that I made just a
4 moment ago regarding the -- we believe that we have a
5 performance-based and risk-informed program, that
6 there's an appropriate melding of those concepts in
7 our program.

8 CO-CHAIRMAN APOSTOLAKIS: I see.

9 MR. COE: Is really our -- trying to help
10 you understand where the philosophy was, where it came
11 from, and how we're applying it. It, of course, is up
12 to you to decide whether or not you'd like to offer
13 your, you know, recommendations to do something
14 different.

15 MR. FRAHM: And as the day goes on and
16 everybody does their parts of the presentation, I'm
17 hoping that it becomes more clear. And if we need to
18 revisit this later in the day, we could do that, as
19 well.

20 CO-CHAIRMAN APOSTOLAKIS: Okay. One last
21 question before we -- we're still at the slide. Is
22 it, on the action matrix colors that talk about two
23 whites or a yellow and so on, how often are these
24 used? How often do you find that you have two whites,
25 or is it the overwhelming majority of cases you have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 one white, and you take action and that's it?

2 MR. FRAHM: Well, there's -- I don't have
3 the number off the top of my head, but there's been
4 several instances where we've had multiple whites.

5 CO-CHAIRMAN APOSTOLAKIS: Multiple whites.

6 MR. FRAHM: Sure.

7 CO-CHAIRMAN APOSTOLAKIS: And these were
8 due to the fact that you are carrying over some
9 incident for several quarters, or in the same quarter?

10 MR. FRAHM: Well, with PIs the results are
11 what they are, they're indicators of performance. And
12 when a PI changes quarterly, it could go on or off the
13 color threshold.

14 CO-CHAIRMAN APOSTOLAKIS: Right.

15 MR. FRAHM: But with the significance
16 determination process, once you cross the threshold
17 and get a white issue, for instance, it stays white in
18 the assessment process for at least a year.

19 CO-CHAIRMAN APOSTOLAKIS: Right.

20 MR. FRAHM: Up until the corrective
21 actions are satisfactory, and a few other criteria
22 that we go by.

23 CO-CHAIRMAN APOSTOLAKIS: So you may have
24 two whites because of this fact.

25 MR. FRAHM: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CO-CHAIRMAN APOSTOLAKIS: I mean,
2 something happened in January, and something else in
3 September. But to get two whites in the same quarter
4 --

5 MS. CARPENTER: I can --

6 CO-CHAIRMAN APOSTOLAKIS: Yeah. Go ahead,
7 please.

8 MS. CARPENTER: Okay. I'm not sure --
9 this is Cindi Carpenter from the staff. There is a
10 backup slide, Ron, number 32, where the corner I don't
11 know the answer to that, but over the year we know
12 that for six -- for 2002 we know that two plants
13 reached the degraded cornerstone, which would mean two
14 whites in the same cornerstone.

15 CO-CHAIRMAN APOSTOLAKIS: Did you say
16 slide 33?

17 MS. CARPENTER: Slide 32, right.

18 CO-CHAIRMAN APOSTOLAKIS: 32.

19 MS. CARPENTER: The backup slides.

20 MR. FRAHM: And we'll get that up on the
21 screen here.

22 MS. CARPENTER: The regulatory response --

23 CO-CHAIRMAN APOSTOLAKIS: Oh, you mean
24 now.

25 MR. FRAHM: Up here. It's in your slide

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 package. We're trying to find it.

2 MS. CARPENTER: No, I'm sorry. But what
3 that slide would show is that for those plants that
4 had two whites that co-existed in the same
5 cornerstone, that would put them into the degraded
6 cornerstone. And our slide for last calendar year for
7 ROP 3 is showing six plants reached the degraded
8 cornerstone.

9 Now there were a number of other plants
10 that reached regulatory response -- at least one
11 white, or maybe two whites in different cornerstones,
12 which would be the 30. But two in the same
13 cornerstone would be six for last year.

14 CO-CHAIRMAN APOSTOLAKIS: But this is due
15 to the fact that you are carrying over a color for a
16 period of time.

17 MS. CARPENTER: Right, for four quarters.

18 CO-CHAIRMAN APOSTOLAKIS: For four
19 quarters, and I was wondering whether you can get two
20 whites or a yellow in one quarter.

21 MS. CARPENTER: You could.

22 MR. COE: Yes, they don't have to initiate
23 that same quarter.

24 MS. CARPENTER: Right.

25 MR. COE: If you have a white inspection

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 finding in the third and it is residing in the action
2 matrix for four quarters, on quarter three you might
3 have a PI pop up as another white on that quarter.
4 That plant is in the degraded cornerstone.

5 MEMBER SHACK: I think what George is
6 looking at is the number of times you actually have to
7 deal with a simultaneous, you know, that quarter --

8 CO-CHAIRMAN APOSTOLAKIS: Yeah, the third
9 quarter.

10 MR. FRAHM: Two new issues showing up at
11 the same quarter.

12 CO-CHAIRMAN APOSTOLAKIS: Yeah.

13 CO-CHAIRMAN SIEBER: Well, Graham's
14 example was one of that type, two issues in the same
15 cornerstone.

16 MEMBER LEITCH: I don't have the timing of
17 those yet. There were two white issues, but I don't
18 have --

19 MR. FRAHM: It certainly could happen, and
20 I'm sure it has happened, but I don't have a specific
21 example.

22 MS. CARPENTER: Roger has the --

23 MR. PEDERSEN: Yeah. This is Roger
24 Pedersen of the staff. I'll be talking to you a
25 little later on about the Occupational Radiation

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 Safety cornerstone. The example that we're using
2 there in ALARA actually was two white findings in the
3 same outage, the same inspection report. And we
4 recently completed enforcement action for Davis-Besse
5 for the Radiation Protection issues at Davis-Besse,
6 and those are going to be two white findings in the
7 same outage, as well, so it does happen.

8 MEMBER BONACA: I just have a question
9 before you -- we at some point talk about the issue
10 that Dr. Apostolakis brought up at Davis-Besse, I
11 mean, the issue of you do have a cornerstone which is
12 called barrier integrity and, however, it didn't pick
13 up Davis-Besse before or after. The issue that maybe
14 what you have to look at is the inspections and the
15 quality of inspections. I mean, I'm trying -- I'm
16 wrestling with that issue -- for example, I'm
17 wrestling with the issue, should I see the V.C. Summer
18 event where they missed their ISI existence of cracks
19 as a failure of barrier integrity?

20 MR. COE: Yes.

21 MEMBER BONACA: Okay. And then how would
22 I skill my inspection process to pick up those kind of
23 indications? And the reason why I'm worrying about
24 that is that Davis-Besse is another example of that in
25 a way, and to what extent does the ROP get involved

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 into the inspection process? We have shorter and
2 shorter outages. That's going to be probably a place
3 where you are going to have repeat events of this
4 nature. Unless you look into it, you're not going to
5 see it. And I'm trying to understand to what extent
6 the staff is looking at this issue of using the
7 barrier integrity as a means of monitoring these kind
8 of situations.

9 MR. COE: Well, we do have an inspection
10 procedure that looks at in-service inspection
11 activities that the licensee performs, and much of
12 that inspection is performed during the outages when
13 the information becomes available to us. We sample a
14 number of different packages that the licensee has
15 either done repairs or done testing, ISI testing. And
16 so there is a basic element of our baseline program to
17 look at that.

18 Now we modified that procedure after
19 Indian Point tube rupture, because it involves, you
20 know, the steam generator tube integrity inspections,
21 as well. And it looks like it'll be a focus of our
22 attention for -- after we reflect on the Davis-Besse
23 lessons learned, so you may see some additional
24 changes to that procedure. But that is an element, an
25 important element of our baseline program.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. FRAHM: Okay. If possible, I'd really
2 like to get through these next two slides, and get
3 over to detailed PI discussions, because as I
4 mentioned earlier, Don Hickman needs to leave us in
5 the not too distant future. But actually, a lot of
6 our discussion over the past several minutes has been
7 on this third bullet, where we're competing with
8 certain goals within the ROP. And a good example is
9 if you're trying to get as risk-informed as you can
10 possibly be, you're losing some of the
11 understandability, some of the public confidence
12 because they just, you know -- the people who are deep
13 in the process may understand it, but those who are
14 looking from, you know, just a general public
15 perception standpoint, they might be missing the boat,
16 so it's a very careful balance. And we struggle with
17 each change we make to the process.

18 And the last bullet just points out that
19 we recognize that the ROP is not a perfect process.
20 We think it's a very good process, and we do continue
21 to make improvements through our self-assessment and
22 feedback processes, and we continue to have
23 interactions with our stakeholders, including the
24 public, our regional offices, advisory committees like
25 yourself, and the industry. And, in fact, we just

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 completed internal and external surveys of our
2 stakeholders, and we're in the process of reviewing
3 those surveys, and gathering lessons learned. And we
4 plan to address those in our upcoming ROP annual SECY
5 paper.

6 The next slide. The SRM, as you're well
7 aware, did request that we provide recommendations for
8 resolving the apparent conflicts and discrepancies
9 between aspects of the ROP that are risk-informed and
10 those that are performance-based. And as we've been
11 discussing for quite a bit, those two terms are not
12 mutually exclusive, and we tried to combine them to
13 the extent we can in the process. But in a nutshell,
14 our position is that the ROP is working effectively
15 today, and that in general, plants are receiving the
16 appropriate level of oversight. And we're making the
17 second statement that plants are receiving the
18 appropriate level of oversight based on our last two
19 agency action review meetings. Our senior level
20 managers all got together and reviewed the plants that
21 are in the higher levels of the action matrix, and
22 they all agreed that they were able to focus their
23 resources on the appropriate plants and issues.

24 And most recently during our mid-cycle
25 reviews, the regional offices gave us the same

1 feedback, that they are able to focus their resources
2 on the plants that they feel have the most significant
3 problems.

4 We also recognize that there are
5 acknowledged differences between risk-informed and
6 performance-based aspects of the ROP, but we consider
7 these differences, and not necessarily discrepancies.
8 And all inputs in the assessment process are
9 performance-based, but some are more risk-informed
10 than others based on the availability of the
11 information and the applicability of the risk
12 information. And we believe that the ROP does
13 effectively address both risk-informed and
14 performance-based issues.

15 We further recognize the need, and we have
16 for quite some time, that we need to consolidate our
17 basis for these SDP and PI thresholds into a single
18 document, and that's the whole gist of that ROP basis
19 document that we provided a draft of a few weeks back.
20 And we really hope that that goes a long way to
21 consolidating our basis in a more transparent manner,
22 and hopefully making the whole process more
23 understandable.

24 We do expect continued incremental
25 improvements, as I mentioned on the previous slide

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 actually, and we do anticipate several upcoming
2 changes as a result of the Davis-Besse lessons learned
3 task force, as well as the SDP task group that was
4 looking at some problem areas in the SDP process. But
5 those reports I don't -- I think they're actually both
6 out there, but we have not delved into them, and
7 really addressed the recommendations, but we
8 anticipate significant changes to the process as we go
9 forward.

10 And lastly, as we mentioned in the paper
11 and during the September 9th briefing, we have begun
12 discussions with the Office of Research to explore the
13 use of formal decision analysis within the Reactor
14 Oversight Process, but this is very much in its
15 infancy, and this would be considered a long-term
16 project. And as I said earlier, we believe the
17 process is working effectively today, but this might
18 be an area that we'd like to explore as potentially
19 adding some more structured theory to the ROP.

20 And that's really all I had with regard to
21 the SRM. As we go -- as I said earlier, as we talk
22 more today, I'm sure more issues will come up, so
23 please feel free to ask questions as they do come up
24 on the SRM and how we plan to address it. And with
25 that, I'd like to turn it over to Don Hickman to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 discuss the Performance Indicators, and the specific
2 issues of the Risk-Informed Performance Indicator
3 thresholds will be one of the main discussion points.

4 MR. HICKMAN: Thank you, Ron. We've had
5 good discussion I think this morning about
6 performance-based and risk-informed and that sort of
7 thing. This slide is simply to reiterate, I think,
8 what we've all understood from that discussion, that
9 all of the performance indicators are performance-
10 based. We are counting numbers of particular types of
11 events.

12 What we've tried to do is to risk-inform
13 those indicators where we could do that. And, of
14 course, the areas most susceptible to that are in the
15 initiating events cornerstone, and the mitigating
16 systems cornerstone, so we have done what we could
17 along those lines.

18 Of course, when we did that, we used some
19 generic plant models, about a dozen of them, and then
20 we applied that across the industry trying to be
21 conservative with the results of those models. And so
22 they're not maybe the right numbers for every plant,
23 but they should be conservative numbers. And we've
24 had a lot of comment in the past about how we should
25 have plant-specific thresholds. And I think we've

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 acknowledged that we would like to make the PIs as
2 plant-specific as we can, keeping a few principles in
3 mind; and that is, that the PIs do need to be simple.
4 They need to be something that are clear as to what
5 counts and what doesn't count. Some licensees have no
6 questions. We don't get inundated with questions
7 about whether certain events should count.

8 CO-CHAIRMAN APOSTOLAKIS: Why can't we use
9 the goals that the licensees have set under the
10 maintenance rule as some sort of threshold for maybe
11 the green/white for the ROP? That would make them
12 plant-specific, and it wouldn't cost us anything.
13 WE've done it already.

14 MR. HICKMAN: What we are doing is rather
15 than requiring licensees to have PRAs, as you all
16 know, we have developed our own models, and that's
17 what we plan to use for that purpose, rather than
18 relying on the licensees models. We've not checked
19 the accuracy of their PRAs. We've not --

20 CO-CHAIRMAN APOSTOLAKIS: Well, the
21 maintenance rule is a rule. I hope the numbers
22 they're proposing are meaningful. It's not something
23 they are doing in their spare time.

24 MR. HICKMAN: The maintenance rule, you're
25 right. I mean, it is a rule, and they are verified by

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the residents at the site.

2 CO-CHAIRMAN APOSTOLAKIS: Right. And so
3 why can't they be the green/white thresholds for the
4 mitigating systems?

5 MR. HICKMAN: As I say, we have been in
6 the process of developing the SPAR models, and that is
7 what we want to use to confirm the accuracy of the
8 licensee is using. I understand what you're saying.

9 MR. COE: I think the answer to your
10 question is it could be done that way. And, in fact,
11 I will tell you that that discussion occurred in the
12 development and the conception of the ROP. And it was
13 decided for a number of reasons, I guess independence
14 being the principal one, that we would not rely upon
15 the licensee's maintenance rule, the risk model that
16 they use for the maintenance rule to base those
17 thresholds on.

18 CO-CHAIRMAN APOSTOLAKIS: Are you saying
19 the maintenance rule is no good?

20 MR. COE: Not at all.

21 CO-CHAIRMAN APOSTOLAKIS: So here is the
22 agency saying we are not going to rely on something
23 that --

24 MEMBER SHACK: Again, if I'm looking at
25 performance rather than trying to assess the safety

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 status of the plant, it seems to me a comparison
2 between plants which is really where the green/white
3 threshold comes out now, is a very reasonable thing to
4 do. You know, I would call all this white/yellow/red
5 threshold risk-misinformed. You know, and even
6 setting the initiating event green/white threshold on
7 a risk-significant basis, I would almost call risk-
8 misinformed because again, I'm going to look at a
9 single isolated parameter, important as it may be, out
10 of context. And again, that's not what I'm trying to
11 do here. I'm trying to get an assessment of --

12 CO-CHAIRMAN APOSTOLAKIS: You are raising
13 two issues. I think the white/yellow/red I agree with
14 you, but the green/white I disagree. The maintenance
15 rule says Mr. Utility, come back and tell me what the
16 unavailability of this safety should be or the safety
17 train. Now those guys went back and they looked at
18 their PRAs. They looked at other things, past
19 experience, so on, and said here is our goal. If we
20 meet this, we are doing okay. And this is plant-
21 specific. Now why isn't that green? Isn't that green
22 the whole idea of green?

23 MEMBER SHACK: If I was measuring the
24 safety status of the plant, yes. If I'm measuring the
25 licensee performance, maybe not.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CO-CHAIRMAN APOSTOLAKIS: But what they
2 did to compare it with other people is using again an
3 unavailability. It's not that they used some other
4 measure. It's the same measure they're using, but
5 they're using now 102 units as opposed to the specific
6 plant. The fundamental approach is the same. They're
7 using the same metric.

8 MR. HICKMAN: George, that point has come
9 up in many of our discussions with industry,
10 particularly -- primarily with regard to the safety
11 system unavailability indicator, and we've gotten --
12 industry has proposed different positions. They would
13 like the indicator -- they were looking at a
14 relationship between the green/white threshold and the
15 maintenance rule requirement. And the discussion was,
16 should the maintenance rule be lower than the
17 threshold so they could fix the problem before they
18 went white? Should they be the same? Should it above
19 that? There's been a lot of discussion about that, as
20 to actually what you would do with that number, where
21 you would --

22 CO-CHAIRMAN APOSTOLAKIS: What was the
23 conclusion?

24 MR. HICKMAN: The conclusion was that we
25 don't really necessarily want to relate the PI

1 threshold to any particular value of that maintenance
2 rule. I think they would like to have the maintenance
3 rule value be higher than the green/white threshold -
4 I'm sorry - lower than the green/white threshold so
5 that they could fix the problems before they go white.
6 That, I think, is their position the last time I think
7 we spoke about this. But we have also discussed doing
8 just that, setting it to be the same. That's a big
9 issue that has been discussed quite a bit in the MSPI
10 as to whether there should be that relationship. And,
11 in fact, we're not doing that.

12 MEMBER KRESS: But you would have plant-
13 specific PIs then.

14 CO-CHAIRMAN APOSTOLAKIS: They don't.

15 MEMBER KRESS: No, but if you tried to do
16 that they --

17 CO-CHAIRMAN APOSTOLAKIS: Then they would
18 be.

19 MEMBER KRESS: Yeah. And I don't think --
20 I think trying to get into plant-specific PIs is going
21 to give you a real headache.

22 MR. COE: That's precisely what we're
23 trying to do with the MSPI program.

24 MR. SATORIUS: Yeah, this is Mark Satorius
25 with the Staff. I just came from the MSPI workshop,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and could possibly add a few insights here; and that
2 is, one of the goals of the MSPI was to get around
3 this very issue you were talking about, Dr.
4 Apostolakis, and that was, that we would have a
5 performance index in this case that would be
6 consistent with the maintenance rule, that licensees
7 would not be forced to take two looks at issues via
8 maintenance rule space and PI space to get them
9 interlocked so they use the same criteria. That was
10 one of the things that we're pilot testing this winter
11 for six months, starting in September, so we're --

12 CO-CHAIRMAN APOSTOLAKIS: So the jury is
13 still out.

14 MR. SATORIUS: The jury is still out.
15 That's the right answer, yeah.

16 CO-CHAIRMAN APOSTOLAKIS: I would --
17 coming back to Bill's point because I think it's
18 important. It keeps coming up. I would agree with
19 you, Bill, if the ROP used a different method to set
20 the green/white threshold, but they're still using
21 unavailability maintenance --

22 MEMBER FORD: Yeah. Why shouldn't we use
23 the same metric? If you --

24 CO-CHAIRMAN APOSTOLAKIS: Well, that's my
25 question, why not use the same -- if you're using the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 same metric --

2 MEMBER KRESS: I'm saying use the same
3 metric. It's a threshold. You could have the same
4 metric with different thresholds.

5 CO-CHAIRMAN APOSTOLAKIS: I don't see why
6 a plant that is highly redundant and this and that has
7 to have the same threshold as a plant that is not.
8 Why?

9 MEMBER KRESS: Because we're not measuring
10 risk.

11 MR. SATORIUS: If I'm trying to maintain
12 safety status that would be true.

13 MEMBER KRESS: That's right.

14 MR. SATORIUS: If I'm looking at
15 performance, their attitude towards safety the way
16 they're doing it --

17 CO-CHAIRMAN APOSTOLAKIS: So in principle
18 you are allowing it then if it's very good to drift
19 up, because it's still below the threshold. Right?
20 One of the very good plants at the low percentile can
21 be allowed to have its unavailability of this system
22 go up, maybe by a factor of five or six, and still be
23 below the threshold and be okay, which brings up the
24 other fundamental issue here. Are we comparing with
25 other plants, or are we -- do want to make sure that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the plant as licensed maintains its status? See,
2 these are deeper issues. Well, South Texas would have
3 a field day. They would have high redundancy.
4 They're one of the more recent plants, and now this
5 ROP comes and says we're going to compare you with
6 some of the oldest plants in the United States, so
7 they say great. Okay. So my -- yeah, we could make
8 a lot of mistakes then, and because we're so low --

9 MEMBER SHACK: Wait until you get an AP
10 1000.

11 MR. HICKMAN: Actually, let me just say
12 something about South Texas. They were very concerned
13 about the SSU indicators because they --

14 CO-CHAIRMAN APOSTOLAKIS: SSU?

15 MR. HICKMAN: The Safety System
16 Unavailability indicator --

17 CO-CHAIRMAN APOSTOLAKIS: Oh.

18 MR. HICKMAN: -- that they're currently
19 using in the mitigating systems because they do a
20 great deal of preventive maintenance, and they said
21 they were going to be close to the green/white
22 threshold just with preventive maintenance, and that
23 it would take very few failures, unavailability hours
24 to push them over the threshold it turns out, so they
25 were very concerned about going white regularly.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CO-CHAIRMAN APOSTOLAKIS: And this is
2 because their preventive maintenance is so strong?

3 MR. HICKMAN: Right. And we questioned
4 them on that.

5 CO-CHAIRMAN APOSTOLAKIS: And this is
6 something that we don't want them to do?

7 MR. HICKMAN: No, no. We questioned them
8 and said do you think you get the benefit out of doing
9 all that much maintenance, and they said we sure do,
10 and we said fine. It's something they choose to do.

11 CO-CHAIRMAN APOSTOLAKIS: And then we're
12 going to turn around and punish them for that?

13 MR. HICKMAN: Well, no. They really
14 haven't gone white. Because as you say, they have
15 redundant systems so their concern was unfounded, but
16 they --

17 MEMBER ROSEN: Four trains of auxiliary
18 feedwater.

19 MR. HICKMAN: I'm sorry?

20 MEMBER ROSEN: South Texas has four trains
21 of auxiliary feedwater.

22 MR. HICKMAN: They have --

23 MEMBER ROSEN: They have three motor
24 driven and one auxiliary, and one steam driven. So in
25 terms of redundancy, there's a lot more redundancy,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 just as an example, in the auxiliary feedwater system
2 in South Texas compared to other auxiliary feedwater
3 systems.

4 MR. COE: There are similar examples with
5 other plants, as well, plants that are penalized, if
6 you will, for accruing an acceptable amount of
7 unavailability. And because those thresholds were set
8 generically, because back to your earlier point, that
9 was the best we could do right at the beginning of
10 ROP, knowing that we're going to penalizing some
11 plants like that because we set the threshold for the
12 plants with the least redundancy and it would have the
13 most significance if they accrue that level of
14 unavailability. So that's where they would have set,
15 knowing that that was a starting point, and the
16 evolution since then has been towards exploring ways
17 of making that more plant specific.

18 CO-CHAIRMAN APOSTOLAKIS: So is it
19 possible then that I can have a plant that is a very
20 good performer, and its unavailability for a year of
21 one system or two systems goes up, but it doesn't
22 really reach the threshold because the threshold is
23 very high. But if I look at its PRA, delta CDF is ten
24 to the minus four, is that possible?

25 MEMBER ROSEN: A very low CDF with a high

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 unavailability of some safety trains is possible with
2 plants that have high redundancy like South Texas.

3 CO-CHAIRMAN APOSTOLAKIS: So don't I have
4 some conflict there now?

5 MEMBER ROSEN: Yes. And that's why there
6 are two South Texas guys downstairs at the MSPI
7 indicator workshop arguing for an even broader MSPI
8 than is being proposed now, to take into account more
9 of the actual equipment than the plant has actually
10 got in place, rather than this artificiality, which
11 penalizes plants with higher redundancy.

12 CO-CHAIRMAN APOSTOLAKIS: I'm puzzled a
13 little by the Committee's attitude towards something
14 that I think is obvious, and maybe I'm wrong, but I'd
15 like to understand that a little better. Why
16 philosophically is it meaningful to compare the
17 performance of this plant with the whole fleet, versus
18 saying no, we have licensed you. We have agreed with
19 your design, your tech specs and everything. Now the
20 RO people make sure that you stay within a little band
21 there over what we have licensed. Isn't that the
22 whole idea of having an inspection program? Why do I
23 care what happens in Southern California? My plant is
24 here, and I'm -- you know, I have all these rules. I
25 have my PRA, and what the NRC should be saying is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 let's make sure that you don't deviate from what we
2 have licensed too much, because that is acceptable.
3 But now we're saying no, we're not going to look at
4 that. We're going to look at you, how you perform
5 compared to San Onofre. For me that's -- I don't see
6 the logic of it.

7 MEMBER BONACA: I think you're right.

8 MR. HICKMAN: Let me explain to you, I
9 guess how we got there. We wanted to start the
10 program, get it in place and make improvements as we
11 progressed through the years. For the mitigating
12 systems cornerstone, the data that were available was
13 from the WANO safety system performance indicator. We
14 have that data, and that's what we used. Although it
15 wasn't an ideal indicator, it served the purpose
16 initially. And what we had then was performance
17 across the industry. We chose for the green/white
18 threshold to use -- to identify outliers from industry
19 performance simply because we could do that. We had
20 the data. We could do that quickly and easily, and we
21 could get something in place.

22 If you look at what's going on downstairs,
23 the mitigating system performance index, and we don't
24 call it an indicator, it's an index. It gives
25 relative change, but what's going on down there is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that the green/white threshold is set at ten to the
2 minus six for all plants. And then plant models are
3 used to determine when they cross that threshold.

4 CO-CHAIRMAN APOSTOLAKIS: Yeah, but again
5 let's separate the issues here. It should be
6 separate. One is, what is the right thing to do. And
7 the other one is, we did it a certain way because
8 under the circumstances, years ago, blah, blah, blah.
9 I think they should be separate. And the discussion
10 today is not focused on why you did certain thing. I
11 mean, we are not blaming you for anything. We
12 recognize that you were under tremendous pressure to
13 do something, but still, it seems to me, we have to
14 discuss the fundamental issues of what we're trying to
15 do and so on, not why certain things have been done a
16 certain way. And this is what I'm focusing on.

17 MR. HICKMAN: Well, I think that's --

18 CO-CHAIRMAN APOSTOLAKIS: For me, the
19 issue of plant-specific thresholds and so on versus
20 generic is still unresolved. I don't understand why I
21 have to compare my plant with somebody else's on the
22 other side of the country, and why should you care?

23 MR. HICKMAN: Well, I think that's the way
24 we have --

25 CO-CHAIRMAN APOSTOLAKIS: I mean, when you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 have your inspectors there, does your inspector --
2 forget about the ROP. Does your inspector go and say
3 oh gee, you know, you violated these but ahh, it
4 doesn't really matter because other plants are doing
5 it too? It doesn't make sense. You have committed to
6 certain things, you better comply. And we are looking
7 at you, not at other plants. And by the way, this is
8 the fundamental idea behind quality control in the
9 industry, that you say look, you're my client. Let's
10 negotiate. You want these kinds of tolerances, then
11 I establish a quality control program to make sure
12 that a year from now I'm still giving the tolerances.
13 I'm not asking myself oh, but this other guy in
14 California is outside, so it's okay for me to be
15 outside too.

16 MEMBER BONACA: Really that's the way that
17 the regulatory system goes, because typically in the
18 South Texas licensee's plants ultimately to accept the
19 tech specs which are pretty consistent with the
20 industry. It didn't say I have, you know, ten of
21 these redundancies, therefore I can lose five. It
22 said simply that you have certain action statements,
23 you know, for individual trains and so on and so
24 forth, which are probably consistent with the rest of
25 the industry.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER ROSEN: Well, Mario, what happened
2 is that's exactly what they were in 1988, when the
3 first of the South Texas units went in service, and
4 there was a great penalty to South Texas because of
5 that. And over the years since 1988, the tech specs
6 have been revised to account for South Texas'
7 redundancy.

8 MEMBER BONACA: Yeah. Okay.

9 MEMBER ROSEN: Based on risk analysis.

10 MEMBER BONACA: Yeah.

11 CO-CHAIRMAN APOSTOLAKIS: Well, maybe we
12 can let you go on for the next two minutes before we
13 interrupt you.

14 MR. HICKMAN: I think that that's the way
15 we're headed, George. That's what we're doing in the
16 MSPI, but there is a problem with that. I mentioned
17 the ASP Program earlier. The ASP Program counts --
18 identifies events with delta CDF, delta CCDP greater
19 than ten to the minus six. And we established the
20 green/white threshold at ten to the minus six, and it
21 turns out that we may have problems doing that.

22 CO-CHAIRMAN APOSTOLAKIS: Delta CCDP?

23 MR. HICKMAN: Uh-huh.

24 CO-CHAIRMAN APOSTOLAKIS: Really that low?

25 MR. HICKMAN: Uh-huh.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CO-CHAIRMAN APOSTOLAKIS: Ten to the minus
2 six.

3 MR. HICKMAN: Yeah. The ASP Program
4 counts anything above ten to the minus six.

5 CO-CHAIRMAN APOSTOLAKIS: Well, they look
6 at it, but they don't really publish it.

7 MR. HICKMAN: Yes they do.

8 CO-CHAIRMAN APOSTOLAKIS: They publish it.

9 MR. HICKMAN: Yeah. Yes, they do. Ten to
10 the minus six, ten to the minus fifth, and down. And,
11 of course, the important ones are ten to the minus
12 four, but they do count that. Using ten to the minus
13 six, we're running into problems where a single
14 failure can put a licensee across the green/white
15 threshold. And the reason is primarily for very high
16 safety significant and high reliability systems, such
17 as aux feedwater at the new CE plants that have no
18 feed and bleed capability, so that's causing us some
19 problems. That may scratch the whole deal.

20 CO-CHAIRMAN APOSTOLAKIS: What you just
21 said now raises a question which is similar to my
22 earlier question regarding the maintenance rule.
23 Since the ASP is already doing it, you know, ten to
24 the minus CDP is pretty low. Why do you need the
25 significance determination process? Why don't you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 just take the ASP and run with it, and change it as
2 appropriate? I think they're already doing it.

3 MR. HICKMAN: The primary difference
4 between the ASP Program and the SDP is one of
5 timeliness. In the ASP Program, they go back to the
6 licensee with their results, get to look at it. He
7 provides any comments of plant systems, or procedures
8 or whatever that they may have missed. And it's
9 revised and sent back again, and it takes -- more than
10 a year behind now.

11 CO-CHAIRMAN SIEBER: Yeah, it's a year.

12 CO-CHAIRMAN APOSTOLAKIS: Still they have
13 the tools.

14 MR. HICKMAN: Right. Shall we go on? We
15 told you last time that we would consider eliminating
16 the yellow/red thresholds for the initiating event
17 PIs. The difficulty -- there's several difficulties
18 with that. One is that without a red threshold we
19 would essentially be sending a message that there is
20 no number scrams that we would consider to be highly
21 risk significant.

22 CO-CHAIRMAN APOSTOLAKIS: Or you can say
23 that you're sending the message that way before
24 something like that happens you will have acted to
25 make sure you will never get there, so it depends on

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 how you look at the message.

2 CO-CHAIRMAN SIEBER: Well, that's outside
3 the program.

4 MR. HICKMAN: And in fact, we do. And in
5 fact, we do. That's not the white threshold, that's
6 the red threshold. We have the white and the yellow.
7 We have the 95-001, 95-002 inspections, and we fully
8 expect that any licensee that gets into the yellow
9 probably isn't going to go operate much longer due
10 simply to its own management, regardless of what we
11 do.

12 CO-CHAIRMAN APOSTOLAKIS: You know, one of
13 the considerations in your deliberations should be the
14 reasonableness of this. I mean, you can't just -- I
15 mean the point that Dr. Shack raised, we can't just
16 change one element in the PRA and make it so large
17 that delta CDF becomes ten to the minus four. I mean,
18 you have to question whether that is reasonable too.
19 I appreciate the value of communication with the
20 public, but you can't base something on something that
21 doesn't make sense so, you know, you can maybe change
22 your message that, you know, you never get there.

23 MR. HICKMAN: We understand that concern.
24 We appreciate that concern. The thing is, in PIs we
25 don't know how to factor in other types of potential

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 failures. It has to be something that is very clear
2 as to what counts, and the scrams certainly are.

3 CO-CHAIRMAN APOSTOLAKIS: And why do you
4 need the red?

5 MR. HICKMAN: I'm sorry?

6 CO-CHAIRMAN APOSTOLAKIS: You don't need
7 the red. You don't need to have that panel there.
8 You just don't let them get there, period.

9 MR. HICKMAN: Well, from a public
10 perception standpoint, that would be indicating that
11 there's no number of scrams above six that we would
12 consider to be highly risk significant.

13 CO-CHAIRMAN APOSTOLAKIS: No, it will mean
14 that they will never get there. You will never let
15 them go. Way before then you will take action.

16 MR. HICKMAN: At what point? That would
17 be the --

18 MEMBER ROSEN: At greater than six. You
19 don't have to put 23 underneath there. You put
20 greater than six. And then you put red.

21 MEMBER SHACK: The ninety-ninth
22 percentile.

23 MR. HICKMAN: So you're suggesting getting
24 rid of the yellow band I guess then.

25 MEMBER ROSEN: Probably yes. Yes is the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 answer.

2 CO-CHAIRMAN APOSTOLAKIS: Now one other
3 question. We've had problems in the past with timing.
4 Something was of immediate safety concern or was not
5 of immediate safety concern, and apparently nobody
6 ever did anything about it. When you say considering
7 eliminating, when will we have the answer? When is
8 your consideration going to be complete?

9 MR. HICKMAN: Well, that's what I was
10 going to tell you today. We don't see how we can
11 eliminate that threshold.

12 CO-CHAIRMAN APOSTOLAKIS: So you have
13 already considered it and decided against it.

14 MR. HICKMAN: Well, the question is, if we
15 eliminate the threshold, we have no red band.
16 Whereas, we do with everything else in the initiating
17 event cornerstone and mitigating systems, except the
18 PIs that are not risk-informed.

19 MEMBER ROSEN: You're erecting a strawman
20 and then knocking it down. You will -- what we're
21 suggesting is you do have a threshold. It's greater
22 than six can be red. It's just having the number 23,
23 21, whatever is on the table now is ludicrous. So
24 what we're saying is don't make an argument that we
25 can't change it because we wouldn't have a threshold.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Put a threshold in, just don't make it the one you
2 have.

3 MR. HICKMAN: That's a different argument
4 I hadn't heard before to eliminate yellow and use the
5 red. The thing is that, as you mentioned earlier,
6 George, we have tried to risk-inform the process to
7 the extent that we can. And when you look at the
8 number of uncomplicated scrams that it takes to rise
9 to that level, it really is quite large.

10 CO-CHAIRMAN APOSTOLAKIS: But this is a
11 performance issue. This has nothing to do with risk.
12 It seems to me this -- I have never heard of any plant
13 getting into a risky situation because the frequency
14 of some initiating event. It's always the combination
15 of little things that are put together, and all of a
16 sudden you have a problem, so the frequency, I'm with
17 Dr. Shack. This should not be risk-based.

18 MR. HICKMAN: We have what we think is a
19 good balance in that regard. The PIs look at
20 individual events because that's about all we can
21 count in a PI. We can't have all kinds of different
22 combinations that they need to count. And we look at
23 events, individual, singly, but we look at the
24 accumulation of those counts over some period of time.

25

1 And when they have too many, we take action.

2 The SDP looks at an individual event to
3 see what happened in that event, and was that single
4 event risk-significant, so we have that balance in the
5 program. And when we look at what it takes --

6 CO-CHAIRMAN APOSTOLAKIS: Public
7 confidence is not determined only by the fact that you
8 may have a yellow/red threshold. It's also determined
9 by the quality of your analysis, by the reasonableness
10 of your arguments. And to have a 23 or 25 yellow/red
11 threshold undermines, in my view, public confidence.

12 MR. SATORIUS: This is Mark Satorius with
13 the staff. I think maybe the best approach here would
14 be this is something that would need to be brokered
15 with industry because it's contained within the NEI
16 guidance. Possibly we could place it on the agenda
17 for our next working group meeting with them. And a
18 solution might just as was suggested by one of the
19 members; and that is, you footnote the fact that, you
20 know, the expectation that the staff will take action
21 prior to the number six, or greater than six scrams
22 such that there is no need for a red/yellow threshold.
23 Maybe it's as easy as that.

24 CO-CHAIRMAN APOSTOLAKIS: Yeah, it is.

25 MS. CARPENTER: We have -- this is Cindi

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Carpenter from the staff. We have an ROP working
2 meeting this month, and we could put that on the
3 agenda.

4 CO-CHAIRMAN APOSTOLAKIS: That doesn't
5 sound right to me though. Essentially what you're
6 saying is that you want the permission of the
7 industry.

8 MR. SATORIUS: I would not characterize it
9 that way. I would --

10 CO-CHAIRMAN APOSTOLAKIS: I know you
11 wouldn't, but it sounded that way.

12 MEMBER ROSEN: I think the word "brokered"
13 is a little mis -- unfortunate.

14 CO-CHAIRMAN APOSTOLAKIS: It seems to me
15 that if there is something logical we should do it.
16 Now if the industry has a comment on points to
17 something that it illogical or maybe not practical
18 then, of course, we should listen. But to say that we
19 will consider it together with the industry doesn't
20 sound good to me.

21 MR. SATORIUS: I think you're right. I
22 think the word "brokered" was probably not the best
23 word.

24 CO-CHAIRMAN APOSTOLAKIS: Okay.

25 MR. SATORIUS: In this instance, I would

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 just say discuss. We would need to discuss with
2 industry. It is their guidance document that we
3 endorse, so there would need to be some discussion
4 engaged with stakeholders.

5 MEMBER SHACK: It's a guidance document
6 that meets your inspection program.

7 CO-CHAIRMAN APOSTOLAKIS: Yes.

8 MR. SATORIUS: PI Program, yes, sir.

9 MR. HICKMAN: We had a lengthy discussion
10 prior to the start of the program, even the original
11 pilot program as to who should write the document.
12 And recognizing that there would be many changes
13 coming early in the program that are difficult for the
14 NRC to handle in a timely manner, that NEI would write
15 the document. But they are simply documenting what we
16 agreed to in the medians. However, let me say agreed
17 to. We try to reach agreement. If we cannot and this
18 has happened on several occasions, and we feel it's in
19 the best interest of the program, we will tell them
20 that, and they agree that it's our program.

21 CO-CHAIRMAN APOSTOLAKIS: Have you
22 endorsed the NEI guidance?

23 MR. HICKMAN: Yes, we do. Every time
24 there's a new revision we send out a Regulatory
25 Information Summary.

1 CO-CHAIRMAN SIEBER: I think we should
2 move on.

3 MEMBER SHACK: We could make it a
4 Frequently Asked Question.

5 CO-CHAIRMAN SIEBER: Well, I think it's
6 not particularly appropriate to have a bunch of
7 footnotes that modify the basic scheme of the ROP,
8 because now the footnotes become exceptions, and
9 they're more important than the ROP itself. And I
10 think that that's sort of a clumsy way to do it, but
11 I think that we're falling behind, and we ought to
12 move on, if we can, so either speak faster, or cut
13 something out, or we shouldn't ask so many questions.

14 MR. FRAHM: Actually, we're doing quite
15 well in accordance with the agenda.

16 CO-CHAIRMAN SIEBER: You're undermining my
17 thought.

18 MR. FRAHM: We actually had scheduled to
19 go up until 11:00 to discuss the PIs, so if we want to
20 move on, I'm sure Don could be useful downstairs at
21 the MSPI workshop.

22 CO-CHAIRMAN APOSTOLAKIS: Are you saying
23 we're ahead of schedule?

24 CO-CHAIRMAN SIEBER: Yes.

25 MR. FRAHM: Yes, we are.

1 CO-CHAIRMAN SIEBER: Have we concluded the
2 PI section?

3 MR. FRAHM: I think we've concluded our
4 prepared remarks. If there's any --

5 CO-CHAIRMAN SIEBER: Well, are there any
6 additional --

7 MEMBER BONACA: They knew it would take
8 two hours to cover six slides. That's why --

9 CO-CHAIRMAN SIEBER: Well, are there any
10 other questions on PIs, because this may be a good
11 time to take a break. If there are no further
12 questions, we thank you for that portion. And I think
13 that we could take about a 20 minute break.

14 (Off the record 10:02 - 10:23 a.m.)

15 CO-CHAIRMAN SIEBER: Okay. Let us begin
16 or continue.

17 MR. COE: Thank you, Mr. Chairman. This
18 portion of the meeting gets into two, I think,
19 distinct -- gets to two distinct questions, the first
20 of which is the treatment of concurrent multiple
21 equipment functional degradation. The second of which
22 is a series of examples which we hope will help
23 illuminate or illustrate the reason that the staff
24 believes that the current thresholds are adequate for
25 the purposes of the ROP, again not without

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 acknowledging that they can continue to improve as we
2 gain operating experience with the program.

3 But I would offer to start as we have in
4 our package here with the question of concurrent
5 multiple equipment or functional degradations, and how
6 the ROP was modified after its initial start to
7 accommodate these kinds of issues when they come up.
8 We sent you the guidance directly from our inspection,
9 our SDP procedure. And I would just start by asking
10 if you have any specific questions that you would like
11 to get on the table right away, I do want to make this
12 portion of the discussion --

13 CO-CHAIRMAN APOSTOLAKIS: This is the
14 draft inspection manual?

15 MR. COE: No, this is in our letter of
16 December 19th, there is enclosure one that is actually
17 taken directly from our inspection manual, Chapter
18 0609 that deals with SDP. I just want -- you know,
19 this is a question regarding how we deal with
20 concurrent issues. And if there are any specific
21 questions, I do want to address them. And if you have
22 them to put on the table now, I'd certainly invite
23 that.

24 CO-CHAIRMAN APOSTOLAKIS: I do agree with
25 the comment Tom Kress made, that the decision, what is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 independent and what is not is highly subjective, and
2 probably you have to always assume independence and
3 calculate delta CDF given that you found, you know, a
4 set of things rather than splitting them up. I think
5 that is a realistically conservative way to approach
6 it, conservatively realistic. Because, you know, it
7 comes back to the root cause analysis. What is a root
8 cause is not well defined. In one analysis we find
9 them independent, in another we find them deeply
10 dependent.

11 MR. COE: And I would agree with that.
12 There's clearly some room for judgment here, and all
13 I would offer is that the ROP objectives are met when
14 our judgments are scrutable, the basis for our
15 judgments are scrutable, so we have the obligation
16 when we make judgments such as, are these collection
17 -
18 - is this collection of equipment degradations that
19 happen to have coincide at the same period of time
20 related to a single underlying cause or are they all
21 completely independent of each other, and it was just
22 happenstance that they all happened to line up.
23 You're right. Those require judgment.

24 Now what we've tried to do is help to
25 provide some guidance for that judgment, so we've

1 tried to set a threshold above the cross-cutting issue
2 threshold, or above the management threshold, because
3 I think we can all acknowledge that it would be easy
4 to say if you have a collection of degradations that
5 occur concurrent in some period of time, that we can
6 just lump them all into a pot that's called
7 management, you know, deficiency. And we could do
8 that, you know, with whatever issues came up. But
9 what we tried to do is suggest that in keeping with
10 the risk-informed aspect or objective of the program,
11 we try to make a distinction. We try to say if -- and
12 the example that was given in the procedure itself, if
13 you have a bad maintenance procedure and it's applied
14 to a number of different things and they all happen to
15 degrade the same way, it's an easy, that's a fairly
16 easy call to say there was a single issue and it had
17 the effect, the risk impact of the collective multiple
18 degradations, so we enter the action matrix with a
19 single issue.

20 CO-CHAIRMAN APOSTOLAKIS: I think this is
21 a good example of focusing on performance rather than
22 risk. Say that you have two deficiencies or two
23 problems that may both affect an accident, so they
24 raise this. But you decide that they're due to
25 independent causes so you treat them separately. So

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 from the risk perspective now you went up, but from
2 the performance perspective you didn't, because they
3 were just random occurrences or whatever, and you're
4 focusing on performance.

5 MR. COE: Right. First of all, the
6 individual issues would be still inspection findings.
7 There's still a degradation there or deficiency there,
8 and perhaps what you're suggesting is what could occur
9 is that they could both individually treat it
10 independent of each other be green findings. And yet,
11 when you -- because they apply to the same accident
12 sequence, maybe there's a synergism there that causes
13 the collection of those two things to be greater than
14 green. Maybe it's white, or even yellow.

15 One of the things we captured in the very
16 last sentence in our guidance, if I can essentially
17 paraphrase, that what we're trying to say here is, is
18 that in any case, the staff should be honest and
19 forthright about the collective risk impact. But for
20 the purposes of entry into the action matrix, we may
21 end up with two green issues, which may not prompt
22 additional action. However, if the collective
23 significance of these independent issues was greater,
24 you know, was of some threshold that should prompt
25 some response, that response -- we have tools in our

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 inspection program to do that, tools that do not
2 depend on whether or not the -- do not depend on
3 decisions like this one as to whether or not we have
4 independent findings or a single finding. And that is
5 guided by Management Directive 8.3 which allows us to
6 initiate a special inspection in AIT, or even an IIT
7 as a response that is risk-informed, so if in fact we
8 have a significant issue here, risk-significant that
9 is dependent upon these multiple equipment
10 degradations, even before we know if there is a common
11 underlying cause or not, we have the tools in our
12 program to initiate an additional inspection to try to
13 get more information so that we can come to a
14 conclusion.

15 CO-CHAIRMAN APOSTOLAKIS: Now on this
16 issue, it may not be directly related, but I think it
17 is related. When I read the inspection manual on page
18 B-6, which is Appendix B and 7, there is reference to
19 follow-up. "The NRC normally follows up plant events
20 in three ways, events of low safety significance,
21 events of moderate safety, and events of greater
22 safety significance." Later on it says, "Plant status
23 purposes and identifying and understanding emergent
24 plant issues, current equipment problems and ongoing
25 activities and their overall impact on plant risk".

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And then later on on the next page it says, "The
2 supplemental element of the inspection program was
3 designed to apply NRC inspection resources either by
4 inspection findings evaluated using the SDP or when PI
5 thresholds are exceeded." Right, B-6 and B-7.

6 Now there is a lot of focus here on
7 events. Perhaps what we've learned from Davis-Besse
8 is that we should not focus on events alone, that
9 there is -- what if there is information that, you
10 know, like erosion of the head, the vessel and so on
11 and then it was discussed here and so on. It's not an
12 event at a particular plant, but there is this
13 information that is out there. Shouldn't the
14 inspectors take that into account when they decide on
15 supplemental inspections and so on? I mean, maybe
16 that would be a way of handling something like Davis-
17 Besse, not just focus on what's happening at the
18 plant, but also take into account outside information
19 that is relevant to the plant and ask yourself well,
20 are they doing anything about it? Should we have a
21 supplemental inspection regarding this?

22 You know, that's touching now on the issue
23 of safety culture and so on, but in a more pragmatic
24 and realistic way. What's the difference between
25 realistic and pragmatic? They sound nice. If you say

1 both of them, they sound nice.

2 MR. COE: I would agree.

3 MEMBER SHACK: Realistic could still be
4 unpragmatic. It frequently often is. To be pragmatic
5 you have to be conservative.

6 CO-CHAIRMAN SIEBER: Which would be this
7 side of the table. Right? Let me expand on that a
8 little bit. If some incident occurs in the Far East.
9 It would be pretty much of a stretch to expect every
10 licensee to be fully informed of that kind of an
11 incident. On the other hand, if there is information
12 that is issued by the NRC on that, or perhaps an INPO
13 SOER or SER, something like that, I think the
14 expectation from the staff would be that the licensee
15 should deal with that. And there used to be an
16 inspection module that followed up to see if licensees
17 actually did review all this information back in the
18 days when you had 100 information notices a year. I
19 would think that it would have to come to the licensee
20 in some official or semi-official kind of way before
21 you could include that as something you would expect
22 them to do or know about in the process of operating
23 the plant. Is that correct or incorrect?

24 MR. COE: That's correct. And we have
25 tools to do that. Clearly, an issue, an IEP, a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 bulletin, information notice as you say, regulatory
2 information summary. But typically for the
3 significant issues, we issue a bulletin which requires
4 a response. We also implement in many of those cases,
5 we implement a temporary inspection instruction to ask
6 our inspectors to go out and review the actions that
7 licensees took in response to that bulletin. And then
8 that instruction is closed out when all of those
9 temporary actions, or all of those inspections have
10 taken place. And then we evaluate whether or not,
11 based on the results of those inspections whether or
12 not we should make other changes to the program.

13 CO-CHAIRMAN SIEBER: On the other hand,
14 one the staff takes those actions, the licensee is
15 expected to respond to it, and you have the tools to
16 follow it up, and so the fact that some incident in a
17 foreign plant or domestic plant for that matter that
18 bears on a condition in the licensee's plant is
19 relevant and should be part of the ROP.

20 MR. COE: In some cases we would agree,
21 because we do benefit from operating experience
22 review. In fact, we're taking a very dedicated look,
23 re-look at how this agency in total handles operating
24 experience. And this is motivated in large part
25 because of the lessons learned from Davis-Besse, so we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 are taking a look at that. But we have -- my point,
2 I guess, is that we have tools in place now, and I
3 think that we're looking at how to employ those tools
4 more effectively or even to create new tools, if that
5 might be appropriate.

6 But I'd like to get back to Dr.
7 Apostolakis' point, because it is true that there may
8 be information and circumstances that help provide
9 insight and input to a decision on supplemental
10 inspection activities. But I would offer that the way
11 that that's done is that the initiation of
12 supplemental inspection continues to rest on the
13 objective facts, you know, the performance, the
14 particular degradation that the deficient performance
15 caused. And once that threshold is reached that, you
16 know, we come to the pre-determined conclusion in the
17 action matrix that we would initiate in supplemental
18 inspection, the focus and the specific activities of
19 that inspection. And this is a point that is often
20 lost in these discussions, is informed by everything
21 that the inspectors know to be true or know to be
22 problem areas in the plant that they're inspecting.
23 Our baseline inspection programs day-to-day are
24 informed collectively by the collective understanding
25 that a resident inspector develops on a day-to-day

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 basis at the site. The samples are chosen within the
2 baseline inspectable areas, you know, with an eye
3 towards trying to identify the most significant
4 problems that may exist at that site.

5 This is true of a supplemental inspection,
6 as well. The circumstances that prompted the
7 supplemental inspection are certainly clear, as is the
8 history and other, I guess you would put it
9 circumstantial evidence and information that would
10 imply maybe a deeper lying issue, and this forms, you
11 know, part of the basis for how that supplemental
12 inspection is conducted. So I would offer that that's
13 -- you know, I don't know if it satisfies the question
14 but that is how the program deals with that.

15 CO-CHAIRMAN APOSTOLAKIS: Well, even for
16 Davis-Besse though, I mean maybe it was not part of
17 ROP, but the NRC did ask for extra inspections. I
18 don't know if you want to call them supplemental. It
19 did. And then the argument was, you know, when to do
20 it. Should they do it in March, in February, in
21 January, on December 31st. Right? But that outside
22 the ROP wasn't it?

23 MEMBER SHACK: Yes.

24 CO-CHAIRMAN SIEBER: That was a bulletin.

25 MEMBER SHACK: That was a separate thing.

1 Right.

2 MR. COE: Are we talking about after the
3 head degradation issues were revealed?

4 CO-CHAIRMAN APOSTOLAKIS: No, before.

5 MR. COE: Before.

6 CO-CHAIRMAN APOSTOLAKIS: You know, the
7 issue of doing it by December 31st.

8 MEMBER SHACK: The inspection for the
9 cracking.

10 CO-CHAIRMAN APOSTOLAKIS: For the
11 cracking.

12 MR. COE: For the CRDM cracking. The
13 licensee's own inspection.

14 CO-CHAIRMAN APOSTOLAKIS: Yes.

15 MR. COE: I understand.

16 CO-CHAIRMAN APOSTOLAKIS: That was outside
17 the ROP. All I'm saying is perhaps we should think
18 about the language here that this is focused on events
19 or indications that people see at the plant, and those
20 may trigger a supplemental inspection. I'm saying
21 that it may not always be an event, may be some piece
22 of information, and I agree with Mr. Sieber that it
23 has to be transmitted through formal channels. We
24 don't expect those guys to read all the journals that
25 are published, and know everything that happens EBF or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 EPCO, but given the risk has happened, unless it's
2 something big like Davis-Besse where the inspection
3 was required now by a different group, shouldn't there
4 be a way here of triggering a supplemental inspection?
5 Maybe that would help us catch the big events. They
6 don't give you advance warning, but then, you know,
7 you realize after the fact that you came close to
8 something really bad.

9 MR. COE: It's a legitimate question.

10 It's one that's been on our minds from almost the very
11 start. The way that we articulate that question is
12 that there may be issues that a risk evaluation is so
13 difficult to do, to accomplish that the effort it
14 takes to do that, there's -- you start running into a
15 cost benefit issue here. How much -- do you continue
16 to invest money and dollars, and resources and time,
17 and it becomes more and more untimely as times goes on
18 to try to get to some answer. You know, there's a
19 question that's on the table, is there a cost benefit
20 crossover point where we just say it's not beneficial
21 to continue down this path. And there may be another
22 -- there may be a need for creating another mechanism
23 to prompt the supplemental inspection that you're
24 discussing. But the original objectives of the ROP
25 are still very much on our minds. We want it to be an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 objective determination, and the more you allow the
2 more subjective elements to enter into that decision
3 process, of course, the further away you get from
4 being objective. And we want it to continue to
5 conform, you know, with understandable, scrutable and
6 repeatable, or you know, consistency in how we treat
7 one licensee to the next. And so all of those -- it's
8 a classic engineering optimization problem. Right?
9 You've got all these competing goals and objectives,
10 and you're trying to find the right balance.

11 We haven't answered the question that I've
12 articulated, which I hope is similar to the concern
13 that you've expressed. And it is an action item on
14 our SDP Improvement Initiative to resolve that
15 question at some point in time, so that's the best I
16 can give you as an answer right now. It's a good
17 question.

18 MEMBER SHACK: I mean, since you're so
19 bound and determined to make this process risk-
20 informed, why aren't you adding up the risk from
21 everything that you find and using that as your
22 trigger?

23 MR. COE: In terms of the concurrent
24 findings that may exist?

25 MEMBER SHACK: Yeah.

1 MR. COE: I guess it has to do with having
2 to decide what goes into the action matrix, and all
3 the various combinations of the ways that issues can
4 arise, and what periods of time, and what various
5 individual significances they might have. And we felt
6 that the action matrix, and this is a good point to
7 make. The action matrix in a very high level way
8 aggregates and sums, if you will, the inputs that come
9 to it.

10 MEMBER SHACK: After I've screened it, and
11 screened, and screened.

12 MR. COE: After each -- after we've
13 decided that there is individual deficiencies that
14 meet from each other, and therefore, independent. And
15 therefore, their significance characterization is
16 analyzed independently from the others. But then we
17 input those collectively and we have an aggregation.
18 Now that doesn't necessarily catch the synergies that
19 may occur for some specific independent issues that
20 may -- there may be a synergy there from a risk
21 standpoint --

22 MEMBER SHACK: Synergy, smynergy. Risk is
23 a scaler. It's additive. I just add it all.

24 MR. COE: And that's --

25 MEMBER SHACK: Even if I'm only capturing

1 a portion of it so heck, if it's getting big already,
2 I know I've missed something else.

3 MR. COE: And that's essentially the
4 philosophy behind the action matrix. But our
5 difficulty from a program office standpoint was in
6 helping to decide when is a collection of issues to be
7 treated independently, and all provide independent
8 inputs to be aggregated in the action matrix, or when
9 should they all be lumped together into a single issue
10 and input into the action matrix as a single finding?
11 So we've tried to give some structure to the decision
12 process acknowledging that it's not cut and dry. I'm
13 not sure I've answered your question.

14 MEMBER SHACK: Well, you're determined to
15 be risk-informed, that you're only looking at your
16 risk one aspect at a time, you know, until you get to
17 this final action matrix, then you do some
18 combination. You know, if you were risk-informed, I
19 would think you would be looking at the aggregate.

20 MR. COE: And again, the golden rule here
21 is that we will be honest and forthright about any
22 collective significance that may come from multiple
23 degradations that occur at the same period of time.
24 If we choose to split those up and to be independent,
25 we have to be very clear about that we did that, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 why we're doing it.

2 CO-CHAIRMAN APOSTOLAKIS: In accident
3 sequences, or even the incidents we've had in the
4 past, you know, there's always a sequence of events.
5 It's not one thing. It's not clear to me that there
6 was a common underlying cause. The valve staying
7 stuck at Three Mile Island, what did that have to do
8 with auxiliary feedwater system being unavailable for
9 eight minutes? It was a different thing, yet a
10 combination of these things led to something. So why
11 then not analyze them as an aggregation of things,
12 rather than looking at the underlying cause? Now
13 again, an argument in the name of performance, you
14 might say yeah, I can look at these things separately,
15 but in the name of risk you have to look at them --
16 you know, I look at the plant at one instant. This is
17 what I find; therefore, risk is this. I remember
18 somewhat earlier you said that even when they're
19 treated separately, the inspectors are required to
20 actually do the aggregation, as well. Is that still
21 the case?

22 MR. COE: Well, the inspectors are
23 required to do --

24 CO-CHAIRMAN APOSTOLAKIS: Or the analyst,
25 the reactor analyst.

1 MR. COE: Yes.

2 CO-CHAIRMAN APOSTOLAKIS: Even if you have
3 two events and they are judged to be not to have a
4 common underlying cause.

5 MR. COE: Correct.

6 CO-CHAIRMAN APOSTOLAKIS: At some point,
7 there is a risk evaluation considering them
8 concurrent.

9 MR. COE: Right.

10 CO-CHAIRMAN APOSTOLAKIS: I thought that
11 was the case.

12 MR. COE: That is what we tried to capture
13 in the last sentence of the guidance. In all cases
14 the risk of concurrent multiple equipment or
15 functional degradations, and our basis for treating
16 these as either being common cause or being
17 independent should be documented in an inspection
18 report, so we want to be honest and forthright. If
19 there are these -- there's this collection of issues
20 created at a particularly significant period of time,
21 we want that to be very clear. But it goes back to,
22 I think what you were saying, the action matrix deals
23 with the performance of the licensee, and so it
24 wouldn't necessarily be appropriate if there were two
25 completely, at least in our way of thinking, have two

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 completely independent performance deficiencies that
2 could have happened at any period of time, but just
3 probabilistically happened to happen at the same time.
4 And in many cases, I'm not sure that there would be a
5 real significant difference in our action or our
6 response. At least the evidence to date suggests that
7 there wouldn't necessarily be a difference in our
8 response, that the combination of those two things,
9 whether we call them a single issue or two independent
10 issues, that we would have much of a different
11 response.

12 CO-CHAIRMAN APOSTOLAKIS: It's still not
13 clear to me, coming back to Davis-Besse, there were
14 indications like the air filters, containment and so
15 on, did the inspector supply this thinking there?

16 MR. COE: Well, I don't think so, only
17 because the issues at Davis-Besse arose over a period
18 of time which span both the old program and the new.
19 And the type of thinking that you're suggesting is
20 appropriate, we would suggest is appropriate also, to
21 think of or to observe how various indications of
22 degradation could potentially combine together to be
23 particularly risk-significant. And we would hope that
24 over time as the program provides the tools for
25 inspectors to become more risk-informed, that they

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 would be more sensitive to things like that.

2 I'm not sure how well that applies to the
3 specifics of Davis-Besse, because I mean, the fact
4 that they saw some coolers clogging up in the
5 containment, you still have to make the logical
6 connection to where that material is coming from, and
7 that it could potentially have come from the reactor
8 coolant pressure boundary.

9 CO-CHAIRMAN APOSTOLAKIS: That's good
10 thinking. Why didn't they ask that question? Why
11 didn't they say that? Because the moment you say
12 that, I mean, maybe risk analysis would tell you that
13 boy, we better look into it.

14 MR. COE: Exactly. And that comes from a
15 sensitivity to what could potentially be the
16 significance of a degraded reactor coolant pressure
17 boundary. Again, I would hope that over time our
18 inspectors, given the tools and the training that we
19 believe are appropriate, will come to a greater
20 sensitivity of issues that could be -- I mean, the
21 whole program -- the whole reason we have significance
22 determination processes that are publicly available,
23 laid out in a document for our inspectors, as well as
24 the licensee, as well as the public to see is to
25 provide a road map, a yardstick, if you will, of what

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 things are more significant than others. And we would
2 hope that our inspectors take those road maps and use
3 them to lead them in the areas of greater
4 significance, and to help them differentiate the
5 things that they probably don't need to pay as much
6 attention to from the things they really should.

7 CO-CHAIRMAN APOSTOLAKIS: Is there an
8 investigation going on now, how the -- what lessons
9 the ROP should learn from Davis-Besse? Is that what
10 -
11 -

12 MR. COE: Absolutely, yes. Yes, sir. We
13 have -- in fact, we're well along in that process, and
14 have been given the results of a very substantial task
15 force effort that has specific line items that have
16 been handed to the program office for direct oversight
17 process, and that we're taking a very specific look
18 at. And it involves utilizing operating experience
19 better, improving our ISI inspection procedure, and a
20 host of other things in terms of operator sens -- I'm
21 sorry, inspector sensitivity and training.

22 CO-CHAIRMAN APOSTOLAKIS: When do you
23 think this Committee will find out about this?

24 MR. COE: I don't know the answer to that.
25

1 I'm asking for some help.

2 MS. CARPENTER: Okay. I think the Davis-
3 Besse task group report is issued. And then what the
4 staff is now doing is taking all those recommendations
5 and we're putting them into action plans. And we have
6 a due date to the Commission with those action plans,
7 I think February 28th.

8 CO-CHAIRMAN APOSTOLAKIS: This February?

9 MS. CARPENTER: This February, right.
10 That's the action plan on all the items that we need
11 to do, and we're starting to work on those now.

12 MS. WESTON: That's just the action plan.

13 MS. CARPENTER: That's just the action
14 plan.

15 MS. WESTON: Not the responses to the
16 issues raised in the action plan.

17 CO-CHAIRMAN SIEBER: And you're referring
18 to the Lessons Learned Task Force.

19 MS. CARPENTER: Right. The Lessons
20 Learned Task Force.

21 MS. WESTON: Right.

22 CO-CHAIRMAN SIEBER: There is no other
23 task force.

24 MS. CARPENTER: No.

25 CO-CHAIRMAN SIEBER: Other than that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MS. WESTON: Right.

2 CO-CHAIRMAN APOSTOLAKIS: But I didn't see
3 there any statement as to why the inspectors at
4 Davis-Besse acted the way they acted. It just says
5 that the NRC failed in certain respects, so how can
6 you learn from that? Anyway, are we going to see this
7 plan?

8 MS. WESTON: Yes, we will.

9 MS. CARPENTER: That plan -- my guess is
10 that plan should become public. And the staff is
11 beginning to --

12 CO-CHAIRMAN APOSTOLAKIS: No, no, no. Not
13 as members of the public. Come on. Are we going to
14 review it?

15 MS. CARPENTER: I don't know the answer to
16 that.

17 CO-CHAIRMAN APOSTOLAKIS: I know I'm a
18 member of the public.

19 MS. WESTON: No, we will put it on the
20 agenda.

21 CO-CHAIRMAN APOSTOLAKIS: February 28th is
22 too close.

23 MS. WESTON: No, February 28th you will
24 only --

25 MS. CARPENTER: Just the action plan.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MS. WESTON: -- is only the action plan.
2 The EDO sent a letter back to research and NRR asking
3 them to do action plans for the issues that came out
4 of the Lessons Learned Task Force.

5 CO-CHAIRMAN APOSTOLAKIS: Okay.

6 MS. WESTON: So the only thing that
7 they're going to do there is to say this is our plan
8 to address those issues. There will be no issues
9 addressed in the February 28th --

10 CO-CHAIRMAN APOSTOLAKIS: And we will be
11 briefed after the issues are addressed?

12 MS. WESTON: When -- as the issues are
13 being addressed, hopefully.

14 MEMBER KRESS: I guess George's concern
15 is, have they identified the right issues.

16 CO-CHAIRMAN APOSTOLAKIS: The right
17 issues, and also, you know --

18 MS. WESTON: Well, you have to look in the
19 Lessons Learned Task Force for that. The 50 some
20 recommendations in there are those that -- with the
21 exception of two I think went forward. The Management
22 Task Force recommended that they look at all of those
23 issues with the exception of two.

24 CO-CHAIRMAN APOSTOLAKIS: It's not just
25 the issues though. It's also what you plan to do

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 about it. I mean, everybody keeps raising the issue
2 of questioning attitude, but what to do about it is a
3 monumental problem.

4 MS. WESTON: That's what the action plan
5 is supposed to address.

6 CO-CHAIRMAN APOSTOLAKIS: Okay. And
7 that's where I think we should --

8 MS. CARPENTER: In reality, the action
9 plans are only addressing the high priority items.
10 There are a number of items that were medium and low
11 priority, that many of the branches are already
12 beginning work on, that we're taking them -- we have
13 to make sure we budget the resources and everything
14 into these. So those action plans will only address
15 the high priority items. I'm thinking there are about
16 28 of those. But there are a lot of others that will
17 simply be put into our budget, and we're going to
18 start working on them. We are starting to work on.

19 MR. COE: And they go well beyond our
20 program.

21 MS. CARPENTER: Exactly.

22 MR. COE: I mean, ROP is a part of it, but
23 not the whole picture.

24 CO-CHAIRMAN SIEBER: Well, I think
25 fundamentally you're getting down to who has what role

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in the process of operating the plant. The resident
2 inspectors, there's usually a couple of them at the
3 plant, and a stenographer, and two people cannot cover
4 every minute aspect of the operation of the plant.
5 And so whether a filter clogs up some place, which is
6 not a regulatory event typically. That's just
7 something that is a maintenance or a service item,
8 whether that clogs up in conjunction to the fact that
9 somebody issued the bulletin, and you may have
10 suspected CRDM cracking, I'm not sure that one would
11 expect the ROP or even the resident inspector in his
12 normal function to be able to put all this stuff
13 together to say to the licensee, I think you have a
14 leak and your reactor vessel head is degrading.

15 I can see if he were qualified as an
16 operator on that plant, and that was his
17 responsibility, like operators are supposed to have it
18 as their responsibility, then he could put it together
19 because that's what operators do, and it's the
20 licensee who is supposed to operate the plant. And
21 the NRC is supposed to regulate how that plant is
22 operated. In other words, are all the programs and
23 processes in place. To me, I think there's a little
24 bit of confusion as to whether there should be an
25 expectation on our part that the resident inspector

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 should have deduced the fact that the head was being
2 degraded.

3 MEMBER BONACA: I agree with you, and I
4 think that, you know, hopefully this task force also
5 looks at the issue of whole strategy accepted by the
6 NRC for the CRDM cracking was the visual inspections.
7 And yet, at Davis-Besse the three top nozzles were
8 never inspected visually. They never accessed them,
9 so here you have a situation where we are setting up
10 for failure really plant personnel at the working
11 level, because they don't set the strategy as well as
12 the resident inspector and everybody else, by the fact
13 that a fundamental requirement to support the strategy
14 of just depending on visual inspections has not been
15 implemented, and has not been followed through. And
16 I'm not sure that I read that in the root cause, but
17 I think I can read it through some of the
18 recommendations, but it's not so explicitly stated.

19 MS. WESTON: With regards to the resident
20 inspector, that issue was discussed at length at the
21 Commission meeting last Wednesday on the Lessons
22 Learned Task Force, and the commissioners raised
23 several questions regarding what they would do about
24 the resident inspector and their learning process in
25 terms of being able to raise issues that they were not

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 capable of handling themselves outside of that
2 process. And with regards to the inspection part of
3 it, NRR is, in fact, taking another look at the
4 inspections at the plants. And we will hear more
5 about that later.

6 MEMBER BONACA: I know that now. I mean,
7 everybody is asking why we would do what the French
8 did. But, I mean, you know, that's however -- the
9 bigger issue is even though we had a different
10 strategy, why didn't we follow through by assuring
11 that in fact the inspection would take place? And
12 after 12 years or 10 years from the first finding of
13 this cracking, still those three top nozzles were
14 never looked at. I mean, that's a pretty significant
15 issue that sets up everybody else for failure, you
16 now, including, of course, the resident inspector who
17 is the guy who is not going to go up there and look at
18 it himself. He again is doing other things, and he
19 failed. Maybe we failed.

20 CO-CHAIRMAN APOSTOLAKIS: Another issue we
21 have raised in the past is this assumption that if the
22 safety conscious work environment has deteriorated, we
23 would see that in equipment performance. And I see th
24 is inspection manual repeating that. It says, "In
25 short, no separate and distinct assessment of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 licensee's safety culture is needed because it is
2 subsumed by either the PIs or baseline inspection
3 activities." And it's not even dated, so I presume
4 it's still draft. Should we really say things like
5 that now in light of what happened at Davis-Besse?
6 Shouldn't we just soften it a little bit and say that
7 maybe we are thinking about it, and what to do?
8 Because clearly, that's not the case.

9 MEMBER ROSEN: Where are you reading,
10 George? What page?

11 CO-CHAIRMAN APOSTOLAKIS: Page 11 of the

12 -

13 -

14 MR. COE: I think you're reading the draft
15 basis document.

16 CO-CHAIRMAN SIEBER: Right.

17 CO-CHAIRMAN APOSTOLAKIS: Well, it says,
18 "NRC Inspection Manual, Chapter XXXX."

19 MR. COE: That's the draft basis document.

20 MS. WESTON: It's the basis document.

21 CO-CHAIRMAN APOSTOLAKIS: So what does
22 that mean?

23 MR. COE: It means it provides the basis
24 for the rational and the basis for how we --

25 CO-CHAIRMAN APOSTOLAKIS: The very last

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 sentence of this section, "Safety Conscious Work
2 Environment", repeats this assumption.

3 MR. COE: Yes.

4 CO-CHAIRMAN APOSTOLAKIS: And, you know,
5 we questioned it in the past, and I wonder whether
6 after Davis-Besse we should still say that.

7 MR. COE: That is a subject that's on the
8 table for us to examine.

9 CO-CHAIRMAN APOSTOLAKIS: So why don't you
10 say that, that we are thinking about that. I mean,
11 that was a prior assumption, now we are --

12 MR. COE: Basically because the basis
13 document represents the current philosophy, the
14 current basis for the current program. We are saying
15 that we're -- you know, pursuant to our effort to, you
16 know, respond to the task force on Davis-Besse, we are
17 going to look at this. But I can tell you that early
18 in the program, you know, it made sense that if you
19 had cross-cutting issue problems at a plant, that they
20 would over time reveal themselves, and we expected to
21 pick up on those manifestations of that underlying
22 problem.

23 There was some thought given to how to
24 inspect safety conscious work environment directly
25 through the use of survey instruments, such as the one

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that the Office of IG utilized for the NRC staff, but
2 that was dropped from further consideration
3 principally because of the cost involved of exercising
4 that kind of an instrument, you know, at our licensees
5 over a period of time.

6 CO-CHAIRMAN APOSTOLAKIS: Its value is
7 questioned. I mean, if you go and ask somebody, do
8 you have a questioning attitude, what is he going to
9 say? No, I'm stupid, I never ask questions. Come on.
10 This is ridiculous. These surveys don't mean much in
11 my book, but coming back to your point though. I
12 think in many cases you're right, there will be
13 deterioration that will be observable some place.

14 Unfortunately, there are some cases, for
15 example, involving barrier integrity like Davis-Besse,
16 where you may not have this luxury of advance warning,
17 and this where, you know, we may want to do something
18 about it, but I don't think it's something that can be
19 resolved in a week or in a month. But I was just
20 struck by the statement. I mean, it's as if nothing
21 has happened. I mean, I know that this was the
22 position in the past, but I would expect it to be
23 softened by now. In fact, there is another statement
24 up there, possible indications of an unhealthy safety
25 culture include a high number of allegations of weak

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 employee concerns program and a high corrective
2 maintenance backlog. None of these would have caught
3 Davis-Besse, so drop it then. You don't need that.
4 Why do you have people like me criticizing that? I
5 mean, Davis-Besse is not -- I think it was a major
6 test of the ROP, and I don't think that you gentlemen
7 and lady think that way. I thought it was a major
8 test and it failed, and we have to do something about
9 it. And that's why it bothers me when I see these
10 things. I always -- my mind goes there and I say well
11 gee, a weak employee concerns program. That has
12 nothing to do with Davis-Besse.

13 MR. FRYE: This is Tim Frye from the
14 staff. Doug already mentioned this, but I just wanted
15 to re-emphasize that the basis document is trying to
16 capture the basis of the program as it exists today.
17 And it's also important to remember that it's a living
18 document. And that as the ROP changes, we'll be
19 looking to update the basis document to reflect the
20 changes we made. But, you know, right now that's the
21 basis of the current program. That's why it reads
22 that way.

23 MR. COE: I would offer -- I'm not sure
24 that the staff has yet concluded or will conclude that
25 the ROP was a failure with respect to its application

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 at Davis-Besse. You know, even the Commission
2 acknowledges that the issues at Davis-Besse occurred,
3 you know, well before the ROP came into effect, and
4 the previous program didn't necessarily identify this
5 underlying issue.

6 The ROP does have tools. Now again, we
7 are taking a look at how to improve the tools based on
8 our lessons learned from Davis-Besse, but currently
9 cross-cutting issues or cross-cutting aspects of
10 inspection findings are captured in a specific place
11 in our inspection reports. And those are accumulated
12 and then made available for the express purpose of
13 making available to our team inspections that look at
14 problem identification and resolution programs. So in
15 addition, we have an opportunity to discuss cross-
16 cutting issues with licensees at our mid-cycle and
17 end-of-cycle letters that we -- assessment letters
18 that we provide to the licensee every six months, so
19 these are the tools that exist, and perhaps we can use
20 them better. Perhaps there can be other tools that we
21 can conceive of that would help in this area.

22 MEMBER BONACA: I think, however, it seems
23 to me that we are looking at, you know, safety culture
24 and the stop gaps to a situation that had other
25 elements in it. And I brought up already one before,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 this lack of follow through. The whole industry, I
2 mean, we're really -- the way it was handled, the CRDM
3 cracking, the leakage, the assumptions that, you know,
4 boric acid would not corrode, evidently, you know, the
5 carbon steel. I mean, because of all the reasons, set
6 up the whole situation that cascaded in this. Now
7 then we're looking at safety culture as a stop gap
8 situation that will identify all these problems.
9 Clearly, it didn't. The only thing that surprised me
10 about davis-Besse is that there were no differing
11 opinion, that nobody raised this issue of concern
12 about clogging of the filters. It's almost like, you
13 know, for me there is organization walking lockstep,
14 and everybody had this full agreement on where it was
15 coming from. But, you know, I think that there was a
16 lot of situations that could have been recognized well
17 before that. If you look at the failure of the
18 program, and I'm not that what is taking place is
19 going to really identify that. And that to me, that's
20 really the root cause of the whole thing. Okay.
21 Again, the cracking of this -- I mean, if you think
22 about the whole process that was brought to bear and
23 everybody accepted, and dangerously, and set up all
24 those Davis-Besse people.

25 MR. COE: And I think that both the

1 industry and the NRC are owning up to their share of
2 the responsibility here, and that's reflected in the
3 task force's recommendations.

4 MEMBER BONACA: I'm not looking about the
5 past. I'm looking at what we need to do in the future
6 to prevent situations like this from occurring. You
7 know, because I mean there was a clear distinction
8 there between the way that the French went about it,
9 which was automatic inspection from day one, and that
10 resulted cascading into replacement of the heads very
11 quickly because it's too expensive to do automatic
12 inspections, from the way we did it here, we said we
13 are going to accept visual inspections. And then we
14 didn't eve put forth requirements to have proof that
15 these inspections were being done.

16 MR. COE: You'll have a opportunity, as
17 was mentioned, to review the task or the action plan
18 to respond to the task force's recommendations. And
19 I think it would be very useful to get your insights
20 on that task action plan to ensure that we are
21 covering all of the aspects that are important.
22 You're making some good points. I don't dispute that.

23 MEMBER LEITCH: Doug, could I go back to
24 something that you said a few minutes ago, at least I
25 understood you to say. I'm not sure I heard you

1 correctly; that in common underlying causes, you kind
2 of limit how far you drill down, I guess because if
3 you drill down far enough you can find a common cause
4 for almost anything. But by limiting how far you
5 drill down, don't you eliminate the potential to find
6 some of these cross-cutting issues, like safety
7 culture or management issues. It seems to me that you
8 have to be sensitive in that limitation because if you
9 don't find those kind of -- if you limit your look so
10 that you don't look deep enough to find those kind of
11 cross-cutting issues, it seems to me that you prevent
12 the ability to find some of these safety culture
13 management kind of issues.

14 MR. COE: It's a good question, and the
15 response is that although that we tried to set a limit
16 on how far you can drill down, as you say, that's a
17 decision result. Getting to that decision, I think
18 intrinsically means that you have to examine deeper
19 issues to try to come to the decision point. Is it or
20 is it not a cross-cutting issue? Is it a common issue
21 that we just lump everything together and call it one
22 issue? So you have to drill down deep enough in order
23 to make those judgments, and I would offer also that
24 our inspectors and our -- and their supervisors and
25 their managers continue to be sensitive to extent of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 condition questions, and cross-cutting issue
2 questions, and again, we have elements in our program
3 that they can avail themselves of to document those
4 kinds of issues, and roll them up over time, and talk
5 to the licensee in assessment letters, and use those
6 insights in our PI&R Inspection. So it's a very good
7 question, and those are the ways that the program
8 intends to try to deal with that.

9 MS. WESTON: Now, Doug, as a cross-cutting
10 issue, is any thought being given to documenting or
11 capturing the number of times that action items are
12 entered into from the tech specs? That's one of the
13 issues with Davis-Besse also. They apparently entered
14 tech spec many times. Is that going to be considered
15 as a cross-cutting issue when you look at the impact
16 that Davis-Besse may have had on the ROP, or what you
17 need to do about changes to the ROP?

18 MR. COE: Right. If there are issues that
19 keep recurring, obviously in our corrective action
20 program, for example, the equipment, you continue to
21 have to enter tech spec action statement, you know,
22 repeatedly over a period of time because of some
23 deficiency, or failure, or need to remedy some
24 problem. Then those kinds of issues are good sampling
25 opportunities for the PI&R Inspection. And all I can

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 say is that the PI&R Inspection affords us that
2 opportunity, and I believe it has specific guidance in
3 it that suggests that we look for those kinds of
4 things. A lot of those kinds of things come from our
5 insights that the residents gain over a period of
6 time. They know that certain things are problems.
7 They know that they reside in certain areas of the
8 licensee's plant or their organization. Those are all
9 inputs that are utilized and are useful to picking the
10 samples that we pick. I mean, there's only so much
11 time that you have in these inspections, and so you
12 have to make the most effective use of that time, so
13 we try to pick smart samples and use all available
14 information.

15 CO-CHAIRMAN SIEBER: On the other hand,
16 you could find a fair number of indicators that would
17 tell you maybe the safety culture here isn't very
18 good. On the other hand, the mitigating equipment
19 operates, meets its test requirements. You don't have
20 a lot of initiating events, and the licensee seems to
21 be getting by. If that's the case, then what does the
22 staff, including the resident inspector do with this
23 new insight they have given their inability to connect
24 the dots, would be the phrase we've heard over the
25 last few weeks.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. COE: And that's a good question
2 because we set a higher standard in the ROP for
3 connecting the dots. Clearly, the -- and even prior
4 to ROP, as a senior resident inspector, my inspectors
5 would often come to me with issues that, you know,
6 were not necessarily the smoking guns. It's a
7 feeling. It's like, you know, I think there's a
8 problem here.

9 CO-CHAIRMAN SIEBER: Right.

10 MR. COE: And so well, where's the
11 evidence? Okay. I mean, I can't go to the exit
12 meeting with the licensee and lay down that I have a
13 feeling that there's a problem here. Even before ROP
14 we set a higher standard for ourselves. Now in ROP,
15 we not only have to have the deficiency identified,
16 performance deficiency identified, but if it's -- you
17 know, if we're going to take further action in terms
18 of additional supplemental inspection, it has to reach
19 a certain threshold that we've pre-defined. So it
20 goes without saying that I think we set a higher
21 standard for ourselves, but knowing what we know as we
22 walk through the plant day-to-day, day in and day out,
23 gives us clues. And I can tell you, I have a deep
24 affinity that our inspectors face on a day-to-day
25 basis going into these plants confronting enormous

1 information, quantities of information. I mean,
2 everything they see, everything they hear, every
3 discussion they have with a licensee staff person
4 provides clues, and those clues are the things that
5 they have to pull together and connect the dots with.
6 And it's a very difficult challenge.

7 CO-CHAIRMAN SIEBER: Well, it's not only
8 connecting the dots. Maybe you firm up your suspicion
9 to some extent, but you don't find a violation of the
10 rules, and you don't find a risk significant
11 situation. I read a speech, as we all did I think,
12 about safety consciousness, safety culture which is
13 different than safety consciousness, is becoming an
14 issue because of Davis-Besse. The question is, should
15 you regulate it, and if you should, how do you
16 regulate it? And I think that that's a very, very
17 difficult problem that's been around since the mid-
18 1970s, and attacked and backed-off of, the subject of
19 negotiations between the industry and the NRC, and all
20 kinds of things. That's where INPO came from, so on
21 the other hand, I see it raising its head again.

22 MR. COE: And our colleagues in other
23 countries often take different approaches to the
24 direct observation, inspection, and in some cases
25 regulation of those kinds of elements, more subjective

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 safety conscious management type of issues. And we
2 acknowledge that there's different ways of going.
3 Recall again though that the ROP was driven by a
4 desire to be more objective and move away from that
5 because it was perceived by some as having given us
6 too much latitude, and it was not being consistently
7 applied.

8 MEMBER ROSEN: I would add to that
9 discussion that safety culture in aviation and
10 medicine has been recognized as a prime determinant,
11 and I happen to be holding in my hand a book by
12 Helmreich and Merritt called Culture at Work in
13 Aviation and Medicine, which talks a lot about how the
14 aviation industry particularly came to the conclusion
15 20 years ago that the culture of the cockpit, crew
16 resource management is important whether or not people
17 got to their destination site, so now we're faced
18 again with the same discussion.

19 CO-CHAIRMAN APOSTOLAKIS: We will have
20 this some other time.

21 MR. COE: Lessons to learn there.

22 CO-CHAIRMAN APOSTOLAKIS: Coming back to
23 the ROP.

24 MR. COE: Yes.

25 CO-CHAIRMAN APOSTOLAKIS: This basis

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 document again.

2 MR. COE: Yes.

3 CO-CHAIRMAN APOSTOLAKIS: Page C-3, "Use
4 of change in core damage frequency versus condition of
5 core damage probability." I'm not quite sure I follow
6 this. You have a number of findings, and you decide
7 there is a common underlying cause, let's say. Then
8 you have a choice whether you want to calculate the
9 CDF or CCDP. Is that -- that's what this says. "The
10 SDP can be used to estimate either CDF or the CCDP
11 given any plant configuration, which may include the
12 combination of degraded equipment functions and
13 equipment outages for maintenance." And then you
14 say, "The staff recommends the use of the estimated
15 change in CDF instead of CCDP." And I'm trying to
16 understand what does that mean?

17 MR. COE: The choice of using the change
18 in core damage frequency is derived from the need to
19 have a baseline core damage frequency that we accept
20 to be -- that we accept as acceptable that includes
21 periodic maintenance, et cetera, and over time there's
22 actual -- day-to-day there's a change, but on average
23 there's a baseline core damage frequency that includes
24 maintenance activities and other testing activities,
25 that sort of thing. And that what we're trying to do

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 is to measure the impact the licensee's performance
2 deficiencies had on public health and safety risk by
3 choosing a metric that is the increment of risk above
4 that baseline, that nominal baseline.

5 The way that's done is to take the CCDP
6 for the particular time period involved, and then that
7 CCDP is essentially normalized across the entire -- on
8 a per year basis to be compared to that nominal
9 baseline CDF, and then increment then is a delta CDF.

10 CO-CHAIRMAN APOSTOLAKIS: Is that the same
11 as saying I found that the unavailability of two
12 systems was higher than should be for a period of say
13 three weeks? Now what is the probability of having
14 the initiating event in that period? Because if I
15 have an initiating event, then I'm in trouble, so that
16 would be the CCDP. But then you normalize it over the
17 year because it was three weeks only. I mean what --
18 does the ASP do th same thing? The ASP calculates --

19 MR. COE: It does -- in essence it does
20 use the same metric. Although the -- remember that
21 we're also making a distinction between an event and
22 a condition. An event is always evaluated in terms of
23 the probability of core damage given that the event
24 occurred. And a condition involves all the range of
25 possible initiating events that may have occurred

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 during the time period the condition existed. But
2 that's not the way that I used CCDP just a moment ago.
3 What I used a moment ago was essentially condition
4 CCDP. I'm going to take events off the table for the
5 moment, because the SDP deals with conditions.

6 CO-CHAIRMAN APOSTOLAKIS: Are any of your
7 examples later involving conditions versus events,
8 because we have a number of them.

9 MR. COE: All of the examples are the
10 reactor safety SDP involved conditions, because that's
11 the only thing that the SDP analyzes for use by the
12 action matrix, is conditions. The moment in time,
13 probability of core damage when a particular event may
14 have happened is a metric of interest to us, and the
15 ASP Program will, in fact, attempt to evaluate that.
16 But it's not considered an input to the licensee's
17 performance, unless we can identify a particular
18 performance deficiency which resulted in some
19 degradation to the plant's design or function that has
20 contributed to that event.

21 CO-CHAIRMAN APOSTOLAKIS: But this
22 section, I must say, I don't understand. If CCDP were
23 used to characterize licensee performance, the result
24 would be inconsistent as it is influenced as much by
25 timing, that is plant configuration, as by deficient

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 performance. How can you avoid the issue of timing?
2 I mean, if the condition existed for a week, that's
3 different from a condition that exists for six months.

4 MR. COE: That is taking into account the
5 time, not the timing. What was meant by "timing" is,
6 if the timing of the deficiency happened to occur at
7 precisely the time that acceptable on-line maintenance
8 was occurring, the procedures in the SDP require that
9 you not include the unavailability of the equipment
10 that was -- which acceptable on-line maintenance was
11 being performed, because going back to what I said a
12 moment ago, the baseline nominal CDF includes all of
13 the -- probabilistically includes all of the
14 maintenance activities that go on over the year, so
15 that all the maintenance activities are normalized to
16 the nominal baseline CDF. And what we're trying to
17 measure is that increment that is due just to the
18 performance deficiency, and not due to the fact that
19 it happened to have occurred when on-line maintenance
20 was occurring.

21 There is a further mathematical treatment of
22 this particular point after this discussion, I think,
23 if we retained that. We did at one time.

24 CO-CHAIRMAN APOSTOLAKIS: I didn't see it.

25

1 I'm sure the inspectors or the reactor analysts don't
2 calculate delta CDF based on this guidance. This is
3 just a description of what's going on.

4 MR. COE: This is the basis. The guidance
5 basically says that if you have your deficiency during
6 a period of time of on-line maintenance, that you
7 disregard the fact that the on-line maintenance was
8 occurring. You only evaluate -- you evaluate the
9 increment of health risk --

10 CO-CHAIRMAN APOSTOLAKIS: Because you're
11 focusing on performance.

12 MR. COE: Yes.

13 CO-CHAIRMAN APOSTOLAKIS: You're
14 distinguishing it from risk. You are. You can't do
15 both.

16 MR. COE: We're focusing on the
17 performance aspect, and how that performance aspect
18 has contributed an incremental additional risk above
19 and beyond the nominal acceptable baseline risk for
20 the plant.

21 CO-CHAIRMAN APOSTOLAKIS: But in order to
22 do the risk part, you have to consider the fact that
23 it happened during some preventive maintenance period.
24 I mean, you know --

25 MEMBER SHACK: What you're saying -- I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 mean, when the guys goes to count the systems that
2 he's got available, he still counts the system that is
3 having preventive maintenance being put on it.

4 MR. COE: That's correct.

5 MEMBER SHACK: That's what you're really
6 saying. Although in the real world, it was not
7 available, because he's looking at performance.

8 CO-CHAIRMAN APOSTOLAKIS: But Doug says
9 no, I'm also looking at this. Well, you are in some
10 sense, but it's distorted.

11 MR. COE: If we allowed that to enter into
12 the SDP calculation, the on-line maintenance
13 additional impact to the risk for that period of time,
14 then the outcome of the SDP would be as much a
15 function of the particular happenstance of when the
16 degradation occurred due to deficiency, as it did on
17 the deficiency itself. It would be an influence on
18 the probabilistic timing of that event or condition.

19 CO-CHAIRMAN APOSTOLAKIS: So the risk part
20 should be affected by that. The performance part
21 should not.

22 MR. COE: And again --

23 CO-CHAIRMAN APOSTOLAKIS: The performance
24 has nothing to do with it, because this is --

25 MR. COE: Uh-huh.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CO-CHAIRMAN APOSTOLAKIS: It could have
2 happened some other place. But it seems to me that
3 you are really focusing throughout this on
4 performance, and you are using risk to do certain
5 things, but you're really focusing on performance,
6 which I think is appropriate. It's appropriate. It's
7 just that some of the stuff on risk is not too solid.

8 Like this Paragraph A here, "The reactor
9 safety cornerstone performance indicator thresholds
10 were based on the increase in annualized CDF. Thus,
11 in comparing and adding the effects of PIs and
12 inspection findings within the action matrix, is it
13 necessary to use the same risk metric."

14 In other words, we use risk to define the
15 thresholds for the PIs, and now we have the SDP
16 results of the risk. And because both of them are
17 based on CDF we can add them, although you don't
18 really add them. You consider them as a --

19 MR. COE: Yes, that's correct.

20 CO-CHAIRMAN APOSTOLAKIS: I don't have
21 anything else.

22 CO-CHAIRMAN SIEBER: Why don't we move on.

23 MR. COE: Yeah. We've gotten a little bit
24 away from I think the earlier discussion on concurrent
25 multiple equipment. And I think that unless there's

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 other questions about that, I think it would be useful
2 to move to the example.

3 CO-CHAIRMAN APOSTOLAKIS: But, Doug, again
4 the consistency of it all. The PIs you take a
5 frequency of one initiating event and you change is so
6 much so that you will see a change in CDF.

7 MR. COE: Independent of any other
8 changes.

9 CO-CHAIRMAN APOSTOLAKIS: Right. Then you
10 go to the SDP. Now you have a set of findings, and
11 some things happened to occur during a preventive
12 maintenance activity. And now you say no, I'm not
13 going to estimate risk based on what I see. I'm going
14 to assume that this equipment that's under preventive
15 maintenance is available, so I'm distorting the risk
16 assessment. Why does that make sense?

17 MR. COE: I would say that there is a
18 consistency aspect between the safety system
19 unavailability PI which measures the unavailability of
20 mitigation equipment to how the SDP would evaluate
21 that. And the SSUPI did use delta CDF because its
22 thresholds were set using a representative sample of
23 some risk models that included baseline maintenance.
24 In other words, nominal amount of maintenance, so what
25 you're trying to do is you're trying to set a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 threshold for unavailability that has some basis in an
2 increment of the risk that's over and above a nominal
3 plant risk. And we accept that nominal plant risk has
4 some maintenance activity going on during the year,
5 and so that concept carries over to the SDP in the
6 discussion we just had. So I would say that there is
7 a measure of consistency there, and that was the
8 intent. We can explore this further later on.

9 CO-CHAIRMAN APOSTOLAKIS: But that
10 unavailability will be averaged over the year, you
11 know, just to make a simple example. If you have a
12 two-train system and one is down for maintenance, and
13 now you have an activity that disabled the other
14 train. Okay? And you have no system whatsoever left,
15 both redundancies are gone. I mean, it seems to me
16 that to simply assume, you know, the average
17 unavailability of the first system over the year
18 doesn't measure the significance of the event.

19 MR. COE: And that's -- again, I'll return
20 to kind of the golden rule here. We're going to be
21 honest and forthright about the impact on risk of that
22 that you've described. And we have tools, such as the
23 initiation of a special inspection, and augmented
24 inspection team or an IIT, that deals with the
25 specific risk as best we can determine it or estimate

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 it in the early stages as an issue comes up. And we
2 have and we will continue to use those tools to engage
3 additional inspection resources to get to the bottom
4 of what's really going on, because your assumption was
5 that you were doing just acceptable maintenance on one
6 train, and then you had a deficiency that causes the
7 other train to become disabled. And one of the
8 questions is, is that assumption correct? Is that
9 maintenance being done? Is that being done just
10 because of preventive reasons, or is there really some
11 other reason that it's being done?

12 We need the full facts. We need to get
13 the whole picture, and then we make decisions about
14 whether the causes were related or not related, and
15 then we choose how to input them to the action matrix.

16 MEMBER BONACA: Because, I mean, it seems
17 to me also you have other considerations such as, for
18 example, in the original design these plants were not
19 supposed to be maintained half-power, and so
20 therefore, you really have set up a system of
21 tolerance of that situation, provided that you have,
22 in fact, a risk evaluation done ahead of time. And we
23 talked about that. I mean, if you have multiple
24 systems out of service, and in fact -- and that the
25 licensee takes care of protecting the redundant train,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and doing all those things that need to be done when
2 you're taking a system out of service, so you have a
3 lot of considerations you have to take care of. There
4 is a lot of responsibility of the licensee taking a
5 train out of service for maintenance.

6 MR. COE: Indeed there is, and we've
7 acknowledged that and provided the maintenance rule to
8 set some standards so that the licensee can perform
9 this kind of maintenance because we acknowledge that
10 there can be a benefit, a safety benefit from the
11 performance of that kind of maintenance, and so we've
12 accounted for that via the maintenance rule, and we
13 account for it in the SDP by allowance of it, and such
14 that it does not affect our evaluation of the risk
15 impact on the public, when we're really after that
16 increment that was due specifically to that
17 performance deficiency, and not due to anything else.

18 Okay. Mr. Chairman, move on?

19 CO-CHAIRMAN SIEBER: Yes.

20 MR. COE: Okay. Actually, I've got about
21 an hour to cover several examples, and we'll go
22 through these at a high level, but we'll try to get to
23 whatever level of detail you're interested in. And I
24 do have the detailed packages that the SERP panels
25 looked and reviewed, in case that I don't have enough

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 detailing in the slides.

2 I think what -- again going back to the
3 success objectives of the meetings, is to go through
4 these examples, not just -- we're going to start with
5 the reactor safety cornerstones, and then subsequently
6 hit the other cornerstones. But the idea here is to
7 give you a feeling for where our thresholds are in
8 terms of our response to, you know, how we respond to
9 a red finding, or yellow findings across cornerstones,
10 or white findings, so we've given some examples in
11 here of red findings and yellow findings that I'm
12 going to speak to, but I think it might be perhaps
13 more informative for you to consider that the
14 thresholds for all of the white findings, you know,
15 collectively to give you a sense of where you think --
16 whether you think the thresholds are about right or
17 not for the level of response that we're giving it.
18 And, of course, we're always interested in your
19 thoughts and insights on that.

20 To start with, the first example that we
21 have here is Example A. It starts on page 11. The
22 issue here was essential service water pump that
23 failed a surveillance flow test, and it was determined
24 that the licensee had allowed some Tygon tubing to
25 enter the intake bay and become lodged in the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 impeller. The essential service water system for this
2 particular plant provided cooling water to the diesel
3 generators, contained coolers, CCW heat exchangers, a
4 number of other -- it's a safety-related system so
5 this condition based on their evaluation existed for
6 approximately 132 hours, or about seven and a half
7 days.

8 The issue screened through the SDP logic
9 and resulted in a white. And if you'll turn to the
10 next page, that presented at a high level. First of
11 all, the Phase 1 screening logic was to ask the
12 question, does it represent an actual loss of safety
13 function for a single train greater than an allowed
14 outage time? And if that's true, then a further
15 analysis is required. In other words, we can't --
16 there's a potential for it to be greater than green
17 and, therefore, we want to do some further review.

18 When the Phase 2 analysis was applied,
19 what was identified was that of all of the sequences
20 that this deficiency or this degradation affected, the
21 one that was most dominating in terms of a risk
22 evaluation was the loss of off-site power sequence,
23 that essentially represents a station blackout that
24 persists for up to five hours. At that point, the
25 assumption is made that the core will become damaged

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 as a result of the loss of seal cooling, and the
2 resultant loss of coolant without recovering any
3 power. So in the Phase 2 level of detail, the loss of
4 off-site power frequency was given a value of three,
5 which represents ten to the minus three, and that was
6 a combination of the time; that is the 182 hours, and
7 the expected return rate or frequency of loss of off-
8 site power. So three represents ten to the minus
9 three essentially and higher, an order of magnitude
10 higher.

11 The emergency AC power is represented as
12 ten to the minus two, and that reflects the fact that
13 one of the trains of emergency AC power, that is one
14 of the diesels is rendered inoperable because of this
15 particular deficiency, such that if the loss of off-
16 site power occurred, this particular emergency
17 service, or essential service water pump that feeds
18 one of the diesel generators would also -- is already
19 disabled. Therefore, there's no -- it would not
20 support that particular diesel generator. So,
21 therefore, there's only one diesel generator left in
22 a loss of off-site power scenario.

23 And then finally, the recovery of AC power
24 does not occur within the five hour time period, it is
25 given a likelihood or probability of ten to the minus

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 one. That's represented by the one. If you add these
2 figures up, and these again represent the negative
3 logarithm of the actual values of probability being
4 used, you get three for the loss of off-site power
5 probability during that period of time, two for the
6 failure of the one remaining diesel generator, and one
7 for the loss or the failure to recover within five
8 hours. That represents a total of six, or ten to the
9 minus six, which represents the low end of a band that
10 represents the white significance level.

11 Now I will say that as in many cases, this
12 is a way of just talking about the influences, various
13 influences and assumptions that are built into the
14 staff's determination of the significance, the color
15 of the significance. In this case, as well as many
16 others, we do additional analysis with detailed
17 computer-based models. The licensee does analyses and
18 so forth. In this particular example, those analyses
19 supported this result, and I'll just leave it at that.

20 The dominating influences were similar,
21 and so we could rely on a computer-based model. We
22 could rely on the licensee's model, but none of those
23 -- neither of those would be as scrutable as the
24 representation that's given here in a very summarized
25 form.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER LEITCH: Suppose the Tygon tubing
2 had the potential to affect the other emergency
3 service water pump, how would that change the
4 analysis? Would that make the actual loss of safety
5 function a higher number?

6 MR. COE: Without knowing all of the
7 details, what I've read in the package would suggest
8 that there was a single Tygon tube attached to a
9 funnel that was being used near the intake structure
10 for this particular train. This happens to be the B
11 Train that was affected. Without knowing the plant's
12 arrangement and design, I'm going to somewhat
13 speculate that there was only the one tube, and it was
14 only going to go to that one pump. And if that's the
15 case, then there would not be a common cause
16 influence. But if there is a common intake
17 structure --

18 MEMBER LEITCH: That's my question, there
19 had been a common intake structure.

20 MR. COE: Right. If there was a common
21 intake structure, you know, with one Tygon tube, it
22 would be expected to have impacted only one of the two
23 pumps perhaps if there's a two train system. I know
24 that, and if there's only one essential service water
25 pump in each train, then it would only impact one in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 any case. If there was a difference; that is, if it
2 could have impacted the other one, and that would have
3 potentially represented greater significance because
4 of the loads that it served, then there might be a
5 difference. I don't know that that was the case.

6 MEMBER LEITCH: Yeah, I understand. I was
7 just wondering --

8 MEMBER SHACK: You would have lost the
9 two, and so you would have been a three plus one,
10 four. You'd have been very bad news.

11 MR. COE: It could have been worse if it
12 had been another pump that had a greater -- you know,
13 had greater loads on it, or could have been
14 potentially more significant to have lost that. But
15 in fact, what we are going to evaluate though still is
16 the actual degradation that actually occurred, and
17 that's a given. And the fact that that occurred
18 represents that loss of function for that period of
19 time. And then we look at all of the various
20 initiating events that could have happened during that
21 period of time. And in this case, it was the loss of
22 off-site power that came up as the one of greatest
23 significance.

24 In a more detailed evaluation, you would
25 have summed up all of the other sequences of lesser

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 significance, and you would have done that in a very
2 complete way, and so that's what the computer does
3 very well.

4 MEMBER WALLIS: It may be that there are
5 many sequences which are equally important. When you
6 add them up, you get a different answer than if you
7 just look at the --

8 MR. COE: That's correct. But in this
9 particular case, you know, checked against the other
10 more detailed models, risk models, both the licensee
11 and the NRC concluded that this was, in fact, a
12 dominant influence. But it does only represent that
13 Pump B was the one that was affected, and whether or
14 not it should have represented that there was a
15 possibility the other pump was -- could have been
16 affected, I don't know, but it wouldn't have made any
17 difference in any case, if only one pump could be
18 affected, and pumps were equal in all respects.

19 MEMBER KRESS: I have a couple of
20 questions about this. One of them is, does this
21 necessarily represent a poor performance of that
22 particular licensee? That's question number one.
23 Question number two is, suppose this licensee was
24 South Texas, and they had a CDF of ten to the minus
25 whatever, and its role -- a performance role of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 licensee could be viewed as to keep their CDF below an
2 acceptable value. Now with South Texas, this thing
3 would not even have gotten anywhere close to an
4 accepted value, for some other plant though that might
5 have exceeded an acceptable value. So the two
6 questions I have is, should we treat this differently
7 as a plant-specific issue? It should be different at
8 different plants rather than look at the delta. If
9 you had looked at the actual absolute value of CDF,
10 which would incorporate all those other things. And
11 in my view, what should the plant have done
12 differently that would have been better performance?
13 I mean, is this really necessarily a bad -- an
14 indication of a bad performing plant?

15 MR. COE: Well, to answer your second
16 question first, Dr. Kress, the performance deficiency
17 was noted to be that there was no procedure for
18 installing or removing the temporary drain hoses, and
19 that there was a lack of a questioning attitude the
20 length and the duration of the event. They had
21 several opportunities to question the location of the
22 Tygon hose and failed to do so.

23 This is a judgment, the fact that this is
24 being viewed as a performance deficiency, but the
25 staff's basis has been identified in the inspection

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 report.

2 MEMBER KRESS: I would have automatically
3 given those things some sort of performance criteria
4 that would have given probably more than white, rather
5 than going back to a CDF and --

6 MR. COE: That gets to your second
7 question, or the first question which I'll now answer.
8 And that is, would it be appropriate to represent the
9 significance on the basis of some absolute risk value?
10 And the choice that was made in this program is to
11 evaluate the licensee against their own nominal
12 baseline risk level that we believe is acceptable.
13 And it's acceptable if you assume that all of the
14 plant's design features are available, given that
15 there's some likelihood they might not perform when
16 called upon, and that's reflected in the probabilistic
17 values of failure probabilities and unavailabilities
18 that we apply in a risk model. So given that, each
19 plant is judged against it's own - and I think that
20 was a question that came up earlier - as against its
21 own licensing basis essentially. And that was felt to
22 be more fair, I guess, if you will than to try to hold
23 every plant to the same absolute standard when all
24 plants are designed with differences. And there might
25 be a range of acceptable risk, nominal risk values

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that are still acceptable depending on which plant you
2 go to.

3 MEMBER KRESS: I think this is another
4 reason that I would like to see the system divorced
5 from risk considerations, and actually be performance-
6 based.

7 MEMBER ROSEN: If you had a third train
8 here so that this thing wasn't risk-significant, would
9 you still feel better if you didn't --

10 MEMBER KRESS: Yeah. I would have still
11 thought the performance was bad.

12 MEMBER ROSEN: Wait a minute now. Let's
13 use the example you just raised. South Texas has
14 three safety trains, three ESW pumps, call them EC
15 pumps but it's the same thing. So what you do on your
16 bottom line there, your bottom bullet is, you have
17 three, plus two, plus two, not three, plus two, plus
18 one. So you end up with ten to seven, or ten to the
19 minus seven, which isn't white any more. And what it
20 does, it's green. It takes into account the fact that
21 the plant has more redundancy for essential services.

22 MEMBER KRESS: Yeah, but I would have said
23 that was bad performance in South Texas. It ought to
24 be a bad performance.

25 MEMBER ROSEN: It was bad performance.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. COE: It was. It's a finding.

2 MEMBER KRESS: Yeah.

3 MEMBER ROSEN: It's a finding, but it
4 gives the plant some credit for the installed
5 redundancy.

6 MR. COE: Correct.

7 MEMBER ROSEN: And you're suggesting we
8 should take that away, and I don't agree.

9 MEMBER SHACK: It doesn't help its
10 performance.

11 MEMBER KRESS: It doesn't help the
12 performance. That's right.

13 MEMBER ROSEN: No one argued that it did.
14 It's just properly -- the redundancy is properly
15 reflected. The plant's owners invested in the
16 additional redundancy. They should get some credit.

17 MEMBER KRESS: I think the assumption
18 ought to be that poor performance can override a good
19 plant design, and this sort of mixes them up, and I
20 don't think you should mix them up. I think you
21 should have performance being performance.

22 MEMBER ROSEN: I think the reality of it
23 is you have both performance and design. You can't --
24 tracks are stubborn things, Tom.

25 MEMBER KRESS: Yeah.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER ROSEN: The fact that those pumps
2 are out there, and are installed, and are safety-
3 related, you can't argue them away.

4 MR. COE: It gives us a more direct link
5 to public health and safety risk, which is really at
6 a high level. What the Commission asked us to do is
7 base our actions more on an objective measure, such as
8 that we could come up with, and this is the one --

9 MEMBER KRESS: Then we'd fall back on Bob
10 Christie's "Living PRA", and look at the CDF. I think
11 we all --

12 CO-CHAIRMAN APOSTOLAKIS: We look at the
13 risk.

14 MR. COE: That's right. We look at --

15 MEMBER KRESS: Well, look at LERF. I'm
16 sorry.

17 MEMBER ROSEN: The wind blows.

18 MR. COE: Well, these are good questions.
19 And actually, on the next page is a list of four of
20 the principal sensitivities that will change these
21 results. And I thought that this was valuable to you,
22 to give you a sense for -- to see how the numbers
23 racked up to give you a white.

24 If you go down these four bullets, for
25 one, the exposure time was seven days. If it changes

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 by an order of magnitude, then the result changes by
2 an order of magnitude. Okay? If it was 70 days, you
3 would be talking about a yellow instead of a white.
4 If it was only less than .7 days, we'd be talking
5 about a green. Okay? So that will influence -- the
6 actual facts of the matter will influence the
7 significance here.

8 MEMBER WALLIS: So if you get Tygon tubing
9 in your pump, it doesn't happen for very long, it
10 doesn't matter.

11 MR. COE: Not that it doesn't matter.
12 It's just that the significance, if it's .7 days
13 instead of seven days, you would expect the
14 significance to be just under the green/white
15 threshold, which makes it green. It's still a
16 finding. The licensee still has to correct it, but we
17 wouldn't necessarily implement a supplemental
18 inspection procedure. We would allow the licensee's
19 corrective action program to deal with that issue.
20 It's still a finding we still document in our
21 inspection report.

22 In addition, the mitigation capability you
23 mentioned, if a plant has greater redundancy, that
24 would influence the significance of this outcome.
25 Common cause effect would be an intrinsic aspect of

1 this analysis. If we found that this Tygon tube was
2 actually -- maybe there were multiple Tygon tubes that
3 impact or that could have impacted all of the pumps
4 simultaneously, that could have been taken into
5 account. There may have been an order of magnitude
6 effect there, and again, it could have bumped a order
7 of magnitude.

8 Recovery, in this particular case it
9 didn't apply because once the tube was wrapped around
10 the impeller, there was no chance that the operators
11 could recover, so they didn't get any credit for it
12 anyway. Had a different situation arose where there
13 may have been an opportunity to take recovery action,
14 we would have assessed that. And if it was warranted,
15 if we felt it was warranted, we may have given credit,
16 which might have taken that white to a green, if we
17 had given an order of magnitude credit.

18 MEMBER WALLIS: During this time, and it
19 failed a surveillance flow test, but presumably, the
20 Tygon tubing had been in there for some time before
21 the test was run?

22 MR. COE: As best I understand it, is that
23 the -- and I'm not sure of the exact time sequence and
24 time line, but somehow they were able to figure out
25 that the Tygon tube fell from its location and entered

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the intake structure 172 hours --

2 MEMBER WALLIS: So they worked back to
3 when it came in.

4 MR. COE: Yes, sir. Okay. The next
5 example is the tube failure or the tube integrity
6 problems. And although it's not represented in the
7 slides, this is clearly Indian Point Two. In this
8 particular case, and I'm going to make the distinction
9 again. We had an event that initially we thought
10 might be significant because tube ruptures in general
11 are typically -- the events themselves could typically
12 be significant. When we investigated the event
13 itself, we did find some problems with operator
14 response, but on the whole, the actual risk
15 significance of the CCDP for the probability that that
16 event -- given that that event, that the core could
17 have been damaged, was relatively low. However,
18 subsequent investigation identified that the tubes had
19 been degraded over a period of approximately two
20 years. And at the end of that two year period of
21 time, there was a tube rupture event.

22 This slide here on page 14 identifies that
23 there was a minor radiological release that was within
24 regulatory limits. It was about 146 gallon per minute
25 leak, which isn't -- it's not a double ended single

1 tube rupture. It was less than that actually, and
2 that has an influence later on here. But there were
3 some identified performance issues and, therefore, the
4 finding though that is the subject of this discussion
5 is the deficient tubes, the fact that tubes were
6 allowed to remain in service over a period of
7 approximately two years in a deficient state. And
8 that that was because of deficiencies involving the
9 licensee's in-service inspection program at their last
10 outage.

11 The Phase 1 process asks some screening
12 questions again, and in this case the finding
13 contributed to the likelihood of a primary system LOCA
14 initiator, and that automatically requires a Phase 2
15 evaluation. This is a trigger that we set a low
16 threshold on. A system LOCA is a potentially
17 significant event no matter what the circumstances,
18 and so we want to do further analysis, so we went to
19 Phase 2.

20 MEMBER WALLIS: So the bad performance was
21 having a deficient inspection program.

22 MR. COE: That's correct.

23 MEMBER WALLIS: I mean, this would never
24 have been discovered unless this tube had actually
25 failed?

1 MR. COE: I don't know that it would never
2 have been discovered, but we would hope that there
3 would be some evidence at some point in time, you
4 know, less than a tube rupture.

5 MEMBER WALLIS: There could be other
6 plants out there with the same deficient inspection
7 program who haven't yet had a tube failure --

8 MR. COE: Yes, indeed.

9 MEMBER WALLIS: You wait until they have
10 a tube failure before you diagnose that they have a
11 red situation?

12 MR. COE: No. In fact, I mentioned
13 earlier today that the inspection procedure for in-
14 service inspection review has been modified since this
15 event occurred to give added weight and added effort,
16 and further guidance, further detailed guidance to the
17 inspectors, so that we can potentially identify a weak
18 program at an earlier stage.

19 CO-CHAIRMAN APOSTOLAKIS: So it seems that
20 this event and this occurrence in Davis-Besse have a
21 lot in common. They both have deficient problems, and
22 they both refer to the pressure boundary.

23 MR. COE: Yes.

24 CO-CHAIRMAN APOSTOLAKIS: So clearly
25 there's a message there. We have to do something

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 about it.

2 MEMBER WALLIS: And Davis-Besse didn't
3 have a rupture.

4 CO-CHAIRMAN APOSTOLAKIS: No, but the
5 fundamental -- one of the causes was the deficient
6 corrosion inspection program.

7 MR. COE: Exactly right.

8 CO-CHAIRMAN APOSTOLAKIS: But the pressure
9 boundary, I think creates a unique problem. I mean,
10 coming back to this earlier discussion and the
11 assumption behind the safety conscious work
12 environment, the corrective action program and so on,
13 that if they are not very good there will be
14 indications, you know, deteriorating equipment and so
15 on. When it comes to the pressure boundary, you may
16 not be able to see that deteriorating until it's too
17 late. It's kind of a unique situation, and we have to
18 pay special attention to it, it seems to me. That
19 assumption doesn't seem to hold very well when it
20 comes to the pressure boundary.

21 MR. COE: Which assumption? I'm sorry.

22 CO-CHAIRMAN APOSTOLAKIS: The assumption
23 that I will see deterioration in the performance of
24 equipment if the safety culture is not very good.

25 MEMBER SHACK: Before something really --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CO-CHAIRMAN APOSTOLAKIS: Before something
2 really bad happens.

3 MR. COE: I understand. And we have seen
4 evidence before, pressure boundary degradations that
5 have not been -- you know, that resulted in events.
6 Of course, the CRDM nozzle leaking, I think somebody
7 had mentioned earlier, the Surry high-pressure
8 injection nozzle that had the circumferential crack in
9 it. These things cause evidence to occur, high leak
10 rates, high primary leak rates and that sort of thing.
11 And the licensee is responsible to follow those up,
12 and we're watching as they do.

13 I don't disagree that we perhaps need to
14 be more sensitive to pressure boundary degradation
15 issues, and I'll agree right now that what we do, my
16 hope would be that -- and anybody who can understand
17 that, you know, in a risk model, if you increase the
18 likelihood of a small break or a medium break LOCA,
19 that you get a fairly significant increase in core
20 damage frequency risk. It is fairly sensitive. Core
21 damage frequency is fairly sensitive to those
22 assumptions, and if those assumptions change, if the
23 frequency, or the probability or likelihood of those
24 initiating events increase, then we can easily get to
25 some fairly significant inspection findings. So

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 knowing that should prompt greater sensitivity to
2 evidence that occurs in a plant that suggests that
3 there might be pressure boundary leakage.

4 MEMBER WALLIS: How can you relate a
5 deficient program to CDF?

6 MR. COE: Only through the actual
7 degradation that we know has occurred.

8 MEMBER WALLIS: You have to then find the
9 degradation. The program being deficient itself has
10 no influence on your CDF, although it may be the root
11 cause of an ultimate problem.

12 MR. COE: A deficient program raises the
13 likelihood of a greater possibility of an actual
14 impact to plant systems. But unless we find that
15 impact, or identify it, or it self-reveals, you're
16 correct. A deficient program, we can comment that
17 perhaps the licensee isn't following a particular
18 standard, an industry standard, or that they might not
19 be even following their own internal processes and
20 procedures. And those might even be findings, but
21 typically they're not going to be greater than green
22 unless there's been an actual impact on safety
23 function.

24 CO-CHAIRMAN APOSTOLAKIS: So what was the
25 problem? Why was the inspection program deficient?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. COE: In the case of this example.

2 CO-CHAIRMAN APOSTOLAKIS: Yes.

3 MR. COE: Partly, I would say because the
4 industry standards for in-service inspection of steam
5 generator tubes is kind of a constantly changing thing
6 that sort of depends on the state-of-the-art. As time
7 goes on, the probes become better, the equipment
8 becomes better, the analysis methods become better.
9 At the same time, plants are different in the way that
10 they apply this equipment, and the way that -- and
11 they analyze the results. And some plants, there may
12 be a lot of noise in the system. There may be -- they
13 were having difficulty discriminating the defects from
14 the noise, that sort of thing. There's a signal-to-
15 noise ratio aspect of this finding that wasn't -- the
16 licensee's noise levels were fairly high in this case.

17 Again, this is all reflected in the
18 inspection report, and this has been going on for
19 quite a while. But what it has resulted in is
20 additional inspection guidance in this area, and we
21 hope that we're addressing some of these issues, and
22 increasing the sensitivity.

23 The other thing is, is that not all plants
24 have steam generators that are this old. And all of
25 them that do, are replacing them ultimately, or have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 plans to. So, I mean, over time we would hope that
2 the overall risk of steam generator tube ruptures gets
3 better.

4 In this particular case, the analysis
5 turned out to be red, and in fact, the assumptions
6 that the staff made, you know, were as much related to
7 core damage frequency as they were to large early
8 release frequency.

9 CO-CHAIRMAN APOSTOLAKIS: Isn't red about
10 ten to the minus four?

11 MR. COE: The red/yellow threshold for CDF
12 as we know, is ten to the minus fourth per year core
13 damage frequency.

14 CO-CHAIRMAN APOSTOLAKIS: This is yellow.

15 MR. COE: No, actually that's -- the large
16 early release frequency thresholds are an order of
17 magnitude lower. And in this case there was a
18 presumption of a one-to-one relationship between core
19 damage frequency and large early release, because if
20 core damage occurred because of a steam generator tube
21 rupture, it would be a direct path to bypass
22 containment through the safety relief valves. And
23 that's a somewhat conservative assumption, perhaps,
24 but it's for simplicity and for, you know, kind of
25 maintaining a standard across at PWRs. It's the way

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that we've based our SDP assumptions.

2 MEMBER ROSEN: Was it influenced by the
3 site population density?

4 MR. COE: No, sir, it was not. It was
5 only --

6 MEMBER ROSEN: It would not have been. It
7 would have been red at a site with very low population
8 density, as well?

9 MR. COE: You're talking about collective
10 risk. And no, sir. The metric is specific to the
11 plant itself, whether there's a large early release
12 potential there or not, or how much of one there is.

13 It does not -- the metric that we've chosen to use
14 does not depend on population density. It's an
15 interesting point, but it -- I'm not sure how we would
16 adjust the -- how we would predictably and
17 consistently make adjustments for population density,
18 because once you start doing that, you may have to
19 take into account prevailing winds and everything.

20 MEMBER ROSEN: You also have to take into
21 account the definition of LERF. Large early release
22 means before effective -- early means before effective
23 response measures can be implemented. At a site with
24 very low population density, it might have been
25 possible to implement effective response measures, so

1 you would not have had a large early --

2 MR. COE: You're exactly right.

3 CO-CHAIRMAN APOSTOLAKIS: You don't do
4 that on a site-specific basis.

5 MEMBER ROSEN: I'm just saying if this had
6 happened that --

7 CO-CHAIRMAN APOSTOLAKIS: Just take the
8 release categories and they say on a generic basis, if
9 this happens --

10 MEMBER ROSEN: One could argue --

11 CO-CHAIRMAN APOSTOLAKIS: It's generic.
12 I mean, it's not -- it should be plant-specific.

13 MR. COE: It may be a future refinement,
14 but right now we did not go to that level or degree.

15 CO-CHAIRMAN APOSTOLAKIS: So what does red
16 mean now?

17 MR. COE: For delta LERF it's greater than
18 ten to the minus fifth per year.

19 CO-CHAIRMAN APOSTOLAKIS: But then the
20 response -- shut them down?

21 MR. COE: Well, the red in this particular
22 case they shut down to replace their steam generators.
23 But the agency response was an inspection procedure
24 that essentially initiated essentially about a staff
25 year worth of direct inspection effort. And there's

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 even been some follow-up inspections beyond that that
2 have continued to examine some of their corrective
3 actions and their effort to improve their ISI program.

4 MEMBER ROSEN: Can I finish my thought
5 about your argument with the large early release? To
6 me, it's the same argument one makes with respect to
7 redundancy. It's a plant feature, the low population
8 density that can't be argued away by semantics. It
9 is, and this goes out and looks at it, so if you take
10 -- if you credit additional redundancy, and getting
11 down to the fine strokes and deciding between yellow
12 and red, for example, in a case like this, one ought
13 to consider the incontrovertible facts of low
14 population density.

15 MEMBER KRESS: Well, when they looked at
16 the LERF that corresponded to fatality, a safety goal,
17 they found that plants vary about that a factor of
18 four. For LERF they would meet the prompt fatality
19 safety goal depending -- and it's site-specific, but
20 that doesn't really count. That's an individual risk.
21 The LERF is an individual risk, and no matter -- and
22 you're only going to vary a little bit between sites
23 on that because it is an individual risk. One guy
24 there can raise it up, so what they ought to have is
25 something besides LERF dealing with those things, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 not to take into consideration the total population,
2 the total number of deaths.

3 MR. COE: One death is as bad as two.

4 MEMBER KRESS: Yes, you're basically
5 right.

6 CO-CHAIRMAN SIEBER: If you're the one.

7 MEMBER KRESS: If we're going to stick
8 with LERF, it's all right with me if they want to make
9 it across the board with all the plants. If they want
10 to do something that's more correct, they ought to
11 take into consideration the population.

12 MEMBER WALLIS: I'm trying to separate out
13 this Phase 1 and Phase 2.

14 MR. COE: Uh-huh.

15 MEMBER WALLIS: Their performance, they
16 had lousy performance because they had a poor
17 inspection program. But they could have had a steam
18 generator tube failure in spite of the fact they had
19 an excellent inspection report, that the steam
20 generator tube had just happened. It's no reflection
21 on their performance.

22 MR. COE: That's correct.

23 MEMBER WALLIS: And yet on the
24 probabilistic analysis, it still gives the same CDF
25 numbers.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. COE: Actually, we would never -- as
2 I mentioned I think earlier, we would never enter the
3 significance determination process unless we'd already
4 determined that there was a performance deficiency.

5 MEMBER WALLIS: Okay. So it's key that
6 they have this deficient inspection.

7 MR. COE: Yes, sir, it is. That's the
8 starting point, yes.

9 MEMBER WALLIS: Although the effect on
10 public safety of having a steam generator tube failure
11 is the same.

12 MR. COE: Yes, that's correct.

13 MEMBER WALLIS: So I'm not quite sure how
14 you're balancing risk and performance here.

15 MR. COE: We're measuring performance
16 using a risk scale. Again, we're forthright and
17 honest. If we have a steam generator tube rupture
18 that's spontaneous and is not linked to any
19 performance deficiency on the part of the licensee, we
20 have programs such as ASP, and we would stand up and
21 acknowledge what the significance, what we felt --

22 MEMBER WALLIS: But with the green -- you
23 cannot find any --

24 MR. COE: There would be no finding, there
25 would be no color.

1 MEMBER WALLIS: You cannot find there's
2 anything they did which led to it.

3 MR. COE: That's correct, because we're
4 measuring -- we're trying to measure licensee
5 deficient performance, and so you have to start with
6 that assumption. If you talk to the people who have
7 monitored and conducted the accident sequence
8 precursor program, one of the insights that they
9 derived, that they offered at the beginning of the ROP
10 was that that event will happen without any
11 correlation to a plant's performance. That event will
12 happen to good performers with as much frequency as
13 they happen to bad performers.

14 MEMBER KRESS: In that case, does NRC get
15 a red finding?

16 MR. COE: That's a good point. And, in
17 fact, if a steam generator tube rupture occurs through
18 no -- because, in fact, the licensee has complied with
19 all regulations and there is no deficiency in
20 performance, maybe the NRC does need to look at the
21 regulations. Maybe the performance levels and the
22 standards and requirements should be tightened.

23 CO-CHAIRMAN APOSTOLAKIS: This is the
24 classic question in quality controlling. Something
25 extraordinary is observed. The fundamental question

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 is, is it due to a systematic cause, or is it random
2 events, that you have to make a judgment as to what it
3 is. That's what you guys --

4 MEMBER ROSEN: The way this is said is if
5 you flip a coin ten times and it comes up heads ten
6 times, you have witnessed a rare event.

7 CO-CHAIRMAN APOSTOLAKIS: Or is the coin
8 biased. That's a question. Is it biased, or have you
9 witnessed a rare event? Do you think that all these
10 problems with the pressure boundary would go away if
11 the material experts did a better job?

12 MEMBER KRESS: Are you being Dana Powers
13 now?

14 CO-CHAIRMAN APOSTOLAKIS: I'm asking Doug
15 for an answer.

16 MR. COE: If he materials -- what, the
17 materials organizations in NRC, or the licensee
18 materials, the vendors?

19 MEMBER ROSEN: It's intended to provoke
20 our materials expert.

21 CO-CHAIRMAN APOSTOLAKIS: I managed to
22 provoke one. The other one --

23 MR. COE: We can always improve.

24 MEMBER SHACK: He works on BWRs. That's
25 his solution to the problem.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MR. COE: What is needed on the part of
2 both the industry and the NRC, is an aggressive effort
3 to find out the causes, and to understand the physics
4 of failure when these things occur. Every failure
5 provides a window of opportunity to increase our
6 understanding. And if we don't take advantage of
7 those windows of opportunity and really seek to
8 understand the physics of the failure, then we can't
9 decide whether our programs are good enough.

10 Let me move on to the next example.

11 MR. FRAHM: Did you want to go through
12 this?

13 MR. COE: I think we did. We already
14 covered -- all of those sensitivities apply to all of
15 these reactor safety examples, and can influence them.
16 They are the principal means of influencing, and I
17 offered them to give you a sense of sensitivity,
18 things that can change these results.

19 Example C, starting on page 16, was a loss
20 of instrument air, but in fact, this is also turns out
21 to be a red issue. And again, although we haven't
22 indicated it here, it's clearly the Point Beach. In
23 this case, the loss of instrument air actually has an
24 auxiliary feedwater system because the minimum flow
25 recirculation valves all fail shut on loss of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 instrument air. And if the pumps are being utilized
2 to restore and maintain steam generator level, and the
3 recirculation valves shut, at some point the operators
4 throttle back on the flow to the steam generators, and
5 then there's no -- and if there's no recirculation
6 flow, the pumps will burn up within a very few
7 minutes.

8 A number of things may cause a loss of
9 instrument air, in addition to a spontaneous loss of
10 instrument air, and that could be caused also by a
11 loss of outside power, loss of service water, or a
12 seismic event. These were considered during the SDP.
13 This condition was present since the initial start-up,
14 so in such a case we annualized the annual risk on a
15 per year basis. We don't try to accumulate risk over
16 prior years. Essentially --

17 CO-CHAIRMAN APOSTOLAKIS: The crucial step
18 I thought was always is th is a performance issue.

19 MR. COE: Correct.

20 CO-CHAIRMAN APOSTOLAKIS: Why is it a
21 performance issue?

22 MR. COE: Well, that's a good question.
23 I guess I could look up the specifics in here, but I'm
24 going to speculate just a little bit that -- I don't
25 know how it's actually articulated in the official

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 documentation, but this is a design deficiency in
2 which there was a number of opportunities over the
3 period of the plant's operation since start-up to
4 identify this. It's essentially a failure modes and
5 effects analysis kind of a result, where you conclude
6 that there's a -- to be a substantial impact, risk
7 impact or safety impact due to the single failure.

8 MEMBER ROSEN: This is a license design.
9 Right?

10 MR. COE: Yes, this is a license design.

11 CO-CHAIRMAN APOSTOLAKIS: He's not saying
12 that the performance issue was the design itself. It's
13 the failure to find the deficiency --

14 MR. COE: That's correct. And I believe
15 that's the way it's articulated. In fact, the
16 license --

17 MEMBER LEITCH: Also, with respect to the
18 lack of the operating procedures warning the operator
19 about this potential. I thought it related -- the way
20 it got to performance was through inadequate operating
21 procedures.

22 MR. COE: It could. That may be. It
23 actually was identified by the licensee's PRA staff,
24 by the way, but it was -- the conclusion I think that
25 the staff drew was, that they had a number of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 opportunities up to that point.

2 Now the question here as to whether or not
3 this can -- this was -- there is a provision, and I'm
4 not really prepared to talk about it here, that this
5 was a -- could be considered an old design issue.
6 There's some credit that can be given under the terms
7 of our assessment process that allows some
8 consideration of the fact that they found this through
9 a program, or through a means that was over and above
10 the normal routine expectation that the agency has for
11 these kinds of activities, design review activities.
12 That decision hasn't been made yet. Okay.

13 Whether we -- and there's -- I'm not
14 prepared to go in all the reasons why, because that's
15 still pre-decisional, but there is a finding here, and
16 it does relate to missed opportunities to identify
17 this condition. I can't put my finger on it in the
18 package right here, but --

19 CO-CHAIRMAN SIEBER: It seems that as we
20 go along through the process, one of the deficiencies
21 of reactor oversight, whether it's this program or the
22 SALT program, or anything else, this one in particular
23 is that it's not particularly timely. You know, the
24 event occurs or the deficiency is found, or a
25 violation is found, and if it has more than one order

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of complexity to it, it seems to take forever. You
2 know, it seems to me that that's not good. It's like
3 spanking your dog two days after he wets on the
4 carpet. And maybe -- is there some hope that the
5 process would ever speed up?

6 MR. COE: Yes. The answer is yes. And
7 we've acknowledged from an early point that we need to
8 improve timeliness. The Commission has reminded us of
9 that. The implementation of the SDP improvement
10 initiatives are designed to deal and address each of
11 the elements that we see as providing untimeliness, a
12 factor of untimeliness. Part of it involves just
13 getting more clear on what the risk characterization
14 process is or should be. And coming to perhaps a
15 better balance of how detailed our analytical
16 calculations have to be relative to the judgments that
17 are being made, and all of the uncertainty that
18 exists, that we acknowledge exists, both the epistemic
19 and the aleatory, and to be able to continue to get to
20 a decision point even in the face of those
21 uncertainties. As long as we recognize them, we
22 acknowledge them, and we agree that we can make a
23 judgment and move forward.

24 Now it is always the staff's judgment. We
25 invite perspectives from the licensee because they

1 often have good information to provide, and so we do
2 solicit and invite that. Our program, you know, allow
3 for that, and in fact, requires it. So can you get to
4 a more timely result? We're going to try to find all
5 the things that we can do to improve the efficiency to
6 get to a decision faster.

7 CO-CHAIRMAN APOSTOLAKIS: So you did the
8 Phase 2 and you concluded it was red. I think the
9 message here is that we are focusing on the fact that
10 there was a performance issue, because they missed a
11 number of opportunities for finding those design
12 deficiencies. But at the same time, we're saying
13 look, this is not like the old SALT or other ways we
14 used to use, where just the fact that they missed it
15 is good enough for taking some action. The fact that
16 they missed them, and it was a safety-related issue
17 makes it important, so in that sense the process is
18 focusing on performance, but is risk-informed. That's
19 the way I see it.

20 In other words, the calculation of the red
21 only sends the message that for certain things you
22 have to be more careful than others. Just like
23 missing things may be, you know, you missed something
24 but it was not important. That's fine. This is an
25 industrial facility, after all, but when it comes to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 safety, you know, you have to be risk-informed
2 regarding what you're missing.

3 MR. COE: I would agree, except I would
4 say it's not that it's fine. They still --

5 CO-CHAIRMAN APOSTOLAKIS: Oh, it's not
6 fine, but it's not of the same importance.

7 MR. COE: It's not of the same importance.
8 And if we act as an agency in a risk-informed fashion,
9 then there's an expectation, a natural one that the
10 licensee will also act in a risk-informed fashion,
11 will pay more attention to the things that are more
12 important.

13 CO-CHAIRMAN APOSTOLAKIS: But my point is
14 that the focus here should not be on the red. The
15 focus should be on the original cause that you
16 identified, which occurred in a circumstance that was
17 risk -- I don't know if it's significant but relevant,
18 risk relevant. If you put it that way then I think
19 you're really focusing on performance throughout. And
20 risk is just a supplementary piece of information that
21 helps you discriminate as opposed to the old case
22 where a violation was a violation. Missing something
23 was missing something, independently of its
24 significance.

25 See the danger that I see here is because

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of these equations, and the two, and the three, and
2 the parentheses, and blah, blah, blah. Maybe people
3 will focus too much on this stuff, forgetting the
4 reason why we're doing all this.

5 MR. COE: That's a good point, and the
6 focus needs to quickly get to an assessment of how we
7 grade the significance of this issue so we can move,
8 so the licensee can move on, we can all move on to
9 correct the problems. Okay? Because that's our
10 ultimate intent, is that the licensee correct these
11 problems. And so I don't think I would disagree with
12 anything you say. I think that's what we're trying to
13 achieve. If we act in a risk-informed fashion, the
14 licensee will act in a risk-informed fashion too.
15 That's our goal. And so I would have to agree.

16 CO-CHAIRMAN SIEBER: What I'd like to do
17 is, being that lunch time is fast approaching and we
18 have a number of examples to go, it would be good if
19 you could finish up instrument air, and perhaps do one
20 other.

21 MR. COE: Sure.

22 CO-CHAIRMAN SIEBER: And the one that I
23 would be interested is Example F.

24 MR. COE: F.

25 MR. FRAHM: Actually, that's going into

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 this afternoon's portion.

2 MR. COE: Is after lunch.

3 CO-CHAIRMAN SIEBER: Oh, okay.

4 MR. COE: It's after lunch. We'll get to
5 that.

6 MR. FRAHM: Doug is only handling the
7 reactor safety SDPs which include the first five, so
8 there would only be two additional ones.

9 CO-CHAIRMAN SIEBER: WE'll deal with that
10 --

11 MR. COE: I only have -- I'm at the end of
12 this one.

13 CO-CHAIRMAN SIEBER: Okay.

14 MR. COE: And I just have two more, and
15 they're relatively simple, I think.

16 MR. FRAHM: It will be right after lunch.

17 MR. COE: The loss of instrument air is
18 represented here in a Phase 2 level of detail just to
19 give you a sense of where the -- what the
20 significance, the risk significance derives from. And
21 in this case, the accident sequence of greatest
22 concern is the loss of instrument air, the spontaneous
23 loss of instrument air, and with no remaining aux
24 feedwater capability. That was confirmed by the
25 licensee's more detailed analysis, using the more

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 detailed risk models, and our own, as well. But this
2 is a high level representative of the drivers, the
3 risk drivers for that issue. And that's really all I
4 need to say about that example.

5 The next example is a little bit of a
6 different one. It's captured under the mitigation
7 cornerstone because it's operator requalification or
8 operator performance kind of a deficiency, and
9 operators in this context are considered part of the
10 mitigating strategy or mitigating systems of the
11 plant.

12 In this particular case, the SDP was
13 developed in consonance with some industry dialogue.
14 This was -- there was an opportunity for the industry
15 to comment and interact with us as we developed this
16 particular SDP, and it's fairly cut and dry. And
17 essentially --

18 CO-CHAIRMAN APOSTOLAKIS: Could you send
19 it to us? I'm curious how you developed the risk
20 metric that reflected this particular failure. What
21 did you do, you changed the operator error rate?

22 MR. COE: I'm not -- no, I don't know.
23 Let me put it that way. I'm pretty sure that we did
24 not change the operator fail rates because that is not
25 part of the basis, I think, that we provided in the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 basis document, although it's been a long time since
2 I read that portion of the basis document.

3 I don't know to what extent you've had a
4 chance to examine this particular SDP, other than --

5 CO-CHAIRMAN APOSTOLAKIS: Can we have this
6 SDP? Can we have it sometime in the next couple of
7 weeks?

8 MR. COE: Yes, absolutely.

9 MR. FRAHM: 609, Appendix I.

10 MR. COE: Appendix I.

11 CO-CHAIRMAN APOSTOLAKIS: What does IMC
12 stand for?

13 MR. FRAHM: Inspection Manual Chapter.

14 CO-CHAIRMAN APOSTOLAKIS: No we can look
15 at the chapter, but I would like to see the actual
16 SDP.

17 MR. COE: It's Appendix I of Manual
18 Chapter 0609.

19 CO-CHAIRMAN APOSTOLAKIS: It's based on
20 Appendix I, but can I see the actual SDP for this
21 event?

22 MR. COE: Actually, if you turn the page
23 to the next page, there's a table which essentially
24 represents the SDP. The particular issue in question
25 was the high failure rate during annual simulator

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 examinations as part of the licensee requal.

2 CO-CHAIRMAN APOSTOLAKIS: I understand
3 that, but SDP produces CDFs.

4 MR. COE: Not in this case. This is an
5 example of essentially of a performance-based SDP in
6 which there really wasn't a good mechanism across the
7 board to create a generic SDP -- I'm sorry, to create
8 a plant-specific SDP for these kinds of issues, so a
9 generic SDP was created, and it was built from
10 essentially judgment, and not from a particular risk
11 analysis or evaluation.

12 CO-CHAIRMAN APOSTOLAKIS: But you have
13 observed a high crew failure rate.

14 MR. COE: Yes.

15 CO-CHAIRMAN APOSTOLAKIS: Why did you need
16 a color to decide. Why go through the pain of
17 developing the color, since it's something that's
18 really very difficult to quantify. Did you gain any
19 additional insights or did you decide your first
20 reaction was to do AB, and then the color says oh, no,
21 you should also do C and D? I mean, in a pragmatic
22 way again, do we always have to develop a color?

23 MR. COE: When we have an inspection
24 procedure that goes to look at a licensee activity
25 that's governed by our regulations, there should be a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 way of adjudicating the findings that come from that
2 in terms of their significance. And I will admit that
3 we don't have that in all cases. We don't have
4 necessarily an SDP for spent fuel issues, for example.
5 So we're continuing to work on those kinds of things,
6 but in this particular case we do inspection of
7 requalification programs, and we generate findings.
8 And in this case, the operator licensing people who
9 manage this program felt that they needed -- that this
10 was an SDP that they needed in order to adjudicate the
11 findings coming from that inspection. And when we
12 find high failure rates, it certainly prompts our
13 questioning and our evaluation, and so we needed a
14 consistent predictable scrutable way in which we can
15 grade licensee performance. So we account for in this
16 SDP, if you'll notice on the table, we account for the
17 fact that licensee may have any number of operating
18 crews, and so we gauge our significance
19 characterization on the number of crews that failed
20 our simulator exam relative to the number of crews
21 that they have, so it's like a percentage.

22 MR. SATORIUS: Doug, if could help here
23 too, our operator licensing person is not here.
24 Apparently they went to lunch, but in the past, we
25 would perform examinations of requal programs. And

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 occasionally there would be unsat requal programs, and
2 there was a certain level of effort of follow-up
3 inspection that was performed as a result of those
4 unsatisfactory requal programs.

5 My thought is, is that this table captures
6 what had been learned through experience of examining
7 requalification programs, determining if they're
8 satisfactory or not, and what levels determined when
9 they were unsat, we would undergo a certain inspection
10 effort to assure that they reached the quality that
11 would be considered satisfactory again, so that's what
12 this table was derived from, that experience that was
13 gathered through inspecting requal programs.

14 CO-CHAIRMAN APOSTOLAKIS: How come there
15 is no red? And you guys are resisting so much
16 removing the reds from the performance indicators.

17 MR. COE: Some performance indicators
18 don't have red values either. This was a case where
19 the level of effort --

20 CO-CHAIRMAN APOSTOLAKIS: Well, we have a
21 precedent. Now we're negotiating the price. Can you
22 remove it also from the frequency of initiating events
23 since you've already done it?

24 MR. COE: This particular SDP, I think
25 that the judgment was made that the 95-003 level of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 effort, which again constitutes about a staff year
2 worth of direct inspection effort, not to mention all
3 of the documentation and prep that goes with that, was
4 too much. It wasn't necessary to focus on a very
5 specific program that had fairly definite boundaries.

6 CO-CHAIRMAN APOSTOLAKIS: Twenty-five
7 transients is too much. It's the same logic.

8 MR. FRAHM: Point taken.

9 CO-CHAIRMAN APOSTOLAKIS: It's the same
10 logic.

11 MEMBER KRESS: On this table you here,
12 this matrix, give me a little bit of information on
13 the vertical axis. For example, if I look at the four
14 or five level on that vertical axis, does that mean
15 that plant only has five operating crews, or does it
16 mean that they only gave five tests to the number of
17 operating crews they had?

18 MR. COE: The answer to that should be in
19 the definitions for this SDP, and all I'm showing here
20 is the table, so I'm at risk of giving you the wrong
21 answer if I try to --

22 MR. SATORIUS: I can help here, and that
23 is the requl -- the regulations that require
24 operators to undergo a requl program, and I don't
25 know that periodicity, but they don't have to do it

1 every year, so that would --

2 MEMBER KRESS: But there is a control over
3 -- given how many crews they have, there's a
4 regulatory control over how often they have to be
5 tested.

6 MR. SATORIUS: That's correct.

7 MEMBER KRESS: So you don't have to --

8 MR. SATORIUS: So in other words, a
9 facility may have, I'll just pick a number, 13 crews.
10 And once again, these are just illustrative examples.
11 Five or six may have to every year cycle through a
12 requal program, so that's what you get for the left
13 hand. That's the number of crews that took the test.

14 MEMBER KRESS: And I would have thought
15 that might be a performance indicator as to whether
16 they actually did that, but I presume there's such
17 controls on that that there's no way they'd miss --

18 MR. SATORIUS: Well, I wouldn't say no way
19 because I was involved on July the 4th on an issue at
20 Dresden where we had to issue 53 notices of
21 enforcement discretion because the licensee had read
22 the dates wrong and failed to administer requal exam
23 within the periodicity.

24 MEMBER KRESS: Now that to me would have
25 been a performance indicator.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CO-CHAIRMAN SIEBER: Just to clear up the
2 record, every operator who is licensed goes to a
3 requal program every year.

4 MR. SATORIUS: That's true.

5 CO-CHAIRMAN SIEBER: And it's a licensee
6 run program. And there is an exam associated with
7 that program, a simulator exam and other exams. And
8 on the other hand, the NRC oversees a certain portion
9 of those every year, and so this comes to the portion
10 that the NRC oversees.

11 MEMBER KRESS: They also --

12 MR. SATORIUS: That's a good
13 clarification.

14 MEMBER KRESS: They also approved the
15 licensee's specific tests, don't they, before?

16 CO-CHAIRMAN SIEBER: That's correct. You
17 submit and they say yes or no to the questions.

18 MEMBER WALLIS: I'm very surprised at the
19 levels here as a naive member of the public. If part
20 of them fail you give the green. If a third of the
21 school bus drivers fail their driving test in my town,
22 I don't think that's an insignificant event.

23 CO-CHAIRMAN SIEBER: Don't ride the bus.

24 MEMBER WALLIS: Why are you so soft?

25 MR. COE: Actually, the particular plant

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in this example didn't think -- thought we were pretty
2 harsh in awarding a - what was it, a yellow?

3 MEMBER WALLIS: I would think if one of
4 them fails, it's a significant event.

5 CO-CHAIRMAN SIEBER: Well, what happens is
6 that the operator who fails cannot operate until he
7 undergoes remedial training and takes another exam.
8 It's like the school bus driver who just got his
9 license revoked - okay - or suspended until such time
10 as he could demonstrate or she can demonstrate that
11 they can operate --

12 MEMBER WALLIS: This guy has been
13 operating until he took the test.

14 MEMBER LEITCH: That's right. What this
15 is, is number of crews too. This is not particular
16 operators. I mean, we're talking here about simulator
17 performance, so what you do is evaluate the crew
18 competence, not particularly an individual -- not
19 necessarily -- in fact, not at all an individual
20 operator. You're looking at the performance of the
21 crew on the simulator which may be a licensed operator
22 and an STA or something in the simulator.

23 MEMBER WALLIS: Well, I don't know what
24 the test is, but if it means that if they were faced
25 with an accident that 30 percent of the time they'd

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 make the wrong decision and you still give them the
2 green, that doesn't sound good to me at all.

3 MR. COE: And actually, in this particular
4 case the licensee thought we were harsh because the
5 reason that they failed their operators in these cases
6 weren't necessarily because they failed to perform
7 critical tasks correctly. There were infractions of
8 lesser significance that they used in their own
9 evaluation process to cause them to fail. And so part
10 of that argument coming back to us was that well, you
11 know, they really didn't fail anything really
12 critical, and we -- you know, we set a higher standard
13 for ourselves, so they thought they'd actually get
14 some credit for that. But we established the SDP
15 based upon their own determinations of their failure
16 criteria.

17 CO-CHAIRMAN SIEBER: I would point out
18 that we only get 30 minutes for lunch today, and if we
19 break right now we'll just get the 30 minutes. Any
20 further discussion beyond this will encroach on that
21 length of time. Now I don't think there is time to
22 talk about fire suppression. We have an hour after
23 lunch. You amongst yourselves of the staff can decide
24 whether you can deal with EP, rad con and fire
25 suppression at the same time.

1 MR. COE: At the end of the day --

2 MS. WESTON: You have one hour after
3 lunch, and then one hour after our break, so you know
4 we have two hours to finish your's.

5 MR. COE: And if at the end of that time
6 you want to come back and look at this example, we can
7 do that.

8 MEMBER ROSEN: Given the fire protection
9 subcommittee's comments on fire suppression and SDP I
10 would particularly like to go through this one.

11 CO-CHAIRMAN SIEBER: Well, why don't we
12 take our luncheon break now and come back at 1:00, and
13 then we could continue on where we're at.

14 MEMBER SHACK: Will we release Doug if we
15 go through this one now?

16 MR. COE: No, I'll come back.

17 MEMBER SHACK: You'll be back in.

18 MR. COE: Yes, I'll be back.

19 MR. FRAHM: Doug is a key member of the
20 team.

21 MR. COE: I'll be happy to cover that
22 example.

23 CO-CHAIRMAN SIEBER: Okie-doke. Okay.
24 Let's recess until 1:00.

25 (Off the record 12:32 - 1:07 p.m.)

1 CO-CHAIRMAN SIEBER: I think we have our
2 discussions on the ROP. And we'll start with fire
3 suppression since everybody seems to like fire
4 suppression.

5 MEMBER ROSEN: Better than fire going out
6 of control.

7 CO-CHAIRMAN SIEBER: Well, it depends on
8 the fire.

9 MR. FRAHM: And in the interest of
10 time, over the next hour we hope to cover this example,
11 as well as examples in occupational and public
12 radiation safety, so we definitely need to keep
13 moving.

14 MR. COE: I'll just preface the beginning
15 of this example by saying that as you probably know,
16 the fire protection SDP continues to be under intense
17 review to seek ways in which it can be improved in
18 terms of its efficiency of use and simplicity, and its
19 overall usefulness and effectiveness. That work is
20 ongoing.

21 The example here is a reflection of the
22 existing process as it's currently documented in
23 Manual Chapters 0609, Appendix F. The deficiency in
24 this particular case was the revelation that a
25 particular fire area which housed a number of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 components used or credited for safe shutdown did not
2 have the required suppression equipment installed. In
3 fact, I believe the licensee in conducting some
4 follow-up research to a tri-annual NRC fire protection
5 inspection determined, made the determination that
6 this fire area has not been correctly classified, and
7 therefore, did not have the correct suppression
8 equipment, so they placed the issue in their
9 corrective action program. But subsequently, they
10 closed out the issue inappropriately before they had
11 addressed the need for the additional suppression
12 equipment. And it was reopened after the NRC
13 identified the inappropriate closure in a PI&R
14 inspection. So here's an example, I think, that
15 reflects our earlier discussion this morning in a case
16 where the NRC identified a closed issue that was
17 closed inappropriately, and subsequently the licensee
18 reopened it. That finding was made through the PI&R
19 inspection procedure.

20 In this particular case, the equipment
21 that was in this room included the B train motor-
22 driven AFW pump, the turbine-driven AFW pump, two 480
23 volt switch gear buses and an instrument air
24 compressor. And there were cables for both A and B
25 trains of equipment that passed through this fire

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 area. It's kind of hard to imagine that they would
2 have missed that.

3 MEMBER ROSEN: And they shot themselves in
4 the foot. They might have had an old design issue if
5 they hadn't then shot themselves in the brain with not
6 correcting it.

7 CO-CHAIRMAN SIEBER: There were many
8 designs from the 1960s/early 70s that were like that,
9 unfortunately.

10 MR. COE: I believe that this was an older
11 vintage plant. In any case, the finding then was one
12 of not having provided appropriate fire suppression
13 capability, and that this was seen as a performance
14 deficiency. It entered the Phase 1 screening and
15 passes directly to Appendix F, which deals with
16 findings involving degraded fire suppression barriers
17 and equipment.

18 Appendix F then goes through some further
19 screening, and it took the issue to a point in the
20 Phase 2 analysis that required some risk evaluation.
21 And that was based principally on a couple of
22 important assumptions. One was the ignition frequency
23 for that fire area, and although it's not given in
24 this slide, I only have a very high summary here, high
25 level summary, the ignition frequency was based on a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 value that the licensee used in their own evaluation
2 of this issue. And they got that frequency from an
3 EPRI database that reflected turbine building pump
4 fires. And so that was approximately one to the minus
5 four.

6 And then there was some credit given from
7 annual suppression, and as it's noted here on the
8 slide, but no credit for any fire barriers or
9 automatic suppression since, of course, they didn't
10 exist. So with an additional ten to the minus one
11 essentially credit for manual suppression, the
12 initiation frequency multiplied the manual suppression
13 gives you an order of magnitude of about ten to the
14 minus fifth.

15 Then one more factor is involved here, and
16 that is, the ability of the operators to recover one
17 failed train, so if a fire occurred there was
18 apparently in this particular instance an opportunity
19 for the operators to recover one failed train of
20 alternative safe shutdown, and so an additional ten to
21 the minus one credit was given for that recovery.
22 This all, by the way, is in accordance with the
23 prescribed amounts of credit that are defined in this
24 SDP.

25 Given that, the range of the -- or I

1 should say the value of the finding in terms of risk
2 significance comes out to be on the order of between
3 ten to the minus fifth to ten to the minus sixth,
4 which is white.

5 The licensee's own analysis using more
6 detailed techniques involving severity factors and so
7 forth came out to within the same range, at the high
8 end of the white, but still within the white range.
9 So in this case, the Phase 2 result did comport with
10 the licensee's own evaluation, using more detailed
11 analytical techniques.

12 MEMBER WALLIS: When you say high end of
13 the white, do you mean it was almost yellow?

14 MR. COE: The licensee came out around
15 ninety to the minus six. Phase 2 doesn't make
16 distinctions any more refined than orders of
17 magnitude.

18 MEMBER ROSEN: It was still white.

19 MR. COE: Yes, sir, still. It was an
20 agreement.

21 MEMBER ROSEN: I was at the fire
22 protection forum, the last one where they showed --
23 one licensee showed how they had done some detailed
24 fire model given the circumstance. I don't know
25 whether it was this one or another one. I mean, I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 know what they were modeling, but I don't know what
2 this one was and so I don't -- and I don't want to.
3 But the question really was about the detailed fire
4 model. Would you have been willing to entertain the
5 discussion of a detailed fire model of this if the
6 licensee had chosen to provide one?

7 MR. COE: Yes.

8 MEMBER ROSEN: What would you have done
9 with a good detailed fire model?

10 MR. COE: Well, I would suspect that in
11 this case a detailed fire model would get to questions
12 of, you know, is there sufficient combustible material
13 in this, or initiators, fire initiators in this
14 particular fire area. And in this case, there were
15 some documented assumptions. I didn't mention it, but
16 regarding that there was sufficient combustible
17 material and sources of ignition that there was a
18 reasonable fire scenario that could evolve to impact
19 the equipment in that fire area.

20 The kind of modeling that I think you're
21 speaking of, and we've had these discussions with our
22 fire protection staff, you know, often involve the
23 quantities of combustible materials and the location
24 of those sources of combustible materials and sources
25 of ignition relative to the various equipment that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 could be impacted, so because of the spatial
2 arrangements it could become very complicated. But it
3 involves, you know, not only the opportunity to
4 combust this material, but also the development of hot
5 gas layers that rise to the ceilings and impact cable
6 trays and that sort of thing. So fire sciences is
7 clearly a complex area. I believe based on the little
8 bit that I've seen that it's tantamount to the severe
9 accident phenomenology that we deal with in terms of
10 its, you know, the various physical -- the physics of
11 what's actually -- what we're trying to model and
12 what's actually happening, and so it's a very
13 difficult area.

14 We use the best insights that we can to
15 construct this SDP in a manner which lends some
16 structure to our decision process, and that's where
17 we're at.

18 MEMBER ROSEN: Well, I think that's a good
19 answer, but I wouldn't agree that it's the same as
20 severe core damage phenomenology, because in that case
21 you don't -- you have almost no testing and no
22 experience. And here we have fire, we have lots of
23 testing, and lots of experience with hot gas layer
24 propagating, and testing can be done at reasonable
25 costs and that sort of thing, so there are some real

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 differences, Doug. But one of the things you can do
2 with a detailed fire model is get some insight into
3 how long it takes for the fire to progress to where
4 more than one train of safety equipment is damaged,
5 and the likelihood that manual suppression, there was
6 no fixed suppression installed, the likelihood that
7 manual suppression could be employed in the time
8 available based on the fire model.

9 In this case where you've given credit for
10 manual suppression already, I don't think that helps
11 so, you know, this seems like a case where a detailed
12 fire model would not have helped.

13 MR. COE: And we picked this case because
14 it was relatively simple. Other cases do become more
15 complex and may depend more on the factors that you've
16 mentioned, so your point is a good one.

17 MEMBER ROSEN: And your answering that if
18 given certain circumstances, and faced with a yellow
19 or some other color finding that the licensee did not
20 want to have and didn't believe was appropriate,
21 because he could have put that fire out, this
22 postulated fire which, of course, is all it is. He
23 could have put that postulated fire out he thinks, and
24 he's willing to do the work to show you a good
25 analysis that under those circumstances he would take

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it into account.

2 MR. COE: And in this case, I think that
3 we certainly -- we did credit the manual actions based
4 on whatever inputs they gave us and our own judgment
5 that the manual actions could reasonably be
6 accomplished so you're right. And we've engaged
7 licensees, particularly in fire protection areas, in
8 which they've expended a great deal of effort to
9 provide to us the results of various tests and
10 modeling, and so forth. And this is causing a lot of
11 concern because of the expense that's required to
12 answer some of these fire science questions, as well
13 as some of the probabilistic questions. So one of the
14 efforts -- one of the objectives of the effort going
15 on now to improve the SDP in this area is to help
16 improve the timeliness and the efficiency of doing
17 these SDPs.

18 MEMBER ROSEN: Well, I would applaud that,
19 of course. But I also would suggest that if the staff
20 takes a positive attitude towards fire modeling, that
21 the industry is more likely to do it. And doing it
22 reveals a lot of useful things about how fire
23 propagate, both for design purposes and for
24 suppression and operational purposes. And I think the
25 agency ought to encourage that, rather than take a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 stance that discourages it.

2 MR. COE: I agree completely. I think, in
3 fact, I would hold up the difficulties we've had with
4 fire SDP as a really good illustration of why it's
5 necessary to have the engineering and science, fire
6 science people interacting very closely with the
7 probabilistic risk people. In many cases, at least at
8 the initial outset, it seemed like there was a
9 difficulty in communicating across this barrier. But
10 as both sides contributed to the discussion and the
11 dialogue, what's come about today is a very
12 integrating working group of people from both sides of
13 the fence that are working together to try to create
14 and SDP process, and improved SDP process in this area
15 that accommodates the fire science views, as well as
16 the probabilistic framework, so it's a difficult
17 process but it's necessary when we're dealing with
18 this kind of analytical tool. And that's all I have
19 for this example, unless there's other questions.

20 MR. FRAHM: Okay. Next we have Roger
21 Pedersen to go over some occupational radiation safety
22 issues.

23 MR. PEDERSEN: Yeah. My name is Roger
24 Pedersen. I'm the subject matter expert in the
25 occupational radiation safety cornerstone to ROP.

1 Before I start into the specific example which I
2 believe is Example 4 in the package. It says Example
3 F in the slides, but before I go into that, I think I
4 need to talk a little bit about the basis for the SDP
5 in ALARA before we actually get into the example.

6 A number of the discussions that I heard
7 this morning were reminiscent of a lot of the
8 difficulties that the staff had early on in this
9 process when we were trying to develop the ROP, both
10 performance indicators and the significance
11 determination process. As a matter of fact, the '98
12 white paper that the industry provided prior to the
13 original public workshop that kicked off the
14 development of ROP, specifically excluded radiation
15 protection, both occupational and public, and security
16 and safeguards from this ROP process, because they
17 were using the definition of risk-informed that was
18 using risk insights from a PRA. And, of course, it
19 doesn't apply to our areas.

20 The NRC took a broader definition of risk-
21 informed, and that's one that takes risk insights from
22 other sources other than PRA, and we were all
23 excluded. That's why we have a separate cornerstone
24 process.

25 What that did is force us subject matter

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 experts and the industry into trying to evaluate how
2 risk is associated or is reflected in our regulatory
3 and licensing requirements. In terms of radiation
4 protection, our measure of risk is dose, so our SDP is
5 somewhat dose-based.

6 Now from the outset, I'll tell you that we
7 -- there was never any attempt to try to normalize
8 between the cornerstones. In fact, even within our
9 cornerstone between ALARA, which the metric is
10 actually collective dose as opposed to an individual
11 exposure situation where the dose of the individual is
12 the risk determiner. There was no attempt to try to
13 normalize those.

14 The way we came to the decision gates in
15 the SDP and it was also reflected in how we picked the
16 criteria for the performance indicators, was driven by
17 the action matrix. The action matrix was already
18 developed. There were bins of NRC performance, or
19 excuse me, NRC response that were already pre-
20 identified, and that we went through several public
21 workshops and public meetings to come up with an
22 expert opinion, if you will, subject matter expert
23 opinion as to what level of dose, what level of a
24 performance deficiency that had a certain dose
25 consequence or potential dose consequence to determine

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 what bin or what NRC response mode we should be in.

2 So having said that --

3 MEMBER KRESS: We don't think you need to
4 apologize because we think --

5 MR. PEDERSEN: No, I'm not apologizing.
6 I'm just saying --

7 MEMBER KRESS: WE think that's the way it
8 ought to be.

9 MR. PEDERSEN: I'm not apologizing.

10 MEMBER ROSEN: You need not apologize for
11 some of this.

12 MR. PEDERSEN: I'm not apologizing. I'm
13 just going through how we came to where we are, and
14 why the SDP looks the way it does.

15 MEMBER ROSEN: Now you're just redefining
16 risk as not core damage risk.

17 MR. PEDERSEN: I don't know if that's
18 redefining it or not. The dose limits that we have in
19 Part 20 are based on epidemiology. They're based on
20 mortality and morbidity probabilities of certain dose
21 levels. It's not determined through PRA, it's
22 determined through epidemiology.

23 MEMBER ROSEN: But the word "risk" and
24 risk-informed regulation has always been meant by
25 those who speak it and those who hear it, to think of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 core damages.

2 MR. PEDERSEN: That's right. That's
3 exactly right.

4 MEMBER ROSEN: And you're saying well,
5 yeah, but there's another kind of risk. There's
6 individual risk --

7 MR. PEDERSEN: That was told to me.

8 MEMBER ROSEN: That's okay.

9 MR. PEDERSEN: And that's the ground rules
10 that we operated under.

11 MEMBER ROSEN: Okay.

12 MR. FRAHM: And we did convey that in our
13 December 19th paper also.

14 MEMBER ROSEN: An okay kind of thing to
15 do.

16 MR. PEDERSEN: Okay. ALARA has a very
17 particular place in ROP. It's an exception to just
18 about everything ROP stands for, I think, in that the
19 regulatory requirement to begin with is performance-
20 based. It's a program base. We have a regulatory
21 requirement that a licensee have a program to
22 demonstrate or to provide doses through ALARA, not
23 that the doses themselves are the minimum possible
24 achievable. That's in the Statements of Consideration
25 in the 1994 rule making that established, if you will,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 the ALARA requirement, so we had some difficulty.

2 The industry early on recognized the
3 subjective nature to ALARA. There was no performance
4 indicator that was put forward, and there is no
5 performance indicator in this area. It was left to
6 the inspection program to do the assessment of this
7 area of the radiation protection program. That
8 "admittedly subjective criteria" that's on the slide,
9 that comes right out of the Statements of
10 Consideration in the 1994 that's referenced in the
11 Federal Register right above it.

12 So we had, as I said, many stakeholder
13 meetings in which we wrestled with how we were going
14 to come up with objective criteria to judge or assess
15 the performance of a subjective area. A number of
16 issues we had to deal with was what is the unit of
17 performance that we're talking about. We're talking
18 about a rolling three year collective dose which was
19 a performance indicator that was previously used in
20 the industry, or are we talking about the performance
21 at any particular outage, or any particular annual
22 cycle?

23 What we ended up with was -- well, and
24 then a standard to judge that performance against.
25 What we ended up with was coming up with the standard

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of the licensee's own program. We judged the
2 licensee's performance against their own program,
3 against the planning that they put into place prior to
4 going into the work activities. They're required --
5 this is the requirement in the regulation to have a
6 program to determine what the doses are going to be,
7 and if necessary, take actions to minimize those
8 doses, or to reduce those doses, so the outcome of
9 that planning program is what we used as the standard
10 to judge the performance of the licensee's program.
11 And we determined that that was best suited, since the
12 SDP process is supposed to be putting risk-
13 significance to inspection findings, that that would
14 be judged on a planning unit basis.

15 Early on we used the term "job", which
16 became a major stumbling point in the Callaway
17 enforcement action. There are different definitions
18 of what a job is. The term "job" refers to different
19 things, especially in outage planning. You have a JCN
20 sometimes, that talks about jobs as far as critical
21 path flow and that type of thing. The job that we
22 were referring to here, and subsequently have changed
23 the terminology to a work activity, that's the job or
24 the unit of work that the licensee themselves has
25 broken their outage into for the purposes of ALARA

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 planning. So we judge on a work activity basis the
2 licensee's performance.

3 Another issue that we had to deal with
4 was, in fact, that the overall industry performance in
5 ALARA has actually been getting better and better over
6 the last 15, 20 years. We did not want to all of a
7 sudden start trying to put an oar in the water and
8 drive anybody's program, because the overall
9 performance is very good at this time.

10 When I first got to the NRC back in the
11 early 80s it wasn't uncommon for BWRs, in particular,
12 to have 1,100, 1,200 person-rem outages. The end of
13 the 90s, 1999, Quad Cities had a 600 rem outage and
14 they were very shocked by that. They were embarrassed
15 by it, and I heard the RPM give a presentation at the
16 HP Society Meeting, and there was a ripple that went
17 through the audience actually, because a 600 person-
18 rem outage was now unheard of.

19 So what we tried to do is provide a
20 process in which licensee performance not only was
21 judged against their own planning, but against the
22 industry, it says "industry average". We actually
23 used the median values in 1999 for the data that was
24 available for the rolling three year averages. The
25 135 person-rem for a BWR and a 240 person-rem for a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1 PWR. Excuse me, vice versa. 135 for a PWR and 240
2 for a BWR. That was the median rolling three year
3 average collective dose for those two classes of
4 licensees in 1999, so the data we had at the time was
5 1998, was '95, '96, '97.

6 MEMBER ROSEN: In the case of PWRs, that
7 includes two different basic groups, ones that have
8 extensive steam generator work and ones that don't.

9 MR. PEDERSEN: We couldn't define it that
10 finely. The data we had was only stratified on BW and
11 PWR.

12 MEMBER ROSEN: Well, I know you had the
13 data, but I'm saying that you really have two --
14 because the steam generator work is typically the
15 highest dose activity in an outage, plants that have
16 recently replaced their steam generators who don't
17 have a lot of work to do end up with low levels of
18 rems.

19 MR. PEDERSEN: This is a very roughing
20 filter, if you will. As a matter of fact, it becomes
21 a filter. What is being shown here on this slide is
22 the original, it's called Group 2 Screening. That
23 grouping is not important. It's part of the -- it's
24 how it's characterized in the Manual Chapter.

25 Originally, the very first draft of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 ALARA SDP, these two boxes were actually in the SDP as
2 a screening process. The first box is where we're
3 judging the licensee's program against itself. We're
4 comparing the actual dose, collective dose that was
5 experienced for work activity against what was planned
6 for that work activity, and the criteria 50 percent is
7 just expert opinion. Then we go to that second box
8 which is how they stand against the entire industry in
9 terms of a rolling three-year average collective dose.

10 Historically, that has been -- that
11 rolling three-year average has been a performance
12 indicator. One of the things that the industry
13 stakeholders pointed out in this whole process is that
14 it's been misused quite a bit. That rolling three-
15 year average has a lot of detail in it that is
16 completely covered up by averaging these three years
17 in terms of what a challenge is, whether you have
18 steam generators to replace, or whatever the issue is.
19 And it came up again when we were having stakeholder
20 meetings post the Callaway.

21 The industry objected to the staff's
22 characterization of people that are -- licensees that
23 have experience, a rolling three-year average above
24 that median as having a bad or a poor performance.
25 And what we determined is actually this rolling three-

WASHINGTON, D.C. 20005-3701

1 year average is more an indicator of the challenge of
2 the program, of the licensee's program, as opposed to
3 the performance of the program. Licensees with a high
4 rolling three-year after collective dose may, in fact,
5 have the best program in the country, but they might
6 have a legacy problem. They might have a problem with
7 poor fuel from early in operations, or whatever the
8 issue is, so it still works out the same.

9 What we're doing is those licensees that
10 have less of a challenge, that are below the median
11 value that's listed there, the max now at this time we
12 screened them out as having no finding at all, is one
13 of the things we changed in the lessons learned from
14 Callaway. Now it's incorporated in the SDP that's in
15 your package, that indicates that they could have a
16 maximum of a green finding.

17 The last diamond at the bottom there is
18 just a lower discriminator. We didn't want to be
19 nitpicking the licensee's programs, so the work
20 package, the actual dose that's experienced from a
21 work activity has to be greater than 5 person-rem, if
22 you will.

23 Now we didn't try to use any risk factors
24 to those person-rem to come up with some absolute
25 risk. This is all expert subject matter -- subject

1 matter expert opinion as to what levels of issues
2 should make it into the SDP. And then in the SDP,
3 what levels of issues should cross from a green to a
4 white performance issue.

5 MEMBER LEITCH: That first diamond has the
6 potential to have unintended consequences with a high
7 estimated dose to begin with.

8 MR. PEDERSEN: And that's one of the
9 things we had to clarify. It's basically -- the
10 guidance given to the inspector is to use the
11 licensee's program outcome, but he needs to review the
12 bases for that, and if he sees a discrepancy in the
13 licensee's historical dose for that job and this
14 planning, he needs to investigate that. And if there
15 is no bases for that, if there is some padding, if you
16 will, of the dose, then he's to use the historically
17 justified dose for that job to base it against.

18 MEMBER LEITCH: Does this all factor in
19 the -- there's an economic trade-off for man-rem
20 saving. I forgot what the number is, \$10,000 of man-
21 rem or something like that is a number that's --

22 MR. PEDERSEN: It was originally \$1,000.
23 We put out a new reg that says \$2,000. Licensees use
24 anywhere from 10 to 25,000 dollars per man-rem. That
25 should be factored into their ALARA planning. And the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 fact that there isn't a single number also is one of
2 the reasons why we are using the licensee's own
3 planning process as a standard to judge their
4 performance against. We don't know if 25 rem for this
5 job is the right number or not, taking into
6 consideration all the economic issues, as well as the
7 availability of -- you know, all of the things that
8 should be factored into their determination that that
9 dose is ALARA, if you will.

10 MEMBER LEITCH: So it's more an assessment
11 of does the licensee have a good program. Is he
12 asking all the right questions?

13 MR. PEDERSEN: Correct. Now there's two
14 aspects. When you compare the actual dose, collective
15 dose that was experienced from a job to what was
16 planned, if there's a discrepancy there, that could be
17 from two different reasons. Either the planning
18 process isn't very good, or the implementation of that
19 plan isn't very good, so there's a performance aspect
20 on both sides of that.

21 MEMBER LEITCH: Sure.

22 MR. PEDERSEN: If that happens, that's
23 what we need to go in and look at. That's why we feel
24 that additional inspection from the NRC or additional
25 oversight is warranted.
