EVALUATION OF AMENDED RESPONSE AND UNSATISFACTORY VERIFICATION OF
CORRECTIVE ACTION REQUEST (CAR) YM-92-073 RESULTING FROM YUCCA MOUNTAIN
QUALITY ASSURANCE DIVISION (YMQAD) AUDIT YMP-92-22

The YMQAD staff has evaluated the amended response to CAR YM-92-073 submitted to this office on December 15, 1992. The response has been determined to be satisfactory.

The corrective action due date provided in the amended response was December 15, 1992. The verification of completion of the corrective action was performed and was determined to be unsatisfactory because Reference Information Base Item 1.4.4 has not been removed.

You are requested to submit a response to this office within five working days of the date of this letter indicating when the appropriate corrective action will be completed. Verification of completion of the required corrective action will be performed after the date provided.

If you have any questions, please contact either Robert B. Constable at 794-7945 or Gerard Heaney at 794-7826.

Richard E. Spence, Director
Yucca Mountain Quality Assurance Division

Richard E. Spence, Director, Yucca Mountain Quality Assurance Division,
YMP, NV

RESPONSE TO ISSUANCE OF CORRECTIVE ACTION REQUEST (CAR) YM-092-073 RESULTING
FROM YUCCA MOUNTAIN QUALITY ASSURANCE DIVISION AUDIT YMP-92-22 OF SANDIA
NATIONAL LABORATORIES

After careful review of CAR YM-092-073 (enclosure 1), I have concluded that
this CAR should be withdrawn for the following reasons:

1. No Quality Assurance (QA) requirement has been violated. The requirement stated in Block 5 of the CAR is taken out of context. The stated requirement applies to planning measures included or referenced within a scientific investigation planning document. Work performed under Work Breakdown Structure 1.2.1.3.3, for the Reference Information Base (RIB) is not considered a scientific investigation, nor is the RIB a scientific investigation planning document.
2. The information items referenced in CAR YM-092-073 have two different purposes. The purpose of Item 1.1.2 (enclosure 2) is to specify a table of the corrected absolute Z-elevations for the thermomechanical units in USW G-4. The intent of Item 1.4.4 (enclosure 3) is to depict graphically the relationship between the conceptual hydrologic zones and the thermomechanical stratigraphy. The purposes of these items are clearly defined and the information sources are referenced.
3. It is clearly outside of QA's charter to review analyses, calculations, data, etc., for correctness. QA personnel do not necessarily have the technical expertise to undertake such a responsibility. Rather, QA's charter is to help establish and ensure that the processes and procedures defined for a particular effort are necessary, sufficient, and are adhered to. No violation of process or procedure has been discovered or recorded in the audit or resulting CAR.

Although no QA requirement has been breached, it is recognized that there is a potential for misuse of information presented in Figure 1 of Item 1.4.4. I appreciate the fact that the audit results pointed this out. Steps will be taken, in accordance with Yucca Mountain Site Characterization Project Administrative Procedure 5.3Q, to rectify the problem.

CHAPTER	SITE CHARACTERISTICS	YUCCA MOUNTAIN PROJECT REFERENCE INFORMATION BASE			
SECTION	SITE GEOLOGY				
ITEM	BOREHOLE STRATIGRAPHY	CHAPTER 1	SECTION 1	ITEM 2	PAGE 1 of 3
		VERSION 4	REVISION 0	RELEASE DATE 2/1/89	RIB CONTROL NUMBER DR6

Keywords: USW G-4 borehole thermal/mechanical stratigraphy

Description and Methodology

Borehole stratigraphy and thermal/mechanical unit contact criteria for borehole USW G-4 are shown in Table 1 and are based on information used in the preparation of a three-dimensional model of the repository site (Ortiz et al., 1985). Borehole USW G-4 was drilled in the vicinity of the proposed Exploratory Shaft Facility. The reference information presented here is based primarily on information from Table B-6 of Appendix B of the Ortiz report, which describes the model.

Nevada state plane coordinates (x,y) for the base of each thermal/mechanical unit identified have been corrected for the deviation of the borehole from the initial surface location. (The values of the "adjusted locations" tabulated in Table B-6 of the Ortiz report have been modified for the three-dimensional model through a "prefaulting" correction. Subtracting the faulting corrections yields the values listed here.) The corrected elevations were obtained by adding the vertical deviation correction to the unadjusted elevations, both sets of which are provided in Ortiz's report. The elevations were calculated in feet and converted to meters by multiplying by the correction factor 0.3048 and rounding to the nearest whole meter.

The corrected depth is the run (i.e., the difference between the ground-level elevation and the unadjusted elevation at the base of a unit) minus the vertical deviation correction. The corrected depth represents a vertical depth from the starting elevation (i.e., ground level) of the drill rig; it is not a vertical depth from the surface at the map coordinates (x, y) corresponding to that contact/borehole intersection point because topographic changes between the drill rig and this point (x, y) have not been accounted for. Total borehole depth for USW G-4 was taken from Figure 5 of the Ortiz report.

Criteria for the selection of contacts between thermal/mechanical units (Ortiz et al., 1985) are listed in the description of the respective stratigraphies. An uncertainty described by a "+" symbol indicates that the contact could be at a greater depth, while a "-" indicates that the contact could be at a shallower depth. Where mineralogy differs within a unit, the reference stratigraphic notation has been modified by the addition of an identifying symbol; e.g., the vitric and zeolitized regions within CHn1 of drillhole USW G-4 are identified as CHn1v and CHn1z, respectively. The notation TZZ refers to the top of prevalent zeolitization. Additional bibliographic references for lithologic logs are included in the Ortiz report.

Quality Assurance Information

The information presented in Table 1 was collected, analyzed, and interpreted under procedures for which satisfaction of the requirements of 10CFR60, Subpart G has not been demonstrated.

TSw2	Transition from devitrified tuff to vitrophyre in lithologic log.
TSw3	Transition from vitrophyre to vitric ashflow in lithologic log.
CHn1	Transition from ashflow to basal-bedded unit of the Tuffaceous Beds of the Calico Hills in lithologic log.
CHn2	Transition from bedded unit to ashflow in lithologic log.
CHn3	X-ray data indicate a change from a mineralogy dominated by zeolites to a mineral assemblage indicative of devitrification at depths between 1,788 ft and 1,794 ft; contact assigned at the midpoint of the interval; uncertainty: +2 ft, -2 ft.
PPw	X-ray data show a change from a mineral assemblage indicative of devitrification to a mineralogy dominated by zeolites at depths between 1,952 ft and 1,968 ft; contact assigned at the midpoint of the interval; uncertainty: +8 ft, -8ft.
CFUn	X-ray data indicate a change from a mineralogy dominated by zeolites to a mineralogy assemblage indicative of devitrification at depths between 2,238 ft and 2,263 ft; contact assigned at 2,258 ft, based on density log; uncertainty: +5 ft, -20 ft.
BFw	X-ray data indicate a change from a mineral assemblage indicative of devitrification to a mineralogy dominated by zeolites at depths between 2,681 ft and 2,716 ft; contact assigned at 2,682 ft, based on density log; uncertainty: +34 ft, -1 ft.
CFMn1	Transition from ashflow to bedded tuff in lithologic log.
CFMn2	Transition from bedded tuff to ashflow in lithologic log.
CFMn3	X-ray data indicate a change from a mineralogy dominated by zeolites to a mineral assemblage indicative of devitrification at depths between 2,823 ft and 2,840 ft; contact assigned at 2,828 ft, based on density log; uncertainty: +12 ft, -5 ft.
TZZ	The base of TSw3 is at a depth of 1,345.4 ft, and x-ray data show zeolites present at a depth of 1,381 ft. An examination of the core suggests that the contact should be assigned at a depth of 1,363.5 ft; uncertainty: +2 ft, -2 ft (core examination); +17 ft, -19 ft (X-ray data).

CHAPTER	SITE CHARACTERISTICS	YUCCA MOUNTAIN PROJECT REFERENCE INFORMATION BASE			
SECTION	GEOHYDROLOGY				
ITEM	HYDROGEOLOGIC ZONES	CHAPTER 1	SECTION 4	ITEM 4	PAGE 1 of 6
		VERSION 4	REVISION 0	RELEASE DATE 04/13/92	RIB CONTROL NUMBER CR70

Keywords: hydrogeologic properties, hydrogeologic stratigraphy, hydrogeologic zones

Description and Methodology

This Reference Information Base (RIB) Item identifies hydrogeologic zones at Yucca Mountain, Nevada. These hydrogeologic zones were delineated by the Performance Assessment Computational Exercises for 1990 (PACE-90)(SNL, 1991). The modelers believed that the distribution of hydrogeologic properties based on the thermal/mechanical stratigraphy was inadequate. A different method was to capture the hydrologic properties of the rock mass, and thus provide the basis for a more realistic model of groundwater percolation flux on the scale of the site. A more detailed stratigraphy was developed using data on the geologic and hydrogeologic characteristics of the tuffs within the modeled region. The information used to define the PACE stratigraphy included data on lithology, porosity, grain and bulk density, saturated hydraulic conductivity, fracture conductivity, and moisture-retention characteristics obtained from drill holes in the area. As a result, the PACE stratigraphy delineated 19 units within a 600-m-thick section.

In developing the hydrogeologic zones, time-stratigraphic units were defined. The units were subdivided into layers having similar geologic characteristics. Characteristics used to distinguish layers include degree of welding, size and amount of pumice and lithic fragments, composition and amount of phenocrysts, extent of vapor-phase recrystallization, presence of zeolitization, extent of devitrification, lithophysal content, reworking of fragments, and formation of bedding. Individual candidate zones were categorized as bedded tuffs or densely, moderately, or nonwelded tuffs. Finally, the locations of the boundaries between adjacent zones were determined by the changes in porosity. Although porosity varies within each zone by as much as 30 percent, the mean value between adjacent zones varies by a greater amount. Characterization of candidate zones with similar lithologic properties relies primarily on measured moisture retention and saturated hydraulic conductivities (Peters et al., 1984). Where no measured moisture-retention data was available, data were extrapolated from similar zones, and modified as necessary to account for differences in degree of welding.

The relationship of these conceptual hydrogeologic zones for the USW G-4 drill hole location to the geologic and thermal/mechanical stratigraphy is shown in Figure 1 (SNL, 1991).

Table 1 contains a summary of the geologic and hydrologic characteristics of the hydrogeologic zones (SNL, 1991). The hydrologic characteristics in the table are based on limited data, and, at best, represent only the general nature of each zone. The location of these zones, and the corresponding properties, are presented in Tables 2 and 3 (SNL, 1991). The extent and location of the modeled region (and hence the hydrogeologic zones) were selected because this region was bounded by four drill holes (G-1, G-4, H-1, and UE-25a #1), from which site-specific lithologic and hydrogeologic data were available.

An apparently anomalous value of 2.4×10^{-8} m/s is presented in Table 2 for the saturated conductivity of the Topopah Spring nonwelded zeolitic zone (Tpt-TNV) in drill hole G-4. There was considerable variability in the permeability of this layer at various locations. It was decided that for drill hole G-4, a high value equal to that of the Tpc-BT layer would be used for Tpt-TNV; in drill hole G-1, a lower value of 3.0×10^{-10} would be used (SNL, 1991).

Table 4 lists the hydrogeologic properties for fractures (SNL, 1991).

Quality Assurance Information

Tables and figures were prepared as part of the PACE-90 "Nominal Configuration" exercise, which is considered as non-quality affecting. The material presented in these tables and figures was collected, analyzed, and interpreted under procedures for which satisfaction of the requirements of 10CFR60, Subpart G, has not been demonstrated.

CORRECTIVE ACTION REQUEST (Continuation Page)

- 1) Corrective Action Amended Response for CAR # YM-92-073
 - A. Remedial Action - Make corrections to data if necessary
 - B. Investigative Action - Perform technical review of data items 1.1.2 and 1.1.4 of RIB document
 - C. Root Cause Determination - N/A
 - D. Corrective Action to Preclude Recurrence - Investigate AP 5.3Q for procedural clarity
- 2) Completion Date - December 15, 1992
- 3) Responsible Manager - Charles M. Newbury Date 30 OCT 92

CORRECTIVE ACTION REQUEST (Continuation Page)

1) Corrective Action Response for CAR # YM-92-073

- A. Remedial Action - Delete RIB Item 1.4.4 Hydrogeologic Zones. This action removes the apparent inconsistency described in the CAR.
- B. Investigative Action - Principal Investigators at SNL reviewed the information contained in Items 1.1.2 and 1.4.4 of the RIB. The conclusion of the review was that a more detailed technical assessment was necessary to recommend changing either Item. Because the RIB contains the best available data at a given point in time, it was determined that the best available Stratigraphic Data is contained in RIB Item 1.1.2 which has more utility at this time than RIB Item 1.4.4. Therefore, to eliminate an apparent inconsistency, RIB Item 1.4.4 will be removed. Updated hydrogeologic data will replace the current information as it becomes available.
- C. N/A
- D. Corrective Action to Preclude Recurrence - An RIB administrator will be appointed within the next month to provide a check against submitted data and provide clarification of AP-5.3Q when necessary. In the interim, the M&O's Technical Data Manager will provide this check and balance service.

2) Completion Date - December 15, 1992

3) Responsible Manager -

Date 12/15/92
