**Subject:** Fuel.mac

Chris,

I got the input files pulled off so I have them available for reference now. Attached is the fuel.mac macro. It is different from the other one you might have since it also computes density and specific heat which are necessary for a transient analysis. Also, I think the fuelk.mac is for the lumped basket properties used in an axisymmetric cask model, not the 2D basket cross-section in case you're wondering.

Let's see how this works.  
Brian
