

S. ROUSSO LETTER

- 1 -

MAR 14 1989

Mr. Sam Rousso, Acting Director
Office of Civilian Radioactive Waste Management
U. S. Department of Energy
Washington, D. C. 20545

Dear Mr. Rousso:

I am responding to your February 16, 1989 letter which provided further information on two topics that were discussed in your briefing to the Commission on December 20, 1988. First, you suggested changes to 10 CFR Part 2, "Rules of Practice for Domestic Licensing Proceedings," that the U. S. Department of Energy (DOE) believes would be beneficial for streamlining the hearing process for licensing a high-level waste repository. The U. S. Nuclear Regulatory Commission's (NRC's) Office of General Counsel will consider DOE's suggestions as part of a review requested by the Commission to determine whether any additional modifications are necessary, beyond those contained in the rulemaking on the Licensing Support System, to the general procedural provisions for the repository licensing proceeding to ensure that the licensing proceeding is conducted efficiently, as well as providing for a thorough review of the License Application.

Second, you summarized DOE's consideration of the use of multi-purpose casks for transport, storage, and disposal. Your discussion of DOE's decision not to pursue the universal self-shielded waste package concept was informative. The "Final Version Dry Cask Storage Study" (DOE/RW-0196) addresses compatibility of the various steps in the storage, transport and disposal of spent fuel and the need to enhance safety and efficiency in fuel handling. In a March 1, 1989, letter from Chairman Zech to Secretary Fitzpatrick, the Commission encouraged DOE to actively pursue this effort, both through its own actions and in concert with industry.

Finally, you expressed interest in future discussions with the NRC staff on the early resolution of possible licensing issues through rulemakings and other mechanisms. The NRC staff considers that the ongoing prelicensing reviews and consultations with DOE, and other interested parties, have been effective mechanisms for identifying concerns and steps necessary for resolving them. In addition to these prelicensing reviews, the NRC staff briefed the Commission at a public meeting on January 5, 1989 on its regulatory strategy of using rulemakings and Technical Positions to work towards resolving regulatory uncertainties. The NRC staff's approach is described in its regulatory strategy (SECY-88-285) which I have enclosed. This strategy lists and

describes the use of rulemakings, Technical Positions, and precicensing reviews. I would appreciate any comments that you might have on this strategy. If you or your staff would like to be briefed on this strategy or discuss it, please contact John Linehan on 492-3387.

Sincerely,

~~(Signed)~~ Robert M. Bernero

OFFICIAL RECORD COPY

POLICY ISSUE

(Information)

SECY-88-285

October 5, 1988

For: The Commissioners

From: William C. Parler
General Counsel

Victor Stello, Jr.
Executive Director for Operations

Subject: REGULATORY STRATEGY AND SCHEDULES FOR THE HIGH-LEVEL WASTE REPOSITORY PROGRAM

Purpose: To inform the Commission of the staff's strategy and schedule for the overall high-level waste repository program, with emphasis on the regulatory framework.

Summary: The Commission requested the staff to inform it about the status of the regulatory framework for the high-level waste (HLW) repository program, as well as about the overall program strategy and schedule. The staff has already written one Commission paper (SECY-88-227, dated August 4, 1988) that covered the rulemaking actions that the Executive Director for Operations (EDO) has already approved and for which resources already have been budgeted, as well as the subjects for potential future rulemaking. This present paper expands on the first paper by describing: (1) the existing regulatory framework for licensing a repository; (2) the approaches for identifying uncertainties in the framework; and (3) the current strategy and schedules for further refining the regulatory framework, to reduce uncertainties, using a mix of rulemakings, Technical Positions, and Regulatory Guides. No additional resources are needed in FY89 for the potential new rulemakings. However, as the staff gains experience in preparing rulemakings and Technical Positions and as new candidates for both are identified, changes in the program will be factored into the annual update of the Five-Year Plan and Budget.

which this current paper builds in refining the existing regulatory framework. Many of the ongoing and new activities described in this present paper implement some of the approaches originally discussed in the October 1986 paper.

Some additional background is given below about the statutory framework for the HLW repository program. The Nuclear Waste Policy Act of 1982 (NWSA) establishes the statutory milestones and responsibilities, among other things, for the overall nuclear waste management program for which the repository program is one part. The U. S. Department of Energy's (DOE's) Mission Plan and Project Decision Schedule (PDS) periodically update the schedules for the milestones. The status of the actions that the NWSA requires NRC to take is tracked in an enclosure to the staff's Quarterly Progress Report on the Pre-licensing Phase of the DOE Civilian High-Level Radioactive Waste Management Program. The NWSA milestones and current schedules for both DOE and NRC actions are defined, for the staff's planning purposes, as level one milestones and are given in Enclosure 3. These level one milestones make up the basic statutory framework which NRC's program must meet.

Under the statutory framework established by the NWSA, the overall repository licensing process can be divided into five distinct phases (Enclosure 4). The first phase is the prelicense application phase. This phase precedes DOE's License Application submission and NRC's decision on docketing it. This phase consists of two parts, the pre-Site Characterization Plan (SCP) part, which involves informal reviews and consultations, and the post-SCP part, which primarily involves NRC's review of DOE's SCP and semi-annual progress reports. The first phase is referred to as "informal," because NRC has no licensing authority over DOE. The second phase, which begins after docketing of the License Application, involves the formal licensing activities related to the NRC decision on authorizing construction of the repository. The third phase results in the NRC decision on granting a license to receive waste. The fourth phase leads to the NRC decision on amending the license to allow permanent closure, and finally, the fifth phase ends in the NRC decision on terminating the license.

The staff is currently concentrating on the first and second phases of the licensing process. During the first phase, the Office of Nuclear Material Safety and Safeguards (NMSS), OGC, and the Office of Nuclear Regulatory Research (RES) staffs

Background:

By memorandum dated June 6, 1988, (M880512B) the Office of the Secretary identified several Commission requests, to the staff, for information dealing with the HLW repository program. In Item 2 of that memorandum, the Commission requested that the EDO and the Office of the General Counsel (OGC) prepare a joint paper carefully examining relevant regulations and guidance (e.g., staff Technical Positions, Regulatory Guides, rulemakings), to determine whether the proper mix of regulatory tools is in place for the U. S. Nuclear Regulatory Commission (NRC) to make a licensing determination for the HLW repository. Furthermore, in Item 3, the Commission requested a staff paper listing proposed rulemakings, Technical Positions, and standards, etc., that the staff may suggest within the next six months, to enhance the licensing of a HLW repository. Previously, a May 26, 1988 memorandum from Commissioner Rogers to Chairman Zech requested that an overall licensing program strategy and a detailed (level 1 or level 2) schedule be prepared.

In response to the above requests, the staff has already written one Commission paper (SECY-88-227, dated August 4, 1988) that covered the rulemaking actions that the EDO has already approved and for which resources already have been budgeted, as well as subjects for potential future rulemaking. This present paper expands on the first paper by describing: (1) the existing regulatory framework; (2) the staff's ongoing efforts to identify uncertainties in the existing regulatory framework; and (3) the current strategy and schedules for refining the regulatory framework, using a mix of rulemakings, Technical Positions, and Regulatory Guides. Although this paper focuses on the regulatory framework part of the program, a summary of the overall program and schedules is given in Enclosure 1. This summary explains all the major activities in the program and, most importantly, the interrelationships among developing the regulatory framework, developing the staff's independent review capability, and conducting prelicensing reviews and consultations with DOE.

In response to an earlier Commission request, a Commission paper was prepared (SECY-86-323, dated October 30, 1986) on approaches to licensing a geologic repository (Enclosure 2). Approaches were discussed for streamlining the hearing process, identifying and resolving licensing issues early, and improving the appeal process. Specific approaches such as the licensing support system (LSS), pre-licensing consultation, Technical Positions, and rulemakings were evaluated. The October 1986 paper is a foundation upon

will ensure that in the second phase the staffs will be able to conduct an effective review and that the construction authorization decision can be made within the NAWPA-mandated three-year time period. To achieve this during the first phase, NMSS and RES in close consultation with OGC will: (1) refine the existing regulatory framework to support licensing; (2) ensure that DOE will submit a complete and high quality License Application that the staffs will find acceptable for conducting the licensing review and hearing process within the statutory time period; and (3) develop their technical capabilities to review DOE's License Application. During the first phase, both DOE and NRC will need to address many unique and complicated technical uncertainties related to the predictions of repository performance over 10,000 years, as required by the U. S. Environmental Protection Agency (EPA) Standard. Reducing these uncertainties will be an evolving and iterative process. Finally, during the first phase, the OGC staff will primarily focus on revising the procedural requirements for repository licensing in order to expedite the Hearing on the issuance of the Construction Authorization, in the second phase.

NRC's program during the first phase of the licensing process is subdivided into three levels of activities. The summary level of program activities is designated as level two. Current schedules for these are shown in Enclosure 5 and discussed in Enclosure 1. This discussion and the levels one and two scheduled activities demonstrate how NRC's program supports the statutory framework. A further level of schedule detail is designated as level three. The key rulemaking activities shown in Enclosure 6 are an example of the level three detail. A fourth level of detail, now being developed, will include the specific input and coordination activities with RES, OGC, the Advisory Committee on Nuclear Waste (ACNW), the Commission, DOE, and NRC contractors. Therefore, the specific integration of NRC's HLW repository program will be identified by these fourth-level activities and tracked by the High-Level Waste Management Division's (HLWM's) detailed operating plan.

Discussion:

I. The Existing Regulatory Framework

The existing regulatory framework consists of the following primary regulations:

- o 10 CFR Part 60, "Disposal of High-Level Radioactive Wastes in Geologic Repositories";

- 10 CFR Part 2, "Rules of Practice for Domestic Licensing Proceedings"; and
- 10 CFR Part 51, "Environmental Protection Regulation for Domestic Licensing and Regulatory Functions."

Additional regulations are incorporated by reference into the above primary regulations. With respect to 10 CFR Part 60, in February 1981, the Commission finalized "Licensing Procedures for HLW in Geologic Repositories," (46 FR 13980) and in June 1983, the Commission finalized "Technical Criteria for HLW in Geologic Repositories" (48 FR 28204).

In addition to the basic regulations, the existing regulatory framework also includes staff guidance to DOE in the form of Technical Positions and one Regulatory Guide on the format and content of DOE's SCP. Enclosure 7 lists the rulemakings, Technical Positions and Regulatory Guide, issued to date, applicable to the Yucca Mountain Site.

II. Strategy to Identify Uncertainties within the Existing Regulatory Framework

The staffs' identification of uncertainties within the existing regulatory framework has been and will be a continuous process to refine the regulatory requirements and improve the effectiveness of the licensing process for use by NRC reviewers, adjudicatory boards, and DOE. For example, a rulemaking completed in 1985 was conducted to resolve regulatory uncertainties of a technical nature about disposal in the unsaturated zone, after DOE began considering a repository in the unsaturated zone at the Yucca Mountain site in Nevada. Similarly, the passage of NWPA created institutional uncertainties of a procedural nature about site characterization and State/Tribal participation. These uncertainties were resolved by a 1986 rulemaking. In addition, the Commission recently issued a proposed rule amending 10 CFR Part 51, to establish the Commission's NEPA review procedures for repository licensing in accordance with the NWPA.

As a follow-up to the October 1986 Commission Paper on approaches to licensing, the NMSS, OGC and RES staffs have been identifying the most significant regulatory, technical, and institutional uncertainties related to 10 CFR Part 60, to determine what refinements to the regulatory framework might be needed. Regulatory uncertainties exist where the

meaning of a requirement or definition in 10 CFR Part 60 is subject to more than one interpretation (e.g., definition of disturbed zone) or where what must be proven in general terms to demonstrate compliance with a requirement (i.e., elements of proof) is not completely defined in the requirement itself. Technical uncertainties are related to how compliance with a requirement should be demonstrated (i.e., an acceptable method or sufficient information). Institutional uncertainties pertain to conflicting or unclear roles, actions or schedules, between NRC and other participating agencies, that could adversely affect licensing (e.g., NRC's adoption of DOE's Environmental Impact Statement (EIS) and NRC's role in reviewing compliance with mine safety regulations or other regulations referenced in 10 CFR Part 60). These also include procedural reforms relating to repository licensing.

The staff has identified and will continue to identify uncertainties based on: (1) the experience with applying the regulation to prelicensing technical reviews of the DOE program; (2) the results of NMSS and RES contractor studies; and (3) the identification of uncertainties by DOE, the State of Nevada, and other parties. For example, the staff's review of the consultation draft SCP resulted in a concern with DOE's interpretation of "substantially complete containment" in 10 CFR Part 60. As a result, the staff has commented to DOE and is considering a rulemaking to clarify these terms. Another example relates to the recent concern about the lack of compatibility between the methods used in on-site spent fuel storage at reactor sites and DOE's transportation and disposal systems. As a followup to this concern, the staff will review, from a systems engineering standpoint, the need for a rulemaking which would standardize container requirements for reactor storage, transportation, and disposal in a repository, so as to minimize the handling and repackaging of waste.

The staff is also using two other approaches to identify uncertainties and evaluate the regulatory framework. The first is a coordinated effort, among the CNWRA, NMSS, and OGC staffs, to systematically analyze the regulations related to NRC's NWPA responsibilities, including those related to the repository. This approach will be a more systematic and complete analysis of the regulations to identify regulatory, technical, and institutional uncertainties. It will also recommend mechanisms to reduce the uncertainties found. The first portion of this analysis is focused on siting-related uncertainties and is currently scheduled to be completed in late December 1988. The full-

scale analysis is scheduled to be completed by September 1989. The staff's consideration of the resulting recommendations may result in a future adjustment to the current plans, described below, to improve the regulatory framework. New or modified research needs and priorities may also result.

A second approach to identifying regulatory and technical uncertainties involves the staff developing capability to use computer models and perform analyses related to determining compliance with the performance objectives of 10 CFR Part 60, including the EPA standard (i.e., performance assessments). Recently, a coordinated effort has been started between NMSS and RES to develop the staff's modeling capability (initially based on a transfer of contractor-developed capability). The ultimate objective of this effort is to ensure that the NRC staff will be able to review the demonstration of repository compliance with 10 CFR Part 60 that DOE must provide in its License Application. However, in developing this capability, a short-term benefit will also be gained, which will allow the staff to perform independent, site-specific performance assessments throughout the prelicense application phase as DOE collects data. These assessments are expected to be an important additional way to identify both regulatory and technical uncertainties and to assess their significance. Thus, they can identify areas where new or modified rules, guidance, or research may be needed. They will also be used to prepare or revise the staff's review plans and focus staff reviews of DOE's site characterization program on significant areas of technical uncertainty and site features of concern. Ultimately, these assessments will be repeated in the licensing review process to determine whether the site is acceptable.

The staff will assess the results of the ongoing efforts described above and, as needed, will revise the plans to improve the regulatory framework. This will be done as part of the Five-Year Plan and Budget planning process. In addition, any significant changes to the plan that are necessary during the year will be brought to the Commission's attention in Item 7 (early resolution of issues through a program of Licensing Topical Reports and other mechanisms) of the Quarterly Progress Reports to the Commission on the Pre-licensing Phase of the DOE's Civilian High-level Radioactive Waste Management Program.

III. Reducing Uncertainties and Refining the Regulatory Framework

The plans for both ongoing work and new work to revise the existing regulatory framework are described below. The staff's objectives are to reduce regulatory uncertainties, reduce institutional uncertainties involving NRC's licensing role and procedures, and provide DOE with guidance in areas of high technical uncertainty.

As previously mentioned, the staff has categorized uncertainties as regulatory, technical, and institutional. Therefore, the discussion below will address each of the three categories of uncertainty by identifying the mechanisms and the specific activities NMSS, OGC, and RES staffs will use for reducing these uncertainties.

A. Reducing Regulatory Uncertainty

It is clear that reducing regulatory uncertainties identified by NRC, DOE and others is NRC's responsibility. The staff will use rulemakings, Technical Positions, and at least one Regulatory Guide to reduce major regulatory uncertainties. Rulemakings will be considered where authoritative and binding clarification or elaboration is needed on the meaning of requirements or definitions in the 10 CFR Part 60. Rulemakings might also be used to address what must be proven to demonstrate compliance with a requirement (i.e., elements of proof) for selected requirements. In either case, however, rulemakings would be pursued only where practicable. For example, reducing regulatory uncertainty may depend on site-specific information to provide a firmer basis for determining what additional requirements may be necessary to protect health and safety. Therefore, attempting to reduce such an uncertainty in the abstract might not be worth the additional effort of rulemaking.

A major benefit to rulemaking is that uncertainties can be formally resolved and then, according to 10 CFR Section 2.758, the Commission's rules generally cannot be challenged in a licensing proceeding. Therefore, rulemaking can provide more assurance that uncertainties have been reduced and will not be contested in the Hearing. However, rulemaking is, of course, subject to litigation. This potential risk, along with the resources commitment necessary to conduct a rulemaking, will be considered before recommending topics to the EDO for rulemaking.

As previously noted in SECY-88-227, the staff has tentatively identified nine new topics (listed in Enclosure 8) where regulatory uncertainties could be reduced by means of rulemaking. In FY89 the staff will first develop preliminary positions for these topics and then decide which of them to recommend to the EDO for approval to initiate the formal two-year rulemaking process. Those not so recommended may be issued as Technical Positions. These rulemakings are currently scheduled (see Enclosure 6) to be completed by FY92, which is when DOE is currently planning to begin developing its License Application. One of the candidate rulemaking topics is a result of previous Commission action. In the development of 10 CFR Part 60, the staff identified the need for regulations dealing with emergency planning criteria. Another rulemaking conforming Part 60 to the EPA standard issued in June 1986 is being held in abeyance, pending the completion of a court-ordered EPA review of these standards. Finally, it is important to note here that the potential rulemaking on establishing criteria for containment of greater-than-Class-C low-level waste is dependent on the proposed amendment to 10 CFR Part 61 regarding disposal facilities to be used for such waste.

In addition to rulemakings, the staff will prepare a Regulatory Guide for the format and content of the License Application. Regulatory Guides have consistently been the mechanism used by other NRC programs to give format and content guidance to applicants. Guidance will be given on the specific content of the License Application. The staff might also include the essential elements of proof (i.e., what must be proven to demonstrate compliance with the requirements of 10 CFR Part 60). This Regulatory Guide will also give guidance on the format and organizational structure of the License Application and, therefore, will be a framework for the staff's License Application Review Plan.

B. Reducing Technical Uncertainties

The staff considers it to be DOE's responsibility to reduce technical uncertainties (e.g., develop acceptable test and analysis methods) through site characterization activities and precicensing consultations with NRC, the State of Nevada, and other parties. However, the staff intends to prepare Technical Positions in areas of high uncertainty where standard testing or analysis methods are either not available or existing methods are controversial. The staff

considers it more appropriate for NRC as a regulatory agency to develop Technical Positions which give criteria for acceptable methods than to prescribe specific acceptable methods developed by the staff. Criteria would also provide a basis for the staff's review of DOE's methods. Technical Positions will be developed through a process of involving all interested parties, including targeted technical groups, so that their questions and concerns can be addressed in an open and documented manner.

Technical Positions will allow testing and analysis methods to evolve that are appropriate for the Yucca Mountain Site. Presently, the staff considers that reducing technical uncertainties by rulemaking is not appropriate since reduction may depend on collection of site-specific data or development of site-specific methods requiring further understanding of the site. In addition, for some cases, rulemaking may be unreasonable for methods where technology is still evolving. Therefore, as mentioned above, it is DOE's responsibility to reduce technical uncertainties. The staff, however, will continue to consider the appropriateness and timeliness of using rulemakings for resolving technical uncertainties that require authoritative and binding clarification or elaboration.

The staff also considers that the prelicense application review and consultation process will complement Technical Positions in giving DOE guidance on reducing technical uncertainties before DOE submits the License Application. In its review of DOE's Topical Reports and Issue Resolution Reports, the staff will identify objections, that if not resolved by DOE, would result in the staff not accepting the License Application. Objections will be identified for areas where DOE's reduction of technical uncertainties is unacceptable to the staff. Any unresolved objections would also be factored into NRC's Preliminary Site Characterization Sufficiency Comments (required by Section 114(a)(3) of NHPA) that will be submitted as part of the President's Site Recommendation to Congress.

There are several benefits from DOE's resolving NRC objections. One benefit is to have a complete and high-quality License Application which will reduce the number of technical uncertainties and focus the remaining uncertainties that would be adjudicated in the Hearing. The extent to which objections to DOE's reduction of technical uncertainties do not become licensing issues in the Hearing will be an important factor in meeting the three-year licensing requirement. Even if resolved

objections are raised in the Hearing, the Hearing Licensing Board will be able to deal with them more directly and quickly because of the documentation that will exist. The staff's open item tracking system will provide access to this documentation by identifying all the documents related to the identification and resolution of objections (and other concerns) with DOE's reduction of technical uncertainties. Documents would include DOE's resolution, and NRC's comments and acceptance, along with comments from other parties. Resolving objections will also streamline the staff's review of the License Application regarding sufficiency of information and acceptable methods since, ideally, these will have already been reviewed and DOE's resolution of NRC objections accepted by the staff. This would allow the staff to concentrate its review on DOE's compliance demonstrations and the results compared to the regulatory requirements.

At this time, the staff has identified 22 topics for which work is ongoing or will begin on developing Technical Positions (see Enclosure 8). Work will begin in FY89 on topics that are considered to be most important to DOE's surface-based testing and exploratory shaft construction testing. Work will begin later, in FY89 and FY90, on other topics important to longer-term DOE work, such as repository design and in-situ testing that will start in FY91 after the two exploratory shafts are connected. As site characterization proceeds, additional topics will probably be identified.

C. Reducing Institutional Uncertainties

The staff will reduce institutional uncertainties using a variety of mechanisms, depending on the nature of the uncertainty. Possibilities include rulemakings, memoranda of understandings, and comments and consultations on DOE's PDS.

Four rulemakings to resolve institutional uncertainties in 10 CFR Parts 2, 51, and 60 are listed in Enclosure 8 and their schedules shown in Enclosure 5. Two of these rulemakings are going on now and will resolve uncertainties of a procedural nature. The first rulemaking, for which a proposed rule has been recently issued, deals with amending 10 CFR Part 51 to implement the NWPA provisions that require NRC to adopt DOE's Environmental Impact Statement (EIS) to the extent practicable. This rulemaking will complete all rulemakings required for conformance to NWPA and the Nuclear Waste Policy Amendments Act (NWPAA).

The second ongoing rulemaking is the negotiated rulemaking on the LSS. The draft proposed rule was recently forwarded to the Commission (SECY 88-249). In general this draft proposed rule revises 10 CFR Part 2 to establish the basic procedures and schedules for the HLW licensing proceeding, including procedures for the use of the LSS in the HLW proceeding. Specifically, the draft proposed rule establishes requirements for: submission and entry of material to the LSS; access to the LSS; a Pre-License Application Licensing Board to resolve disputes during the period before DOE submits the License Application for the repository; LSS administration; the electronic transmission of formal papers during the licensing hearing; discovery; intervention and participation in the Hearing; appeals; and the Commission's immediate effectiveness review of the initial Licensing Board decision on the repository. OGC believes that the LSS rulemaking will establish the fundamental procedural framework necessary for the effective conduct of the licensing proceeding. As such it addresses the critical issues related to streamlining the hearing and appeal process identified in SECY 86-232 (Enclosure 2).

A potential future rulemaking of a procedural nature deals with revising the existing content requirements in 10 CFR Part 60 for the License Application and establishing criteria for acceptance of the License Application. The purpose of such a rulemaking would be to have DOE either (1) resolve, before submittal of the License Application, NRC's objections raised during the prelicense application reviews concerning sufficiency of information and acceptable compliance demonstration methods, or (2) explain in the License Application why resolution was not achieved, and the significance to licensing.

Finally, the staff's upcoming review of the PDS and the systematic analysis of the regulations are two activities that may yield additional institutional uncertainties.

III. Effects on the Five-Year Plan and Budget

The activities described above for improving the regulatory framework affect the NMSS FY89-93 Five-Year Plan and FY91 Budget only in the areas of rulemakings and Technical Positions. Other activities and associated resources are not affected. The plans described above show an increase in potential rulemakings (from two to nine) and a decrease in Technical Positions (down from 29 to 22). The NMSS resources needed for the additional rulemaking have become

available from both the decrease in the number of Technical Positions and a delay in starting some Technical Positions from FY89 to FY90. Therefore, NMSS does not need additional resources at this time.

The RES resources needed for the additional rulemakings identified in this paper will be made available by delaying completion of regulatory efforts such as achieving comparability with EPA regulations to implement the Uranium Mill Tailings Recovery and Conservation Act (UMTRCA) and the development of lower priority Regulatory Guides. Therefore, RES does not need additional resources in FY89. Furthermore, NMSS and RES have not identified the need to initiate additional research other than what is ongoing and currently projected in the Five-Year Plan to develop rulemakings. Finally, no additional resources are needed in FY89 for OGC.

It should be emphasized that the resource estimates are best estimates at this time and may change as the staff gains experience in preparing rulemakings and Technical Positions and as new candidates for both are identified. Such changes in resource estimates will be factored into the annual update of the Five-Year Plan and Budget.

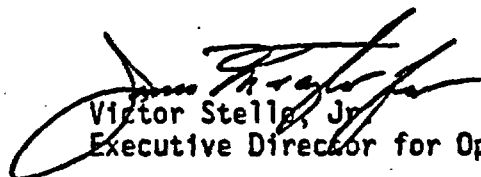

Conclusions:

Based on the discussion above, the staff has the following major conclusions:

1. A regulatory framework for licensing a repository is currently in place.
2. As a result of its ongoing program to identify uncertainties and refine the existing regulatory framework, the staff has the following coordinated set of activities scheduled:
 - a) Nine potential new rulemakings and one Regulatory Guide are currently planned to reduce regulatory uncertainties. The topics being considered for rulemaking will be evaluated to determine if rulemaking is needed and practicable. If not, Technical Positions will be prepared.
 - b) Four ongoing and potential rulemakings are planned to resolve institutional uncertainties involving NRC's licensing role as well as procedures and schedules for the licensing proceeding.

- c) Twenty-two Technical Positions are planned which will give guidance for DOE's reduction of major technical uncertainties.
4. The prelicense application review and consultation process will complement Technical Positions in guiding DOE's reduction of technical uncertainties before submittal of the License Application. This process could also help streamline the detailed review of the License Application by the staff.
5. No additional resources are needed in FY89 for the potential new rulemakings.
6. Finally, it should be emphasized that the resource estimates are best estimates at this time and may change as the staff gains experience in preparing rulemakings and Technical Positions and as new candidates for both are identified. Changes in the program will be reflected in the Quarterly Progress Reports to the Commission and factored into the annual update of the Five-Year Plan and Budget.

ENCLOSURE 1

SUMMARY OF HIGH-LEVEL WASTE REPOSITORY LICENSING PROGRAM ACTIVITIES**1. INTRODUCTION**

The U.S. Nuclear Regulatory Commission's (NRC's) high-level waste repository licensing program is both proactive and reactive. Proactive activities include such events as NRC initiating the actions of preparing Technical Positions or rulemaking which are timely enough to support the U.S. Department of Energy's (DOE's) key programmatic milestones, but do not depend on a DOE action such as issuance of the Site Characterization Plan (SCP). In contrast, reactive activities involve an NRC action in response to a DOE action. These include reviewing DOE programmatic reports (e.g., SCP, Mission Plan, and Project Decision Schedule (PDS)) and auditing the DOE program. Both proactive and reactive work forms the basic program; however, in the event of delay in reactive work (e.g., delay in issuance of the SCP) resources will be balanced by adjusting the priorities and schedules of proactive activities.

2. PROACTIVE ACTIVITIES

The proactive part of the program involves an ongoing effort of: (1) identifying uncertainties in the regulatory framework; (2) developing regulatory requirements and guidance to resolve uncertainties; (3) developing the staff's independent site characterization and license application review capability; and (4) evaluating progress toward meeting the Nuclear Waste Policy Act (NWPA) and Nuclear Waste Policy Amendments Act (NWPAA) requirements. The ongoing effort of identifying uncertainties in the regulatory framework will be complemented by two new activities. The first effort is an ongoing systematic review of all the relevant regulations in order to identify the regulatory, technical, and institutional uncertainties that need to be addressed during the pre-licensing period, so that licensing can be conducted within the three-year time period mandated by the NWPA. Regulatory uncertainties exist where the meaning of certain existing regulatory requirements are subject to more than one interpretation or where what must be proven in general terms to demonstrate compliance with a requirement (i.e., element of proof) is not completely defined in the requirement itself. Technical uncertainties are related to how compliance with a requirement should be demonstrated. Institutional uncertainties pertain to conflicting or unclear roles, actions, or schedules between NRC and other participating agencies (e.g., NRC's adoption of DOE's Environmental Impact Statement (EIS)). These also include procedural reforms relating to repository licensing. The second new effort involves the Office of Nuclear Materials Safety and Safeguards (NMSS) and the Office of Nuclear Regulatory Research (RES) developing and using performance assessment models

with Yucca Mountain site data. While the direct purpose of this effort is to develop the staff's technical assessment capability, it will have the additional benefit of identifying areas of regulatory and technical uncertainty.

2.1 Programmatic and Regulatory Requirements and Technical Guidance

Rulemakings will focus on resolving regulatory and some institutional uncertainties related to significant ambiguities in the meaning of a requirement or definition in 10 CFR Part 60 and those regulations incorporated by reference in 10 CFR Part 60. Rulemakings, in some cases, may also include defining the elements of proof for certain requirements where these are unclear and where resolution by rulemaking is important enough to make the investment of time and resources worthwhile. The License Application Format and Content Regulatory Guide will provide a format and organizational structure, for the information to be included in the License Application, that will facilitate the staff's review. Therefore, the outline of the Guide will provide a framework for the License Application Review Plan. This Guide might also contain the essential elements of proof (i.e., what DOE must prove to demonstrate compliance with the regulation). Technical Positions will focus primarily on technical uncertainties related to acceptable methods for how compliance should be demonstrated for selected areas that are both controversial and critical to repository performance. These Technical Positions will consist of the criteria that will be guidance to DOE and that the staff will use to review the methods DOE develops to resolve the technical uncertainties. Both the Technical Position mechanism and the use of criteria (rather than prescribe specific methods) allow DOE flexibility in its application of state-of-the-art technology to demonstrate compliance. Technical Positions will become major components of the License Application Review Plan. To the extent practicable, the staff will resolve significant regulatory uncertainties with final rulemakings and Technical Positions before 1992, which is generally when DOE will begin preparing its License Application. Draft Technical Positions and proposed rulemakings, however, will provide DOE and other parties an early opportunity to understand and comment on the staff's evolving position. Finally, the process of developing the above mentioned rulemakings and guidance involves all interested parties, including targeted technical groups, so that their questions and concerns can be addressed in an open and documented manner before licensing.

2.2 Technical Assessment Capability

In addition to developing guidance for DOE, the proactive activities result in developing the staff's independent review capability in the form of review plans, assessment methods (including models and codes), and the capability to

apply these tools to review DOE's program. The SCP Review Plan, the Study Plan Review Plan, and the Quality Assurance (QA) Review Plan guide the staff's review of both the technical and QA plans for DOE's overall prelicensing and site characterization program. The License Application Review Plan will guide the staff's review of the data collection activities, data, and assessments resulting from the DOE site characterization program; preliminary site characterization sufficiency; and ultimately the License Application itself. This plan will integrate and focus all the staff's proactive work by referencing staff Technical Positions and assessment methods and combining these with the review criteria and procedures the staff will use to conduct its independent review of DOE's License Application. The Performance Assessment Review Strategy will be prepared as an initial phase in developing the License Application Review Plan. This strategy will determine how thorough and independent the staff's reviews of DOE's compliance demonstration modeling should be. Such guidance will be a basis for further developing the License Application Review Plan and will also be a justification for which areas and what types of assessment capabilities should be developed by the staff. Those methods developed will be referenced in the License Application Review Plan. NMSS and RES have recently completed a memorandum of understanding to assure a coordinated effort in developing and implementing a staff modeling capability consistent with the Performance Assessment Review Strategy.

The final proactive activity is the quarterly evaluation of progress on NRC statutory actions required by NWPA and NWPA and DOE actions that the staff considers critical for a successful prelicensing program. This evaluation is documented in the Quarterly Progress Reports to the Commission on the Pre-Licensing Phase of the DOE's Civilian High-Level Radioactive Waste Management Program and sent to DOE. This evaluation complements the numerous more specific reviews and consultations by taking a broad view of progress and identifying fundamental concerns, based on a synthesis of specific concerns.

3. REACTIVE ACTIVITIES

The reactive part of the program consists primarily of the QA activities and prelicensing and site characterization technical reviews and consultations following the review plans that the NRC staff prepares for the proactive part of the program. This work depends on a specific DOE action such as the issuance of the SCP or the scheduling of a DOE audit. These reactive activities are for a selected sample of DOE's program, including followup on previously identified concerns with DOE's program and how DOE is resolving them. These activities will focus on areas of significant technical uncertainty. They will give DOE programmatic guidance for the specific parts

of the program reviewed, and will be used to resolve problems with the effectiveness of DOE's implementation of the overall issue resolution process given in the SCP.

3.1 QA Program Activities

The QA activities consist of reviewing DOE's and DOE's contractor QA plans and evaluating their implementation. Both NRC audits and NRC observations of DOE audits, using both QA and technical staff, will check implementation. The objective of these reviews and audits is to identify and resolve staff concerns so that NRC can accept DOE's program before significant data collection activities are performed during site characterization. The QA activities complement the selective nature of technical reviews described below by independently assuring that DOE is effectively implementing a qualified QA program to assure the quality of its work from the start of its program and to assure that DOE is also verifying that its program is being implemented properly.

3.2 Prelicensing and Site Characterization Reviews

NRC's prelicensing and site characterization reviews follow DOE's sequence and schedule of activities. Therefore, in the early stages of the program, the emphasis is on reviewing plans such as the SCP (required by NHPA and NRC regulation) and the more detailed study plans and procedures which implement the SCP. The SCP review will focus on the top-level strategies, assumptions, and content of DOE's program, as described in DOE's issue resolution strategies and each of the program and investigation plans. NRC will review all study plans to determine if DOE's study plan process is effective and if there are any objections to starting work (i.e., potential adverse effects on either waste isolation or other site characterization activities). However, detailed reviews will be conducted for only a sample (about 20 percent) of the approximately 100 study plans. This sample is less than half of the study plans where key concerns already have been identified, for studies related to potential adverse conditions at the site, areas of significant uncertainty, and for certain nonstandard or controversial test methods. These detailed reviews will also be used to determine the proper implementation of the SCP at the detailed level.

As site characterization proceeds the SCP will be updated semiannually by DOE and reviewed semiannually by NRC, until DOE submits its License Application. NRC's review of these SCP semiannual progress reports will focus on: (1) evaluating DOE's resolution of previously identified NRC concerns (open items) and (2) identifying new concerns with new information about the site and designs, new plans, or changes to the original plans and schedules.

Also during site characterization, NRC will conduct on-site reviews of selected DOE testing activities and the data that are collected by them. These activities are another way to check the proper implementation of the SCP by DOE. In addition, NRC will review selected DOE study reports and position papers which document the detailed results of DOE's work. NRC will review DOE's topical reports and issue resolution reports which summarize, integrate, and evaluate the site characterization work for individual licensing topics and DOE issues related to demonstrating compliance with NRC's regulation. As such, these reports will become inputs to the License Application, and therefore, the staff's review of these will identify concerns that DOE needs to resolve before submittal of the License Application. Similar concerns might also result from the staff's review of site characterization sufficiency, as required by NWSA, before DOE's site recommendation to the President and Congress.

All concerns identified in the staff reviews and DOE's progress toward resolving them and their root causes will be tracked by the staff as open items. The tracking system, presently being implemented, will focus the staff prelicensing review activities on identifying and resolving concerns with how DOE is resolving technical uncertainties. The tracking system will also provide a document trail, to use in licensing, of all the NRC and DOE actions related to resolving specific concerns.

Lastly, on-site representation at the Yucca Mountain site will continue to facilitate direct information exchange with DOE as well as the State of Nevada, and will provide both QA and technical oversight of data, documents, and site characterization activities.

ENCLOSURE 2

POLICY ISSUE
(Information).

October 30, 1986

SECY-86-323

For: The Commissioners

From: William C. Parler
General Counsel

Victor Stello, Jr.
Executive Director for Operations

Subject: APPROACHES TO LICENSING A GEOLOGIC REPOSITORY
FOR THE DISPOSAL OF HIGH-LEVEL WASTE

Purpose: To inform the Commission of the staff's evaluation of
possible approaches to licensing a geologic repository
for the disposal of high-level waste (HLW).

Background: In a June 12, 1986 memorandum to the Executive Director
for Operations (EDO) and the General Counsel (OGC),
Chairman Palladino requested that the staff identify and
evaluate potential approaches to licensing a HLW repository
(Enclosure 1).

The approaches considered by the staff are discussed under three categories: 1) streamlining the hearing process; 2) early identification and resolution of licensing issues; and 3) the appeal process.

The first category, "streamlining the hearing process," evaluates several alternatives for making the licensing hearing more efficient. One alternative includes the implementation of an information management system (Licensing Support System) to facilitate the management of documents that will be generated in support of the licensing application. A second alternative discusses the development of an approach for adopting the Environmental Impact Statement prepared by DOE pursuant to §114(f) of the Nuclear Waste Policy Act of 1982 (NWPA). A third approach considers potential efficiencies to the hearing process through the adoption of the proposed amendments to 10 CFR Part 2 "Rules of Practice for Domestic Licensing Proceedings--Procedural Changes in the Hearing Process," or through the adoption of the Federal Rules of Evidence as guidance in Commission licensing proceedings.

The category "early identification and resolution of issues" examines a number of mechanisms for identifying and closing issues, to the extent practicable, prior to the receipt of the license application. These include the effective use of the pre-license application consultation period, staff guidance, and rulemaking. Other mechanisms considered include the use of partial initial decisions, a multiple licensing board approach, the use of stipulations, and the early identification of potential safety problems. This section also includes a discussion of early approval of the surface facilities for the repository through a Limited Work Authorization (LWA).

The final category, "the appeal process," addresses the issues of how much appellate review is required and who will do it. Specific issues examined in this section are the potential role of the appeal board, interlocutory review of licensing board decisions, and application of the immediate effectiveness rule.

Discussion:

Under Section 114(d)(2) of the Nuclear Waste Policy Act of 1982 (NWPA), the Commission is required to issue a final decision approving or disapproving the issuance of a construction authorization no later than 3 years after the application is submitted, although the Commission could extend this deadline for twelve months for good cause. The NRC staff believes the 3 year period for reaching a

licensing decision on repository construction is tight. Meeting this schedule depends on early and open consultation between NRC and DOE on the information that will be needed for licensing and on DOE plans and activities, and on the submission by DOE of a high quality and complete license application. Given these assumptions, the staff has evaluated various alternatives that would streamline the HLW licensing process without sacrificing fairness and quality. Effective implementation of these alternatives is also going to be dependent on the cooperation of DOE, and on the participation of the States, Tribal governments, and other interested persons.

In developing this paper, recommendations were considered from DOE, the public, the electric utility industry, the Atomic Safety and Licensing Board Panel ("Licensing Panel"), and the Atomic Safety and Licensing Appeal Panel ("Appeal Panel"). For example, recommendations for licensing reform, including several proposed by the electric utility industry, were presented in a March 1986 report by the Subcommittee on Energy Research and Production of the U.S. House of Representatives Committee on Science and Technology entitled "Nuclear Waste Policy Act of 1982: Progress and Problems" (Enclosure 2). Other suggestions were proposed by the National Association of Regulatory Utility Commissioners (NARUC) in an April 15, 1986 appearance before the Commission, and in a follow-up letter to Chairman Palladino (Enclosure 3). An evaluation of these and other alternatives is provided in this paper. While a few of these alternatives are new, some are already in the process of implementation.

The alternatives examined are confined to those that are consistent with the basic licensing approach established in 10 CFR Part 60. For example, the staff did not consider alternative dispute resolution techniques such as arbitration, or the use of hybrid or informal adjudicatory hearings, or the elimination of the existing "two-step" licensing process for the repository (construction authorization and license to emplace waste). These alternatives were not considered because of the Commission's long-standing policy on formal hearings and a "two-step" licensing approach for the repository. The Congress was cognizant of this policy in its deliberations on the NWPA, and the expectation of the States and Tribes is that this approach will not change.

In the last several years the Commission has initiated numerous reforms of the hearing process, including the proposed amendments discussed below in Section I.C.. In order to put the existing hearing process, and the HLW proceeding, into some perspective for the Commission, the staff has enclosed a timeline of the hearing process as it exists today (Enclosure 4). However, this timeline represents the minimum time required for hearing, and most hearings run substantially longer. A proceeding of the size and complexity as the HLW proceeding would have a particularly high potential for a lengthy hearing if no steps were taken to streamline the licensing process. For example, as noted by the Licensing Panel, the HLW proceeding involves a facility whose cost will be substantially greater than the average reactor facility, will involve a multi-million document data base (approximately thirty to forty times more documents than the average reactor operating license proceeding), and will involve substantially more and better funded parties than the average reactor operating license proceeding.

In terms of the types of reforms that might prove most effective, the staff believes that the greatest potential for decreasing the length of the hearing process lies in reforms related to the procedural aspects of the hearing process. Although proposals for reducing or better defining the issues to be litigated in the proceeding will have an impact on the length of the proceeding, no matter how few or contentious the issues in a particular proceeding, the existing procedural aspects of the hearing assure that a certain length of time will be involved. One such reform, the development of a licensing information management system and its use for discovery in the HLW proceeding, is discussed below.

I. Streamlining The Hearing Process

A. Licensing Support System (LSS)

One of the most significant contributors to the length of licensing review has been the time associated with sending, receiving, and handling information and data. This is true for docketed correspondence between receivers and applicants, for discovery by the production of documents and by interrogatories, and service of documents during adjudication. Current technology for electronic storage, retrieval, and mail could substantially reduce the time needed for information processing.

If the Commission is to reach its construction authorization decision within the allotted time, it will be necessary to facilitate the discovery process, as well as to reduce the delays normally associated with the physical service of documents. Hence, the information and data supporting a DOE application should be made available to all interested persons, to the extent practicable, before the application is submitted and formal NRC review begins. This would entail DOE development of a licensing information system providing ready access to all pertinent documents. The system would not involve the generation of new data, but rather, would capture in electronic form all the data that would normally be generated relevant to the licensing decision. As such, it would serve as a means for efficient management of the information to be used in the licensing decision. To meet this intended purpose, all parties to the licensing proceeding would provide access to relevant data within their control by making the data available in a standard electronic format for easy incorporation into a centralized computer data base in the licensing information system. The standardized electronic format will ensure compatibility of information and data submitted by parties to the licensing hearing. It would also eliminate the need to re-key information and data into an NRC-accessible system. The compatible information and data would then be accessible to all interested parties (States, Tribes, and others).

The staff proposes to implement this process through a rulemaking which would require all parties to the HLW licensing proceeding to place all of their relevant documents in the data base and to use the licensing information data base for discovery purposes. Because all relevant licensing information would already be available through access to the LSS, this type of process would eliminate the traditional filing of first round discovery requests and thus would eliminate accompanying search times by the party from whom the records were requested. It would also eliminate the mailing time associated with the request and the response, and would substantially reduce requests for extensions of time in the proceeding because documents were not provided or because adequate search time was not available. Furthermore, it would ensure, to the extent practicable, the availability of data at the earliest possible time, thereby facilitating the early resolution of licensing issues. In SECY-86-133, the EDO informed the Commission that the Staff intended to use the process of negotiated rulemaking to develop the proposed rule that would provide for the use of the LSS in the HLW

proceeding. In SECY-86-308, the staff has recently transmitted a proposal to initiate this negotiated rulemaking for the Commission's review and approval.

The staff believes that implementation of the LSS has the greatest single potential for substantially reducing the hearing time for the HLW proceeding. A preliminary analysis of recent reactor operating license hearings show that 30% to 50% of a typical four year hearing is occupied by the discovery process and the time expended on the physical submission of documents. The staff anticipates that the use of the LSS in the HLW proceeding should substantially reduce the amount of time traditionally spent on these aspects of the hearing.

B. NEPA

In SECY-86-51, the staff set forth three rulemaking options for developing NEPA review procedures to be used in connection with the issuance of a construction authorization and license for a HLW geologic repository. The rulemaking options would establish procedures and criteria to govern the Commission's review and adoption of the Department of Energy's environmental impact statement (EIS) "to the extent practicable" as required by § 114(f) of the NWPA. These rulemaking alternatives attempted to balance the clear mandate of Congress to avoid duplication of work (and expenditure of public resources) with the independent responsibilities of the Commission to assure compliance of the repository with the Commission's public health and safety standards.

Under the approach recommended by the staff (Option 2 in SECY-86-51), the NRC would conduct a review of the DOE EIS and identify specific environmental issues addressed in the DOE EIS which would be adopted and would not be subject to challenge or change during NRC review. Traditional NRC practice would be followed as to environmental issues that the Commission did not adopt; i.e., independent analysis of those issues by the Commission and litigation of those issues in the Commission's licensing proceeding. This approach would be implemented by conducting a rulemaking indicating the procedures the Commission intended to follow in adopting the DOE EIS and spelling out exactly how the adoption determination would be made when the EIS was issued. The staff recommended Option 2 as the most balanced approach to the Commission's NEPA responsibilities under §114(f) of the NWPA. Commission approval of this

rulemaking approach should reduce the time and staff resources normally devoted to litigation on EIS issues in the licensing proceeding. Adoption of Option 1 in SECY-86-51 could substantially increase the Commission's litigation risk in regard to the implementation of §114 of the NHPA. Adoption of Option 3 could seriously jeopardize the Commission's ability to meet the three year statutory timetable.

C. Regulatory Reform

In order to improve the licensing process, the Commission recently issued a proposed rule that would amend certain provisions of its rules of practice, 51 Federal Register 24365, July 3, 1986. The proposed revisions address the admission of contentions, discovery against the NRC staff, the use of cross-examination plans, the timing of motions for summary disposition, and limitations on intervenor's filings of proposed findings of fact, conclusions of law, and appellate briefs. Although these proposed revisions were directed primarily toward the licensing of nuclear power plants, they would also be applicable to other licensing proceedings conducted under 10 CFR Part 2, Subpart G, including the HLW proceeding. The staff believes that these proposals would achieve efficiencies in the HLW licensing proceeding similar to those anticipated for reactor licensing.

For example, the Licensing Panel has suggested, in the context of raising the threshold for the admission of contentions, that the Commission should require detailed fact pleadings, or adopt some variant of Federal Rule of Civil Procedure 12(b)(6). This approach would revise the Rules of Practice to require more factual specificity in all pleadings, including contentions. However, the proposed regulatory reform amendments, cited above, already include a proposal for raising the threshold for contentions. Proposed 10 CFR §2.714 would require the proponent of the contention to supply information showing the existence of a genuine dispute with the applicant or the NRC staff on an issue of fact. The showing must include references to the specific portions of the application which are disputed. The contention must be supported by a concise statement of the alleged facts or expert opinion, together with specific sources and documents of which the petitioner is aware, which will be relied on to establish the facts or expert opinion. The purpose of the increased threshold is to sharpen the issues in dispute throughout the pre-hearing and hearing

phases and to ensure that the resources of all parties are focused on real rather than imaginary issues. The staff believes that this proposal is particularly appropriate for the HLW proceeding, which requires the resolution of many complex issues within a specific period of time.

In addition, the Administrative Conference of the United States (ACUS) has recently recommended that agencies should adopt evidentiary regulations applicable to adjudications that clearly confer on presiding officers discretion to exclude unreliable evidence and to use the weighted balancing test in Rule 403 of the Federal Rules of Evidence (FRE), which allows exclusion of evidence the probative value of which is substantially outweighed by other factors, including its potential for undue consumption of time. ACUS Recommendation No. 86-2, 51 Fed. Reg. 25641, 25643, July 16, 1986. Although it is the NRC's well-established practice to use the FRE as guidance, the practice is followed less by some boards than others. The Licensing Panel believes there would be an advantage to codifying the practice of using the FRE as guidance, particularly Rule 403. In the view of the Licensing Panel, codifying the FRE as advance guidance for litigants would provide predictability in the HLW proceeding.

However, as noted by the Appeal Panel, the Commission's Rules of Practice already authorize and direct the boards to exclude unreliable, unduly repetitious, cumulative, and "time-wasting" evidence. Promulgating a regulation to "codify" this practice is unnecessary, and may actually cause a board to exclude more evidence at the outset of the hearing than it would otherwise, thereby providing more issues for appellate or judicial review. It may be more efficient in the long run to admit more evidence initially and give it appropriate weight later as part of the decision-making process. Finally, the Commission, in its order establishing the HLW proceeding, can make explicit reference to the use of existing case-management techniques, such as those on the exclusion of evidence, to ensure their application.

II. Early Identification And Closure of Issues

DWM High-Level Waste Program Five Year Plan FY86-FY90
(Enclosure 5) calls for the development and implementation of a systematic process for identifying, examining, and closing issues to the extent practicable prior to the receipt

of the repository license application. The process includes mechanisms for the identification, prioritization, and resolution of issues; focusing technical meetings and technical positions on issue resolution; assuring active and effective participation by affected States and Tribes; identifying issues that are ripe for early closure; better definition of issues through the issuance of Staff Technical Positions (STP); and formal closure through rulemaking or possible early litigation of selected issues. This process is designed to reduce the number of, and to better define, the issues that will be litigated during the licensing hearing.

A. Pre-Licensing Consultation

The principal means for the early identification and resolution of issues is through pre-licensing consultation with DOE, States and Tribes. During this period, generic and site specific issues are identified through our ongoing consultation with DOE, States, and Tribes, and staff reviews of DOE data or documents (e.g., Environmental Assessments, Site Characterization Plans) or other documents bearing on the repository program. This ongoing consultation and review process helps to ensure the early identification of potential licensing issues so that they are addressed by DOE's site characterization program. As part of the above process, an open item tracking system is currently being developed to track and document the status of the resolution of issues.

This process provides a mechanism for focusing NRC/DOE interactions and NRC action on the identification of critical issues; the extent of uncertainty associated with a particular issue; potential information needs; alternative approaches to addressing an issue; and to the extent practicable, on formal closure of issues. NRC/DOE meetings, which solicit the active participation of States and Tribes, are scheduled on these issues. Minutes are drawn up at the close of these meetings to document the progress towards resolution of the issues, the extent of agreements or disagreements, as well as any further actions needed to resolve the issues. The staff intends to implement closure of these issues through the development of formal Staff Technical Positions and through rulemaking. It may also be possible to use the consensus developed through the pre-licensing process as a basis for later stipulations by the parties (see Section II F).

B. Staff Guidance

Staff Technical Positions (STP's) provide a means to 1) establish NRC's technical positions and provide guidance to DOE on strategies and methodologies acceptable for demonstrating compliance with NRC regulations, and 2) move toward resolution of particular issues. The process of developing an STP assures that the topic is open to public review in order to obtain input and strive for consensus from the technical community, interested parties, and other targeted groups. Draft STPs are noticed in the Federal Register and also forwarded to interested parties and targeted groups for comment. Comments received on a draft STP are considered in the development of a final position. The final STP will formally document any consensus between DOE, NRC, States and Tribes relative to the issue(s) under consideration. The staff has developed a number of draft and final STPs on such issues as the items and activities that are subject to the quality assurance requirements in 10 CFR Part 60, the interpretation of the disturbed zone concept in 10 CFR Part 60, the waste package reliability analysis, design information needs in the site characterization plan, and the licensing assessment methodology for the HLW repository.

Traditionally, the use of technical positions and regulatory guides has been intended to provide guidance to licensees and license applicants concerning what information the staff will require for review of the license application, what standards will be employed in the staff review of a license application, and those methods that the staff finds acceptable for implementing the general criteria found in the NRC regulations. As such, this guidance makes the licensing process more efficient. However, the existence of formal NRC guidance does not preclude a licensee or license applicant from utilizing a method different from that contained in the guidance document to demonstrate compliance with the regulations. It also does not preclude other parties in the hearing from challenging the way that the guidance documents interpret the regulations, or otherwise demonstrating that the methods approved in the guidance documents are inadequate. Therefore, it may be advisable to close selected key issues out through rulemaking, rather than through the use of staff technical positions.

C. Rulemaking

In order to resolve selected major issues more formally prior to the licensing hearing, the Staff plans to use

rulemaking where appropriate. Unlike staff technical positions, the regulatory approach set forth in the Commission's rules generally cannot be challenged in a licensing proceeding. Therefore, rulemaking can provide more certainty in the early resolution of technical issues. However, rulemaking is more resource-intensive than the development of staff guidance, and requires longer lead-times for resolution. Issues closed in this manner must be mature, and important enough to make the investment of time and resources worthwhile. The staff is in the process of identifying, on a systematic and continuing basis, issues that are appropriate for resolution through rulemaking. Although some concern has been expressed by the Licensing Panel over the time required for rulemaking, past practice demonstrates that disciplined rulemaking efforts can be completed in a timely manner.

Possibilities for rulemaking include the methodology for demonstrating compliance with the EPA standard, and waste package compliance. For example, the Commission's regulations in 10 CFR Part 60 now establish design requirements for the HLW waste package. A rulemaking to establish more specific criteria on the methodology for compliance with the waste package requirements would not only contribute to a more efficient hearing process, but would also allow DOE to proceed with more certainty in the design of the waste package.

D. Partial Initial Decision

It is also possible to use the mechanism of partial initial decisions by the Licensing Board for the early and systematic closure of issues. Partial Initial Decisions are typically used by the Boards to reach a decision on discrete issues in the hearing after the complete license application is filed. Use of a Partial Initial Decision after the complete application is filed would achieve efficiencies in the hearing process. In the promulgation of the final rulemaking on the technical criteria in 10 CFR Part 60, the Commission recognized the desirability of Partial Initial Decisions when it stated that the identification of anticipated and unanticipated processes and events under 10 CFR Part 60 will have such a pervasive effect on the design basis for the repository that--

...rulings made in the course of construction authorization hearings on the scope of anticipated and unanticipated processes and events be separately identified by the presiding officer and certified to the

Commission for interlocutory review... 48 Fed.Reg.
28195, 28200, June 21, 1983.

Partial Initial Decisions could also be used to close out selected issues in advance of the full license application being submitted by DOE. Used in this manner, selected issues could be eliminated from the hearing before the three year decision period begins. However, use of Partial Initial Decisions in this manner would require the early filing of a portion of the license application, selection of parties, filing of contentions on the particular issue involved, and discovery on those contentions. Therefore, the issue to be decided would need to be mature enough for consideration, with site characterization having provided sufficient information on the issue. In addition, if the issue was dependent on other repository licensing issues that could only be addressed after the full application was submitted, then the issue could not be resolved without taking these interdependencies into account. This approach would require a revision to Commission regulations to provide for early convening of the licensing board and to establish criteria for what types of issues could be considered.

However, use of the Partial Initial Decision before DOE submits its completed license application could have adverse consequences. For this first-of-a-kind facility, with its technical complexity and uncertainty, it would be advisable for the Commission to adopt a conservative approach to the review of the license application, and to defer any adjudication of issues until a complete license application is submitted. This would allow each issue to be reviewed in the context of the total information submitted in the license application, and for the staff and the licensing board to be fully aware of the interrelationships among the various segments of the license application and the extent of the gaps and uncertainty in the total information submitted. In addition, because of the high visibility of the HLW program, the submittal of the license application in increments could place a distorted focus on the first issues brought to hearing, causing more NRC, DOE, and intervenor resources to be expended than ordinarily would have been devoted to those issues. It is also possible that the hearing on the incremental issues would proceed slowly, leading to later coordination problems when the full application was submitted. Early filing would also cause the ex parte rules to apply to any portions of the application that were in adjudication. This would constrain the Commission from having the benefit of

viewing these issues in the context of its periodic comprehensive review of pre-licensing issues.

Based on the current DOE Project Decision Schedule, the use of Partial Initial Decisions before the complete license application is submitted may be impractical in light of the time remaining before the DOE license application is filed. Assuming that some amount of site characterization is necessary to gather sufficient information on the particular issue to be closed, there will not be much time before the full DOE license application is due in 1991. Therefore, it may not be feasible, and could be counterproductive, to initiate a Partial Initial Decision process during this time period. Finally, other alternatives such as rulemaking may provide a satisfactory method for resolving certain issues.

Although the Appeal Panel agrees that the use of Partial Initial Decisions before DOE submits its completed application would be risky, the Licensing Panel believes that an early and segmented DOE license application is desirable so that issues can be heard as documentation is completed. The Licensing Panel cited waste package compliance, and EIS issues as examples of where a segmented, early application could be filed.

E. Multiple Licensing Boards

A new approach suggested by the Licensing Panel is the creation of a "Managing Board" to coordinate multiple licensing boards. The Appeal Panel also endorses the use of multiple licensing boards. Each board would decide different issues and the "Managing Board" would have primary responsibility for: (1) issuing the final Initial Decision; and (2) management responsibility for the entire case. Multiple boards have been used successfully in reactor licensing, and the addition of the Managing Board concept would complement the use of Partial Initial Decisions in the HLW proceeding. However, as noted in the discussion of Partial Initial Decisions, the effective use of Partial Initial Decisions and multiple boards will be dependent on the extent to which it is feasible to segment the HLW licensing issues. The Commission should establish the multiple board framework by specifically addressing this issue in its order establishing the HLW proceeding.

As part of the hearing management process, the Managing Board could develop a number of pre-trial management orders that could make the hearing process more efficient. Pre-trial orders could be issued on such subjects as

defining and redefining issues in detail and certifying them as ready for hearing, establishing lead counsel and liaison counsel, and procedures for obtaining stipulations on various issues. Such orders are within the authority of the presiding officer under 10 CFR 2.718. However, such orders must be consistent with the other specific requirements in the Rules of Practice, including for example, the anticipated rules governing the use of the Licensing Support System for discovery purposes.

F. Stipulations

10 CFR 2.753 permits stipulations as to facts in a licensing hearing after the license application has been docketed. Agreement of all parties to comprehensive stipulations can avoid time-consuming evidentiary hearings on some issues and the resulting delay and costs. The staff anticipates that its attempts to resolve selected issues during the pre-licensing phase, and to develop consensus among the interested parties on these issues, can profitably be used to reach agreement on stipulations which will reduce delay in the licensing proceeding.

G. Early Identification of Potential Safety Problems

In an April 15, 1986 appearance before the Commission, and in a follow-up letter to Chairman Palladino of June 18, 1986, the National Association of Regulatory Utility Commissioners (NARUC) recommended that the Commission explore the feasibility of "a more continuous type of licensing process" where the NRC Staff would "continuously follow the progress of DOE, reviewing and signing-off as identifiable tasks are completed by the DOE thus eliminating delays that could lead to expensive retrofits." The Commission's discussion with NARUC on this issue focused on the identification of potential safety deficiencies and how this could eliminate delay in the licensing of the repository.

The staff does intend to monitor the progress of DOE after a construction authorization is issued to ensure compliance with Commission regulations and construction authorization conditions, as well as to avoid future compliance problems. In terms of ensuring that potential safety and licensing problems are identified and addressed well before the Commission's decision on the license to emplace waste at the repository, 10 CFR 60.32(b) now provides for the incorporation of provisions into the construction authorization requiring DOE to furnish reports on any data

about the site obtained during construction which are not within the predicted limits upon which the facility design was based, and on any deficiencies in design and construction, which, if uncorrected, could adversely affect safety at any future time.

II. Early Approval of Surface Facilities

DOE had initially planned to obtain an LWA from the Commission for the HLW repository. The LWA envisioned by DOE would enable it to excavate additional shafts, construct the waste receiving building, and conduct some limited underground construction. Based on subsequent analysis by the NPC staff, DOE abandoned this proposal. A summary of the legal and technical analysis of the LWA alternative is provided below for the Commission's information.

Commission regulations in 10 CFR 50.10(c) prohibit the commencement of construction of a production or utilization facility until a construction permit has been issued. Commencement of construction includes any clearing of land, excavation or other substantial action that would adversely affect the environment of the site, but does not include pre-construction monitoring activities necessary to establish background environmental values.

The Commission's regulations in 10 CFR 60.3(b) contain similar restrictions in regard to a HLW repository. However, unlike the regulatory framework for the HLW repository, Section 50.10(e) of the Commission's regulations authorizes the granting of a LWA to permit certain site preparation activities to occur before a construction permit is granted. Provision of an LWA is currently limited to utilization facilities, and does not extend to any other type of Commission license. Section 50.10(e)(1) authorizes the issuance of what is commonly referred to as an "LWA-1" for site preparation activities such as the construction of temporary access roads, excavation for facility structures, the construction of service facilities such as sewage treatment plants, and the construction of structures, systems and components that will not eventually be involved with accident prevention or mitigation. Section 50.10(e)(2) authorizes the issuance of what is commonly referred to as an "LWA-2" for the installation of structural foundations for structures, systems, or components which prevent or mitigate the consequences of accidents. An "LWA-1" may only be issued after the licensing board, in a separate hearing,

has made all of the NEPA findings required by 10 CFR Part 51 of the Commission's regulations for a construction permit and has determined that there is reasonable assurance that the proposed site is a suitable location for the facility in question. In addition to these findings, an "LWA-2" may be issued if the licensing board determines that there are no unresolved safety issues related to the additional work that is authorized.

The NWPA neither prohibits nor mandates the use of an LWA in the Commission's repository licensing process. However, the broad authority provided in the Atomic Energy Act over nuclear materials would allow the Commission to extend the LWA concept to a licensing proceeding to receive or possess source, special nuclear or byproduct material at a geologic repository. The procedures in 10 CFR Part 60 do not currently provide for a LWA. Specifically, 10 CFR 60.3(b) prohibits DOE from commencing construction until it obtains a construction authorization from the Commission. In language transferred verbatim from 10 CFR 50.10(c) "commencement of construction" is defined in Part 60 as the clearing of land, surface or subsurface excavation or other substantial actions that would adversely affect the environment of the site.

In the development of the 10 CFR Part 60 rule, the Commission explicitly considered the type of activities that would be permitted prior to the Commission's initial licensing decision and did not provide for an LWA. Under the Commission's Proposed General Statement of Policy, which outlined the proposed procedures for the licensing of geologic repositories for high-level radioactive waste, only surface exploration combined with some test borings would have been permitted prior to the Commission's issuance of a construction authorization or a provisional construction authorization. 43 Fed.Reg. 53869, November 17, 1978. After further review of this issue, the Commission determined that exploration and in-site testing at depth should be allowed prior to the issuance of construction authorization. 44 Fed.Reg. 70408, December 6, 1979. In arriving at this position, the Commission noted that the incremental costs for these activities would be small, in the context of overall project costs for a repository, and implied that such increased financial investments and institutional commitments were warranted only because of the substantial improvement in the quality of available data that could be expected. While the character of DOE activities under an LWA is unclear, there

would appear to be no comparable benefit in terms of improved data for licensing. As the above commentary indicates, the Commission heretofore has not been favorably disposed to the concept.

In addition, establishing LWA procedures may not provide substantial time savings because of the required hearing on site suitability and environmental issues. Traditional LWA criteria require the completion of the final EIS and a hearing and favorable decision on all the NEPA findings of 10 CFR Part 51. In the licensing of a first of a kind facility, these will be difficult issues and the hearing process could occupy a substantial amount of time. The Commission's ultimate approach to the implementation of its NEPA responsibilities in HLW licensing (see Section I.B.) would affect this process. For example, a decision by the Commission to adopt the DOE EIS in its entirety, although not the approach recommended by the staff in SECY-86-51, would foreclose litigation of NEPA issues in the licensing hearing. In this case, the traditional LWA criteria would be superfluous. If the Commission adopted the staff recommendation, which allows for partial adoption of the DOE EIS, the number of issues to be addressed in the LWA hearing would be reduced to the extent of the Commission's adoption. Finally, the potential exists for the work performed under an LWA to adversely affect the satisfaction of the performance objectives in 10 CFR Part 60, or to necessitate costly mitigation measures.

It should also be emphasized that 10 CFR Part 60 would now permit DOE, prior to submitting the license application, to pursue all activities related to site characterization and other pre-construction monitoring and investigation necessary to establish background information related to the suitability of the site. This could include many site preparation activities such as the clearing of land, the construction of roads and support facilities, and the sinking of exploratory shafts, that will ultimately prove useful in expediting the construction of the repository.

The same considerations discussed previously on the LWA concept would also apply to the proposals that the Commission consider surface facility construction at the start of the licensing hearing. A favorable Partial Initial Decision could then allow surface facility construction to begin in advance of the final decision on construction of the entire repository. This post-license application alternative was recommended by the industry in testimony

before the Subcommittee on Energy Research and Production (Enclosure 6). As with the LWA, this alternative would require both submission of a complete license application for the entire repository, and revision of the Commission's regulations to explicitly provide for this procedure.

III. The Appeal Process

The Commission has not yet determined the specific procedures for appellate review of the licensing board's Initial Decision. The existing requirements in 10 CFR Part 2 only specify that the decision of the presiding officer shall not be immediately effective. 10 CFR § 2.764. Because this is not a 10 CFR Part 50 proceeding, the licensing board decision could not be appealed to an appeal board under the existing regulations, unless specifically directed by the Commission. 10 CFR §2.785. Therefore, the issues of how much appellate review is required or desirable, and who will do it, still remain to be determined.

One option for appellate review is to not involve an appeal board in the review process, and provide for direct review of all appeal issues by the Commission. The non-involvement of the appeal board is the situation that exists under current rules, and will remain as the status quo, unless the Commission specifically directs an appeal board to hear and decide any appeals from the licensing board decision on the HLW repository. Providing for appeal board involvement obviously adds more time to the licensing process. However, use of the appeal board would provide a careful, detailed review of the hearing record. This would facilitate Commission review and should also serve to reduce the litigative risk of the Commission's ultimate licensing decision being overturned on judicial review. The additional time devoted to appeal board review could be mitigated by allowing the licensing board's Initial Decision to become immediately effective.

As noted above, 10 CFR §2.764 specifies that the decision of the presiding officer will not be immediately effective. The Commission could revise this policy to provide for immediate effectiveness of the licensing board decision. This would permit compliance with the three year statutory timetable while allowing appellate review to proceed at a more deliberate speed. In this regard, requests for a stay of the licensing board's decision should go only to the Commission and not both to the Commission and an appeal

board. This approach has the advantage of removing the time period necessary for appellate review from the three year statutory license review period. This would increase the possibility that the Commission would meet the statutory requirement, and would also allow careful review of the licensing board decision before the Commission's final review. However, it also entails revision of a long-standing Commission policy that is based on the desirability of having the Commission itself examine the construction authorization decision on its merits before allowing DOE to proceed with construction. However, as with the use of the immediate effectiveness rule in reactor licensing, it will be possible for parties to request a stay of the initial decision. If the Commission decides to adopt this approach, the staff anticipates that a process similar to that recommended in SECY-86-296 concerning the Commission's immediate effectiveness procedures, would be used to implement this approach.

The Commission could opt to omit formal partial initial decisions and appeals entirely by receiving only "findings" from the licensing board and reserving the issuance of the final decision to itself. This would eliminate the formal appeal stage entirely, but would require close monitoring of the licensing proceeding by Commission representatives. This approach would be a new and untested method for the Commission. As such, there would be considerable uncertainty as to the effectiveness of this approach. It would also necessitate detailed review of the entire licensing board record by the Commission, requiring substantially more resources and time than would normally be expended by the Commission.

The Commission's regulations now prohibit interlocutory appeals from licensing board decisions. 10 CFR 2.730(f). There would be a benefit in suspending this prohibition for the HLW proceeding for certain categories of issues. Requiring parties to appeal the admission or rejection of contentions, as well as summary disposition rulings, at the time those decisions are made, rather than at the conclusion of the proceeding, would have obvious benefits. The litigation of improper issues would be minimized, and issues wrongly excluded would be identified and remedied before the hearing is closed and licensing action is taken. It would also keep the appellate process more in step with

the evidentiary hearings. As noted previously in the discussion on Partial Initial Decisions, the Commission, in the Supplementary Information to the rulemaking on the final technical criteria in 10 CFR Part 60, did contemplate that licensing board decisions on the identification of anticipated and unanticipated processes and events would be certified to the Commission for interlocutory review. However, unless the Commission is prepared to review the many anticipated interlocutory appeals on such issues as the admission of contentions, providing for appeal board review of the licensing board decision would be a necessary complement to the suspension of interlocutory review.

Conclusions:

Based on suggestions from various sources knowledgeable in the hearing process, the Staff has identified and evaluated several approaches for streamlining the HLW licensing process. After evaluating these approaches from the perspective of which approaches offer the most potential for ensuring that the statutory review schedule is met in a cost-efficient manner, the staff has concluded that the development of the Licensing Support System, adoption of Option 2 in SECY-86-51 for implementation of the Commission's NEPA responsibilities, and the resolution of issues through rulemaking are the approaches that the Commission should pursue in the pre-license application phase. Accordingly, the staff has recommended that the Commission approve the recommendation in SECY-86-308 on the use of negotiated rulemaking to implement the use of the Licensing Support System, and the recommendation in SECY-86-51 on the implementation of the Commission's NEPA responsibilities. In terms of using rulemaking to resolve selected issues, the staff is currently in the process of identifying those issues which are appropriate for resolution through rulemaking. The Commission will be informed of any issues considered suitable for resolution in this manner.

For the post-license application phase, the Commission could endorse the concept of the use of Partial Initial Decisions, final adoption of the proposed rule on regulatory reform, and multiple hearing boards. In order to facilitate the soundest decision-making process, the Commission could provide

for appeal board review. However, to allow for both appeal board review and meeting the statutory timetable, the Commission should revise the regulations to provide for immediate effectiveness of the licensing board decision.

The staff does not believe that the use of Partial Initial Decisions before the complete license application is filed, generic adoption of the Federal Rules of Evidence, or the initiation of LWA procedures, are satisfactory approaches for streamlining the licensing process.

The staff is aware that it is possible to place the emphasis on other combinations of approaches than those recommended by the staff. For example, among the suggestions made by Judge Cotter of the Licensing Board Panel, is that the Commission establish a two-part HLW Task Force to manage the HLW licensing process (page 3, Cotter Memorandum, Enclosure 7). One segment of the Task Force would manage all pre-application issues, and the other segment would manage all hearing issues. Each segment would hold bi-weekly meetings, and the head of each segment would report monthly to a "lead" Commissioner, as well as meeting with Mr. Rusche and DOE.

The staff is sympathetic to Judge Cotter's objectives of keeping the Licensing Panel informed, and ensuring the coordination of activities among all affected elements of the HLW program. However, the staff believes that these objectives could be achieved without the creation of a new bureaucracy, with the attendant problems of duplication of resources, overlapping responsibilities, and potential conflicts. In addition, an approach which promotes and formalizes the role of the Licensing Panel in pre-application issues, especially where interaction with DOE is involved, carries a substantial risk of tainting the credibility and neutrality of the licensing board(s) that will ultimately adjudicate the HLW licensing issues. Finally, the staff has already established an ongoing dialogue with DOE, and regularly briefs the Commission on the overall HLW

program. In order to keep the Licensing Panel informed, as well as to solicit its input, the staff will periodically brief the Licensing Panel on all issues which may affect the hearing process.
