Subject:	Contract No. NRC-02-81-026 Benchmarking of Computer Codes Monthly Letter Progress Report	<u>(Return to WM, 623-SS)</u> and Licensing Assist for September 1984	ance of

Dear Pauline:

This letter contains a management level summary of progress during the month of September. Attached to the report is a copy of the technical status summary with further discussion of work performed during this period. We are submitting a cost summary report under separate cover.

Task 1 - Literature Search - Waste Package Codes

Interim final copies of the waste package code data set report were submitted to the NRC by letter dated September 17, 1984. We are in the process of obtaining permission to use tables and figures in that report. Once permission is obtained we will forward a final camera ready copy to you for publication.

Task 3 - Benchmark Problem Report - Waste Package Codes

By letter dated September 21, 1984, CorSTAR submitted the draft benchmark problem report for the waste package codes to the NRC. The report is being submitted simultaneously for external QA review. We would like to receive the NRC's comments on this report within the next four weeks.

Tasks 4&5 - Siting Codes

During September, the revised Benchmark Problem Report was edited. No other significant activities were conducted during the month.

Tasks 4&5 - Radiological Assessment Codes

During September effort was initiated in writing the manuscript for the benchmark analysis report. Final ORIGEN runs were prepared and submitted to ORNL. As of the date of this progress report, essentially all of the ORIGEN runs have been completed.

CORPORATE SYSTEMS, TECHNOLOGIES, AND RESOURCES 7315 WISCONSIN, NORTH TOWER #702 • BETHESDA, MARYLAND 20814 • (301) 654-8096

WASHINGTON, D.C.

Tasks 4&5 - Repository Design Codes

No new codes were obtained during the month. A special meeting was held at the NRC on September 27 to review progress and to outline our recommendations for dealing with the inavailability of SPECTROM codes. Notes from this meeting are included with the technical status summary report. Also during the month, the code VISCOT was installed at Brookhaven. Enclosed with the technical status summary report is a revised outline for the benchmark analysis report incorporating CorSTAR's and NRC's comments on a draft outline prepared by Acres.

General

The following items that were identified in the July monthly progress report have the potential to impact project schedule or budget. Their status is updated below:

- We have met with NRC to review an approach for responding to comments on the Tasks 4&5 report for the siting codes.
- The NRC will obtain the codes ADINA and ADINAT directly from Adina Engineering for use on this project. We are still awaiting receipt of the codes by the NRC.
- We will prepare revised recommendations for problem substitution for the SPECTROM codes for approval by the NRC.
- We understand that the NRC will obtain a charge number for the use of the code STEALTH at the INEL computer facility.

Our estimate of costs through the end of September (through September 15 for CorSTAR) is:

Actual costs this month:	48K
Actual costs this fiscal year:	775.5K
Actual costs to date:	2774K
Planned costs this month:	58K
Planned costs this fiscal year:	883K

These estimated costs include labor, labor additive, overhead, subcontractor costs, other direct costs, G&A and fee. These cost estimates have not been confirmed by our accounting department.

Sincerely,

Dangles KVayt

Douglas K. Vogt Project Manager

I. INTRODUCTION

A. Background

The licensing of a reposiotry for high level radioactive waste will necessarily involve the application of computer codes to analyze the numerous interrelated factors affecting the performance of the repository. The Nuclear Regulatory Commission (NRC), which has the responsibility for reviewing repository license applications, is sponsoring an evaluation of computer codes in the following five areas of repository performance assessment: (1) repository siting, (2) radiological assessment, (3) repository design, (4) waste package design, and (5) overall systems analysis.

Repository siting codes deal with the analysis of saturated flow, unsaturated flow, surface water flow, solute transport, heat transport and geochemistry. Radiological assessment codes include computer programs for analyzing radionuclide source terms, the transport of radionuclides between various compartments of the surface environment, and the resulting dose-to-man due to ingestion, inhalation and external exposure. The repository design codes will be used to analyze geomechanical processes, structural design and heat transport. Waste package codes simulate those interactions taking place within the waste package and with the surrounding repository host rock. Overall systems codes will be used to address multiple areas of repository performance assessment. The radiological assessment codes PATH1 and BIODOSE, which are evaluated in this report, are actually components of larger systems codes.

The first step in this evaluation of computer codes was a comprehensive survey of available codes in each area. Those codes most applicable to high level waste repository analysis were summarized on the basis of available code documentation. Each code summary dealt with both the operating characteristics of the code (computing time, storage, input and output) and the underlying theory upon which the code is based (equations, numerical approximations and simplifications). In addition, the summary reported the extent to which the code had been subjected to verification, validation and sensitivity analysis.

CorSTAF

Following the preparation of a summary report for a particular code area, a second report was assembled which defined both the independent and dependent variables appearing in the codes and presented data indicating the range of values these variables could take on for repository assessment applications. The first purpose for this data set report was to provide users of the codes with a quick reference to aid in the interpretation of code input data requirements. The report was also designed to serve as a guide in the preparation of benchmark problems for the actual evaluation of computer codes.

The third report of the series gives a detailed description of these benchmark problems. The set of benchmark problems for each code area was developed with several objectives in mind. In some cases the problems were based upon field or laboratory measurements so that running the problem could serve as a validation of the code. A number of the problems have analytic solutions, which can be used to verify the accuracy of numerical methods employed in the codes. Another class of problems is designed to test whether a code can even be used to analyze a hypothetical repository situation. By running these hypothetical problems, the following types of code errors and limitations can be uncovered:

- Code options advertised in the user's manual but not actually available in the program
- Parameter values set within the code which cannot be overridden by the user
- Division by zero, logarithm of a negative number, etc.
- Array size constraints and excessive program run times
- Cumbersome input data requirements
- Options added to a code without having been checked out or even used by the developers of the code
- Vestigial sections of the code which either can no longer be accessed or which cannot affect the outcome of the calculation

In addition to making it possible to evaluate a code, these problems can serve as benchmarks by which the impact of future modifications to the codes can be judged. Also, when a code is undergoing modification, a coding error can introduce problems within portions of the code which have been previously checked out. If the complete set of benchmark problems is rerun after each code modification, this type of problem can be discovered early on in the modification process.

B. Purpose of the Report

After these benchmark problems have been documented, they are run using a subset of the codes which were presented in the code summary report described earlier. The purpose of the current report is the presentation of the results of this benchmarking study for the radiological assessment codes. While much of this report is devoted to a comparison of outputs from different codes, an effort has also been made to evaluate the codes based upon their ease of use. This is an important consideration for the environmental pathways and dose-to-man codes which require long times for the preparation of input data files. The steps and compromises involved in this input data preparation are thoroughly documented.

Although they have been grouped under the general heading of "radiological assessment," the codes covered in this report fall into two distinct categories. The first group of codes calculates the time-dependent radionuclide inventory (ORIGEN) or heat production (ORIGEN, ANSIDECH/BURNUP) within reactor fuel elements based upon the operating history of reactor during the residence time of the fuel element. The second group of codes (PATH1/DOSHEM, CELLTRAN, BIODOSE, PABLM and LADTAP) simulate the transport of radionuclides through the surface environment, their movement through the food chain and the eventual dose-to-man due to ingestion, inhalation and external exposure. The only connection between the two code groups is that the time dependent radionuclide inventory is a required input to a solute transport model which in turn provides the surface water radionuclide input for environmental transport modeling. The benchmark problems for the two code groups are quite different. The problems for ORIGEN and ANSIDECH/BURNUP are based upon engineering data, while the problems for the environmental pathways and dose-to-man codes are hypothetical. The primary reason for combining these code groups is an administrative one.

C. Report Organization

The organization of the report reflects the fact that two different types of codes are being benchmarked. In the discussion of benchmarking results and code to code comparisons, these two code types are treated separately. In Section II of this report the major findings of the study are summarized. The benchmarking of the radionuclide inventory and heat generation codes is described in Section III, with Part A devoted to the code ORIGEN and Part B to ANSIDECH/BURNUP. For each code the discussion is divided into three subparts. The first gives a brief code description which highlights the most important features and capabilities of the code. For a more detailed description of a code the reader should consult the code user's manual or the code summary report described earlier. The code ANSIDECH/BURNUP will, however, be described in detail since it was not summarized in the earlier report. The second subpart provides a detailed description of the benchmark problems to be solved by the code. This benchmark problem description will not be repeated for each code. Instead, only those aspects of the problem which cause difficulties for the code or which require a problem restatement will be examined. In Subpart 3 the benchmarking results for each code will be presented. Part C of Section III will be devoted to an evaluation of the ORIGEN and ANSIDECH/BURNUP codes and the presentation of selected comparisons of code outputs. Section IV contains the benchmarking discussion for the environmental pathways and dose-to-man codes PATH1/DOSHEM, CELLTRANS, BIODOSE, PABLM and LADTAP. The format for this section is identical to the one for Section III. The code description for CELLTRANS is more detailed than for the other codes since the code was not covered in the earlier summary report.

TECHNICAL STATUS REPORT ATTACHMENT TO PROGRESS REPORT FOR SEPTEMBER

Repository Design Codes

Task 4 - Solve Benchmark Problems

Discussions were held on September 27, 1984 at NRC offices relative to the procurement of ADINA/T and SPECTROM codes. The notes of this meeting dealt with outstanding code procurement issues and have been forwarded separately.

Code Procurement

The installation of VISCOT (QA version identifier 420--11C-02) was completed during the month. Direct installation was not possible due to limitations in the small core memory size. To overcome this, the size of the real storage array was reduced; however, this limited the problem size to fewer nodes than required for the hypothetical and validation problems. To overcome this limitation, an update deck to run an example problem which transfers the real storage array to large core memory, has been prepared and successfully used.

Run Benchmark Problems

Problems 6.1 and 6.3 were run this month using DOT. Representative results of problem 6.3 are attached.

Problem 6.3 was run using COYOTECDC. Representative results are attached.

Problems 3.2a, 5.2 and 6.3 were run using MATLOC. The results of problem 3.2a (attached) show excellent agreement with the analytical solution.

Table 3 from the original scope of work is included showing the current number of problems completed.

September 24, 1984

The D. W. Lamb

Acrés American Incorporated Suite 1000 Liberty Building 424 Main Street Buffalo, New York 14202-3592

Dear Dr. Lamb:

NON-TRANSMITTAL OF SPECTROM CODE PACKAGES AND DOCUMENTATION

Thank you for the acknowledgement of receipt of the DOT, VISCOT, MATLOC and SALT4 code package transfers enclosed in your letter of September 11, 1984.

The SPECTROM 11, 21 and 41 code documents are not completed at this time, therefore, your request for code transfer has been disapproved. A user's manual for SPECTROM 41 has been documented (ONWI-326) and is enclosed. However, the documentation is being revised in accordance with NUREG-0856. The draft documentation shall undergo review upon receipt in early November. Once the documentation has been approved, the codes shall be available for transfer. At that time, you will be notified of code availability.

We regret any inconveniences that this may cause you.

Sincerely,

Lecie a. Scott

Notes of Meeting Held September 27, 1984 at NRC Offices, Silver Springs, MD

Present:

.

Pauline Brooks - NRC Dan Fehringer - NRC John Greeves - NRC Raj Nataraja - NRC John Buckley - NRC M. Logsdon - NRC Doug Vogt - CorSTAR Robert Curtis - Acres

PURPOSE

The purpose of this meeting was to review the progress on the benchmarking of repository design codes and to discuss the unresolved issues related to the benchmarking of the SPECTROM and ADINA codes.

STATUS OF BENCHMARKING ACTIVITIES

Figure 1 shows the current status of the project. All of the codes except ADINA/T and SPECTROM have been received. DOT, MATLOC, VISCOT, COYOTE, and STEALTH have been compiled.

For the initial compilation of VISCOT, the size of the main storage array had to be reduced to fit the small core memory limitation at Brookhaven. Currently, an effort is underway to make changes to the program which will allow larger problems to be solved by storing certain arrays in the large core memory. The use of dynamic dimensioning by VISCOT makes this more difficult than for the previously compiled codes.

A total of four analytical and five hypothetical problems have been completed. Work is currently underway benchmarking MATLOC and VISCOT. The ADINA/T codes will be required within approximately two weeks to prevent delay in the schedule.

Although problem 2.10 was attempted using COYOTE, the problem, which is applicable to repository analysis, cannot be handled by COYOTE. Radiation used in COYOTE is from a surface of the model to a Body at constant temperature outside of the model. Thus, Radiation heat exchange between two parts of the model cannot be directly computed. This will be reported in the final report. Notes of Meeting

September 28, 1984

ADINA AND SPECTROM CODES

Acres and CorSTAR proposed that in the light of difficulty in obtaining the SPECTROM codes and the cost of obtaining ADINA, the SPECTROM codes be dropped and VISCOT be benchmarked to elastic-plastic applications. The revised scope would then be as indicated on Figure 15. John Greeves suggested we attempt to obtain ADINA free.

Subsequent to the meeting, a call was placed to Dr. Bathe, the author of ADINA. It was agreed by Dr. Bathe that the NRC could obtain ADINA for benchmarking free of rental charges conditional upon certain terms to be spelled out in a lease agreement. Dr. Bathe will send the lease agreement to John Greeves.
