I believe that Riccio's reference is to the "rogue" database issue.

✓ Jack -

Do you know if the, "design basis issues that were supposed to have been resolved back in the 1990's," that Mr. Riccio refers to are the same as the group of issues in the "rogue database" that came to light in the late April/early May 2003 time-frame? ... Or is he referring to some other set of design basis issues?

If the "rogue database" issues are the same as the ones Mr. Riccio is referring to, my recollection is that those issues (a) weren't safety-significant and (b) have now been added to FENOC's corrective action plan. It was, in part, that issue that led us to add the wording "Some items of low safety-significance would not be required to be completed before a plant restart, but would be required to be captured within FENOC's corrective action program," at the end of the 1st paragraph in section B.6.b of the proposed Director's Decision. If there is some other set of safety-significant design basis issues, the proposed Director's Decision indicates that they would fall under the umbrella of the Restart Checklist and require resolution before a future restart.

Dan

FYI. Enclosed is an e-mail following a discussion that Jim Riccio and I had on Wednesday. I'm not sure how we should proceed on this based on his e-mail to you and Sam in light that he is connecting together the 2.206 final decision and the restart question. Any response has to be closely coordinated with the 2.206 folks and the Panel. We'll kick this around Darrell and get back to you. Christine, please discuss this with Tony and if appropriate from a timing standpoint, put it on next Tuesday's panel meeting agenda.

Thanks.

Jack
