September 24, 2003

Dr. Sattar Lodhi:

We would like to make a slight modifications made to the plenum. As per our license we are making notification. This change is to address the concerns of Reviss with water entering the plenum due to the plenum having a lower pressure than the surroundings. The change will give a conclusive way of knowing whether or not here is water in the plenum. We will no long need to rely on the moisture probe for an indication of water entering the plenum.

The change is that the check valve will be removed from the bottom of the plenum. The check valve was originally intended to be used for purging the water out of the plenum. We would now use the air line that attaches to the bottom of the plenum to purge the water out of the plenum. There would be no change to the air line. This method offers us a much more positive indication of when all the water has been purged from the plenum and it also would tells us how much water was in the plenum because we could see all the water that comes out of the line and we also could see when water stops coming out and air starts rushing out.

This is to be done so that the air can be run at a higher pressure. This will ensure that any transfer between the plenum and the outside is one of air out instead of water into plenum.

The only structural change to the plenum would be the removal of the check valve and the addition of a plug in its place. The check valve is seen on drawing number 36783-017-000.

If you need any additional information I can be reached at 215-529-9522.

Sincerely,

A handwritten signature in black ink, appearing to read 'Marie Turner', written over a horizontal line.
