PALISADES NUCLEAR PLANT DOCKET 50-255 LICENSE No. DPR-20 REQUEST FOR RELIEF FROM ASME SECTION XI, APPENDIX VIII, SUPPLEMENT 11 CODE REQUIREMENTS

Nuclear Management Company, LLC (NMC) requests approval for relief from the American Society of Mechanical Engineers Boiler and Pressure Vessel Code, Section XI, 1995 Edition with the 1996 Addenda, Appendix VIII, Supplement 11, "Qualification Requirements for Full Structural Overlaid Wrought Austenitic Piping Welds," examination requirements for the Palisades Nuclear Plant. The basis for the relief request is attached describing that the proposed alternative provides an acceptable level of quality and safety, pursuant to 10 CFR 50.55a(a)(3)(i).

The technical content of the request for relief is consistent with the Electrical Power Research Institute sponsored Performance Demonstration Initiative model, which was updated to reflect changes as a result of Nuclear Regulatory Commission requests for additional information made to other licensees.

NMC requests approval of the proposed relief request by July 1, 2004, to support Palisades upcoming refueling outage.

This letter contains no new commitments and no revisions to existing commitments.

Daniel J. Malone

### PALISADES NUCLEAR PLANT DOCKET 50-255

**SEPTEMBER 18, 2003** 

REQUEST FOR RELIEF FROM ASME SECTION XI, APPENDIX VIII, SUPPLEMENT 11 CODE REQUIREMENTS

### **COMPONENT IDENTIFICATION**

The affected components are Palisades Nuclear Plant pressure retaining welds in piping, subject to American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel (BPV) Code, Section XI, 1995 Edition with the 1996 Addenda, Appendix VIII, Supplement 11, "Qualification Requirements for Full Structural Overlaid Wrought Austenitic Piping Welds," examination.

#### **CODE REQUIREMENTS**

The following paragraphs are examples of the code requirements for which relief is requested, all of which are contained within Appendix VIII, Supplement 11.

Paragraph 1.1(d)(1), requires that all base metal flaws be cracks.

Paragraph 1.1(e)(1) requires that at least 20 percent (%) but less than 40% of the flaws shall be oriented within  $\pm 20$  degrees of the pipe axial direction.

Paragraph 1.1(e)(1) also requires that the rules of IWA-3300 shall be used to determine whether closely spaced flaws should be treated as single or multiple flaws.

Paragraph 1.1(e)(2)(a)(1) requires that a base grading unit shall include at least three inches of the length of the overlaid weld.

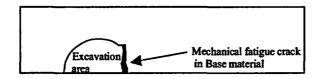

Paragraph 1.1(e)(2)(b)(1) requires that an overlay grading unit shall include the overlay material and the base metal-to-overlay interface of at least six square inches. The overlay grading unit shall be rectangular, with minimum dimensions of two inches.

Paragraph 3.2(b) requires that all extensions of base metal cracking into the overlay material by at least 0.1 inches be reported as being intrusions into the overlay material.

#### **BASIS FOR RELIEF**

Nuclear Management Company, LLC (NMC) is requesting relief from Appendix VIII, Supplement 11, pursuant to 10 CFR 50.55a(a)(3)(i). NMC proposes an alternative to use the Performance Demonstration Initiative (PDI) Program for implementation of Appendix VIII, Supplement 11 requirements.

Paragraph 1.1(d)(1), requires that all base metal flaws be cracks. As illustrated below, implanting a crack requires excavation of the base material on at least one side of the flaw. While this may be satisfactory for ferritic materials, it does not produce a useable axial flaw in austenitic materials because the sound beam, which normally passes only through base material, must now travel through weld material on at least one side, producing an unrealistic flaw response. To resolve this issue, the PDI program revised this paragraph to allow use of alternative flaw mechanisms under controlled conditions. For example, alternative flaws shall be limited to when implantation of cracks precludes obtaining an effective ultrasonic response, flaws shall be semi-elliptical with a tip width of less than or equal to 0.002 inches, and at least 70 percent of the flaws in the detection and sizing test shall be cracks and the remainder shall be alternative flaws.

Relief is requested to allow closer spacing of flaws provided the flaws do not interfere with detection or discrimination. The existing specimens used to date for qualification to the tri-party (Nuclear Regulatory Commission (NRC)/Boiling Water Reactor Owners Group (BWROG)/Electrical Power Research Institute (EPRI)) agreement have a flaw population density greater than allowed by the current code requirements. These samples have been used successfully for all previous qualifications under the tri-party agreement program. To facilitate their use and provide continuity from the tri-party agreement program to Supplement 11, the PDI Program has merged the tri-party test specimens into their weld overlay program.

For example, the requirement for using IWA-3300 for proximity flaw evaluation in paragraph 1.1(e)(1) was excluded. Instead, indications will be sized based on their individual merits.

Paragraph 1.1(d)(1) includes the statement that intentional overlay fabrication flaws shall not interfere with ultrasonic detection or characterization of the base metal flaws.

Paragraph 1.1(e)(2)(a)(1) was modified to require that a base metal grading unit include at least one-inch of the length of the overlaid weld, rather than three inches.

Paragraph 1.1(e)(2)(a)(3) was modified to require sufficient unflawed overlaid weld and base metal to exist on all sides of the grading unit to preclude interfering reflections from adjacent flaws, rather than the one-inch requirement of Supplement 11.

Paragraph 1.1(e)(2)(b)(I) was modified to define an overlay fabrication grading unit as including the overlay material and the base metal-to-overlay interface for a length of at least one-inch, rather than the six-square-inch requirement of Supplement 11.

Paragraph 1.1(e)(2)(b)(2) states that overlay fabrication grading units designed to be unflawed shall be separated by unflawed overlay material and unflawed base metal-to-overlay interface for at least one-inch at both ends, rather than around its entire perimeter.

Additionally, the requirement for axially oriented overlay fabrication flaws in paragraph 1.1(e)(1) was excluded from the PDI Program as an improbable scenario. Weld overlays are typically applied using automated gas tungsten arc welding techniques with the filler metal being applied in a circumferential direction. Because resultant fabrication induced discontinuities would also be expected to have major dimensions oriented in the circumferential direction, axial overlay fabrication flaws are unrealistic.

The requirement in paragraph 3.2(b) for reporting all extensions of cracking into the overlay is omitted from the PDI Program because it is redundant to the root-mean-squared (RMS) calculations performed in paragraph 3.2(c) and the presence of RMS adds confusion and ambiguity to depth sizing as required by paragraph 3.2(c). This also makes the weld overlay program consistent with the Supplement 2 depth sizing criteria.

These changes are contained in code case N-653. A comparison between the 1995 Edition and 1996 Addenda of Supplement 11, code case N-653, and the PDI Program is attached as supporting documentation. The first column identifies the code requirements, while the second (middle) column identifies the changes made by the code case.

There are, however, some additional changes that were inadvertently omitted from code case N-653. In paragraph 1.1(a)(1) the phrase "and base metal on both sides" was inadvertently included in the description of a base metal grading unit. The PDI program intentionally excludes this requirement because some of

the qualification samples include flaws on both sides of the weld. To avoid confusion several instances of the term "cracks" or "cracking" were changed to the term "flaws" because of the use of alternative flaw mechanisms.

Additionally, to avoid confusion, the overlay thickness tolerance contained in paragraph 1.1(b) last sentence, was reworded and the phrase "and the remainder shall be alternative flaws" was added to the next to the last sentence in paragraph 1.1(d)(1). Additional editorial changes were made to the PDI program to address earlier requests for additional information from the NRC to other licensees (Southern Nuclear Company for the Edwin Hatch Nuclear Plant and Progress Energy Carolinas, Inc. for the Brunswick Steam Electric Plant). The changes described above are identified by **bold** print in the third column of the enclosure.

### PROPOSED ALTERNATIVE EXAMINATION

NMC proposes that in lieu of the requirements of the ASME Section XI, BPV Code, 1995 Edition with the 1996 Addenda, Appendix VIII, Supplement 11, the PDI Program be used for examination requirements, as described in the attachment to this enclosure. This alternative provides an acceptable level of quality and safety.

#### CONCLUSION

In summary, NMC is requesting relief from the requirements of Appendix VIII, Supplement 11, in order to utilize the PDI Program. Based on the information presented, and pursuant to 10 CFR 50.55a(a)(3)(i), NMC requests approval for the proposed alternative on the basis that the alternative provides an acceptable level of quality and safety.

#### PERIOD FOR WHICH RELIEF IS REQUESTED

NMC requests approval of the proposed alternative for the remainder of the third ten-year interval of the Inservice Inspection Program for Palisades, which is expected to conclude on December 12, 2006.
