

Post Exam Analysis

The examiners reviewed all questions which were missed by 80% or 100% of the applicants on the written examination. There were three of these on the SRO exam, five on the RO.

The examiners determined that three of these questions on the RO exam could be improved with wording enhancements, however all questions were technically correct and valid.

Seabrook Station
Operator Examination Analysis Information

In accordance with section ES-501 of NUREG-1021, "Operator Licensing Examination Standards for Power Reactors," enclosed is a copy of the completed examination analysis, the completed Form ES-201-3 "Examination Security Agreement," and a completed Form ES-403-1 "Written Examination Grading Quality Checklist." The documents are associated with the Licensed Operator Exams that took place the weeks May 26 of June 2. The examination analysis evaluated all questions that were missed by greater than or equal to 50% of the candidates. The analysis showed that the questions were technically valid and had only one correct answer. Any programmatic changes or subsequent evaluations are noted in the analysis. In addition, the subject questions were reviewed with the candidates to provide a technical remediation for these items.

Should you have any questions regarding this letter, please contact Mr. Daniel Roy, Training Manager at (603) 773-7602.

Very truly yours,

FPL Energy Seabrook, LLC.

James M. Peschel
Regulatory Programs Manager

SEABROOK STATION NRC EXAM ANALYSIS

RO/SRO COMMON QUESTIONS

RO&SRO QUESTION #3 (5/10 incorrect)

The following plant conditions exist:

- The power plant is operating at 100%.
- Service water pump P-41A is tagged out for corrective maintenance.
- Service water pump P-41C trips.
- A tower actuation (TA) signal is manually generated, realigning service water supply to the cooling tower.
- The □A□ cooling tower pump current is oscillating between 20-50 amps on SW-AM-6167.
- PCCW HX □A□ outlet temperature is 90F and rising slowly.

What actions are required per OS1216.01, "Degraded Ultimate Heat Sink"?

- A. Start an additional service water □B□ train pump and cross connect with 'A' train service water and initiate a plant shutdown in accordance with OS1000.06, "Power Decrease".
- B. Continue efforts to restore service water flow. If cannot restore train 'A' service water, initiate a plant shutdown in accordance with OS1000.06, "Power Decrease".
- C. Continue efforts to restore service water flow. If cannot restore train 'A' service water, begin securing train 'A' service water loads in accordance with attachment 'B' of OS1216.01, "Degraded Ultimate Heat Sink".
- D. Start additional 'B' train service water pump and cross connect service water trains in accordance with OS1016.03, "Service Water Train 'A' Operation". Secure train 'A' service water loads in accordance with attachment 'B' of OS1216.01, "Degraded Ultimate Heat Sink."

ANSWER: C

EXPLANATION:

C - is correct; OS1216.01 describes the actions in choice C

A,D - incorrect - do not cross connect trains ever.

B - incorrect - this is action for BOTH trains inoperable

Analysis:

- **All individuals missing this question selected 'B.'**
- **The question is technically valid, however it is felt that the Operational Validity of testing an arcane RNO is questionable.**
- **Question reviewed with students – no further programmatic actions needed.**

RO/SRO QUESTION #19 (7/10 incorrect)

The following conditions exist:

- The crew is attempting to determine the location of a 10 gpm leak in the charging system.
- Prior to the leak charging flow was 87 gpm and letdown flow was 75gpm.
- VCT level is decreasing.
- All systems are in automatic.
- The NSO reports an indication of leakage from the body of CS-V210, Charging Pump >A= Discharge Isolation Valve.

After the transient is complete (steady state to steady state), what would be a positive indication the operator would have on the main control board that CS-V210 is the source of the leak?

- A. Decreased indicated charging flow and pressurizer level decreasing.
- B. No change in indicated charging flow from its initial value and pressurizer level on program.
- C. Increased indicated charging flow and pressurizer level on program.
- D. Increased indicated charging flow and pressurizer level increasing.

ANSWER: B

EXPLANATION:

B - correct - charging flow control valve will maintain PZR level steady by increasing flow by opening flow control valve.

A - incorrect - indicated charging flow does not change; PZR level is constant

C - incorrect - indicated charging flow does not change

D - incorrect - indicated charging flow does not change; PZR level is constant

Analysis:

- **1 individual selected 'A,' 5 individuals selected 'C,' 1 individual selected 'D.'**
- **The question (a Seabrook bank question) was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO/SRO QUESTION #31 (6/10 incorrect)

The following conditions exist:

- The plant is in mode 6.
- The Manipulator Crane area radiation monitor, R-6535A, is alarming at the ALARM level.

Which of the following describes the Containment Air Purge and Containment Online Purge COMPLETE automatic system response, if any, to this alarm?

- A. Containment Air Purge (CAP) and Containment Online Purge (COP) isolation valves shut.
- B. CAP and COP isolation valves shut, CAP and COP fans trip or are blocked from starting.
- C. CAP and COP isolation valves shut, CAP, COP, and refueling purge fans trip or are blocked from starting.
- D. There is no automatic feature for this ARM.

ANSWER: C

EXPLANATION:

C - correct - the alarm will initiate a containment ventilation isolation (CVI) signal which automatically shuts CAP and COP isolation valves and stops/blocks the CAP, COP, and refueling purge fans.

A - incorrect - not all of the automatic actions

B - incorrect -not all actions

D - incorrect

Analysis:

- **6 individuals selected 'B.'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO/SRO QUESTION #32 (5/10 incorrect)

The following conditions exist:

- Reactor power is at 100% with power range channel N-41 failed. All bistables for N-41 are tripped.
- Power range channel N-44 is determined to be failed as is. N-44 bistables are NOT tripped.
- N-44 cannot be repaired within the allotted time, and a power decrease to HOT STANDBY is commenced.

Which of the following describes the effect the channel failures have on plant operation during the down power ramp to hot standby with no operator action?

- A. The failures have no effect on plant operation.
- B. P-7 will fail to block its associated reactor trips.
- C. The reactor will trip when power decreases below 10% power.
- D. Source range permissive P-6 will fail to activate.

ANSWER: B

EXPLANATION:

2/4 > 10% needed to activate trips: 3/4 decreasing to block trips: 2 detectors are
stuck >10%

A - incorrect

C - incorrect

D - P-6 is IR instrument

Analysis:

- **3 individuals selected 'C,' 2 individuals selected 'D.'**
- **The question (a Seabrook bank question) was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO/SRO QUESTION #34 (5/10 incorrect)

The following conditions exist:

- The plant is at 85% power.
- MFP trips and a setback is in progress.
- All steam dumps (SDs) fail to open as required.
- A steam dump arming signal is present.

Which one of the following describes the effect on the main steam system and what is the required response to the stuck SD valves per OS1231.03, Turbine Runback/Setback ?

Note: Pressures and temperatures below refer to S/G conditions prior to any operator or automatic corrective action.

- A. Main steam pressure remains constant through the setback, no corrective action for the steam dumps is required because ASDVs and S/G reliefs will relieve pressure.
- B. Main steam pressure rises through the setback, no corrective action for the steam dumps is required because ASDVs and S/G safeties will relieve pressure.
- C. Main steam pressure rises through the setback, try to manually operate steam dump valves.
- D. Main steam pressure increases through the setback. Without steam dumps, the reactor will trip on high pressurizer level. Go to E-0, Reactor Trip or Safety Injection .

ANSWER: C

EXPLANATION:

C - correct - load decrease on turbine causes S/G pressure and temperature to increase, procedure says to manually operate SDs if proper SD actuation did not take place.

A - incorrect - pressure increases.

B - action is required, either manual operation of steam dumps, or FR-H.4 calls for ASDV operation if yellow path is completed in Heat Sink CSF.

D - incorrect - will not get to trip setpoint.

Analysis:

- **1 individual selected 'B,' 4 individuals selected 'D.'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO/SRO QUESTION #40 (5/10 incorrect)

What are the most abundant radioisotopes (microCi/ml) in a liquid waste discharge and what biological hazard do they pose to humans?

- A. Cobalt-60 and iodine-131; internal and external biological hazard
- B. Cobalt-60 and tritium (H-3); external biological hazard only
- C. Tritium (H-3) and iodine-131; internal and external biological hazard only
- D. Tritium (H-3) and iodine-131; internal biological hazard only

ANSWER: D

EXPLANATION:

D - Analysis in FSAR describes tritium and iodine as most abundant; both isotopes are beta particle emitters and an internal hazard only.

A, B, C - incorrect

Analysis:

- ***2 individuals selected 'A,' 2 individuals selected 'B,' 1 individual selected 'C.'***
- ***The question is technically valid, however it is felt that the Operational Validity of this item questionable.***
- ***Question reviewed with students – no further programmatic actions needed.***

RO/SRO QUESTION #49 (8/10 incorrect)

The following plant conditions exist:

- The plant is recovering from a large break LOCA that occurred 4 days ago.
- The crew receives VAS alarm, ACO ALARM EAH-F-9" for enclosure air handling filter F-9.
- The US implements OS1200.00, "Response to Fire or Fire Alarm Actuation".

In accordance with OS1200.00, what actions must the crew take?

- A. Secure associated fan within 5 minutes. Fire brigade must be dispatched and located at F-9 within 10 minutes of being notified.
- B. Secure associated fan within 5 minutes. Fire brigade must be dispatched and located at F-9 within 15 minutes of being notified.
- C. Secure associated fan within 10 minutes. Fire brigade must be dispatched to investigate.
- D. Secure associated fan within 10 minutes. Fire brigade must be dispatched and located at F-9 within 15 minutes of being notified.

ANSWER: A

EXPLANATION:

A - correct - OS1200.00 directs these actions within these time limits.

B,C,D - incorrect

Analysis:

- **5 individuals selected 'B,' 1 individual selected 'C,'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **CR (TDR) written to evaluate the referenced learning objective for its adequacy in covering this NOTE/CAUTION.**

RO/SRO QUESTION #57 (5/10 incorrect)

The plant is operating at 100% power. 13.8 kV bus #2 is lost. Which of the following is a valid plant response and what actions are required to mitigate the response?

- A. Steam dumps arm and open due to plant heatup, MSIVs should be closed in steam lines 'C' and 'D' to prevent loop cooldown.
- B. Flow reversal in coolant loops 'A' & 'B', attempt to restore bus and restart RCPs 'C' & 'D' In accordance with E-0, 'Reactor Trip or SI Injection'.
- C. Loops 'A' & 'B' Tave and Th decrease. Shut loop 'A' and 'B' MSIV to arrest cooldown
- D. Loops 'A' & 'B' Tave and Th decrease. Attempt to restore 13.8kV bus #2 and restore flow by restarting RCPs In accordance with normal operating procedures.

ANSWER: D

EXPLANATION:

Trip causes all loop Tave, Th to decrease. Operators should perform actions of E-0, then ES-0.1. Which directs restoration of plant systems In accordance with normal operating procedures.

- A - MSIVs are not directed to be shut
- B - No flow reversal in A & B (C&D lost)
- C - same as A.

Analysis:

- **2 individuals selected 'A,' 1 individual selected 'B,' 2 individuals selected 'C.'**
- **The question is technically valid.**
- **Question reviewed with students – no further programmatic actions needed.**

RO/SRO QUESTION #71 (8/10 incorrect)

The following plant conditions exist:

- The power plant is operating at 55% following a rapid power decrease.
- Xenon requires diluting the RCS at a rate of 100 gallons per hour.
- Excess letdown is in service.
- Letdown was previously isolated due to a containment isolation valve failure.
- VCT level is 70%.

How should the operator control VCT inventory in accordance with plant procedures?

- A. The VCT will automatically divert as level increases.
- B. Excess letdown is directed to the reactor coolant drain tank (RCDT) as required.
- C. Excess letdown is aligned to the top of the VCT. The VCT will divert as level increases.
- D. The operator will place the control switch for CS-LCV/LV-112A to DIVERT as needed, which will align letdown and excess letdown to the PDT.

ANSWER: B

EXPLANATION:

- B - V-170 is available in excess letdown line to divert water to RCDT
- A - incorrect
- C - incorrect
- D - 112A is not in excess letdown path

Analysis:

- **4 individuals selected 'A,' 4 individuals selected 'D.'**
- **The question (a Seabrook bank question) was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO ONLY QUESTIONS

RO QUESTION #81 (4/5 incorrect)

The following plant conditions exist:

- A reactor startup is in progress.
- Reactor power is 4×10^3 cps on source range channels, NI-31 and NI-32.
- Reactor power is about 1.5×10^{-11} amps on intermediate range channels N35 and N36.
- Power is lost to 120 VAC panel EDE-PP-1B.
- NI-31 now reads 0 cps.
- SR 31 HIGH VOLTAGE LOST VAS alarm is indicated.

Which one of the following describes the complete set of action requirements for the loss of nuclear instrumentation?

- A. Table 3.3.1. action statement 4 only.
- B. Table 3.3.1. action statement 2 and 4 only.
- C. Table 3.3.1 action statements 2, 3 and 4 only.
- D. Table 3.3.1 action statements 2,3,4 and LCO 3.0.3.

ANSWER: D

EXPLANATION:

D - correct - bus EDE-PP-1B powers one PRNI, one IRNI and SRNI N-32. The loss of 2 SRNIs puts the facility in LCO 3.03. The action statements for the three detectors still apply.

A,B,C - incorrect - 2 SRNIs, 1 IRNI, and 1 PRNI are inoperable.

Analysis:

- **3 individuals selected 'A,' 1 individuals selected 'C.'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO QUESTION #83 (4/5 incorrect)

The following plant conditions exist:

- The reactor was at 100%.
- Tave = 587F, RCS pressure is 2235 psig.
- PCV-456A PORV and associated block valve are stuck open.
- RCS temperatures are stable.
- The reactor trips and SI is initiated.
- The crew transitions from E-0, "Reactor Trip or Safety Injection", to E-1, "Loss of Reactor or Secondary Coolant".
- All systems are functioning as expected with the exception of the stuck open PORV & block valve.
- Pressure is currently at 1350 psig and decreasing.

Which of the following statements is providing accurate guidance for operation of RHR pumps as per E-1 and what is the basis?

- A. Secure RHR pumps because primary pressure is greater than 260 psig to reduce burden on EDGs during design basis accident.
- B. Do not secure RHR pumps because primary pressure and level instrumentation are not reliable during steam space accident.
- C. Secure RHR pumps and place in standby to prevent damage to the pump because pressure will not drop below 1250 psig for 1 stuck open PORV.
- D. Do not secure RHR pumps because they may be needed at lower primary pressure

ANSWER: D

Explanation of answer: Step 8 does not allow securing RHR pump if pressure is decreasing

Explanation of distractors:

- A. not basis for securing RHR
- B. pressure instrumentation is okay; level instrument is not
- C. cannot secure pump while pressure dropping

Analysis:

- **4 individuals selected 'C'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO QUESTION #88 (4/5 incorrect)

The following plant conditions exist:

- The operating crew is responding to "Inadequate Core Cooling", FR-C.1.
- The crew is unable to re-initiate ECCS flow.
- S/G depressurization proved ineffective due to loss of secondary heat sink.
- All core exit thermocouples indicate >1100F.
- RVLIS indicates 35% and slowly decreasing.
- RCP seal injection startup criteria cannot be established.

Which of the following actions are required by FR-C.1 ?

- A. Do not damage RCPs by starting; continue attempts to reestablish ECCS flow.
- B. Do not damage RCPs by starting; continue attempts to reestablish ECCS and secondary heat sink.
- C. Start only one RCP in any available RCS loop. Continue operation of one RCP until core exit thermocouples are less than 725F.
- D. Start RCPs one at a time in an available RCS loop, until core exit thermocouples are less than 1100F.

ANSWER: D

EXPLANATION:

prescribed actions in FR-C.1

- A - RCPs are to be started regardless of starting criteria
- B - RCPs are to be started regardless of starting criteria
- C - Not restricted to only one RCP

Analysis:

- **1 individual selected 'B,' 3 individuals selected 'C.'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO QUESTION #89 (3/5 incorrect)

The CSFs indicate the following:

- RED Path on Core Cooling
- RED Path on Heat Sink

FR-C.1, "Response to Inadequate Core Cooling", has been entered.

When the crew starts RCPs, the Core Cooling Status Tree changes to an ORANGE condition.

Which of the following actions should the crew take?

- A. Immediately transition to FR-H.1, "Response to Loss of Heat Sink."
- B. Immediately transition to FR-C.2, "Response to Degraded Core Cooling".
- C. Remain in FR-C.1 until completion, then transition to FR-H.1.
- D. Remain in FR-C.1 until completion, then transition to FR-C.2.

ANSWER: C

EXPLANATION:

EOP users guide, section 4.3, page 9.

B and D are incorrect because they require transition to a lower priority procedure in the higher safety function. All REDS take precedence over all ORANGES. A is incorrect because once the FRP is started, it is followed to completion.

Analysis:

- **3 individuals selected 'A.'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO QUESTION #91 (3/5 incorrect)

Given the following conditions:

- The crew is performing actions of ES-1.2, "Post LOCA Cooldown and Depressurization".
- Pressurizer level is stable at 58%.
- RCS pressure is stable at 1680 psig.
- The US determines that a charging pump can be stopped in accordance with ES-1.2.
- RCS temperature is stable at 545F.

When the RO stops the charging pump, which one of the following describes the expected PZR level response?

- A. PZR level will remain unchanged.
- B. PZR level rises due to pressure reductions.
- C. PZR level and pressure will stabilize at a lower level and pressure.
- D. PZR level initially drops, then rises as pressure is reduced.

ANSWER: C

EXPLANATION:

Removal of high head pump reduces flow, conditions were stable, break flow/injection flow stabilize at new lower PZR level and pressure

- A - level will drop with reduced flow
- B - break is not isolated level will drop
- C - level will drop regardless of charging alignment

Analysis:

- **3 individuals selected 'D.'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO QUESTION #93 (3/5 incorrect)

The plant is at the following conditions:

- 100% power.
- Tave = 587F.
- RCS pressure = 2235 psig.
- Control rods are in manual.
- An inadvertant dilution is in progress.

What is the expected first-out indication without operator action?

- A. Over Power Delta-T HI
- B. Over Temp Delta-T HI
- C. Neutron Flux Level HI
- D. PZR Pressure HI

ANSWER: B

EXPLANATION:

B - UFSAR analysis of dilution accident at power will result in over temperature Delta-T protective action.

A, C, D - incorrect

TECHNICAL REFERENCE(S): UFSAR Section 15.4.6.2g (Attach if not previously provided)

Analysis:

- **2 individuals selected 'A,' 1 individual selected 'C.'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

RO QUESTION #99 (3/5 incorrect)

The following plant conditions exist:

- The plant is operating at 100%.
- All systems are lined up in their normal lineups.
- All control systems are in automatic.
- The main turbine generator output breaker trips on a fault.

Which of the following describes the expected immediate plant response ?

- A. S/G pressure initially decreases as main turbine is lost, S/G levels initially decrease due to shrink, feed flow initially increases.
- B. S/G pressure initially increases as main turbine is lost, S/G levels initially decrease due to shrink, feed flow initially increases.
- C. S/G pressure initially decreases as main turbine is lost, S/G levels initially increase due to lower steam pressure, feed flow initially decreases.
- D. S/G pressure initially increases as main turbine is lost, S/G levels initially decrease due to shrink, feed flow initially decreases.

ANSWER: D

EXPLANATION:

D - correct - initially (prior to steam dumps opening), steam header pressure increases due to the loss of steam demand. The increased back-pressure in the S/Gs partially suppresses boiling which causes shrink to occur in the S/Gs. The reduced steam demand inputs to the feed controller to reduce feed thus feed flow decreases.

A,B,C - incorrect

Analysis:

- **3 individuals selected 'B.'**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

SRO ONLY QUESTIONS

SRO QUESTION #79

The following plant conditions exist:

- The plant is at 100% power.
- The 'B' Emergency Diesel Generator (EDG) was declared INOPERABLE yesterday at 0600.
- At 0800 today (26 hours after 'B' EDG was declared INOPERABLE), the SM has discovered that the operability run for the 'A' EDG is required and has not been performed.

What action is required?

- A. The unit must be in at least HOT STANDBY by 1200 today.
- B. The operability run on the 'A' EDG must be performed successfully by 0600 tomorrow or be in at least HOT STANDBY within the next 6 hours..
- C. The operability of the 'A' EDG must be successfully performed by 1200 today or be in at least HOT STANDBY within the next 6 hours.
- D. The operability surveillance of 'A' EDG must be performed successfully by 1000 today or be in at least HOT STANDBY within the next 6 hours.

ANSWER: D

EXPLANATION:

D - correct - EDG 'A' becomes INOPERABLE at 0600 today if it is not run successfully. Action statement (f) reads: "with two of the above required diesel generators inoperable....restore at least one of the inoperable diesel generators to OPERABLE status within 2 hours or be in at least HOT STANDBY within the next six hours.

A - incorrect - licensee has 2 hours to show operability.

B - incorrect - 24 hour extension applies to normal surveillances not required by action statements (SR4.0.3) and less than 24 hour frequencies.

C - incorrect - SR 4.0.2 requires that surveillances be completed within 1.25 their stated time limit, or $24 \times 1.25 = 30$ hours for this case, or 1200 today. Action statement requires operability to be determined within 24 hours, or by 0600 today.

Analysis:

- **1 individual selected 'B,' 3 individuals selected 'C'.**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

SRO QUESTION #90

The following plant conditions exist:

- A reactor startup is in progress.
- The reactor is at 48%.
- Containment temperature is 128F.
- Containment pressure is 16.0 psia.

What action(s), if any, are required and why?

- A. Take action to reduce containment temperature. Temperature is outside the band used in the overall safety analysis for a steam line break accident.
- B. Take action to reduce containment temperature. Temperature is outside the band used in the overall safety analysis for a large break LOCA accident.
- C. Restore the internal pressure to within limits within 1 hour, or be in HOT STANDBY within the next 6 hours and in COLD SHUTDOWN within the following 30 hours. Pressure is kept in the allowable band to prevent exceeding the containment design pressure during LOCA conditions.
- D. Restore the internal pressure to within limits within 1 hour, or be in HOT STANDBY within the next 6 hours and in COLD SHUTDOWN within the following 30 hours. Pressure is kept in the allowable band to prevent exceeding the containment design pressure during a steam line break accident.

ANSWER: A

EXPLANATION:

A - correct - TS 3/4.6.1.5 limits containment air temperature to 120F because the safety analysis for the steam line break accident has bounded initial conditions on temperature.

B - incorrect - not for LOCA analysis

C - incorrect - pressure is below the TS limit of 16.2 psia.

D - incorrect - pressure is below the TS limit of 16.2 psia and basis is LOCA not SLB.

Analysis:

- **3 individuals selected 'B,' 1 individual selected 'C'.**
- **The question was reviewed with the students and is determined to be technically valid.**
- **No further programmatic actions needed.**

Item 9

Answer: B
 Point Biserial: 0.81

Correct Responses: Total Group: 60.00%
 Upper 27% of Group: 100.00%
 Lower 27% of Group: 0.00%

Distractor Analysis - * indicates correct answer:

	A	*B	C	D
Pt-Biser.:	-0.81	0.81	0.00	-0.18
Frequency%:	20.00	60.00	0.00	20.00

Item 10

Answer: D
 Point Biserial: 0.00

Correct Responses: Total Group: 100.00%
 Upper 27% of Group: 100.00%
 Lower 27% of Group: 100.00%

Distractor Analysis - * indicates correct answer:

	A	B	C	*D
Pt-Biser.:	0.00	0.00	0.00	0.00
Frequency%:	0.00	0.00	0.00	100.00
