As a result, the reactor vessel pressure retaining head was replaced and an effort to remove dry boric acid deposits from containment was initiated. The plant remained shutdown due to various modifications which included (but not limited to): the Decay Heat Valve Pit, the Emergency Sump, and the Containment Air Coolers. Currently, along with additional work required prior to restart, the DBNPS is involved in the resolution of issues with the High Pressure Injection Pumps.

## SUMMARY:

The reactor was shutdown on February 16, 2002 to begin the 13th refueling outage. Corrosion and degradation was found on the head and it has since been replaced. The reactor remained shutdown through the month of September (due to continuing work), however, the plant entered Mode 3 on September 15, 2003, to conduct a Reactor Coolant System inspection.
