This e-mail serves as notification that PRI had a release of Production fluid (47 mg/L U3O8) at the SR-HUP on October 15, 2003. The release occurred at Well 2P-182 at Wellfield 2 at SR. The release was found at 0910 at which time the well was shut off. It was estimated that 5000 gallons was released. The fluid was partially retained in a open mud pit. The remainder flowed in to a dry ephemeral stream channel within the wellfield and was retained in a depression. A Vac Truck was used to recover about 4000 gallons. All the released fluid was retained in the fenced wellfield area.

It was determined that the release resulted from the failure of a pressure relief valve on the wellhead.

A written report will be submitted within 7 days. If you have any questions please call me. Please acknowledge that you received this notification.

Thanks
